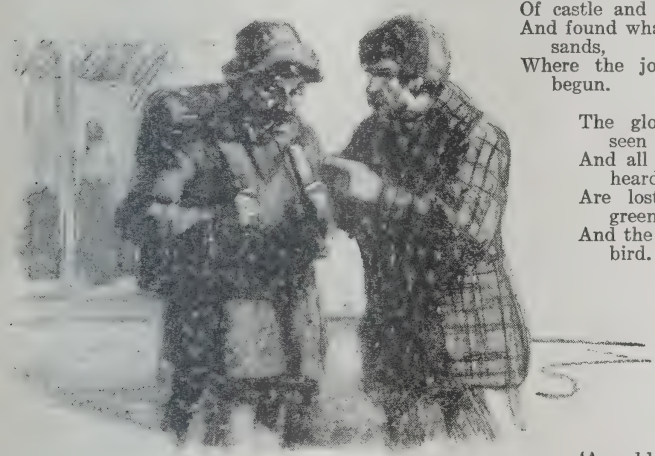
'Dare is man here dat tam name Mans Pean. He's devil from Canada, dat man. I see dat man one tam, he stan' on dis side of de room—I stan' on dat side—he take my watch out my pocket, show me! I don't know how he can do dat. One tam he's in lumber-camp. He's got what you call lil' *gimble*—he bore small hole in tree. He say, "Boys, what will you have?" All de lumberjack say, "Beer." He hold tin can under lil' hole in tree—fill wid good beer—pass roun'! I don't know how he can do dat. Den he say, "What you have now?" All de Injun say, "Can'da wes'!" He hold tin can under *same* hole—fill wid good whisky! —I *know.* He say to me one tam, "Alec, you give me ten dollair I show you how you can get good whisky out all de tree." I say, "Excuse me, Mans Pean, I'm poor man; besides, I drink too much *now.* I don't know what I do I can get whisky out all de tree."

'Well, one tam I carry de mail, Cheboygan-Traverse City, on my back, twelve year. I go down dis week—come back next week. One tam I come to Pine Lake. Mans Pean is dare. He say, "Alec, be pretty hard carry de mail on your back, *non*?" I say, "Yes, t'ank you, pretty

hard — winter, summer, bad road."



'He say, "You like to know how you can carry de mail more easy?"

'I say, "Yes, t'ank you, I like to know, but I got no wing yet."

'He say, "I tell you how you can carry de mail more easy. Next Monday morning you get de mailbag on your back, bottle in your pocket, you take piece bark off dat tree (he show me what tree I get de bark), you stan' your feet on dem bark—you say dese word what I tell you. (He tell me what word I can say.) You go like de wind!"

'Course I don't believe dat; but he's devil, dat man—I don't know what he can do. So next Monday morning I get mailbag on my back. When I'm outside de town I take piece bark what he tell me—den I say dem word what he tell me. By Gar! I go like sea gull in big blow! I meet some women on sleigh wid oxen—dey don't turn dere head, nothing. Nobody see me—I go so fast. Two o'clock I'm Petoskey. Dat be on de record now. T'ree o'clock I'm Petite Traverse.'

'But the words, Mr. Gilbault? What were the words you said?'

'You like to know how you can carry de mail more easy?'

'Dat's what I don't remembair. If I can remembair de word what he tell me I give all I got in dis world—I give my lil' house down dare. I can go to Grand Rapids—Detroit! Bimeby I can go to heaven on piece o' bark! Dat's what I don't remembair—de word what he tell me!'

## IN MICHIGAN

Slow-yielding Nymphs
Evade unpandered Satyrs here,
And sands unconquered laugh at man's invention;
Bright clouds drive darker shadows,
And the bay-breeze bears heavy odors—
Odor-offerings of ragged pine
And spruce.

The white birch single on the hillside,
The hemlocks and I
Are friends
In Michigan.

Nature's fingers
Seem to play upon my strings
In minor harmonies up here—
Where shells of convents shelter
Echoes only,
And the last Indian has laid
His flints and legends
On the grave-mound of the older time
In Michigan.

We think we have a right to be fond of our Michigan north country, and to say good things of it every season. There is a wildness and variety not to be found again in a year's travel afoot. There is a fresh tenderness in the springtime, from the early shooting of the fern, the arbutus and the adder-tongue, to the lettuce-green of the birch leaves and blood-red of maple buds. The lingering autumn, with its blaze of foliage, the soft veil of Indian summer and harvest moon at night, is like a prayer of the dying year; and winter—silent and white against the evergreens, golden in the sunlight and mysterious under the stars—has a witchery that touches the depths of the soul in man. To one who has an ear attuned to the poetry of nature there is a whisper in the pine trees and shifting sands like a voice from the graves of departed tribes; and in the clear skies, pure waters, virgin woods and the great, healthy everlasting motion of things—one finds an uplift of promise and good cheer.

In the evening, after the rain,
At home with the North and the trees,
I turn from the world again—
And find me a world in these.

I searched for a joy in the lands
Of castle and kopje and sun,
And found what I sought—in the sands,
Where the journey was lightly begun.

The glories of continents seen
And all that my ears have heard
Are lost in the garden's green
And the chirp of the nested bird.

## THE STORY OF A COMMON MAN

'A common man was Pere Gilbault,'
So will the townsmen say,
'A sodden leaf left by the snow
Upon the summer way.

'A relic of the older time,
He crooned of moldy years,
Unknown to fame of good or crime—
And sleeps unmourned of tears.'

And this the tribute of the world
To labor's humbler men—
'A thing the jesting winds have whirled
On earth and off again!'

What though he spread the dauntless sail
And quit the shame of kings—
To break the rugged forest-trail
And dwell with silent things?

What though he turned the blades to hoes,
And tamed the savage breeds?—
We hold their homes! No bugle blows
A woodman's homely deeds.

He made a garden, sowed a seed—
But we have plucked the flower!
He laid the faith, we made the creed—
What boots *his* lingering hour?

No mausoleum marks his grave,
No will divides his gold;
No pension soothes a whimpering slave,
His office none will hold.

His tomb is but the earth he trod,
His wealth the poet's heart;
His gift a love for man and God,
His post the honest part.

A common man was Pere Gilbault,
And so the world must say—
'A sodden leaf left by the snow,
Upon the summer way!'

SEND for ALADDIN CATALOG of NOT SECTIONAL HOMES

You can buy all of the materials for a complete home direct from the manufacturer and save four profits, on the lumber, millwork, hardware and labor. WE PAY THE FREIGHT.

5 Room$ ALADDIN 478

Nine different floor plans of this house are shown in Catalog. 2 and 3 bedroom designs—grade and inside cellar entrances.

6 Room$ ALADDIN 618

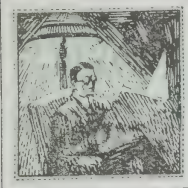
Living room, dining room, 3 bedrooms, kitchen, bath. 3 other plans in catalog. Very high grade lumber throughout.

Story and Half $ ALADDIN 789

Story and a half semi-bungalow, with second floor available for 2 bedrooms. Two floor plan arrangements. Any handy man can erect these houses.

7 Room$ ALADDIN 956

Large living room with circle-tread open stairway, dining room, kitchen. 3 bedrooms, each with closet. Bath on second floor.



Price includes all lumber cut to fit; highest grade interior woodwork, siding, flooring, windows, doors, glass, paint, hardware, nails, lath, roofing, with complete instructions and drawings. Freight paid to your station. Permanent Homes—NOT PORTABLE. Many styles of year 'round dwellings, summer cottages and garages to choose from. ## THE HUMMING-BIRD

When languorous Noons entreat the summer sky
And restive spirits vex the ways of men
In vain emprise; within my garden then
Will I elect to let the world go by,
And watch the humming-bird. Not seen to fly,
He comes, and vanishes, and comes again
And sips the sweets of honeysuckles when
Their lips are frail—but leaves them not to die.

So I have thought how good it were to be
This ruthful corsair, bent on such pursuit,
Against the wear of my foreplanning hours;—
How good it were to live thus liegelessly
Upon the world's unreckoned blossom-loot—
Yet spare from any harm its guarded flowers!

# I Read in the Papers

The pound sterling is swallowing up the fresh vegetables and the comforts that belong to many French homes. Unemployed Englishmen are living in France on their dole money, because of the exchange. This myth is, regrettably, not considered an extravagance like that of *Les Dessous de l'Espionnage Anglais*, a book from which, having bought it on the boulevards, I learned of a lady named 'the Beautiful Flora,' whose headquarters are at 10 Downing Street, and who recruits spies from 'the clan of youths with a few peccadilloes sponged off their conscience by the Lord Chief Justice.'

### *Gallic Ire vs. Cockney Sarcasm*

The tale about the dole and the franc is believed, and is propagated by serious journals. Thus an editorial in the *Liberte:* 'Great Britain . . . gives her unemployed ten shillings a day on condition that they do not work, and that they stay abroad for as long as possible. Ten shillings a day is not much in England. In France it makes seventy-five francs'; and M. Gustave Tery, writing in the *Euvre* under the title, 'We Support Their Unemployed': 'British unemployed draw an indemnity which, thanks to the exchange, permits them to live luxuriously in our country.'

The French, to their credit, have no unemployed. We, unfortunately, have many. I wish the French would accept a friendly assurance that the dole for husband and wife is 23s. a week, or 175 francs, and that since it must be drawn in person, the unemployed cannot afford a weekly return journey to France.

* * *

A schism among the Mennonites has loomed:

### *Hooks and Eyes, Buttons and Religion*

The moot point is one of dogma—whether adherents to the faith first formulated in Holland in 1864 shall wear buttons upon their clothing or whether they shall continue to depend upon the hook and eye, time-honored practice of those plain-dressed folk of simple faith.

The controversy has divided the sect into hostile camps.

Other points at issue which the conference will attempt to smooth out are newspaper reading and automobile riding. Both are banned now as sinful, along with war and education. The sect considers that guns are tools of violence, avoids litigation and never attends the theater.

* * *

The following interesting letter from Richard Curle appears in a recent issue of the New York Times Book Review: 'A copy of the New York Times Book Review, dated Dec. 27 of last year, has come into my hands, and I notice a statement about Joseph Conrad's nationality, quoted from Mr. Pennell's book, *The Adventures of an Illustrator*, which requires to be refuted. As one of Conrad's executors and trustees, and as an intimate friend of his for many years, I venture, therefore, to state the facts as they really are. According to Mr. Pennell, Conrad told him that he was born at Berditchev in Little Russia and that he was a Jew. It is quite true that Conrad was born in Berditchev, either in the district or the town—then part of Russian Poland and now a short way over the border into Russia proper—but it is totally untrue that he was a Jew. There was not one drop of Jewish blood in his veins. Mr. Pennell's memory must be completely at fault on this matter. For generations back Conrad's family on both sides were purely Polish, apart from one ancestor who was either French or Italian. In *The New Republic* (U. S. A.) of Aug. 4, 1918, will be found a long letter from Conrad to a correspondent, giving an account of his family and saying in the most explicit terms that he was not a Jew, as Mr. Frank Harris, the writer, had apparently stated in some publication.'

### *Conrad Was Not a Jew*

* * *

Doctor Shinkichi Uyesugi, of the Imperial University at Tokyo, deplores in a recent issue of the *Japan Times* what he regards as the overhasty adoption of the pseudo-civilization of the West by his countrymen of a generation or two ago. The result, he says, is that 'the Japanese are today a race not unlike a helpless wanderer in a desert, cut off from all their older traditions. The four time-honored classes of samurai, farmers, mechanics, and tradespeople resemble so many lost children, knowing nothing of their future.' The masses are sinking into a proletariat. Their leaders are bereft of counsels. Japan's proud national spirit has vanished, and the author feels sure that 'Japan as a State is fast dying, without waiting for a foreign invasion.'

### *Japs Ardently Copy Our Mistakes*

Consequently the time has come to take new bearings. 'The materialist theory of evolution, which explains the human species as derived from the lower monkey-forms, has utterly failed to solve the problems of individual freedom and personal dignity. Democracy, which means obeying the decision of a majority, has proved hopelessly incapable of producing true constitutional government.' Therefore Japan should return to her old institutions. She should strip off and cast aside the meretricious ornaments she has borrowed from the West. Only that will save her. 'If she returns to her very self, her real and genuine self, she will become fit for any task that lies before her.'—*Living Age.*

* * *

Roscoe Pound, Dean of the Harvard Law School in Finance and Industry, commenting on pioneering and the law says: 'The American people are in a new setting. The pioneer spirit which was a virtue a hundred years ago, is not exactly suited to 1926. A good deal of what we are told is lawlessness is nothing but this spirit of pioneer America trying to adjust itself to urban America. The frontier is gone, but we still have a pioneer attitude toward law. Imagine telling our grandfathers that they might not walk across the street where they pleased. You can't expect new regulations of any sort to sink in overnight. Yet consider the variety of such regulations and their increase in number.

### *Two Extremes of the Law*

'Criminal law all through history has swung back and forth between a minute regulation of the court and the magistrate in their dealings with offenders and a very minute discretion; or between over-tenderness for the individual accused at the expense of the general security, and, on the other hand, an over-regard for the general security and a callous disregard of the rights of the individual accused.

'What I hope for is that presently we shall learn enough to reach a scientific balance between the two extremes. The last high-water mark in the solicitude for the accused was reached toward the end of the 19th Century. There is a tendency in the other direction now, and I think there is danger that we shall move too fast and too far.'

* * *

China in 1925 bought five times as much sole leather as it imported in any of the five years immediately preceding the World War; the Philippines imported six times as much, while Japan also showed a large gain in the importation of the product, which would seem to indicate that occidental influences are working a slow but unmistakable change in oriental habits and customs which have been regarded for centuries as immutable.

### *Shoe Leather Hits Orient*

There are millions of feet in the Orient that have never felt a leather shoe but which now are apparently discarding their straw sandals for the pedal decoration of western civilization. This fact should interest the American farmer and manufacturer who produce and tan the leather to be used in these shoes. A surplus exists in this country of the kind the Orient will likely demand.

URBANA ILL

LIBERTY is not the license of an hour; it is not the butchery of a royal house, or the passion that rages behind a barricade, or the caps that are swung or the *vivas* shouted at the installing of a liberator. But it is the compact, impenetrable matter of much manhood, the compressed energy of good sense and public reason, having power to see before and after and measure action by counsel—this it is that walls about the strength and liberty of a people. To be free is not to fly abroad as the owls of the night when they take the freedom of the air, but it is to settle and build and be strong—a commonwealth as much better compacted in the terms of reason, as it casts off more of the restraints of force.

—*Horace Bushnell.*

CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

THE AVERAGE AGE at which twenty of the greatest inventions were produced is 32, statistics compiled by a group of psychologists reveal. Business men reach their zenith at 53 and military leaders at 55, according to the figures.

WARMTH BY WIRELESS is predicted by a Pittsburgh scientist who believes it will be possible in the future to broadcast heat waves as we now broadcast sound waves.

LETTERS ARE DELIVERED to some of the islands of the Tonga group in the Pacific by means of rocket apparatus operated from passing mail boats.

A TRAIN HAS JUST BEEN devised for the transportation of the precious helium gas used in American dirigibles. The gas is contained in long bottle-like cars designed somewhat like a vacuum bottle.

ALEXANDER THE GREAT had snow transported from the mountains to cool the wine for himself and his soldiers.

A MOSQUITO, WITH the assistance of the wind, is able to fly a mile. An ordinary house fly can travel a distance of eight to ten miles.

NEW USES JUST DISCOVERED for the ancient Chinese drug, ephedrine, indicate that it will be a great aid to modern physicians in raising blood pressure and for use as an anesthetic.

IN 1714 THE BRITISH Government offered a prize of $500,000 for the most accurate marine watch. The prize was won by John Harrison, whose timepiece performed three times better than the standard specified.

THE PETRIFIED BRAIN of a prehistoric man, believed to be 25,000 years old, had been found at Odinzoyo, Russia.

BAGGAGE TRANSFER COMPANIES blame the change in women's fashions and the fact that clothes are neither so heavy nor so plentiful as before, for the serious decrease in their revenues.

AN EAGLE, LURED ON by bits of food tossed into the ocean in the wake of a steamer, flew sixty miles to sea and eventually dropped to the deck from exhaustion.

WATER FROM THE RIVER Jordan was brought by airplane from Palestine to London for the christening ceremony of the daughter of the Duke of York. Jordan water was also used at the christening of Princess Ena of Battenberg, granddaughter of Queen Victoria, and now Queen of Spain.

PRIMITIVE BUSHMEN in the great Kalahari Desert, South Africa, are believed the shyest on earth. At the approach of a stranger, even of their own color, they will run for miles or, if taken by surprise, will burrow in the sand and hide themselves.

THE FIRST ECLIPSE of the moon of which we have record took place 721 B. C., March 19. It was observed in Mesopotamia.

DANISH EGGS ARE NUMBERED by a special system, whereby each egg can be traced to the farm from which it originated.

THE APPLE HAS BEEN crossed with the pear by grafting apple twigs on six-year-old plum trees, the shoots thus obtained being grafted in turn on pear trees.

THE HOUSE OF REPRESENTATIVES broke its own speed record June 11 by approving 119 bills. The previous record was 81.

ALTHOUGH TURKISH GOVERNMENT officials are sponsoring the conversion of the former Sultan's palace at Constantinople into a gambling casino, no Mohammedans will be admitted to the gaming tables. The Koran forbids Moslems from gambling.

THE FIRST MUNICIPAL highway lighting system was installed in Paris in 1558. Pitch or resin torches were burned at night.

THE MAJORITY OF BLIND people in Spanish-American countries are forced to beg for a living. In the United States most of the blind are virtually self-supporting.

BOBBED HAIR HAS MADE 16,700 Chinese women dependent upon charity. They were formerly hair-net makers but the popularity of short hair has thrown them out of work.

THIRTY-EIGHT AMERICAN artists are on their way to a point within the arctic circle to record on canvas icebergs, Eskimos and animals.

THE NUMBER OF RESIDENTS served by each city letter carrier varies from 1,200 to 1,500, according to the topography of the district served, figures published by the Post Office Department reveal.

GUM CHEWERS OF THE United States masticated $47,124,000 worth of their favorite product last year. This was an increase of 17 per cent over the previous year.

HEATING SYSTEMS RECENTLY unearthed in old Roman ruins show that the heating was done by warming marble walls and floors rather than by the dissemination of hot air or water, as is done now.

FOLKLORE AND LEGENDS are preserved by certain tribes in Malaysia and Sumatra on bamboo sticks. The characters are engraved on the wood while it is green. When the wood becomes dry the inscriptions can be preserved almost indefinitely.

HEARTBEATS CAN BE reproduced on phonograph records so accurately as to serve for diagnostic purposes.

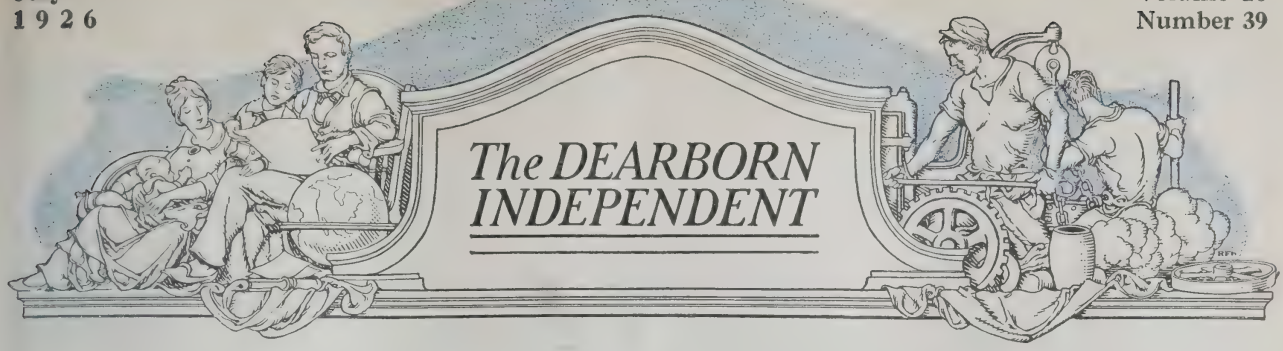
THE 140 RESIDENTS OF the Island of Tristan de Gunha, Britain's loneliest possession, located in the Atlantic Ocean midway between Buenos Aires and South Africa, are facing famine because of the failure of the potato crop.

ONE OF THE LATEST VOGUES, the collarless coat, is the result of a Paris designer delivering by mistake a coat on which the collar had not yet been attached. The buyer was so pleased with the effect that he retained it, and the vogue followed.

JAPAN'S NEW FACTORY law reduces the maximum working day from twelve to eleven hours, prohibits child labor in mines and night work for girls under sixteen. It fails to prohibit woman labor in mines.

SOUTH AUSTRALIAN RAILWAYS have spent nearly $10,000,000 for equipment made in America in the last two years.

NEW YORK POLICE ARE now provided with pistols capable of cutting a clean hole through the body of a motor car going sixty miles an hour.



OUT OF EVERY ONE hundred married women in this country, nine are working for pay outside their homes.

THE DUKE OF YORK has been made an honorary fishmonger by the Fishmongers' Guild of London.

WORKMEN DEMOLISHING an old wooden platform at a suburban railroad station started a real treasure hunt. Coins dropped by passengers in their rush to catch trains had rolled through the cracks and amounted to a considerable sum beneath the boards.

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses the human parasite and shows some of his methods and effects.

Delaware whips criminals and has the lowest crime record in the nation. The state has not experienced a bank holdup in twenty years. Insurance rates are at a minimum. Thugs who follow the New York-Philadelphia-Baltimore trail pass up Delaware as a bad risk. Now, whether the whipping post is *cause* and the minimum of crime an *effect* is a question. Some contend that the whipping post is not a deterrent to crime. Aaron Hardy Ulm tried to find out the truth. His article certainly shows that criminals dread swift, sure, painful, personal punishment. Anything but the lash! (p. 3)

Have you an old violin in your home? Leave it there. It probably is not the valuable relic of the old masters you had supposed it to be, and it if is, your chances of getting full value from a dealer are slim. M. Clyde Wier tells the sad, true tale of 'the attic Strad.' (p. 8)

The circus is coming! Not the modern show with private cars and automatic stake drivers, but the old-time circus that rambled across country in gaudy, squeaky wagons, with the camels and elephants and ring horses stringing out behind! The circus whose battle-cry was 'Hey Rube!' The circus that swam unbridged rivers and built roads across swamps, and was lighted by oil and kerosene flares. (p. 12)

'Gil' Robinson lived for fourscore years with the circus his father founded a century ago. In the Old South where the circus played on plantations to an audience of gentlefolk and slaves. He invaded Texas with the first circus to visit there. He met many famous men; his own adventures were legion. These are tiptop circus stories—and they are all true. (p. 12)

William E. Barton again discusses the clergy: He has a right to do so. A clergyman himself, he has been successful in many fields. Dr. Barton finds that the church is suffering from the lack of an educated ministry. And that lack is attributable directly to the laity! (p. 6)

Most churches nowadays want good mixers, not good scholars. Congregations are demanding pep rather than preparation and power. Pulpit lecturers are more in demand than ministers of religion. It is not building up the Church but filling up the pews that is wanted. What is this doing to religion? (p. 6)

Dr. Chevalier Jackson has saved the lives of scores of children (his friends say a life a day for years), and his name is in honor among surgeons the earth over. You will want to read this article for several reasons. (p. 15)

*The world needs Africa*—and Africa is dying from the world's neglect! The Dark Continent is the world's future granary, but the native races, who alone can live in its fertile valleys, are being allowed rapidly to perish. Dr. H. K. W. Kumm, one of the great authorities on Africa, presents facts and conclusions which cannot be ignored in any intelligent outlook upon Africa. This is an article for young men and statesmen of the near future. (p. 28)

Africa to the arctic. Burt M. McConnell traveled the North with Stefansson, and writes now of the ill-fated Franklin Expedition. In this year of greatest arctic triumphs, it is fitting to recall the deeds of brave men who penetrated the icy fastnesses eighty-one years ago, never to return. (p. 22)

The secrets of the nest—the building genius of the birds—have surely seldom, if ever, received such careful attention as Mr. Aaron has bestowed on them. How the birds learn, how they exercise judgment in selecting locations; and then how the oriole, for instance, actually constructs her nest on daring engineering principles: this article is really an interpretative moving (word) picture of the woodlands' great springtime industry. (p. 2)

And there is a story on the changes taking place in China, once deemed 'changeless.' Don't overlook the anecdote of the college students who sang at the wedding. Old Cathay is donning modern manners, even to advertising. Nowhere, perhaps, is the transformation better epitomized than in the sign over a Nanking shop: 'Leave your baggage with us, we send it in all directions.' China is going in all directions—but mostly forward. (p. 5)

A delightful little tale of reminiscence about British literary lions. Chesterton—a dirigible in a squall . . . Lord Dunsany—a gigantic, tall creature in the most unshapely and voluminous evening coat . . . Masefield—a slight figure in a white suit, his short hair all gray . . . Galsworthy—handsome, suave, gracious, witty . . . Shaw—the gentlest, kindest, mellowest face you can imagine . . . (p. 16)

An article on the homes Uncle Sam provides for his representatives in the far corners of the world . . . One on attorneys barred from practising before the Treasury Department—and why . . . And one on the way San Francisco copes with crime.

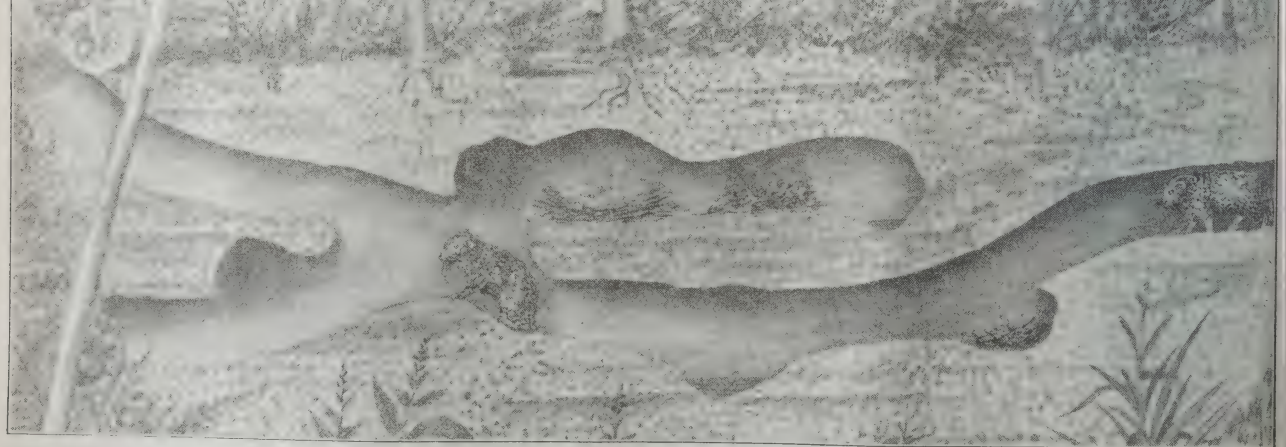
## In the Realms of Fur and Feather Tiny Creatures Show Their Skill in Nest Building

Typical nest of the harvest mouse. A ball of grass in the top of weed stalks is loosely massed, and the chamber is lined with the soft down.

By S. F. AARON

ILLUSTRATED BY THE AUTHOR

THERE are certain degrees of development as a means to an end in which nature has, as it were, almost reached the extreme of perfection; that is, the progressions along definite and necessary lines have exceeded those of similar and equally needful processes and characteristics. Some examples are found in the retractile claws of the cats, the coracoid bone in birds and climbing quadrupeds, the fin feet of the seals, the prehensile tails of monkeys and opossums, the trunk of the elephant, the songs of birds and, almost more than anything else, the highly specialized habit of nest building.



Although the first thought with regard to nest building is its association with the birds, it must be instantly recognized that our feathered friends have by no means a monopoly in the art. Nearly all of the rodents, and especially the mice and the squirrels, are adepts and in the bulky construction of their homes quite outdo their avian competitors. But with regard to skillful methods, if we may use this adjective, and the art of combining materials in a truly workmanlike manner, the birds are equaled only by the most highly organized insects, as the bees, the paper-nest wasps, the mud masons, certain ants and spiders.

While necessity is the prime factor in development, it can never be said that its conditions are fully and perfectly met, however near it. Thus, the paper employed by the white-faced hornets might be tougher and less soluble with a greater employment of sericin. The wax of the honeycomb also might easily be a stouter material and less subject to the voracious attacks of the hive moth. Again, the mud cells of the potter and mason wasps, with a little more labor, could be made more impervious to damp weather which not infrequently dislodges and destroys them, and if they were thus more proof against the attacks of strong-billed birds and those ichneumon parasites with puncturing ovipositors a greater number of their helpless inmates would survive.

The outside nest of squirrels, tree mice and harvest mice, as well as those of the burrowing species, might also show the application of greater skill, considering the length of time given to their construction. Had these creatures, with their comparative strength, the constructive wit of the orioles, vireos, swallows or even the mud-employing thrushes, their homes would better withstand the buffetings of storms, the attacks of enemies and be snug enough for hibernation.

Who has closely examined the nests of the gray squirrel, picking them apart? I can find no record of this having been done. These leafy masses, sometimes the size of a bushel basket, are generally placed not far from the top of high trees with long, limbless trunks so difficult to climb as to offer no special inducements even to mink or weasel.

A foundation is (Continued on page 26)

Burrow, nest, storerooms and drainage depressions of the mountain beaver or sewellel. This is drawn from the description of Dr. E. W. Nelson, and is shown as if the top earth were dug away to expose the tunneling from top and side.

# Delaware Uses the Whipping Post

## Are Lashes 'on the Bare Back, Well Laid On,' Effective as a Crime Preventive?

By AARON HARDY ULM

A lot of people, stirred by recurring crime waves, are advocating the revival of the whipping post as a punishment for crime. These persons are not always opposed to humane methods decreed by the new penology now widely employed. Does the new penology necessarily exclude a form of punishment that in essence is the same as one still employed by many parents and some teachers? In one state it doesn't. With a super-humane system of prison management, Delaware holds to the whipping post. The results are interesting.

THE punishment of whipping shall be inflicted publicly by strokes on the bare back well laid on.'

So says an 18th-Century statute that is still in force in one American state, Delaware. In one other, Maryland, the whipping post is used sometimes in punishing wife-beaters. In Delaware it is used in punishing various offenders against the laws.

How effectively? An indication of the answer may be in the following, which is taken from a recent Associated Press dispatch:

> 'The revival of the whipping post in Delaware has made possible a 33⅓ per cent reduction in rates of hold-up, burglary and theft insurance, the National Bureau of Casualty and Surety underwriters announced today.'

The statement envisages a concrete result more evidential than all speculative findings about the prevention of crime. For facts more than sentiment or mere opinion govern insurance rates.

But the statement is not altogether true. There has been no revival of the whipping post in Delaware for the reason that the use of that device, once common everywhere, has never been suspended there. And many factors enter into the making of the kind of insurance rates referred to in the dispatch.

The prime factor, however, is that of risk, measured by the crime rate as reflected by losses. Rates allowed Delaware were reduced lately and have long been the lowest. Take for example what is known as 100-per-cent blanket insurance, of the burglary kind, on residences. In Delaware it can be procured for $15.13 a thousand. In Chicago this kind of insurance costs $34.38 a thousand.

Some localities other than Delaware get the lowest rates too, some on one or more kinds of theft insurance and some on other kinds. *A few get the lowest rates on all kinds.* Delaware is among these. This fact attests what is claimed on all sides in Delaware; namely, that the crime rate there is lower than that of the country as a whole and probably lower than in other localities properly comparable

'Delaware has been affected by scarcely any "crime waves" of the kinds complained of elsewhere,' declares one of the state's officials, and one who thinks the whipping post has nothing to do with the condition. 'From some sorts of crime the state is almost free. For instance you can walk the streets of Wilmington as unconcerned about pickpockets as if you were out on a farm. And there hasn't been a bank robbery in the state in forty years.'

The last bank robbery there—it occurred away back in the last century—has had much to do with keeping the whipping post in active use, despite much criticism both within and from without the state. The job was pulled off by a gang of notorious professionals, led by Jimmy Hope, who evidently thought it would be easy to make a haul and a getaway in little Delaware. The state is so small that one can get out of it from any point in an hour or two. Big cities are nearby. Its prisons seemed fragile.

The robbers were caught. They were inclined to laugh at the terms in prison that were imposed on them. But they didn't laugh at the floggings which the court said should be applied at once. What has come down about how they took to the whipping post is perhaps largely legendary, but probably contains some fact. One of the stories is that they offered a bribe of $100,000 to be spared the ordeal, which they viewed as a 'disgrace.' Several of them are reputed to have declared that they would rather take lifetime sentences than be made the laughing stock of all the criminal world, in which their 'standing' was high, by being whipped publicly.

Whatever the reason for it, that type of skillful criminal has not been of much bother in Delaware since then. There is both a police and underworld tradition that professionals take care to keep out of the state—at least when 'working.' There also is a claim that when caught there, these criminals often welcome requests for their presence for trial in other states where there are no whipping posts.

'We must make the criminal steer clear of us,' declared a man who at the time was the state's chief justice. 'We do this by preserving strong means of punishment and these means must be continued . . . We need the whipping post to keep the criminals away.'

The whipping post, however, is only one of the 'antiquated' means used in dealing with criminals in Delaware. Others are energetic prosecutions, avoidance of delays in bringing accused ones to trial, adherence to rules of court procedure, that allow few loopholes for escape on technical grounds, including a method of dealing with appeals that is as 'tight' as the one prevailing in England. Another are longer prison terms for certain crimes than are imposed in most states.

Along with these 'antiquated' ways of dealing with criminals, there is now in vogue there a system of prison administration that for modernity probably excels any used in like circumstances. A parole law keeps open a door of hope for all who enter the prison, and the prison is operated in great part by its inmates.

Thus one finds there a singular blending of the stern and the pliant, of the old and new, and the old—including the whipping post—is held to as firmly as the new is supported.

Somewhat as a reminder of the stern aspects of the state's attitude toward crime, a stock is preserved, physically in all of its 17th-Century crudity. Standing near the whipping post at

Warden Leach and one of his 'boys' at New Castle County Workhouse.

the prison that serves as a state penitentiary, that device is kept in as perfect repair as though it might be brought back into use at any time. In fact, it was used until recent years, but, after 1905, for purposes of prison discipline only.

Regularly for many years bills proposing a suspension of the use of the whipping post have been put forward in the state's legislature. None has ever come within a league of passing. The last one received just one vote, that of the member who introduced it.

The only concessions made to those who oppose the whipping post are the exemption—established in 1889—of all females convicted of crimes otherwise punishable by whipping and permitting the courts to omit lashes in sentencing some first offenders. Otherwise, laws having to do with the post have been extended rather than restricted.

In actual practice, however, the whipping post is not used so freely, and perhaps not so vigorously in particular instances, as formerly. The warden of the New Castle County Workhouse, where for many years all whippings for the state have been done, reported 461 whippings for the year of 1904. Many of these no doubt were on the score of prison discipline and not in consequence of court sentences. In recent times there have been only twenty to thirty whippings a year, none being given for disciplinary purposes.

In 1925 there were only sixteen whippings, the smallest number for any year. Five of those whipped were white men and eleven were negroes. The offenses and sentences were as follows:

Stealing auto tires, 2 yrs. and 5 lashes
Stealing chickens (2 cases) 18 mos. and 10 lashes
Robbery (3 cases) 10 yrs. and 40 lashes
Larceny (3 cases) 2 yrs. and 10 lashes
Larceny 1 yr. and 10 lashes
Burglary (2 cases) 4 yrs. and 20 lashes
Larceny (2 charges) 4 yrs. and 10 lashes
Theft 2 yrs. and 5 lashes
Robbery 5 yrs. and 20 lashes.

For some offenses, the courts may direct that as many as 60 lashes be imposed. These rarely are committed, however. Twenty and forty lashes are the maximum which may be imposed in most cases. Wife-beaters may be sentenced to receive from 5 to 30 lashes. This offense was brought within the purview of the whipping post not many years ago, and no whipping has been imposed on account of it for a long time. The first wife-beater in five years was sent to the post recently in Maryland, where the device is maintained for only that kind of offender—a kind which even Theodore Roosevelt said should be made subject to whipping-post punishment. Is the whipping post responsible for the extinguishment of wife-beating in those two states?

Many of the persons whipped in Delaware have had prior experience at the post. There are records of the same men being whipped five and six times, each under a different sentence. These usually are of the petty-thief class, in the main negroes of the loafer type; as a rule, the stupid kinds of law-breakers. Lashes appear to have little restraining effect on the stupid class of criminal. Even its defenders say that the whipping post is most effective when used to punish intelligent offenders, those who feel the sting spiritually as well as physically. And these, they say, are the most dangerous, being the ones who commit the difficult kinds of crime.

Lashes appear to have little restraining effect on the stupid class of criminal. Even its defenders say that the whipping post is the most effective when used to punish the intelligent offenders, ones who feel the sting spiritually as well as physically. And these, they say, are the most dangerous, being the ones who commit the difficult kinds of crime.

While the law says that the whippings shall be applied publicly, practice for many years has made the operation a virtually private one in Delaware. The whipping post is in a small inclosure connected with the main prison by an underground route known as the 'tunnel of tears.' The whippings cannot be seen by persons not within the inclosure, and there is not room in it for many. They permit no pictures of actual whippings to be taken. Inmates of the prison are not among the onlookers. The victim's hands only are fastened to the post. The lashes are given with a cat-o'-nine-tails. Most prisoners take them stoically.

The present warden of the prison where the whippings are administered—and who personally applies the lash—is much opposed to the practice. So was his predecessor, Mordecai S. Plummer, who instituted the honor system of prison management there. Plummer was an old post-office inspector who had had much experience with the yeggman type of criminal. He held that the best way to deal with criminals was so to shape punishment as to arouse a sense of responsibility. Hence when he took hold of the New Castle County Workhouse, he told the inmates that the character of their experience as prisoners would depend mostly on themselves.

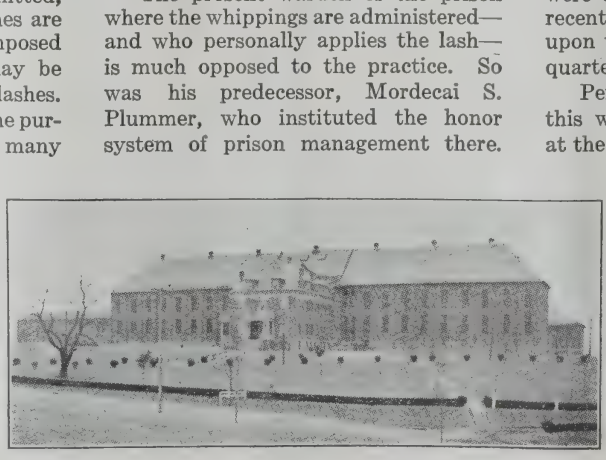
He set up a prison court, composed of inmates. It drew up a code of conduct and tries and prescribes punishment for those who violate the rules. All is done subject only to the warden's approval. Guns were put away. Only three paid guards are now used. Though locks and bars still are used, the doors are attended by prisoners with keys. Work is provided for those who want to enjoy privileges given for good conduct, and a schedule of pay was developed. Prisoners earn from four dollars to sixteen dollars a month. Aided by two farms, cultivated by prisoners, the establishment is about one-half self-supporting.

Elmer J. Leach, who had been assistant warden, succeeded Plummer when the institutor of the system died about three years ago, and has continued to operate the prison by the Plummer method.

He and others who have had to do directly with the establishment claim the method have been eminently successful, as an economy, a measure of safety and in the rehabilitation sense.

'The whipping post isn't in harmony with a prison method of this kind,' says Warden Leach. 'The post merely humiliates and embitters those who are whipped and renders them less amenable to this method. I have seen no evidence of its being otherwise of value, as, for instance, in keeping professional criminals out of the state. It should be abolished.'

Others in Delaware oppose the whipping post outspokenly, but, comparatively speaking, not many. One newspaper has been intense in its demand that whipping cease.



'The post should have been abolished a century ago when the other states were dropping it,' that paper declared recently. 'But it exists as a bar sinister upon the state at the close of the first quarter of the 20th Century.'

Persons on that newspaper told this writer, however, that opposition, at the present time at least, is virtually hopeless.

Another Wilmington newspaper said a short time ago:

'Certain it is that the whipping post, though recently the lash has been administered almost as a love tap and is therefore losing its strength, does instill into hardened criminals that fear which is the only deterrent they know, as the records very clearly disclose.'

The state's (Concluded on page 24)

New Castle County Workhouse, which is also Delaware's State Penitentiary.

# New Phases of Changing China

## Sedan Chairs, and Moth-Eaten Donkeys Giving Way to Modern Things

By INEZ MARKS LOWDERMILK

CHINA is changing rapidly. Uppermost in the Western mind is the ever-changing political situation; but there are other more interesting and fascinating changes that are not apparent in the daily newspaper dispatches, changes which show the trend of the people more clearly than the kaleidoscopic movements of a few leaders. Especially are these changes noticeable in the cities where the influence of the West has been felt for some time.

Boy Scouts of China. These youths are having an opportunity for self-expression that was never accorded boys in earlier days.

China is eagerly adopting Western methods and devices and is catering to foreign trade. The result is often most entertaining. Every city displays numerous smile-provoking signs, such as, 'Leave your baggage with us, we send it in all directions.' In front of a high-class tailor shop is the sign, 'Respectable ladies have fits upstairs.' Near my home is a 'Hair Pressing Parlor.' In another city a fur shop catering to foreign trade has the sign, 'Fur coats made out of your skin or ours.'

A Chinese wedding, foreign style, was a feature of a recent university commencement. In this instance, the bride and groom had done the courting themselves and not through their parents, according to the usual custom. The chapel was filled with high school girls and university men. The bride, dressed in pale pink satin instead of the proverbial red, came in an hour or so late. The groom, whose costume was rented for the occasion, came down the aisle in plug hat and wrinkled full dress, filling the air with an odor of moth balls. The minister performed a beautiful Christian service. The bride and groom then bowed three times to the minister and three times to the guests, an adaptation of the age-old custom of *kaotao*. It was then announced that the university glee club quartet would sing a number in English. With great gusto they proceeded to sing 'Polly Wolly Doodle All the Day.' To the Chinese it was a modern wedding, carried out in true foreign style—even to the rice throwing. All went away happy and eager to tell details to those not fortunate enough to be invited.

Outstanding changes are everywhere apparent on the streets. Speeding autos and motorcycles send the sedan chairs and wheelbarrows and moth-eaten donkeys skurrying off the road for safety. Bicycles, called 'foot carriages,' are the height of elegance and popularity. Small automobiles are most popular with the Chinese because of their adaptability to Chinese narrow streets and corners. Across the street from the telegraph office with its 'lightning words,' as the Chinese call them, the professional story-teller repeats his thousand-year-old historical and folk stories to eager crowds. Some tailor shops have sewing machines making hundreds of stitches a minute; in others the tailors bend over garments in the manner of centuries. On one side may be a modern store with plate-glass windows and the sign 'Foreign Medicines Sold Here.' But nearby is sure to be seen the old Chinese medicine shop with its dried herbs, lizards, orange peel, powdered tigers' bones and all sorts of charms hanging from the walls and ceiling. The God of Lightning, in the form of electricity, now illuminates some streets and shops. But often the next shop will be scarcely visible in the dim light of the vegetable oil taper lamp of primitive China. Brick buildings tower beside mud huts. Factories belch forth smoke over the homes of primitive handicraft. On the same street with a modern dentist shop, the old Chinese tooth puller, with his equipment of stool and pulling lever, walks up and down, calling his trade and exhibiting his trophies of extracted teeth.

Modern China is now paving streets that once reeked with holes. Circle—Bad roads have caused many a scene like this in China.

Pavements are found on many streets that once were reeking mud holes. Alleyways have been widened into streets worthy of the name. Traffic policemen display their authority on thoroughfares where once the mandarin and his servants had power to drive all from their path. Postal systems in all countries have been studied and China now has one of the best postal systems in the world. Even remote corners are reached by rural mail carriers.

The new women of China walk along the streets *beside* their husbands instead of a few paces in the rear. They have cast aside their trousers and wear the abbreviated Western skirt and rolled stockings. Bobbed hair is increasing in popularity. Those most closely in contact with Westerners have taken to cigarets *(Concluded on page 31)*

# Have We an Educated Ministry?

## Only Minority of Present-Day Incumbents Are From Reputable Colleges

By WILLIAM E. BARTON

AMONG the learned professions the ministry was the first for which special scholastic training was required. The earliest colleges in the United States were established avowedly for the main purpose of training pious youth for the gospel ministry. Upon the gates of Harvard are graven in durable record the words from 'New England First Fruits' relating that when God had brought the people of that region safely across the ocean, had enabled them to provide homes for themselves, and establish government, and procure means of livelihood, one of the first concerns was that of establishing a college, because the colonists feared to leave to their children an uneducated ministry after their own faithful pastors should sleep in the dust.

Nearly all the early New England ministers were graduates of Cambridge and the remainder, with few exceptions, were Oxford men. There were very few university graduates in the colonies excepting those in the ministry. The early graduating classes of Yale, Harvard, and the succeeding schools of Dartmouth, Amherst, and Williams, went almost bodily into the pulpit. The ministry furnished the faculties of these and other schools. Education did not begin at the bottom and work up. It began at the top and built down. At the top was the college with training for the ministry as its specialty. Underneath this and preparatory to it was erected the Latin school. The grammar school came to supply material for the Latin school and we have graded down until we have reached the kindergarten. Practically we began at the university with training for the ministry as the prime purpose.

*Standard Not Rising*

It now has come about that collegiate training and special university work of postgraduate character is required for almost every profession except the ministry. Year by year the standards of the law schools, the medical colleges, the schools of journalism and pedagogy are rising. With regard to the ministry the lamentable confession must be made that the reverse is true. The minority of present-day ministers in the American pulpit are graduates of reputable colleges and well-equipped theological seminaries.

This is no accident, and the causes for it are not far to seek. The prime cause must be attributed not to the ministry, but to the standards which the laity have come to regard as acceptable.

It is time for plain speaking on this subject, and the subject should be brought out of the cloistered atmosphere of the ministry itself and dragged into the arena of open discussion. The simple truth is that the average American congregation no longer appreciates an educated ministry.

*Majority Not for Pulpit*

The theological seminaries at the present time are training an absurdly small and inadequate proportion of the ministers of the next generation, but this is not the worst of it. A majority of those who are being trained in theological seminaries will find no permanent place in the American pulpit. Either they are already intending to go abroad as foreign missionaries or they will be seized upon for educational or administrative work. The pulpit is not getting even the meager output of the theological schools.

What does the average congregation want in the way of a minister? Consider, if you will, the church you happen to attend or in which you are in any degree interested; the church of which you may be a member, or an officer, or to which you contribute and to whose Sunday school you send your children.

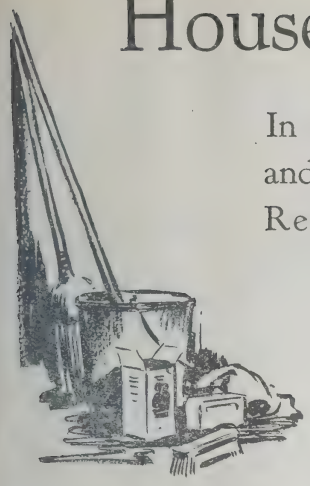
A committee is appointed to secure a new pastor. The members of the committee meet and express their views as to the kind of minister this church needs. It is always assumed that this particular church needs a particular kind of minister. The man they want is in heaven if he is anywhere. How many members of the committee begin by saying, 'This church needs first of all a Christian gentleman of good ability, high moral character, and rather better than the average preaching power, whose judgment we can trust, whose character we can respect, and whose scholarship we know to be adequate.'

That is not what the members of the committee will say. They will say, 'What this church needs at the present time is a good mixer, a man who will appeal to the young people, somebody who doesn't go around with a long face, or preach dry sermons, but who can fill up our vacant pews, get hold of a lot of the fellows who are now playing golf on Sunday and put on some kind of a program that will get out a good Sunday night congregation.'

Perhaps it will be said that scholarship and piety and character and Christian experience are all assumed as belonging to any candidate who is likely to come to this church. That, however, is not the fact. There are few churches that put scholarship anywhere nearly on a par with being a good mixer. There are almost no churches where scholarship in the pulpit would be compared with the ability to fill the pulpit on Sunday night.

The congregations in this country that will tolerate sustained scholarly preaching are an almost negligible minority. It is said that there is only one pulpit in Boston whose minister displays habitually the marks of a scholar and who is able to hold his job.

The average American congregation has very little desire to do any serious thinking. The tired business man does not want to go to church to exert any mental effort. He wants a sermon short and snappy. What to him is a discourse well formulated according to homiletic rule with correct exegeses of Scripture, accurate quotation from choice literature, and a quiet appeal to righteous living, based upon a thoughtful and erudite interpretation of the theme? Scholarship, sincerity, dignity, reliability as to fact and quotation are all subordinate to the twin-born requirement that the minister shall be a good mixer and that his discourse shall be full of 'pep.'



*Ought to Be a Good Mixer*

Now a minister ought to be a good mixer and his sermons ought to contain what is popularly known as pep. I make no appeal for dry and wearisome discourses. I am no apologist for the type of sermon in which learning is paraded or pedantry is wedded to dullness. I am only saying that a congregation whose prior observance of the Sabbath has been a survey of

(Concluded on page 24)

# Housecleaning in the Treasury

## In Four Years There Were 300 Cases in Which Attorneys and Agents Practising Before the Treasury Department Were Respondents in Suspension or Disbarment Proceedings

THE Calendar of the Committee on Enrollment and Disbarment is assuming such proportions that if complaints continue to multiply, it will be necessary to create a special court for the purpose of trying cases,' said an important official of the Treasury Legal Division.

Some 300 cases, both closed and pending, represent the complaint calendar in which attorneys and agents practising before the Treasury Department have figured as respondents, in either suspension or disbarment proceedings, during the past four years, and of these twenty-three have been disbarred and seventeen suspended.

The laws governing recognition of attorneys, and others representing claimants before the Treasury Department, are specific. Before an attorney or agent is permitted to appear before that department, representing a taxpayer, he must be enrolled; and to be enrolled must have complied with the requirements of the statute, violation of which, after enrollment, will justify disbarment or suspension in the same manner in which it would have precluded admission.

Specifically, any conduct contrary to the canons and ethics of the American Bar Association furnishes cause for disbarment proceedings; yet it is a fact that the American Bar Association rarely, if ever, conducts supplementary proceedings based upon the action of the Treasury Department, although such action might have a wholesome effect upon the type of attorney shown to be still practising although disbarred before the Treasury.

The character of the charges filed in these proceedings furnishes some startling information as to the reputation of attorneys, as follows:

'Charged with obtaining money under false pretenses from clients in a tax case, and charges found proven by committee.'

'Charged with contracting with deputy collectors to refer taxpayers to him on commission basis, charges found proven by committee.'

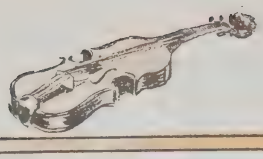
'Charged with making an offer to a revenue agent to divide fees in income tax cases procured through such agent, charges found proven by committee.'

'Charged with unethical solicitation by mail of tax business from taxpayers whose affairs in one case were handled by a business associate when employed in the Bureau of Internal Revenue, and in another case the respondent held out his own former employment in said Bureau as an inducement to taxpayer to make contract with him, and charges found proven by committee.'

'Charged with having arranged with employe of Income Tax Unit to supply lists of taxpayers liable for extra assessments and charges found proven by committee.'

'Charged with accepting a bribe to pay a confederate in Income Tax Unit to decide a tax case, and failed to file answer to charge, and charges found proven by committee.'

'Charged with receiving fees from clients in tax matters and failing to render any service; obtaining money under false pretenses; passing worthless checks; defrauding hotels; and fraudulently selling worthless oil stocks; and charges found proven by committee.'



The suspensions are based on similar charges.

The practices thus employed and upon which charges have been sustained are bribery, conspiracy, larceny, arson, subornation, obtaining money under false pretenses, intimidation, misappropriation, and so forth, to an almost unbelievable extent.

The housecleaning might also be employed for removing legal perverts from the roster of one of the most conservative and honorable professions of all time.

A departmental cleaning-up day at Washington.

# Parentage of Attic Strads

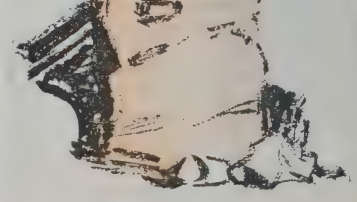
By M. CLYDE WIER

PUBLICATION of the fabulous prices that dealers ask and sometimes get for famous violins has sent many a man to the attic or the closet or the pawn shop to seek spoil that he too may sell for his own advantage. And many a man, for his search, gets his momentary thrill and the inevitable shock that follows. For he is apt to see within his 'find' a ticket that bears the name of the great Stradivari.

To the inexpert this seems to be almost the conclusion of the whole matter. All that remains to be done is to announce his possession to the world. Later he learns to his surprise that the world is not interested, for the world knows that seven dollars and a half will buy a Stradivari violin, label inside, a music rack, case, bow, book of instructions, and jazz folio thrown in. That is what the world pays for such an outfit when the sons and daughters of the world contemplate learning to play. It is good enough for the sons and daughters whose beginning is none too certain; and if the beginning, as often, meets with a speedy end, the fiddle, not being furniture, is apt to be relegated to the attic or the closet shelf, there to repose and shelter little mice until the hunter of antiques rescues it and restores it to the light.

That is the type of most of the discoveries—very cheap affairs—not even imitations, with a label as inaccurate in its wording as the instrument in its outlines. The date of one shows that Strad was a hundred and fifty years old when he made it, while that of another sets him back to the boyhood of his grandfather. But whatever the label, the finder copies it, often inaccurately, and sends it to an expert, hoping to hear that he has found something worth while. Of course the expert can only say that he cannot judge a violin without seeing it. It is surprising how many people in different walks of life think that the reading of a label is the proper way to determine an instrument's parentage. It is just as sensible to sit down and write: 'Dear Sir; I have a long slender horse with ribs exposed, white feet, short mane, one shoe missing. Do you think he can win the Derby for me?' Perhaps so, but the chances are against him.

It is better to treat a 'find' as a 'find,' use it if you have use for it; if not, give it to some one who has. If it is a cheap instrument it has no commercial value; if it is a fine one it needs a clever dealer to exploit it and get the price such things are supposed to be worth. If it is an old heirloom, keep it and prize it and don't be too anxious to know all there is to be known about it. Such knowledge is too often a bitter disappointment. In fact it is almost impossible to get accurate knowledge of an old instrument that has no history.



Dealers and makers and collectors and experts are all very conservative folk, particularly when it comes to speaking of another man's fiddle. They will show him their wares, which of course are authentic and genuine in every detail. But his is a different matter—'a copy, a cheap copy; a German or a French, a Mittenwald or Mirecourt—no value whatsoever. Perhaps he would like to turn it in as part payment on a good violin, something fit for an artist.'

Don't be in too great a hurry to accept the kindness of such a Samaritan. He is always looking for bargains, and knows one when he sees it; and he will take yours with as little conscience as a satyr, if you will allow him.

An offer of exchange is as close as he is apt to come to saying what you are so eager to hear: 'My dear Sir, you have here a wonderful Stradivari for which I will give you ten thousand dollars.' This, of course, happens only in dreams or fairy tales. But do not trade; take the instrument home and play it or give it to a child for a plaything.

It is hopeless to think of getting a fortune for an old fiddle. If you want to go into the fiddle business, well and good; try it. You will find it interesting enough and profitable enough. But from the point of view of the private individual who has in his possession an old instrument of great value, which he is willing to dispose of for a large consideration, the situation is almost ridiculous.

The game is loaded from the start. The dealer is the man who gets the big price. He pays eleven (Concluded on page 20)

# MR. FORD'S PAGE

THERE are men of whom we feel that, given even less than a common start, they would still have excelled over their fellows in the achievements of life. Their power is in themselves, not in their property; their great possession is their personality; if they were stripped of all material goods and position they would merely have to exercise their innate creative power to attain again a commanding place.

Some men are the creatures of others. This is honorable or shameful, depending on the character of the relationship. A great vision may be vouchsafed to one man, but it may require millions of men, enlightened by his insight, energized by his faith and directed by his wisdom, to realize the vision in usable form. In a sense these millions have found their place in life through the vision of one man. But their relation to him is honorable. They are fellow-servants with him of the Idea, they are working with him to bring to the plane of use what otherwise would remain an unbelieved vision. They are contributing toward the main object.

The difference between parasites and contributing servants is sometimes not visible but is nonetheless real. A parasite's motive points only one way—inward toward himself. As he says, he 'looks out for Number One.' Of course, he is mistaken in that. A man without a cause to serve, a work to do, a contribution to make to life, is a cipher. He never is a number until he has his place of service in the world. The true Number One is nothing else but a man's reason for living.

Bryan once said, 'I am not a great man. Any of you young men can do as much as I have done. Whenever I saw a balloon going up, I caught hold of a rope. It is the causes I have enlisted in that have pulled me up with them.' That illustrates how a man may share in the success of a cause.

But all that is different from the parasitism which attaches itself to the personal fortunes of another for the sake of its own. There seems to be a peculiar breed of human being which keeps watch of persons who are likely to go far or who are conspicuously and fortunately situated, and they watch with selfish appraisal in their eyes for no higher purpose than to attach themselves somehow to that person's position, not for the sake of any service they may render to it, but for what they may draw out of it for themselves. These are parasites whose main and only object in life is themselves. Their narrow social or financial ambitions are all based on a barnacle-like attachment to persons on whose favor they are dependent.

These parasites are seldom of positive use to the person upon whom they have fastened. True, they could not maintain their place if they were positively repulsive or if they did not *seem* to justify their existence. But their pretended service is usually negative if not actively enervating. To begin with, a parasite is not a high-minded character anyway; if he were, he would not be a parasite; he would demand to stand on his own feet. So that it is perhaps unfair to blame him that his influence on his victim is bad. But the fact should be understood, even if the blame is withheld. One cannot blame a serpent for not being a lamb, but it is just as well to understand the difference between the two.

*OF ALL parasites, the human species is the least tolerable. It is possible to find a reason in nature for every kind of parasite save the human kind, for there is no reason, natural or invented, which can excuse any man for not standing on his own feet. And yet, hosts are primarily to blame. The parasite cannot fasten save where he is permitted to. Disease germs can lodge only in an unhealthy body. Industrial parasites can lodge only in a business whose pulse is running below normal. The parasite is not an intake pipe, but a drain, nor does he drain off waste, he drains the vigor and responsibility of his victim—be it man or business.*

The influence of the parasite usually runs toward an emphasis on the lighter side of life. He is more facile in laughter than in logic. Every parasite instinctively feels that he must be in part a court jester. His presence is known by his essential hostility to the serious things of responsibility. Responsibility is a serious thing and one who bears it cannot make the lighter side of life anything but the mere margin or fringe of his existence. A man must be one thing or another. If a man of responsibility, he should measure shrewdly the influences which draw him into higher circles and interests.

The parasite also destroys the sense of responsibility by developing the habit of leaving too much to 'George.' There are two ways of destroying responsibility: first, by loading it up with too much detail; second, by too continuously passing responsibility to others. The parasite may be a great muddler in details, but usually he is an apostle of delegated authority. In either case, he works to the same end, and his influence is bad.

But as the moth cannot attack clothing where a careful housewife is, nor worms nor weather attack wood that is properly guarded by paint, nor rust the iron that is in use and cared for, so the parasite cannot fasten to anyone who is parasite-proof. In the last analysis the parasites are not to blame, 'for 'tis their nature to'; the blame must be given the 'host' that permits it. Healthy bodies offer no resting place for disease parasites. It is so in social, industrial and financial life. Health is resistant and self-protective.

## *Jellyfish?*

A GOOD bishop, delivering the commencement address at an institution of learning, advised the young graduates to make their rule in life the understanding of the other man's point of view. Like many other excellent courses, isn't there a danger of it being overdone? Is it not too much like that false form of tolerance often urged upon us which leaves us so soft and pliant toward others' objectives that we feel it somehow unbrotherly to urge our own? The issue of the kind of tolerance preached in this country of late is spineless and immoral indifference. Young men moved to obey the bishop's counsel may become so assiduous in understanding the viewpoint of others that they will be unable to achieve a viewpoint of their own.

We need a change of emphasis in these things. Take your own stand on the matters at issue in your times. Stand in your line of succession, or as intelligent observation, or as special study may dictate. But take a stand. Do not wander among all points of view, upholding none and upheld by none. Get a conviction. Do all that you can to make it a right, just, constructive, human conviction, and *stand by it*—open-minded where opinion is concerned, but a stone wall for firmness where principle enters. A jellyfish probably has no racial, religious or political convictions that offend anyone, but no jellyfish ever opened new gates of freedom to the people. In the national gallery of immortal jellyfishes there may be some notable names, but just now we cannot remember one.

## *Babies as Armament*

WHO knows?—maybe we have all been blind—maybe the League and the World Court and the Disarmament Commission really are to save the world after all and blow war to smithereens—on universal gales, volcanic gales of laughter. The League, we understand, wants to change the calendar to thirteen months a year, to decree which are the best 500 books, and maybe start a department of humor. And now the Disarmament Commission furnishes the world with a new thought—that *babies are armament.* How are the nations to disarm when babies are armament? What a chance for the Birth Controllers to hook up with the pacifists for universal disarmament? 'I didn't raise my boy to be a soldier' must give place to the new universal anthem of peace—'I will not raise no boys at all, they're armament.'

'Birth rates and bayonets, infants and infantry, cradles and cannon, away with them all!'

Boys and girls, like pigs, are classed as potentials of war. So are fogs. A nation whose coast raises lots of fog is to that extent armored. This awakens us to a new sense of need: Mr. Salmon Levinson, the Jew who gave the Christians their slogan, 'the outlawry of war,' should now start a new society, enlisting the aid of the *Christian Century,* of course, for 'the outlawry of fog.' It seems that Nature herself has been in the nefarious business of supplying certain nations with natural smoke-screens, of which London is the largest user.

So are ocean-currents armament. If a current flows in one direction to keep a certain country warm and supple, and another swerves in another direction to freeze another country up, it has a big bearing on war. But how are nations to give up their ocean currents? True, they may be diplomatic about it. England may say, through her best ambassadors, that in the interest of world peace, she stands ready to sacrifice her warm Gulf Stream if Russia, say, will divest itself of its Arctic current. That's fair. And, besides, it is in the best form of Disarmament Conference procedure.

And so the merry conference at Geneva proceeds. But the United States is represented there. Nothing will occur—(that should end the sentence, but it doesn't) without our knowing it.

## *Speed With Safety*

FAST driving in an automobile is not necessarily dangerous. Slow driving probably causes as many accidents. A good driver, who attends strictly to driving, may run at a smart pace with less danger to himself and others, than one who crawls along at fifteen or twenty miles an hour and ignores the common courtesies and rules of the road. A judge in one of Michigan's most congested cities has said that autoists should be permitted to go from thirty to thirty-five miles an hour on through highways. He believes many accidents are the result of congestion caused by slow drivers. Eventually we shall have roads built for the slow drivers. Then it will be unlawful for a slow driver to crawl along a high speed road. The automobile has become a necessity and as part of our business must be speeded up to synchronize with modern industry.

### *The Alienist Before the Court*

THE professional partisan alienist seems at last without friends. Long distrusted by the public, he is now haled before the court of public opinion by his own fellows—the members of the American Psychiatric Association, in convention assembled. Elimination of *paid opinion* by partisan alienists is demanded. Instead the psychiatrists want *impartial opinion* by experts appointed by the court.

To the lay mind this sounds reasonable enough. However sincere the partisan alienist may be, the very conditions of his employment have operated for years to place him under grave suspicion. Chief resentment centers in his invariable association with wealthy defendants. Seldom if ever in the past two decades has a rich man, accused of a major crime, lacked an array of experts to testify as to his mental incompetency and therefore legal inculpability. Reports of enormous fees for this testimony have only emphasized that the poor man is never thus befriended.

The system first came into prominence with the Thaw trial and reached its flower at the Loeb-Leopold hearings. The diametrically opposing testimony given by alienists for the defense and prosecution in these two notorious instances demonstrates the imperative necessity for *impartial expert advice* for the court in similar cases in the future.

The Massachusetts system was commended to the Association by Dr. L. Vernon Briggs, of Boston. Under this, an expert examination of all persons accused in capital cases and felonies is conducted before trial by two competent psychiatrists appointed by the State Commission of Mental Diseases. The findings are then laid before the court for such action as is deemed fitting. The entire theory of American jurisprudence is based on one thing—impartiality. Paid partisan opinion should not be allowed to enter.

### *'Those Good Old Songs'*

WE CALL them 'those good old songs'—those songs our grandmothers used to sing—but we have no idea whether, in a strict musical sense, they are good. We have, in fact, such an awe of the musical highbrows that we are reluctant about saying whether music is good or bad. So we speak vaguely of 'those good old songs.'

We need not be so reluctant: as a people, the musical world is discovering our musical judgment is rather sound.

As a people, we do not have so much use for what Sousa calls music of the higher mathematics type; for music, that is, which is an intricate and baffling patter, a thing for the brain to follow, and not the senses. But according to the monetary measure of our musical taste, we like pleasing music, and to musicians who please us we give great rewards—rewards extended through the box office, through salaries, or in the purchase of phonograph records.

Of the three names which connote wealth-from-music—Paul Whiteman, Enrico Caruso and John McCormack—it may surprise you to know that the American public rendered tribute to Caruso with almost twice as many dollar marks of esteem as it now bestows upon the young man who is sometimes called the Prince of Jazz. It is even more surprising to be told that our reward for the Irish singer is even greater than that which we bestowed upon the great Italian tenor. Why? The musical world explains it easily: he sings 'those good old songs' which we like so well.

According to Sousa, who has traveled back and forth across the country for more than thirty years, and knows what we want, the test of good music is that you want to hear it again. Also, the sure way to kill bad music is to play it often enough.

That test has been applied lately, by radio. The claptrap of Tin Pan Alley dies quickly through repetition 'on the air.' Good songs endure.

Presented with both good and bad music on the same program by the broadcast stations, we have lost no time in registering our vote. We like good music, and we are fed up with the jangles: every test proves it.

As a people we are voting against Tin Pan Alley; while 'the good old songs' which our grandmothers sang—and others like them—have endured and grown in popularity.

Which is another proof that the American public is a lot sounder than reports from Greenwich Village would indicate.

---

### *Tourists and Flags*

THIS is the season of counsel for tourists. They are growing much better than they were at first. Touring is an art, and our first essays in it were rather awkward. But as quickly as we learned better, we put it into practice.

As in previous years, the complaint again arises that Americans who tour in other countries are, many of them, still unlearned in the courtesy of the flag. It is not enough to carry the American flag: courtesy requires that the flag of the country through which you are driving should also be shown. In Canada it is proper to show the British flag alongside the Star Spangled Banner. It prevents the imputation of flag flaunting and at the same time is a delicate and much appreciated courtesy to the inhabitants of the land. Many thoughtless tourists are responsible for tagging the whole tribe of us as ignorant of this rule.

# Under the White Tops With 'Gil'

## This Veteran Showman Takes You Into a World Where Clowns, Camels and Wild Beasts Are the Actors

'GIL' ROBINSON, in the following series of articles, tells the story of the great show founded by his father more than a century ago—'Pa's circus,' he always calls it. 'Gil' is now an octogenarian—'the world's oldest living circus man born in the business.' In this fascinating narrative, comedy, tragedy and romance are alluringly blended.

By HARRY E. BARNET
ILLUSTRATED BY GEORGE HARPER

THROUGHOUT a hot morning near the end of last July, Gil Robinson continuously tramped the uneven surface of the fair grounds in Hamilton, Ohio, the while he watched John Robinson's Circus get ready for business. About noon, Gil settled himself in a roomy canvas chair in the main entrance of the show. Only forty-eight hours had elapsed since he had celebrated his eightieth birthday.

'Judging from the look on their faces when it's announced at the start of the performances that I'm with the show, and that I'm the world's oldest living circus man, born in the business,' Gil said at the moment he sat down, 'I guess the audiences expect to see a skinny, decrepit creature like a half-revived Mexican mummy carried into the center ring on a stretcher—and here I am, almost as nimble as a working acrobat.'

Gil was short on description. In addition to his agility, his eyes sparkle and twinkle—dimness that bespeaks the years is absent. His hair is pure white; and he has a heavy shock of it. His face is full. The skin of it is soft, and clear of sags, bags and wrinkles, save for crinkles around his eyes, which are talebearers of his abounding cheerfulness.

Although he retired from the circus business some years ago, Gil makes frequent visits to the John Robinson show—'Pa's circus,' he always calls it, because his father founded the show more than a century ago, and Gil spent his active lif with it. This particular morning he was beginning another visit. And very early, seated comfortably in his glittery, oversize motor coach (it's almost as big, Gil says, and showy in its own way, as many of the band wagons carried by the show years ago) Gil and John G. Robinson, his nephew, and this roving reporter trailed the baggage wagons from the railroad cars to the fair grounds.

It was a long ride. No lot nearer the heart of the city was big enough to accommodate the show's canvas, a situation here of late that is common throughout the country, because cities and towns are building up, and expanding, like youths outgrowing their clothes.

'Trailing these wagons,' Gil mused, 'reminds me of the way we used to travel over the country fifty years ago before we began to use railroads. We had about a hundred baggage wagons and animal cages, besides a long string of buggies and carriages in which our performers rode. Going from town to town we strung the wagons and cages out behind one another in an orderly way. Then came the ring horses. They were led over the roads so they would be fresh for use in the acts in the ring. Behind them came some of the menagerie animals that we could lead across the country—camels, and sacred cattle, and animals of that kind. Finally, the performers came along in their buggies and carriages. Old Mary, our family elephant, always brought up the rear of the cavalcade.

'When the circus came to town it made an impressive entrance. We had no parades in those days. Instead, just before we went into the towns we stopped and took the covers off the wagons and cages, plumed the horses, and the band played for all it was worth as we made our entry. It was like one of the scenes you read about in history, when one king went out to visit another king.'

Gil paused, chuckled, and went on:

'Mary was a wise old elephant. At first, when we abandoned traveling by wagons and went on railroads, we didn't have our own cars. We used railroad rolling stock; and the biggest box cars on any railroad were too small for Mary. We had to build a railing around a flat car, and she rode around the country in state.

'The bell rope, which struck the signal gong in the engine cab, was stretched from the engine back to the caboose, and it went over the top of the railing of Mary's private car. The first night of traveling by rail the engineer stopped the train several times within a very few minutes. Each time he came back to see what was the matter. Nobody could tell him. He said he had received the signal to stop each time, but everyone denied pulling the cord.

'Finally, we located the trouble. In some way, Mary learned what the bell rope was for, and when the train hit an extra rough piece of roadbed or ran too fast to suit her, she yanked at the cord. I guess she was afraid she'd fall off that flat car. Anyhow, she got

'She ruined that cabbage patch. It cost us fifty dollars to settle the damage.'

so bad at that trick that we had to fix up a set of signals so the engineer wouldn't stop the train when the bell rang, unless he got one of our signals.'

John Robinson's Circus has an unmatched history. Gil's knowledge of it is complete. When something starts him to reminiscing, one incident suggests another, so that he does a good job of story-telling while he's at it.

'Probably the slickest thing Mary ever did,' he continued, 'was down in Marianna, Florida, on Christmas night, 1869. We had a private family camp with the show and this day it was pitched alongside a negro burying ground. Our darky cook was a very black old fellow, and as full of superstition as could be. He had been busy all day fixing up a big family Christmas dinner—a real treat, because we had had wines and eatables sent to us from New York, and our advance man had arranged for plenty of game. Just as we were ready to sit down to the table the night watchman came up and said that old Mary was lost

*Mary Lost and Found*

'Well, the idea of losing an elephant was ludicrous. But if Mary was lost we had to find her. So we left the dinner on the table, and routed out everybody with the show—even took the old darky cook with us—and set out to trail Mary. It was dark as could be and we commenced at the place where she had been chained to a stake when the performance was over. Mary was easy to trail because at every step her feet sank about two inches in the sandy soil. We wound up in a cabbage patch, probably twenty-five acres of it.

'Mary was there and she knew we were after her. So she picked up the chain that was around her neck, coiled it and carried it in her trunk so it wouldn't rattle. Every time we got close to her she went to the other end of the field. We could hear her moving, but she circled. She wasn't going in any direction, just around and around. Finally, we got her cornered and took her back to the show. She ruined that cabbage patch. It cost us fifty dollars to settle the damage.

'And when we got back, our dinner was gone! There wasn't a thing left on the table. Who got it we never knew. Our old darky cook turned ashy when he saw the bare tables, and swore up to the day he left us that "hants," or "speerits" from the graveyard climbed out of their graves and carried it off.

'Nothing was touched on the tables over in the camp of our people and we went over there and ate with them. After dinner the side-show manager said they were going to have a monster bonfire to celebrate Christmas. You know in those days they had big bonfires and illuminations at celebrations, just as we have fireworks in these days. I asked the side-show manager where he was going to get the fuel.

'"Why," he said, "I bought a thousand fence rails from a fellow who lives over there close to the lot."

'"How many did you say you bought?" I asked him.

'"A thousand of them," he replied.

'Well, I thought that was fine, so we carried the thousand rails over close to the tables, and we had a big bonfire. But next morning a man woke me up and said the rails were his; that they had been stolen. Sure enough, I found that the side-show manager had lied, and it cost us $150 for the rails we helped to burn.

'Mary was a kind and docile elephant, just the sort for a family pet,' Gil went on without a break. 'One winter a camel was born in a stall alongside Mary. From the start Mary appeared to think that she was the baby camel's foster mother.

'The little camel was white, and it was with the show for ten or twelve years. Mary never let it get out of her sight in all that time. She always wanted it beside her, and after a while the camel learned that Mary would always take its part. Whenever the camel started grunting or making any fuss Mary commenced screaming and carrying on at such a rate that we would think that she was going to tear everything to pieces. Mary couldn't be quieted until whatever was the matter with the camel was attended to. And sometimes we couldn't find anything wrong with the camel. It seemed as though it wanted a little excitement, and out of pure mischief it raised a fuss so Mary would get started.

*Jungle Beasts at Sea*

'We chartered a ship one season to take the show from Galveston, Texas, to Morgan City, Louisiana. When it came time to load the animals we found the opening was hardly large enough to admit the camels and the elephant, and we didn't know what to do.

'Finally we chained Mary on the wharf, and started with the little white camel. We threw it down, tied its legs together, and started to try to pull it through. We worked at that job for about an hour. All the time the

camel was making a big fuss, and beating around. Mary went crazy when she heard the little camel. She broke her chains three times and ran up to where the camel was wedged; and Mary tried to pull it out with her trunk while we were trying to pull it in.

'Then the camel went through. Mary broke her chains again when the camel disappeared into the ship, and she ran to the opening. Mary got down on her belly, and squirmed and wriggled herself through, and how she did it, I can't tell you. But she solved a big problem for us.'

Breakfast over and done with on the Hamilton fair grounds, Gil was off to see the show put up. He wandered all over the lot, and said after a while: 'Can you imagine me, a man eighty years old, walking around here, keeping up with you fellows?'

The statement was underdone. Gil kept up with no one. He was continuously in the lead.

'Of course,' Gil mused as we walked along, 'there are some things I used to do that I can't do very gracefully now. One of them is to get up on an elephant's back by stepping into the curve of its trunk, and letting the animal lift me to the top of its head so I can step back and get into the howdah.

*'Gil' Rides an Elephant*

'A few years back, this show opened its one hundredth annual tour in Marion, Indiana, and I was there, as the son of the founder, helping to celebrate. Nothing would do but that I must ride an elephant around the hippodrome track, and then into the center ring, and make a speech to the audience before the performance began.

'I had to use a ladder to get up on that elephant's back. It was a cold day, and I was wrapped in a heavy overcoat, which made me pretty clumsy. But it was a great day. The mayor of the town addressed the audience, and told them of the significance of the performance; then he introduced me. The part of his speech that made me the happiest—and that made everybody applaud—was when he said that I was a Union veteran, and probably the liveliest member of the rapidly disappearing Grand Army of the Republic. I enlisted in the Union Army in 1862.'

Making the rounds of the Hamilton fair grounds, Gil bent low, and patted tiny pony colts. He made his way among the ring horses, and lamented the fact that the spotted breeds of them are well along toward what has the look of extinction. Changes in sights and sounds around a big circus that was putting up drew a steady run of comment from Gil.

'Nobody seems to be working to get the show up,' he said. 'Yet, it's going up all right. They're mighty quiet about it. Even the bosses nowadays walk around the lot in white shirts and white collars.

*Getting the Show Up*

'When we put up there was always a big fuss. "Governor" Robinson, my brother (now dead), and I were always out on the lot as soon as the first wagons got there. We wore flannel shirts, and so did all the bosses. And we tore around getting unpacked! There were hundreds of negroes driving stakes with sledges, and unrolling canvas; hundreds of horses pulling the wagons and cages around; whooping and yelling by everybody. The Forepaugh girls and Mabel Reed and the best of the women performers used to get out and lace canvas.

'But no wonder you're quiet about it,' Gil snorted. 'You drive stakes with a machine. Your horses only make one trip between the cars and the lot. They bring up all the baggage at one trip, and don't have to go back after the cages, as our horses did. One of your tractors brings up as many cages at one time, and without any fuss, as we did with twenty-four to thirty-six horses. You carry nothing that doesn't work. Why, we used to carry a hundred ponies for display purposes alone!'

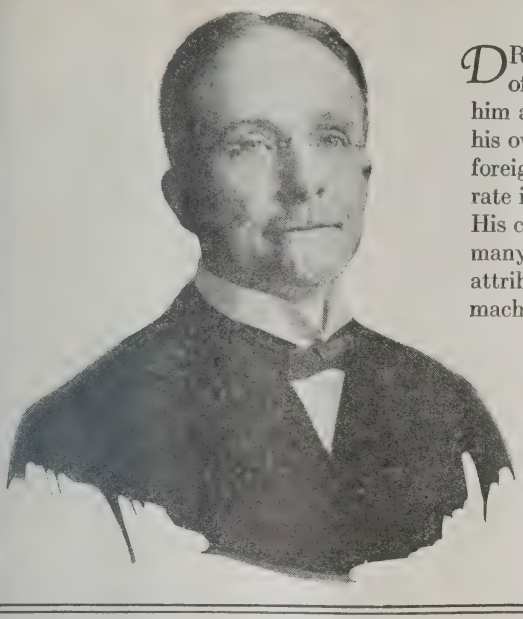
So Gil kept on the go. When the parade assembled, he struck off ahead of it, and walked at least a quarter of a mile in advance. There he stood until it passed him, because he wanted to see what it looked like, approaching, passing him, and in retreat.

'The way I get around,' Gil said as we walked toward the main entrance of the show, 'I can't realize that I'm as old as I am. But when I think back, I'm old in years. I've probably seen more of the great scroll of American history unroll, and looked at it more closely, and looked more closely at the people who made the history, than any living man, because I was always traveling where history was being made.

'For it wasn't very long after mother finished her riding act in the ring of pa's circus that I was born in Buchanan, Virginia. I kept right with it until very recent years. Can you imagine me, a rapidly growing boy, traveling by wagon through the South at the very time that the forty-niners were making their westward rush!

'I guess,' and Gil's thoughts shifted at the moment we entered the main entrance, 'I've entertained and studied the most of the American celebrities under the canvas of this show, because at one time and another they visited us. General Robert E. Lee and General Grant were probably the greatest contrasts we ever entertained.

*A Visit From General Lee*



'General Lee visited us when he was head of the school at Lexington, Virginia. And he was a serious man. He didn't care very much for the performances. The general wanted to know the details of the organization of our show—the efficiency of it, you know.

'We were traveling by wagons, just like an army. We had to meet rowdies in every town, and they always tried to fight the showmen. We had terrific battles almost every day. We carried muskets, and as soon as we got on the lot we unpacked the muskets first and stacked them. When trouble started we blew a whistle, and every man with the show ran to his own particular musket stack, grabbed a gun, and fell into line, ready for battle.

'"You have a wonderful organization," General Lee said. "If we had had such an organization in the Confederate Army there would have been better fighting; and probably a different tale to tell at the end of the war."'

*This is the first of a series of articles on circus life in the olden days. The second will appear in next week's issue.*

DR. CHEVALIER JACKSON of Philadelphia is regarded as one of the world's greatest surgeons. The French Government made him a Knight of the Legion of Honor. By the use of instruments of his own invention he has revolutionized the treatment for removing foreign bodies lodged in the bronchial tubes and reduced the mortality rate in these cases from eighty-five per cent to less than two per cent. His chief love is the saving of children's lives, and he has removed many hundreds of tacks from their food and air passages His friends attribute his singular success to his boyhood apprenticeship as a machinist, and his father's advice: 'Educate your eyes and your fingers.'

# He Takes Tin Tacks From Tiny Throats

## Doctor Who Has Saved Thousands of Children

CLETUS MOORE was only eight months old, but he had a smile that was as contagious as sunshine itself. And it was this smile that won the heart of St. Louis, and in effect saved his life.

Now Cletus had the misfortune, during one of his quests after adventure, to swallow a carpet tack. When he realized that it wasn't some new form of delicacy heretofore denied him, but instead was sharp so that it hurt even worse than his new teeth, he attempted to cough it up.

The tack, however, became imbedded deep in his left lung. St. Louis surgeons were called in, and Cletus was taken to the City Hospital.

The surgeons looked at the baby and they looked at their X-ray photographs, and they shook their heads. There was one chance in a hundred of saving the youngster's life, they said, and that was to rush him immediately to Dr. Chevalier Jackson.

But Dr. Jackson was in Philadelphia, a thousand miles away. It costs money to travel, even for eight-month-old babies, and Cletus' parents were not well-to-do.

In the end it was Cletus' smile that won the day. The nurses at the hospital fell in love with him. Newspapers told his story. And the Catholic Women's League stepped forward with funds to send the youngster to Philadelphia.

Cletus' parents, Mr. and Mrs. Lucius Moore, were persuaded to let him go, though they despaired of seeing him alive again. Mrs. Leila Parrish, assistant superintendent at the City Hospital, was chosen to carry the youngster on the trip. It was a real race against death.

With Cletus in her arms, Mrs. Parrish boarded the fastest train for the East. The papers recorded the progress of the journey. Perhaps, as the train neared Philadelphia, the engineer opened the throttle a bit and pulled in ahead of his regular schedule. Who cares? Maybe he had a baby or two of his own.

Twenty-seven hours after he left St. Louis Cletus was lying on a cot in Jefferson Hospital, smiling up into the face of Dr. Jackson.

Four-and-one-half minutes later the tack had been removed, and Master Cletus manifested his interest by rolling over and going to sleep.

The tack was three-quarters of an inch long and was lodged well down toward the base of the lung. The operation was performed without a knife, and without the use of an anesthetic!

To those who had never before heard of Dr. Jackson the operation seemed little short of miraculous, but to Dr. Jackson it was all part of the day's work. For the saving of babies' lives is the day's work—yes, and the life work too—of this astonishing surgeon.

It has been estimated by some authorities that Dr. Jackson has saved the life of at least one person a day for years!

Children are taken to him from all parts of the country. Adults flock to his clinics, not only from the United States and Canada but from South America and in some instances from Europe.

Scarcely a week passes but that some youngster is rushed to Philadelphia from some distant point to find relief under his skilled hands.

Incredible as it may seem, the tack removed from the lung of Cletus Moore was the 1,265th that Dr. Jackson has removed from the air and food passages of humans.

The list ranges from teeth to toys, from pins to peanuts. It includes jackstones, whistles, animals, small parts detached from large toys, grains of corn, beans, peas, canna seeds, coffee beans, watermelon seeds, beads, buttons, jewelry, coins, stray fragments of metal and of wood, fish bones, chunks of sharp candy, and dozens of other objects.

Once he took a small piece of some toy opera glasses from a tiny gullet. Pins, both safety and straight, comprise a large percentage of the objects removed. Loose Teddy bear eyes seem to have a fatal fascination for youngsters.

Dr. Jackson uses an instrument of his own invention, the bronchoscope, in performing his operations. The bronchoscope, equipped with a long tube in which is a miniature electric light, is inserted into the child's lung or throat or wherever the foreign body is lodged.

The light reveals the object sought. Then a pair of pack forceps are inserted through the instrument and clamped over the head of the object. Following its removal a suction tube is inserted to remove the pus resulting from the lodgment of the foreign article in the delicate membrane.

So dexterous is Dr. Jackson that it takes him scarcely longer to perform the operation than it does to describe it in brief.

Five days after Cletus Moore arrived in Philadelphia he was back home again, safe and well—and smiling—and his place in the Jefferson Hospital clinic was taken by some other youngster. The names of these children are legion.

There was, for instance, the year-old daughter of Mr. and Mrs. William Gillespie, of Arcadia, South Carolina. She swallowed an open (Concluded on page 30)

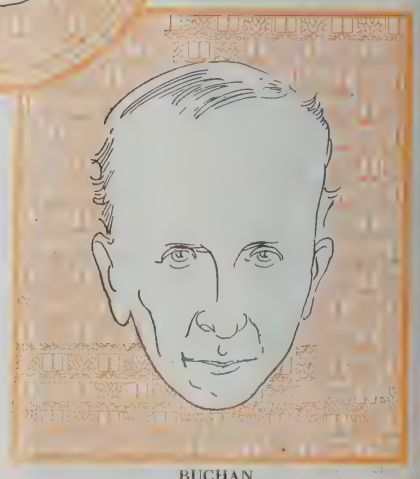
# Patting the Lion's Mane

## American Woman Says That English Men of Letters Are More Interesting Than American; She Gives Some of Them in Their Native Settings and Depicts Their Various Characteristics

By GEORGIA JACKSON SCOTT

PORTRAITS BY RUSSELL LEGGE

CHESTERTON



DUNSANY

DRINKWATER

WALPOLE

BUCHAN

PEOPLE are apt to think nowadays that an undue interest in literary personalities is a sign of feeble-mindedness, but we can of course remind them that the Queen of Sheba once took a long journey to see an early author, and nobody seems to have held it against her. In spite of scoffing, I believe that curiosity about celebrities is as far-reaching and deep-seated—and as venial—as any other human failing. And if, after seeing an author, you feel you never want to read any more of his books, so much time has been saved.

English men of letters are more interesting than American. Perhaps this is because we are so used to Americans; perhaps it is because England produces better writers. It is not difficult to meet these English celebrities—those who do not come to America to lecture can nearly always be found lurking about London. And now that all Englishmen admire Americans so openly, one can usually satisfy one's curiosity without recourse to positive rudeness.

My first British geniuses I saw out of their native setting. You all remember that Chesterton was in the United States a few years ago. I went to hear him lecture in New York. He is a rotund, shaggy-haired man, and he looked very abundant and satisfying in his evening clothes. The audience listened to him with a joy that was almost pain. I was so absorbed in chuckling at his humor and straining not to miss a single paradox, that I found it impossible to keep the thread of his argument. I am not quite certain even now that there was one.

I was with a young American poet. Chesterton had expressed a wish to meet her, and as she was about to leave New York, she said to me, after the lecture, 'It's now or never.' So we went round to the stage entrance, and found the doorkeeper struggling with a refractory lock, the door being about half open. He said truculently that no one was allowed to enter. I began to reason with him, while my friend slipped behind him into the corridor. After one furious glance at her, he melted. 'There comes the gentleman now; you can go in too,' he said.

Chesterton bore down upon us, looking huge and helpless, like a dirigible in a squall. He was very cordial, very complimentary to my friend, but he seemed rather dazed. So, as my friend said, he put his hand behind him and drew out his little wife. She was a bird-like, competent person; unquestionably the pilot of the ship, to be consulted instantly in time of doubt or danger. We had a brief and pleasant chat in that corridor, what about I can't in the least recall, but I do remember clearly the picture of the large and genial gentleman, and when I read his poems now, I can hear his own voice booming out 'Lepanto' or indulging in that most cheering of meditations, 'I think I Will Not Hang Myself To-day.'

Lord Dunsany and John Drinkwater were at the Poetry Society in New York one evening. The former was a gigantic, tall creature in the most unshapely and voluminous evening coat it was ever my fortune to see. He seemed to me to get constantly in his own way. His great hands played with an absurdly fine chain on which his eyeglass dangled. But he had a young face, with deep smile wrinkles, tawny hair that might profitably have been cut the week before, and a small mustache. His smile was delightful when it was spontaneous, though a little overgracious when he was being lionized. But the important thing was that he had great personal charm.

I have seldom seen anything more engaging than Dunsany trying not to smile when Drinkwater was ragging him. I remember the Irishman talked informally about rhythm, which he pronounced in two full syllables—rhythum. He said he thought rhythm was inherent in any expression of noble

MASEFIELD

thought, that they couldn't be separated; that rhythm was necessary to the expression of a fine idea. He said all his work was rhythmical, based on the style of *Ecclesiastes*, which he considered the finest piece of English he knew, particularly the first and last two chapters. He had debated whether to write in blank verse or prose, and finally decided in favor of what he called 'the more difficult form—prose.' And then Drinkwater took issue with him, and made pleasant fun of his theory.

Drinkwater was a very different type—alert, clean-cut, well-poised; a more trig personality. He talked better than Dunsany, but was not so interesting. He might have been any handsome and clever young man. I remember he read that comely little poem of his, 'Anthony Crumble, R. I. P.,' delightfully.

Hugh Walpole I heard speak once; a fine, honest, ruddy, modest person, stocky and substantial, with delicate and adroit humor. He was pleasant to look at and to listen to. When I think of him, I always recall the description one of the Sitwells wrote of him in a survey of the future life—I quote from memory:

> And there Hugh Walpole stands
> So red and clean.

Then there was Walter de la Mare, whom I had always admired deeply. He spoke entrancing things with lovely cadences. His language was as filmy as silver filigree, and ordered into a chaste pattern. I did not see him very well, and could only be certain that he was a good-looking person, rather under medium size.

We had just discovered John Buchan's stories when we were in London. *Huntingtower*, which I still like best, had filled us with deep satisfaction. So we went to hear Buchan give his defense of Sir Walter Scott. He looked like a schoolboy with an enormous head—short, slender, boyish-faced, clean-shaven, earnest, witty. How loyally and handsomely he stood by his compatriot! He brought up one by one all the charges that have been brought against the great romancer and quashed them all, to his own deep complacency and to ours. It would have done Sir Walter good to hear him. At any rate, it did us good. When he lapsed into Scottish, I couldn't understand a word, but it sounded delicious.

At Oxford we attended John Masefield's first poetry-reading contest. Five hundred young people from

BRIDGES

GOSSE

all over Great Britain entered the lists. Masefield was one of the judges, and two of his colleagues were Laurence Binyon and Sir Gilbert Murray. It was interesting, if monotonous, to listen to thirty or more recitations of the same poem, rendered in every conceivable style. Sometimes as in the case of

> Why does your blade sae drap wi' blud,
> Edward, Edward!

the pathos finally became laughable to the listener. For days afterward, on the slightest provocation, my companion would break out with

> Why does your blade sae drap wi' blud,
> Edward, Edward!

But of course it was Masefield in whom we were really interested. He was a slight figure in his white suit, his short hair all gray. He seemed in personality just to miss being insignificant; but one was glad to note that he did miss it. How absorbed he was, how pleased with the success of his project, how almost too serious about it, how painstaking and patient and unsparing of himself! And he seemed not to have any energy to waste. In fact, his wife on the last evening tore him from his friends with a despairing: 'Jack, you *must* come home to bed.' Masefield lives on Boar's Hill, near Robert Bridges' home, a few miles from Oxford, where the English country is at her loveliest.

Mr. Bridges is a venerable and picturesque figure—over eighty, but vigorous, and full of passionate interests. He is tall, handsome, gray-haired and bearded. He is his most characteristic self when, excited over an idea, he rumples his hair into a shaggy brush. A trifle peppery at times, but, on the whole, he is an admirable and astonishing old man.

Edmund Gosse, now Sir Edmund, is also getting on in years. He is quite gray, without a beard, and wears one black glass and one clear glass in his spectacles, which gives him an odd appearance. We were invited to tea at his home, and found a group of more or less literary people. I remember Hamlin Garland was also there that day. Gosse is affable, full of reminiscences of his long career. His wife, a friendly and amusing woman, told us that one day when they were sitting in the park, two little boys hovered about them, and she heard one say to the other, 'You ask him,' and the other said, 'No, you.' So she called them over to find what it was they wanted. It appeared that

# How the U. S. Treats Its Diplomats

## Present Conditions Prohibit Any Man From Attaining the Rank of United States Ambassador Unless He Can Supply Great Wealth to Maintain the Social Obligations of the Post

By MARIAN BRUCE CLARK

WHAT is the matter with the most powerful country on earth? Why does the United States Government, in the smugness of its ultra-modern standard of living, fail to consider the health and comfort of its representatives in foreign countries? Who is to blame for this delinquency as a result of which the American nation is made to be the recipient of a compulsory philanthropy from its diplomatic representatives abroad in order to maintain the dignity and prestige so necessary in their intercourse with foreign governments? How many more congressional jaunts to Europe, Asia, Africa and Australia must be made at the expense of the taxpayers by individuals, committees, commissions and what not before these conditions are remedied?

American Embassy, Paris, acquired in 1924 through an American citizen who purchased it pending an appropriation from Congress

On June 5, 1914, Ambassador Walter Hines Page wrote thus to the late President Wilson:

As I write this, I feel as I felt last Sunday when I wrote my resignation—that's the wisest way out of the difficulty; give it up and tell the public the whole truth, that we can have only rich men for ambassadors—swallow my loss, forget it, go back to my work and earn my living. Then I have another mood—that it is exceedingly unfortunate to change ambassadors so often, that I owe it to you to make every desperate effort not to give up for sheer financial reasons . . . We have gone on in this shabby fashion so long that perhaps no conceivable Congress can be made to understand what an embassy is, or ought to be, we have gone on continually lowering our standing in English eyes at least; and this is one reason why our government is held in contempt here, cordially as they regard our people and our nation . . . The first step in building up a right understanding here is to build a house for our own ambassador. If I go away, however, because I can't afford it, and my successor has to pay for his house, that will not be a flattering or helpful condition for him to begin his labor under. It's surely a bad predicament . . . I pray you pardon all this, my dear Mr. President. I imagine that after all the best way out is for you to relieve me of further duties that I cannot pay for, find a man of fortune for this post and let my resignation help toward an understanding of the whole diplomatic problem. Perhaps that's the best service that I can render after all.

It is entirely within reason to infer that such a situation tended toward the final breakdown of Mr. Page's health which resulted in his death.

Ambassador to Spain! Minister to Greece! Consul General! Charge d'Affaires! High-sounding titles these. and to that element of the American public who note such appointments they appear the very pinnacle of lucrative governmental largesse. The real facts now available to the public through a congressional hearing disclosed, through former ambassadors and others of our foreign diplomatic corps, that all ambassadors have been obliged to make large monetary contributions to their salaries to maintain the dignity and prestige of their official positions, meaning the dignity and prestige of the United States.

This fact, added to the actual hardship suffered by the lower-grade men who are not possessed of wealth independent of their salaries, furnishes conclusive evidence that Congress has too long ignored the fact that *noblesse oblige* operates without discrimination not only as to individuals but as to nations as well. Congress is, more and more, becoming so dominated by the bloc system of government that but few of its members attempt to think in terms of any but their own local problems.

But few Americans in their ultra-modern surroundings realize the self-sacrificing heroism that is demanded from foreign-service men of the diplomatic corps. In many places where the commerce and shipping interests make the presence of an American consul imperative the great bulk of the population is native, living in surroundings in which no American or European could survive. In such places foreign governments and private commercial enterprises erect their own buildings both for offices and for housing their employes, for in any plan of industrial organization it is considered uneconomic that employes be obliged to struggle with insanitary living and working conditions.

American Consulate and neighboring buildings, Changsha.

An official of the Department of State testified as follows before the Committee on Foreign Affairs of the House of Representatives:

'I was here in Washington when Mr. Kellogg was appointed ambassador to London . . . naturally important to him was the question "Where am I going to live?" I happened to be back from the em-

bassy in London and he thought I might know something about available properties to rent . . . As a matter of fact, we had looked into that in advance and I had one or two suggestions to make to Mr. Kellogg. We discussed the properties that were dignified and suitable for an ambassador to rent on the way to London. In reference to one he asked what the annual rent would be. We told him $15,000. He turned and looked out of the window. We inquired, "Is that $15,000 too much?" He turned around and replied, "No; it is not that. I was just thinking how I would spend the other $2,500 of my salary." '

Frank C. Page, the son of former Ambassador Walter Hines Page, testified:

'The cost to live in London, to my father, in 1913 to 1914, was approximately $48,000. That was for one year before they entered the war. From the time the war started until we left there was practically no social activity and during that time, 1914-1918, it cost from $36,000 to $38,000 a year for us to live in London. That is what it costs an ambassador to live on a very modest scale . . . An officer of a government coming to Washington can, unless he happens to be a cabinet officer, live as he pleases. A diplomatic representative cannot. He is obliged to do certain things. He is obliged to entertain foreign diplomats. He is obliged to entertain, if he is an American ambassador abroad, Americans going abroad, particularly if they are officials . . . If an American ambassador is going to do his job with dignity, in keeping with the greatness of his country and if he is going to do it as it should be done, even if you give him a house, he cannot do it for less than twice as much as his salary. Commissions and organizations and individuals who go abroad carrying letters from the Secretary of State or the President must be entertained by the embassies or the legations and the entertainment must come out of the pockets of the ambassadors or ministers as the case may be.'

American Embassy at Constantinople, acquired in 1907.

Former Ambassador Henry White testified that while ambassador to Rome he had spent $20,000 on reconstructing the embassy to make it habitable and $40,000 in reconstructing the house which he occupied in Paris while ambassador to France, in addition to the rental costs.

Former Ambassador to Spain, Honorable Alexander P. Moore, said: 'In Madrid, when I went there, I went to see the place where the former ambassador lived. It was in an awful place on the outskirts of the city limits. The former ambassador could get no other place and it was necessary to go through a garage to get into the embassy. I finally succeeded in getting a very nice place but only because a man and his wife had separated. Then I had to go and weep with him and finally induced him to rent me the place. A Spaniard thinks that his financial credit is injured if he has to rent his house. I say very frankly that an ambassador should have an allowance from the government for entertaining, although I know that the word entertaining is misunderstood . . . The first year that I was there approximately 8,000 Americans came there; the last year there were 45,000. I myself, at San Sabastian, had more than 4,000 persons come to see me for lunch or tea, and I was very glad to have them . . . The Government paid part of the rent because they had the chancery there, but my share of it was between seven and eight thousand dollars.'

Headquarters of the American representatives at Guadeloupe, West Indies.

When it is realized that the foregoing is the experience of ambassadors, all of whom could afford to spend and did spend hundreds of thousands of dollars of their own fortunes in maintaining the dignity of their country during their terms of office, one may readily imagine conditions in the smaller places, in backward countries, for instance. Here is a description of conditions that confront our minister to Albania, the smallest and most Turkish of the Balkan countries:

'The capital, Tirana, is a small village some fifteen miles from the sea. In the center of this village is a common where donkeys and goats and ducks wander around in the mud. Through the center of it runs a little stream which is the central drain of the town and where the people also come to do their washing . . . The legation is a little Turkish house made of mud bricks, not baked bricks. It was remodeled by the first minister who went there who cleaned it out and put in some mosquito screens because it is a malaria-infested place.'

In Turkey proper, where the United States has an embassy in Constantinople, the Turkish Government has moved its capital to Angora, an old Turkish town twenty-four hours by railroad from Constantinople. Under present conditions the United States must keep a consul there since there is no certainty that the location of the capital will not again be changed. This is what the State Department has to say about it: 'We cannot keep a man up there more than a month and keep him well balanced. You have got to bring him back and put him in touch with people and newspapers and news and let him lead a responsible life in order to keep him level-headed. Two or three men had to be taken out and sent to another climate because they contracted malaria in the place.'

In China, a representative of the State Department testified: 'In my earlier days in the service I occupied a small house in a temple in Mukden with our consulate general. The thermometer in winter went down to thirty-five below zero and I have had to get up at night and run around to keep warm because the front of the house was made of paper, being a Chinese building . . . At present in Tiensin the subordinate staff who get less money are scattered around the town in similar places . . . Conditions do not change as to buildings in China. The new buildings are exactly the same type that China has been building for the past two thousand years . . . while in Japan con-

ditions are not much different. Our consul general arrived while I was in Tokyo in 1924 and I accompanied him in an almost fruitless search for a home. There were a few foreign-built houses but they were snapped up by the Standard Oil Company for their own use. They were entirely out of reach of any employe of our consular service. We finally found a half-Japanese half-foreign house on a little alley . . . On rainy days we had to wear boots to get into the place.'

At the State Department it was said that the legation at Amoy, China, was built over the bank of the river. When the river rose it flooded the lower floors and soaked through the walls so that the plaster throughout the house had fallen from the walls and ceilings.

In Formosa, Japan . . . one of our able and energetic young men has been living in a house that threatens to fall down over his head . . . Every night when he and his family go to bed they take with them coils of rope which they place on chairs at their bedside, so that in case of earthquake they may escape through the windows before the building collapses.

*Officials Are Neglected*

Some 26,575 American vessels were operating under the American flag in 1924. During the year 1925 nearly 170,000 passports were issued to American citizens visiting foreign countries, an increase of 30,000 over the year before. Every person who goes abroad, or who resides there in pursuit of American business interests, is operating in a strange environment where laws and customs are alien to him, and where he encounters keen competition of a none too friendly type. The conservation of our American interests and the protection of the huge investment which has been quoted requires the constant vigilance of trained diplomats who are stationed in the most remote places in the world where American interests penetrate.

That these diplomatic officials have been shamefully neglected and sent to places where no American can exist in safety or comfort is almost impossible of belief. In this the United States is the most backward country on earth, it is the only great power in existence today that is guilty of the criminal neglect shown to exist toward the health and efficiency and comfort of its foreign representatives.

Of the salary of our American ambassador in London, which is now $17,500, at least $15,000 has gone for a furnished residence which is also the embassy; yet the British Government furnishes its ambassador in Washington with a residence and a representation allowance of $90,000 a year. In Berlin the American ambassador received $17,500 for salary and the rent of his residence, which includes the office of the embassy. This has recently been increased to between $20,000 and $25,000. The salary of the ambassador at Buenos Aires is also $17,500 and he has so far been unable to find in the city a suitable embassy, although willing to pay out of his own pocket $15,000 a year for such a residence.

The salary of the minister at The Hague is $12,000, and of that he is obliged to pay $6,000 for a furnished house, yet the minister of the Netherlands in Washington is provided with a dignified official residence.

It has been stated that the United States maintains foreign relations with fifty-one countries, yet it owns embassy buildings in only fourteen of them and of this number one was acquired by gift in London from J. Pierpont Morgan and two were secured by the philanthropy of public-spirited Americans who thus prevented our ambassadors from being turned out bodily through the sale of the property over their heads. This did actually occur in Switzerland when the Red Cross purchased the legation building and the American minister was obliged to move out and go to a hotel, where he still stays.

With a foreign investment of approximately $25,000,000,000, including our interallied debts, to be safeguarded by our diplomatic service abroad, it is inconceivable that our ambassadors have at all times been obliged to contribute large sums of money from their own pockets for the maintenance of dignified and habitable residences for embassy purposes, thus making the acceptance of that high office one of virtual impossibility except to an exceedingly wealthy man, which is, in itself, contrary to both the letter and the spirit of the Constitution of the United States. To officials of lesser rank in backward countries the continuation of their public service as well as its quality has been entirely contingent upon their own patriotism and sense of duty, for the conditions which have been described would be unbelievable by the general public had the facts not been contributed by witnesses of unimpeachable authority before a Congressional Committee.

*Facts Are Beyond Question*

Main office of the American Consulate General at Mukden.

## The Parentage of Attic Strads

(*Concluded from page 8*)

dollars for a new fiddle and sells it for seventy-five; he gives fifty for an old one and gets five hundred. The Edinburgh collection is said to have brought $250,000. That is due to its aristocratic historical setting. A violin owned by the fiddling son of Queen Victoria is certainly worth twenty thousand dollars more than that played by the gypsy Rigo, although the latter inevitably made his sound like the better instrument. The Hawley collection brought no such price, nor would any obscure violin, no matter what its intrinsic merit might be.

But most of these old violins that have been for generations in the same family are not good violins; they are derelicts and nothing more. Of course there are exceptions, but these we seldom see, particularly the very fine ones. In the Old South were many choice instruments that her sons brought from Europe when they returned from their studies. But many of these have been lost. Perhaps some of them may yet be found, but not many.

If the man who wanted a Strad knew one when he saw it, the question would be much simpler. He would buy of the owner, wherever he found one. But few players know what they want when they see it; they have to be told. So the prospective purchaser of an old Cremona must go to the dealer whose enterprise has made possible big business, where he will be shown the 'real thing, the genuine article, fully authenticated, with certificate for framing.'

He pays the price and takes his purchase home; but whether a Strad or not he had better make no too persistent inquiry; for if he does, someone will surely tell him that he has been swindled. Experts cut each others' throats with as much *sang-froid* as other pirates.

People who have old instruments that they no longer care for should dispose of them to intelligent musicians who know what they want and are not afraid to depend on their own judgment in making their selection. In that way they are apt to get a better price than they could get from a bargain snatcher, while the purchaser will escape the necessity of paying a price that makes him the notorious dupe of a pack that preys always on the gullible and flourishes at his expense.

## [ Taken from the Classics ]

DAMOCLES was a flatterer in the court of Dionysius of Syracuse. By way of answer to the constant praises of the happiness of kings, Dionysius seated him at a royal banquet, with a sword hung over his head by a single horsehair. In the midst of the banquet Damocles, chancing to look upward, saw the sharp and naked weapon. This immediately taught him that flattery was a dangerous course to pursue when dealing with kings.

The Seven Sleepers were seven noble youths of Ephesus, who fled in the Decian persecution to a cave in Mount Celion, the mouth of which was blocked up by stones. After 230 years they were discovered, and awoke, but died within a few days and were taken in a large stone coffin to Marseilles.

# CHATS WITH OFFICE CALLERS

In the mass of approval that greeted our article on Poland, ***One Dissenting Voice*** was heard. The dissenter was a Jew—living in that great sesqui-centennial Jewish center, Philadelphia. We give below the objector's letter and the author's reply:

'Dear Sir:

'I have carefully noted your article on Poland and am moved to make a few comments on same.

'1. I am sure your intended trip to Poland will be of great benefit to you.

'2. Your statement as to the lack of knowledge of Americans concerning Poland is most assuredly correct. I congratulate you on your foresight in publishing your article.

'Why must Poland come to America for brains and capital? She has or had them, but by her religious and patriotic trade policy has refused this aid which is within her borders—Germans & Jews.

'Recent events have confirmed observations made several years ago of Poland's militaristic policy.

'Compare conditions in the Corridor under Germany and Poland. Compare conditions in Galicia under Franz-Josef and Poland. Compare Warsaw—then and now—Danzig—Silesia and so on *ad infinitum*. And in making these comparisons question your singing Pole. What business capacity have the Poles? There are but two successful movements in Poland, Religious—and Military.

'With apologies,'

The reply:

'My Dear Mr.—:

'1. You don't seem to like the idea that Americans find some good in Poland and the Poles.

'2. You seem to forget that between 1914 (the good old days under Franz-Josef) and 1926 there was the World War and destruction, both material and moral.

'3. You seem to forget, Mr. Aaron, that while your Jewish ancestors were hunted and driven like cattle from other so-called civilized countries of Europe, Poland gave them refuge and made it possible for them to prosper. Now, as a sort of national pastime, the Jews seem to enjoy throwing stones at Poland and the Poles. Is that an expression of gratitude?'

* * *

'Health and not disease is now the great concern of medicine,' said the ***Medical Scientist, Member of a Famous Foundation.*** 'At first medicine was merely curative. It applied itself to the immediate emergency, which was the alleviation of pain and the cure, as far as possible, of disease. The great progress made in that department is, of course, well known. Many ways and means have been found to give Nature's restorative power free course in the diseased body.

'But all this work drove medicine back farther than the abnormal condition itself to the cause of it. Disease is not natural. Medicine will go as far as any healing cult in declaring, perhaps in other words, that disease is not God's will for man—if you care to put it that way. Then arose in our day—it is a recent development—what is called preventive medicine. How to live so that disease will have no cause to come—that was the new program. We have seen its effect in widespread public education in methods of preventing disease, in public sanitation, in organized movements to abolish the causes of certain diseases. There is no more reason for typhoid, tuberculosis and other serious diseases than there is for starvation: they can be removed from civilization as effectively as if they were rattlesnakes. How long would a modern city tolerate conditions that bred rattlesnakes in its streets?

'Now, however, we are in the beginning of a new and positive development of medicine. The emphasis, though not being lessened with reference to prevention, is making a mighty advance toward the increase of the degree of health. The world is full of people who are not sick, who according to the old standards are quite "well," but they are not living that virile, vibrant, vivacious life associated with complete freedom. They are well, but not spilling over with life. They have health but no surplus of spirits. They maintain a sort of neutral position between the health of the gods and the illness of mortals. Now, medicine wants to increase the vital drive of people, increase their health rate, step them up into regions of physical freedom and energy which only the fortunate few enjoy. We live, as the old hymn says, "at a poor dying rate." Well, medical men want to increase the living rate—put more power and joy into the common man's mere matter of living. I don't know what name the new development will take, but it certainly is most hopeful and inspiring. There is no possible way of measuring the reformative social effects of a people vibrant with health. It will change society, I believe, for all the evil things that exist are put over on people who are below par. These things will be impossible when people become dynamos of health and freedom.'

* * *

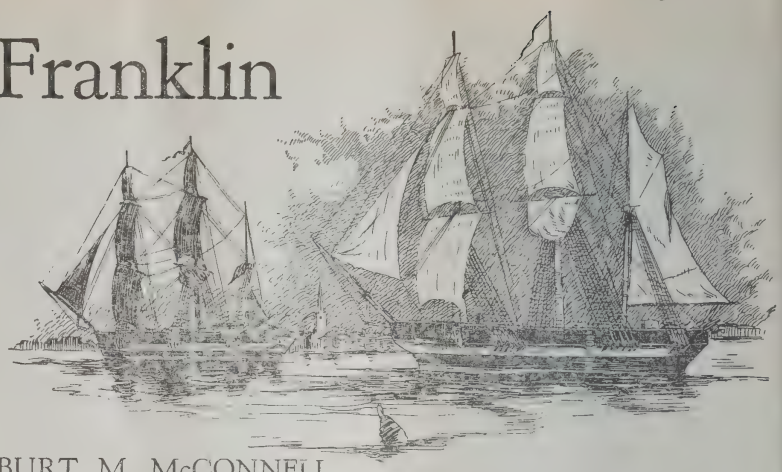
'It is time to take the "F" out of R. F. D.,' said ***The Farmer as he stood by his mail box at the side of the road.*** 'There was political capital made out of the fact that they were *delivering* the farmers' mail, as they did city folks' mail, but to make sure that us hayseeds got the point they stuck in the word "free"—Rural *Free* Delivery. I wonder if they thought how it was going to sound after twenty years. What is free about it, I wonder? Who *is* paying for mail delivery, that the farmer should be kept placarded before the country as being on the free list, or getting some special favor? It isn't a favor, by a long shot. Rural delivery is much cheaper than city delivery. You take a city like Detroit, with its army of mail men, and its great territory, and then look at the extent of our rural delivery routes, and the city has it on us for distances and cost. It isn't such a remarkable thing that mail is delivered in the country—not nearly so remarkable as that it should be delivered in the city. And it isn't "free" in either place. We pay for it.

'I am not kicking. It only makes me wonder why someone in Washington hasn't tumbled to the nonsense of keeping that fake "free" tied up with every letter and newspaper we get. It was politics that put it in; it's just a national lack of the sense of humor that keeps it in. I should think some Senator could make a hit with the farmer in taking this cheap tag off his mail service.'

* * *

***The Virginia Farmer*** is a man who knows what he is talking about. 'Do you know that Congress is trimming down the privileges the farmer has under the Farm Loan Act?' he asked. 'Why, they have passed a bill through the House proposing that the privilege of the farmers to elect the secretaries of their own local farm loan associations be taken away, and that these officers be hereafter appointed. That is a fine thing for an administration, that claims to be so strong for coöperation, to do. They give the farmer a piece of legislation and just as soon as they find any liberal provision in such legislation, whereby the farmer is to exercise a little of his own judgment over the control of what he is supposed to have, they begin to seek a way to take it away from him. These associations are supposed to be organized and owned by local farmers and *their land* is security for any debt they create. Not content with having all the top-heavy supervising officers, they now want the power of appointment of local officers. What they are trying to do is to take all the power away from the farmer and make the farm loan system a bankers' proposition pure and simple. Then, of course, it will be so expensive that it will be useless to the farmer.'

* * *



***The Army Officer*** dropped into the office. 'I notice that Lord Balfour has announced that the British Government has definitely abandoned the proposal to create a minister of defense, for the coördination of the army, air, and naval ministries of Great Britain,' he remarked.

'What effect is that likely to have on General Mitchell's campaign to create such a department in our Government?'

'No effect on Mitchell,' he responded. 'That means nothing in his young life. In fact, I have been told that Mitchell is going forward with elaborate plans for his campaign; that he plans to be elected Commander of his American Legion Post and use that as a stepping-stone to election as National Commander of the American Legion at their next meeting in Philadelphia this autumn. His recent campaign throughout the country was a good means of establishing contact with various Legion Posts. If he is elected national commander he expects to use the weight of the American Legion in support of his ideas before Congress. Personally, I do not believe he will be able to put it over on the boys.'

# Tragedy of the Franklin Expedition

## Conquerors, Even in Death, They Realized the Old Dream of a Northwest Passage

H. M. S. *Erebus* and *Terror* setting out from the Thames.

By BURT M. McCONNELL

IN THE long succession of polar enterprises, dating from the dawn of British history, when King Alfred drove back the invading Danes, the most disastrous of all was the elaborately outfitted expedition of Sir John Franklin of the British Navy. Of the 129 confident and courageous explorers who sailed with him from England in the summer of 1845, not one returned. It was as though the earth had swallowed them. Yet this attempt to discover a route to the Pacific cannot be branded as a failure, for while the adventurers who set forth so hopefully in the *Erebus* and *Terror* perished wretchedly a few years later, disaster and death did not overtake them until they had achieved the main object of their voyage—the discovery of a channel of communication from Baffin Bay to Bering Strait. Thus did Franklin's volunteers realize the centuries-old dream of European navigators—the finding of a Northwest Passage. They were conquerors, even in death.

An almost impenetrable shroud of mystery has surrounded the last struggles and sufferings of Franklin's ill-fated followers. We can think of them but as skeletons, rather than men, ill-clothed, poorly nourished, and at the mercy of the elements, dragging their weary steps through an inhospitable and barren country across the rough and difficult ice, growing fainter every hour, and at last, one by one, weakened by hunger and that fatal scourge of the arctic, scurvy, dropping on the ice or frozen snow to rise no more.

Sir John Franklin, from the statue in Waterloo Place, London.

For four hundred years the world's adventurers, scientific and otherwise, had sought a practicable water route from the North Atlantic to the North Pacific. At one time the British Government had offered a reward of $100,000 for the discovery of such a 'Northwest Passage.' Offers of this sort, the call of the North, and the fire of adventure in the blood, brought the flower of the Old World's manhood to the fore whenever an arctic expedition was in prospect.

Sir John Franklin had become infected with the lure of the North while on an expedition to Spitzbergen in 1818. Parry's later voyages of discovery to the arctic coast of North America fired him with enthusiasm. For perhaps the next twenty years he was the central and dominating figure in arctic exploration. His second expedition was an overland journey from York Factory, in Hudson's Bay, to the mouth of the Coppermine River, on the arctic coast. Hunger and Cold were his constant companions, and Death stalked with the party from the beginning. Two members who became separated from the main body were never heard from again. In the light of subsequent events, an Indian guide was suspected of murdering and later eating them. When, therefore, circumstantial evidence pointed to the guide as the murderer of a third member, he was condemned by the others to die, and was shot by one of Franklin's lieutenants.

Franklin again set out in 1825 on an overland journey from Lake Huron to the mouth of the Mackenzie River. But on this expedition he received such excellent coöperation from the fur trading companies that the hardships and privations which had marked his former overland journey were absent. The fact that this was a successful voyage of discovery, strange as it may seem, caused the fickle British public to lose interest in Franklin, so that it was almost twenty years before he again ventured into the arctic.

This time he never returned. The story of this well-equipped enterprise, which involved the death not only of its leader, but of the brave officers and men who accompanied him, is one of the most tragic incidents in the long history of arctic exploration.

When, in 1845, Britain suddenly experienced a revival of the old scheme for discovering a 'Northwest Passage' from the Atlantic to the Pacific, Franklin was fifty-nine years old. He was appointed to command the expedition, with its two ships, the *Erebus* and the *Terror*. Carefully equipped, provisioned for three years, and carrying picked men as their crews, the two staunch sailing vessels departed from the Thames toward the end of May.

The Admiralty's instructions to Franklin were, in part, as follows: 'Therefore (after assuming from the experiences of Parry that all attempts to penetrate westward of longitude 98° in the direction of Melville Island were useless) you will not stop to examine any openings either to the northward or southward of Barrow Strait, but continue to push to the westward to latitude 74° N., until you have reached 98° W. longitude. From that point we desire that every effort be used to penetrate to the southward and westward in a course as direct toward Bering Strait as the position and extent of the ice or the existence of land, at present unknown, may admit.'

Had Franklin known that a channel existed on the eastern side of King William Land, he probably would not have risked his ships in the heavy ice to the westward of the island, but would have taken the eastern, although more circuitous passage, and would in all probability have carried his ships safely through to Bering Strait the next year. But Franklin had no alternative; he was furnished with charts which indicated no opening to the eastward of King William Land, therefore he had but one course open, and that he adopted.

On the twenty-sixth of July, 1845, the expedition was seen for the last time in Lancaster Sound; then it disappeared, almost without trace. Winter came early and the two ships were frozen in. They were carried backward and forward by the drifting floes in constant danger of being crushed by the force of the wind and currents upon the heavy ice fields. The same fate overtook them in the autumn of 1846.

In 1847, although there was no real public anxiety as to the fate of the Franklin party, preparations began for the possible necessity of sending relief. In 1848 the search began in earnest, and from that time on expedition after expedition was dispatched in quest of the missing explorers. The

various searching parties sent out in search of Franklin and his men may be ranked among the noblest efforts in the cause of humanity that any nation ever engaged in. As a record of long-sustained, repeated, and heroic effort, the Franklin search stands without a parallel in arctic history.

This carefully planned quest, carried on for fifteen years by the British Government and the widow and personal friends of Sir John, won the sympathetic interest of the entire civilized world. Nor was the world content merely to watch; France and the United States also assisted in the search, voluntarily supplying ships and men to help solve the mystery. Approximately forty expeditions in all, both large and small, followed each other year after year. Many of them ended in disaster, and it was not until 1854 that a Hudson's Bay Company expedition, commanded by Dr. John Rae, reported having talked with a group of Eskimos who said they had seen a party of white men several years before dragging their heavy wood boats and sledges over the ice to the southward. In the sign language they indicated to the Eskimos that their ships had been crushed in the ice. Later on the Eskimos discovered the boats and graves of many of these men, they declared, and in proof of their story they produced silver spoons and forks, which without doubt had belonged to the missing explorers. Rae and his party were thereupon paid the reward of $50,000 offered by the British Government for tidings of the Franklin expedition.

From all that can be gathered, one of the ships must have been crushed in the ice, in deep water, and the other forced on the shore of King William Land by the drifting ice, where it lay for years, furnishing the Eskimos with wood for their sleds, bows and arrows, and other implements, and iron for their knives, spears and axes. Upon the death of Franklin in June, 1847, Captain Crozier succeeded to the chief command. On him devolved the terrible necessity of abandoning the ships and endeavoring to save their crews by a desperate attempt to reach the nearest Hudson's Bay Post, more than 450 miles to the southward.

Subsequent events have shown that these explorers starved in a land of comparative plenty, where Eskimos for scores of generations have lived, and still live, by the bow and arrow. The followers of Franklin certainly cannot be called either inexperienced or inadaptable. Captain Crozier had been on three voyages with Sir Edward Parry in the same general vicinity, and had commanded a ship on an antarctic expedition. Two crews, some of whom had been engaged in whaling in the arctic, were carefully chosen.

It may be, however, that these men did not possess an aptitude for hunting. Millions of caribou roamed the land where they starved, and seals, polar bears, musk oxen, geese and ducks were to be found on every side. The skins of these animals would have provided them with clothing, shelter, and footwear, as well as covering for the Eskimo type of skin boat. Instead, they dragged their unwieldy whale boats, weighing at least five times as much as an Eskimo *umiak* of the same size, until they were exhausted. The blubber of the seal could have been used for heating and lighting their tents, for cooking, and for waterproofing their footgear. Instead, they depended upon the old-fashioned tallow candle, and upon the stiff-soled boots of the period, which were unsuited for the work.

*(C) Ewing Galloway.*

Eskimos landing a bear after shooting him with arrows. At the left are two skin boats tied together for safe operation.

Most important of all, however, the meat of the animals would have provided food in abundance—the sort of food that prevents scurvy, as Stefansson has demonstrated in the past fifteen years. For scurvy, as well as starvation, is supposed to have cut down the little band as it fought its way toward one of the outlying osts of the Hudson's Bay Company.

Another possible contributing cause o. the Franklin tragedy (for not a man lived to relate the terrible experience, and we cannot know the definite reasons) was the preserved meat with which the expedition was equipped, some cans of which were found later. Both the nourishing and keeping qualities of this meat were questionable. There is little doubt that it was a breeder of scurvy. But these brave men perished, not because of this one item of unsuitable food, but because in their haste to reach civilization they overlooked the game possibilities of the country. Had they known it, they could have survived several winters in comparative comfort by living on the game the country afforded and traveling slowly southward all the time. This fact was established by several of the relief expeditions which joined in the search for Franklin's followers, and later by Amundsen and Stefansson, who at different times explored virtually the same territory.

Dr. John Rae, one of the dozen men who have revolutionized arctic exploration in the last hundred years, was one of the most indefatigable and ingenious searchers for the Franklin party, as well as one of the most successful. Rae, with a party of half a dozen men to feed and clothe, searched that section of the country for months until he ascertained that a catastrophe had overtaken the entire personnel. He maintained his party by killing game animals in the same country where those he sought had perished. This was an intellectual achievement. He accomplished something which no other explorer had dared try. It was a radical, yet perfectly logical step forward in exploration, one of the greatest in the 19th Century, for by adopting the Rae method, anyone with a good pair of legs, good eyesight, and a dependable rifle can go anywhere he pleases and stay as long as his cartridges hold out.

While Franklin's party perished in a country which had supported Eskimo groups for generations, and where Lieutenant Schwatka, one of the searchers, flourished, it must be remembered that Schwatka had no sick to carry; no scurvy or other disease to battle. It is also probable that at least one-third of the 105 men who survived at the beginning of the retreat were unable to travel and were carried along by their comrades. It is also possible that many of them were suffering from scurvy when they landed from their ships. The fact that they set up a hospital tent within eighty miles of the spot where their march commenced would seem to prove this theory.

*(To be concluded next week, when an account of the various relief expeditions will be given.)*

Eskimo igloo in course of construction.

# Have We an Educated Ministry?

(Concluded from page 6)

the colored supplement of the Sunday morning paper and which balances the attractiveness of the service against that of the golf links is not likely to demand or even tolerate an educated ministry.

Furthermore, the demands made upon the ministry at the present time in the way of administrative and social duties are such as to make serious study almost impossible.

Once there was a time when the minister's sermon found its illustrations and its quotations in a large and wide knowledge of fine literature. What have we now of this sort? We may have an evening discourse in which the minister reviews the latest and most discussed and least worthy best seller or we may have an occasional scrap of poetry quoted or usually misquoted from some homiletic magazine or compendium of brief quotations. Excepting for a few stock and platitudinous jingles the average minister's knowledge of poetry would seem from his sermons to be the odds and ends and leavings of his homiletic pick-up.

*As Jacob Served for Rachel*

In the matter of Biblical knowledge, the case is even more lamentable. A minister with a patent-indexed, limp-backed Bible, with chain cross references to misguide him, can link together passages of Scripture in a way that meets the requirements of the average congregation not only without real scholarship but in utter defiance of all sound Biblical theology; and the worst of it is that hardly anyone in his congregation knows better or desires anything better.

An adequate preparation for the ministry is a long and arduous task. It calls, or ought to call, for four years of severe collegiate discipline and three more years of specialized study, supplemented, in many instances, by still further postgraduate work. The young man who serves these seven years as Jacob served for Rachel may find that they seem to him but a few days because of his love for his work, but they are years of heavy toil with no proportionate additional reward in sight by reason of them. Every day that a young man is thus employed, he knows that many congregations would prefer a get-wise-quick product of some short course to the best that he can offer.

If it were to be answered to all this that, notwithstanding all that I have been saying, the ministry of the present day is making good and doing its work as well on an average as men in other professions are doing, I should be the first to admit it and say that under the conditions our ministers are doing amazingly well; but I still would be constrained to ask what is going to become of the ministry and of the church in the light of this appalling slump in required ministerial attainments and the fearful leakage of the ministry at the top.

*The Fearful Leakage at the Top*

In other professions the struggle for existence is of a sort which encourages the fittest to survive. In the ministry the struggle is of the sort that the competent qualified minister meets a thousand temptations to enter more remunerative and often better appreciated employment and leaves the pulpit to half-trained men who are quite as good as the people want and better than most of them deserve.

The military policy of the United States, according to the standards now held in Washington and taught in Upton's recognized authoritative work on this subject, is based upon implicit faith that in an emergency this country can always raise and train its own army and provide for it an adequate leadership. A careful study of the leadership of the American Civil War shows the folly of this course which the War Department now openly flouts and denounces. In the American Civil War any man who could secure a company of a hundred volunteers was welcome to a commission as its captain, and the man who could bring together ten such companies was cheerfully commissioned as its colonel. Generals of lesser and also of higher rank were commissioned for still less adequate reasons. The Civil War began with innumerable volunteer officers leading armies to disastrous defeat. The severe and terrible processes of the war thinned out this group and gradually gave the command of armies to men of training. Although the citizen soldiers of both armies openly jeered at the martinets who came from West Point, the armies of the Civil War on both sides were ultimately led by West Point graduates.

*What the Pulpit Urgently Needs*

The pulpit of the United States needs not fewer good mixers, or fewer men who are loved by young people, or fewer men who can put pep into their sermons, for all these are important, but it desperately needs an educated ministry, and it is high time for the laymen of America to wake up to that fact and demand ministers of this character.

# Delaware Uses the Whipping Post

(Concluded from page 4)

attorney-general, who has charge of all prosecutions, was asked for an opinion but did not express himself further than to say that Delaware has less crime probably than other comparable localities. He called attention, as others did, to the energy and firmness shown by the courts in dealing with persons arraigned for crimes.

Trial judges are appointed for long terms and usually serve for life. They make up the supreme court which passes on appeals, no judge sitting in cases that arise in his own court. Appeals are handled quickly and reversals are rare.

It is not unusual for an offender to be tried, convicted and his appeal disposed of within a few weeks after the crime is committed.

George Black, superintendent of police in Wilmington, Delaware's only large city, is a firm believer in the whipping post. His belief in it is based on more than thirty years' experience as an officer with criminals.

'It is all right to be humane toward persons who violate the law,' he explained, 'but there are types of criminals who yield to nothing but punishment. You must instill fear into them—fear of something they cannot forget, of something that they dread. And the types of criminals to be most feared, the professional kind, dread the whipping post as they dread no prison. They always expect to get out of prison but they can't escape the whipping post—or forget it when the lash is vigorously but not inhumanly applied.

'Other things have helped to hold crime in check here. One of them is the courts, which give the police all the support we should expect. But the whipping post, especially when seriously employed, has had a lot to do with it, too.

*They Pass Delaware*

'Say what one pleases, a lot of criminals pass Delaware by, although the state is geographically an attractive stopping place for the roving type. That's because we are close to two big cities, Philadelphia and Baltimore, and on the border line between North and South. A bunch of "dips" thought they could reap a harvest and make an easy getaway from here not long ago. They operated for a few days. We got them. And they didn't get off with fines or a few weeks in prison. There has been practically no more picking of pockets around here. And we have had very little of the new kind of banditry, the sort that is carried on by youngsters who trust to the automobile for getaways.

Seven or eight years ago we had a sort of wave of highway robberies, mainly on the heavily traveled motor roads. After a few got long sentences that began with severe lashings, the wave receded. As for bank robberies, there hasn't been one here in Wilmington in my time. There's some safe-blowing, but of the crude type, not often by skilled cracksmen. It is done usually by tramps who use sledge hammers instead of good tools or explosives. The skillful professional rarely operates here in any kind of crime.'

Aside from the elemental equations, the above is the case for and against the whipping post as used and viewed in Delaware. It is needless to review the sentimental equations, or to inquire as to whether the whipping post is a barbarous or brutal implement. Of these anyone can judge for himself.

The important question seems to be: 'Does the whipping post prevent crime?' A vast majority of the people in Delaware believe that it does. The last bill proposing its abolition received just one vote, that of the man who introduced it, in the state's legislature.

## The Janizaries

THE *Janizaries* were a military force established in the 14th Century by the Turkish Sultan Orkhan and further developed by Amurath I. They were recruited from Christian youths captured in war, who were brought up in the Mohammedan faith and trained to arms. It was their boast that they had never fled in battle. They finally became ungovernable, and after a revolt the corps was disbanded in 1826.

The *Abencerrages* were a celebrated family of Moors who held pride of place among oriental races as being of pure Arab descent.

# I Read in the Papers

Suspicion of the recent agitation among politicians for a referendum on prohibition is expressed by the *New York Times*, outstanding Manhattan newspaper. Says the *Times:*

***Suspicious Referendum***

'There is something a trifle suspicious about the sudden zeal of so many public men for a referendum on the question of prohibition. In some cases this looks less like consulting the people than consulting the convenience of politicians in an awkward fix. They note a change in popular sentiment. They are aware of movement to make candidates for office declare themselves explicitly Dry or Wet. From such a terrible ordeal they think to escape by the happy and improvised device of leaving the whole thing to a vote of the electors. Pending the result, they think they can maintain their noble position on the fence.'

ɤ ɤ ɤ

Excerpt from a leading New York newspaper of recent date:

> For several minutes the crowd milled about Mrs. Fowler, menacing her with fists and threatening to lynch her, but was finally driven away by a mounted policeman.

Item from another journal of the same date:

> Miss Kennedy was rescued by police reserves from a menacing, yelling crowd.

The only noteworthy thing about these two items is that they are commonplace. They are the ordinary occurrences of New York's East Side; so ordinary that they are dismissed by the newspapers with briefest mention. Manhattan's representatives in Congress have been active in denouncing manifestations of mob spirit in the South. They profess to see in occasional mob outbreaks in the South justification for the wholesale violation of the prohibition law in New York. Mob law in the South is dying but it seems to be growing in New York.

ɤ ɤ ɤ

Colonel Hanford MacNider, at the West Point exercises, gave this counsel to the young officers:

***Good Advice to Officers***

'You will be expected to listen a great deal and offer little—and then only when asked. You will hear something about the last war, from the best historians it will ever have—the men who fought it. You will hear many fixed, set and unalterable opinions about things military and otherwise. They will all be worth while, but don't dismiss your own entirely. You will serve under men and with men, particularly the old non-commissioned officers, who know more about the Army than you'll know for many a long year. Absorb all you can from them, but leave room in your mind for your own discoveries. The world is always in a state of flux and strange history is being written every day. Stay pliant, and remember that most battles—not military ones alone—have been won by common sense.'

ɤ ɤ ɤ

This parody was taken from the Edinburgh University publication, *The Student*—

'The heights by great men reached and kept
Were not attained by sudden flight,
But they, while their companions danced,
Were sleeping soundly through the night.'

ɤ ɤ ɤ

I shall always associate the first day of the Strike with Joseph Pennell. He, who hated violence and any kind of warfare save verbal contacts about art, inspired or created, on that first, disorganized, angry, apprehensive day of the Strike, a little oasis of peace and love.

***Pennell's Quaker Memorial***

It just happened so.

A proposal had been made to hold the Pennell Memorial Service at the chapel of the Savoy, which is within hail of the sky-dwelling in the Adelphi Terrace where he lived for so many years; but at the last moment the place was changed. We were informed that the service would be held at the Friends' Meeting House in St. Martin's Lane. That was suitable and affecting, for Pennell was born a Quaker.

I had never before been to a memorial service in a Quaker meeting house. It is simple and beautiful, and it was strange also because so many friends of Pennell who are not Quakers were present, including J. M. Barrie, John Lavery, Edmund Gosse, and an alert, white-haired man whose features were familiar, but I could not place him.

We, who were not Quakers, were perhaps a little anxious as to how we should comport ourselves, and I, for one, looked for guidance to the Friends, men and women, who seated themselves in a row upon the platform.

One of them rose, recited a few appropriate verses from the Bible, welcomed us, and then explained the procedure. Anyone was invited, if the spirit moved him or her, to say something about our friend. Then silence. Nothing is so eloquent as silence if the minds of those present are fixed upon one thing. A Quaker meeting will lift the veil from the Seen, and that morning the veil seemed to part easily through the contrast between that meeting-place, dedicated to peace and love, and the conflict and suspicion of the Strike outside and all around.

The silence continued. I should have been content if nothing more had been said. Everybody, I suppose, was thinking of our friend, and commending him, each in his own way, to the tuition of God. It was a perfect memorial service—that sacred silence in the center of disorganized, apprehensive London.

Suddenly—I started—a woman dropped to her knees (we stood) and thanked God for his gift of beauty to the world through artists. Again silence. Another member of that little flock rose, spoke of Joseph Pennell and ended with quoting great passages from the *Apocrypha*. 'The souls of the righteous are in the hand of God . . . In the sight of the unwise they seemed to die . . . but they are in peace.' Another recited a verse of a hymn. Then, after a pause, the alert, white-haired man whose features and figure were familiar to me rose from the back of the Meeting House and recounted at length the art services that Joseph Pennell, by pencil and voice, had done for London, and as he spoke suddenly I knew who he was. He was John Burns.

In one of the silences I had a curious feeling of the telepathy between that Quaker Meeting House in St. Martin's Lane and the old building in Philadelphia. An actual message has since passed, for at the conclusion we signed our names in a book, which has been sent to Mrs. Pennell in America. I record all this because, owing to the Strike, that gathering of Friends and friends in the heart of London has not hitherto been recorded.

ɤ ɤ ɤ

The worst writer I ever knew was an old editor of mine, who was so undecipherable that the whole composing staff of years' and years' experience once turned a sentence of his, 'Nuisances must be abated,' into 'Wise-acres shall not be cheated.' Andrew Lang, too, was very difficult to read. By far the clearest 'fist' among modern authors is that of Mr. Hardy. Many errors have crept into books through their authors' bad handwriting. The Poet Laureate's wife, Mrs. Bridges, who wrote a book on handwriting nearly thirty years ago, has a very beautiful hand, based on Italianized Gothic. The curious thing is that a handwriting which looks beautifully regular is frequently very difficult to read. One interesting aspect of handwriting which has hardly been dealt with at all is the effect of pen-nibs. One learned paleographer declares that the modern pen-point is really badly constructed.—*The Graphic*, London.

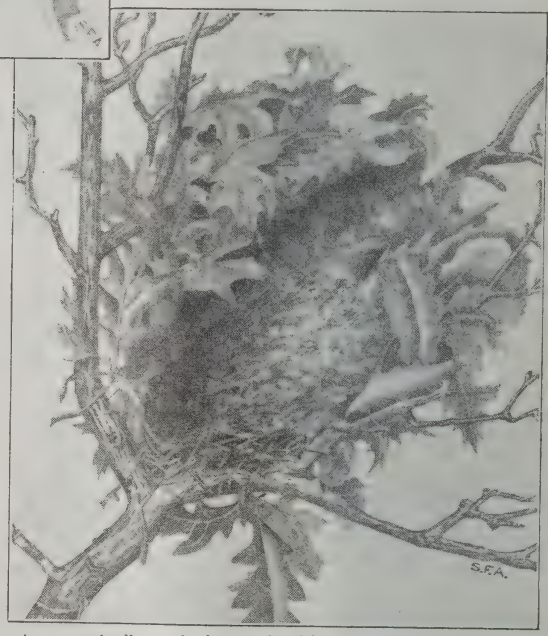
# Wee, Timorous Beasties at Home

(Concluded from page 2)

Nest of the red-eyed vireo. The cradles are hung low in drooping tree branches.

laid of thickly leaved twigs and small sticks rather firmly matted together and placed in a fork of two or three slender limbs with also a number of twigs or smaller branches near the crotch. The floor, walls and roof are made up of leafy twigs and separate leaves placed when green, of course, and although not interwoven or in any way thatched they are packed together by a deal of tramping and bending. The chamber is little, if any, larger than the curled-up squirrel and is often lined in part with soft bark fibers. The entrance is hardly discernible, being only a straight shaft from the side where the leaves are not closely placed; these are mostly pushed aside to admit the animal. Some squirrel nests go to pieces with the first autumn storms; others, the result of more persistent effort in compacting the mass, or being held by vines among the tree branches, last from season to season, but are seldom used twice because of vermin and water soaking.

The nests of the harvest mouse also are merely combinations of dried and naturally bent and twisted grasses somewhat matted together, the tunnels and chambers within lined with softer materials. These nests are easily destroyed and it is quite surprising that hawks, shrikes, owls, crows and weasels do not very commonly tear them apart in search of the inmates and their young. Nelson says harvest mice sometimes use the nest of the orchard oriole and cactus wren, and this may indicate a superior judgment on the part of these individual mice, for the work of the birds, even when weathered, is a great improvement over the flimsy constructions of the quadrupeds. Some birds would take the grasses commonly used by the mice and weave them so firmly together as to defy destruction, by the time an enemy had gained access thereto it would have well earned a dinner.



The nest building of the burrowing rodents—trade rats, kangaroo rats, gophers, marmots, ground squirrels, wild mice, lemmings, muskrats, beavers and mountain beavers—is chiefly a matter of lining their inner sleeping and nursery chambers with soft materials, in which they show wisdom in the selection and industry in the collection. The burrows are the result of hard work and keen judgment; not always mere instinct can account for the obstacles overcome. Warmth, drainage and cleanliness are the principal factors.

Even considering the cocoon builders, especially endowed as they are with silk (this including also the spiders), there are no nest builders that can surpass the orioles with regard to ingenuity, if a purely hereditary and specific instinct may be so termed.

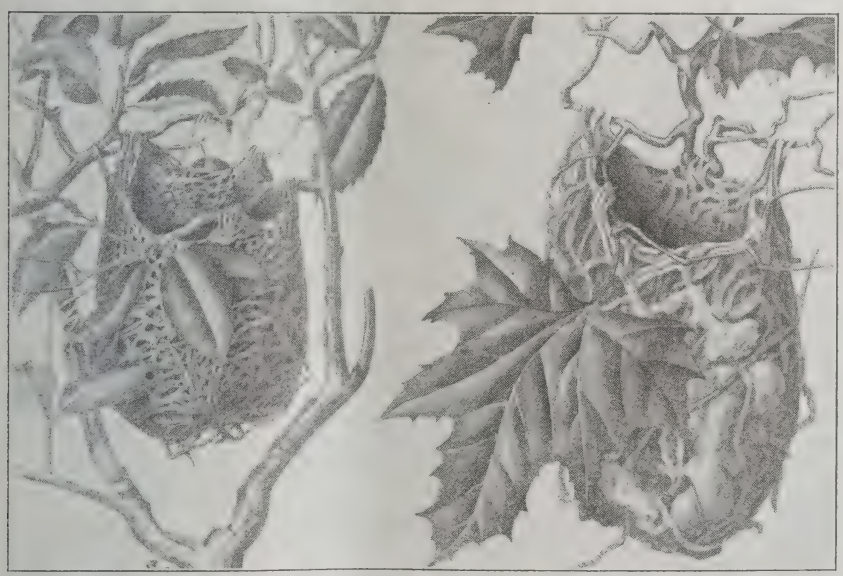
Perhaps no more interesting observation can be made than to watch the female, always alone, construct the pensile cradle for the rearing of her young. It has been the good fortune of the writer to discover an orchard oriole so engaged and, unobserved, to watch her from time to time, through a glass and at a distance of less than forty feet.

The bird had made her selection of a three-pronged crotch near the top of a pear tree and had stretched a long strand of stout dried grass from one of these thumb-sized upright branches to another. Then she was dissatisfied with the situation as probably not sufficiently elevated and selected a two-limbed fork about three feet higher on the same trunk, one of the thinner, flaring branches having a small twig sticking out at right angles and about four inches above the crotch.

A strand of grass was stretched from this twig to the opposite forked branch halfway to its base, each end being passed around the wood several times and made to stay without being tied or tucked under. Across this, nearly at right angles, another was stretched, after being wound around both limbs and the first cable. From near the center of this cross brace a strand was carried to the outer end of the twig and then back horizontally to the opposite branch of the fork, this making a framework for the suspension of the nest as carefully designed for strength and rigidity as any bridge engineer could plan, using these same materials. Following this step in the work, one after another, four hanging U strands were placed about one-half and three-quarters of an inch apart and to these, in and out, horizontally and at acute angles, the cross strands and further supporting grasses were rather loosely interlaced, not exactly interwoven, the attachments and middle wrappings being quite irregular, but nevertheless making the walls continuous and nearly of the same thickness throughout. When this nest was completed in three days of rather desultory but occasionally persistent work, it was three and a quarter inches average inside diameter and five and a half inches deep.

A gray squirrel's nest in the top of a hickory, deserted for the winter.

Burroughs errs in his estimate of the dimensions of the Baltimore oriole's nests; they are not influenced in depth by the prevalence of such enemies as owls and squirrels, for these are everywhere, whether near or far from human dwellings. I look from my window now and see, in a tall sycamore that is one of a grove near the house, three orioles' nests, one quite shallow and several years old, one about five inches long and rather fresher in appearance, another fully seven inches long, built last year. It is reasonable to assume that all these nests were built by the same pair of birds, returning as they do each year to the immediate locality, but never using the same nest twice. In a number of other instances I have observed the marked improvement from year to year in the nest building of individual birds of several other species and I think it may be considered a universal rule. It is particularly observable



with the catbird, though of course it must be assumed that in each case it is the same female that builds every year in the immediate locality; there is no way of determining this, except by trapping and banding the bird. Individuality often shows itself in song, but the nest-building females do not sing. A degree of tameness or little mannerisms respecting their associations with humans may sometimes aid the observer in distinguishing one bird from another of the same species.

It may be admitted that the orioles, and especially the Baltimore and those western forms most closely related thereto, are the most expert workers of nesting materials among the birds of North America. The vireos, however, are hardly inferior to the brighter colored artisans and in the matter of hiding their nests from prying eyes show better judgment.

It has been my good fortune to witness also the making of a red-eyed vireo's nest. It was placed in the nearly terminal fork of a horizontal tupelo branch that reached to within a few feet of my study window and the bird either could not discern me through the screen, or believed this was a sufficient barrier.

It was very interesting, during the few minutes from time to time that I could spend in watching her, to see the application of the fibrous vine and weed bark, the bits of leaves and some pieces of paper laid on in layers of nearly equal thickness throughout, some of the longer, stringy pieces carried over the two small supporting twigs, each smaller than a lead pencil. But I could not witness the actual application of the saliva which, as a mucilage, makes the particles adhere quite firmly, after the manner of the chimney swift with its sticks, though not used so profusely. This also is exactly the method used by many insects, as the paper-nest wasps, the mud masons, the caddis fly and others. It seems likely that the strands used by the vireo receive their thin coating of saliva while held in the bird's beak; but if so, it is odd that the important adhesive element would be withheld while the nest is being lined and finished with slender strands of grapevine bark that are put in most cleverly and held in place by being bent against their own tendency to straighten.

It is not at all unlikely that the modifications of the bills of certain birds have been influenced by the necessities of nest building. Or does the latter follow the development of the bill for other purposes? Perhaps this reflection seems most apt regarding the woodpeckers. Certain it is that the tapered bill of the oriole is admirably adapted to the interweaving of grasses, and the same may be said of its relative, the meadow lark. The bills of the vireos also could hardly be improved for the purpose. Yet there are birds with bills of like construction that make very simple nests, the matter of obtaining food evidently being the sole influence in development. On the other hand, some of the finches, having thick, seed-cracking bills, do intricate work in lining their nests with hair and fine grasses.

Oriole nests. These birds are the most expert weavers in North America. The nest of the orchard oriole is on the left and the Baltimore oriole on the right.

# Hints on Bird Houses

WITH the progress of more intensive cultivation of the land and the disappearance of old hollow trees, a number of our most desirable song birds and insectivorous birds are being more and more hard pressed in finding suitable nesting sites. There is a decided housing shortage for these friends of man.

The best time to make and put up bird houses is in late autumn and early winter. Most bird-house contests and bird-house exhibits are held too late for obtaining good results the first season.

Among the most desirable bird neighbors are bluebirds, wrens, nuthatches, chickadees; woodpeckers, martins, and tree swallows. Of this list only the woodpeckers can act as their own carpenters. All the other species must depend on natural cavities or on cavities made but not used by woodpeckers.

The best bird houses are those made of sections of hollow trees or large branches with the natural bark adhering. It is best to cut those sections during winter, when the bark will not peel or become loosened.

It is not advisable to tack bark on sawed boards. Bark tacked on always warps and gives shelter and breeding places to bird vermin.

# Patting the Lion's Mane

(*Concluded from page 17*)

they were doubtful whether Mr. Gosse had an eye under the black glass; whereupon he obligingly took off his spectacles and showed them that he had.

Galsworthy has all the graces. He is the patrician—handsome, suave, gracious, witty. I met him twice, heard him give an address, and preside at a great dinner, and he seemed to me the finest type of literary gentleman I had ever seen. C. E. Montague, the editor of the *Manchester Guardian* and author of *The Hind Let Loose*, and William Archer, the dramatic critic and author of *The Green Goddess*, were at the same dinner, but neither of them interested me very much. Beside Galsworthy's easy brilliancy, they seemed rather heavy-footed.

I remember Mr. Archer held a long brief (if that is not an Irishism) for the teaching of Esperanto as a second language. I had always pictured Mr. Archer as a keen and delightful person, but on this occasion, in spite of the *nil nisi bonum* tradition, I must say he was neither. He talked round and round, seeking a way out. It was not much later that he died. It is pleasant to think that the great success of his only play came before his death.

Sir Sidney Lee, the Shakespearean scholar and author of the recently published *Life of Edward VII*, has just died. He was a stocky man, somewhat deliberate in speech and manner, and on most occasions inclined to be taciturn. But he could be very entertaining, and when we were his guests, he regaled us with literary gossip. At that time he was still working at the *Life*, which had been something of a burden to him, and he had some pleasant anecdotes to tell of his adventures in getting the material from the royal family. He asked about Richard LeGallienne, whom he had known in the nineties, when LeGallienne was a precocious young Londoner, and he was much pleased to have recent news of his old acquaintance.

*Shaw as He Is*

I think I was never quite so completely surprised at any man as I was at Shaw. Of course he looked like his pictures, except that he was entirely gray. His hair and beard were a white mass about the gentlest, kindest, mellowest face you can imagine. His cheeks were as pink and smooth as a girl's. His manner was simple, gracious, unassuming. I wondered where were the fabled cynicism, the conceit, the vitriolic sarcasm. They must all reside in his inkpot, for there was not a trace of them anywhere about the towering, gray-clad figure. He spoke with fascinating ease and charm. Later on an American gentleman discussed briefly a subject of violent interest to all Englishmen—the difference between the English and American language. When he finished, Mr. Shaw rose, came to the front of the platform, and said, 'I wonder if Mr. —— will pardon me if I ask him a personal question?' Of course we all held our breath at such an unwonted proceeding, and he continued earnestly, 'Do Americans say *obligate* or *oblige*?'

After the session was over, we went up to meet him, and he came forward with outstretched hand and a cordial smile. He was all eagerness, everything interested him. Even if Shaw does refuse to come to America, he seems to harbor no malice toward individual Americans.

# Dying Africa Makes Her Appeal

## Our Supply of Africa's Rich Products Will Be Lost If We Do Not Eradicate Her Deadly Diseases

By H. K. W. KUMM

*MORITURI te salutamus*, cried the Roman gladiators as they faced their Emperor.

'Dying, we salute thee,' might also come in these days from the lips of tropical Africa's children, addressed to the temperate Americans who hold in their hands the destinies of many peoples.

The multitudinous microörganisms of torrid Ethiopia are waging in the form of endemic and epidemic diseases a relentless war against human life. *Semper aliquid novi ex Africa*—there is always something new in Africa—was a common saying in Rome. Africa had provided many a thrill for the imperial city, from 'Hannibal before the gates' to Cleopatra, the destroyer, and Cyprian, the 'Father of the Roman Church.' The corn of Egypt gave the *panem* and the lions of Libya the *circenses*.

When Rome fell, the importance of Africa in world affairs decreased and for a thousand years or more little was heard of the lands of Ethiopia. It was not until a few decades ago that the interior of Africa became known even to geographers.

As news value, Africa ranks perhaps with Turkey. Little Japan is vastly more important to the newspapers. Yet withal some of us harbor in our minds a suspicion that some day, and not a hundred years hence either, the newspapers will be demanding daily news from Africa.

It is believed by some who are competent to judge that within sixty years the population of the world will be doubled. Since sanitation and medical science have removed the dangers of many diseases, the excess rate of births over deaths has been very marked and, unless some unforeseen cataclysm should befall, from year to year the death rate will decrease.

Then will come the question of the food supply.

Within the last twenty years we have heard much of sea-power and man-power and we may hear more of air-power, but there is one power that is more vital than any of the others and that is bread-power. The soil of England cannot produce enough food for the people who live on it, nor can that of Germany or Italy or Belgium. The time will come when the one harvest a year of the lands of the temperate zones will not suffice to meet the need.

> Without stressing the opportunity here for a magnificent altruistic service in the cause of humanity, we must give heed to this problem of a sick Africa for the sake of our own health and economic welfare.

The tropics (and that means preëminently Africa, where with sufficient water four harvests a year are possible) will then come into their own.

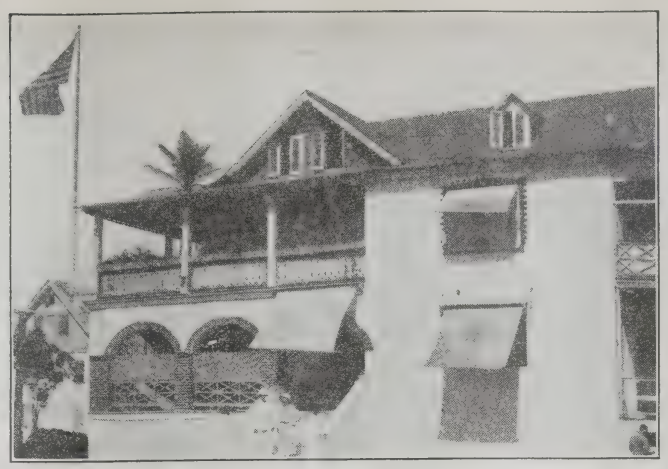
Tropical Africa is hardly meant for white men. White children droop and die. No rosy-cheeked youngsters greet their parents there. The only skin that looks wholesome and velvety in the tropics is the *negro's epidermis*. The pigmentation of his skin makes him rejoice in tropical sunshine. His is the indispensable race in the development of Africa.

Masters of sanitation have made malaria, the former dread disease in Panama, a thing no longer feared. Malaria in Africa, on the other hand, is a far different proposition. More than a third of all the cases in the hospitals are malaria, and they are of many forms. There is remittent and intermittent fever, and rarely does a traveler return from the Dark Continent but with his blood saturated with malaria microbes. Once adequate research work is begun, physicians may be able to cope with the situation.

In the meantime Africa presents the strange phenomenon of the larger forms of life being destroyed by man, who in turn is falling victim to the microscopic forms.

A tribal chief and his men on a visit to the author of this article.

When the white man first came to South Africa, unnumbered thousands of wild animals covered the veldt of that great Southland. The giraffes were the first to disappear; then went the white rhino, and the quagga (not a single living specimen is left in the world). For years it was thought that the white or square-nosed rhino had been wiped out also, but a small number of these pachyderms may still be found on the upper reaches of the Nile where they hide beyond the great swamp. But those gigantic creatures of Africa with horns three and four feet long, out of which walking sticks were carved eighty years ago, are gone. It needs only a few more hunting expeditions into the gorilla country and the chief of the primates will vanish. Collectors from museums and motion picture photographers are now hastening to Africa to collect specimens for the museums and take pictures of the large herds roaming in freedom before all disappear.



We speak of Berber lions and Nubian lions, but there are no lions left in the Atlas Mountains or in Nubia. The Nile-horse, the hippo, has almost disappeared from the Nile. There is no hippo left in the Nile of Egypt, and they are few south of Fashoda. The romance of finding and naming new species of animal life has almost come to an end. The trouble with us humans is that we are hardly introduced to a new form of life before we set out to destroy it. We are, of course, sorry after we have succeeded in doing so, but unfortunately our sorrow does not bring back to life those we have preyed upon.

The higher civilization man attains, the quicker will the wild life disappear before him. The meat-eating pigmies of Central Africa would never have put an end to the last of the okapi, but shortly the white men will have made of them but a memory. Selfishness and improvidence seem to go hand in hand with increased intelligence.

Africa will, somehow, not seem the same when its parkland has been denuded of all the wild life. You may today travel from Cape Town to the Victoria Falls on the Zambezi, 1,250 miles as the crow flies, and never see even an antelope, or from Lagos to Kano without setting eyes on a single head of game. The white man in Africa is a killer.

American Consulate, Monrovia, Liberia.

Only strict game laws enacted by colonial governments can put off the day when the majestic life of the wilderness will be no more.

Those of us who have seen that life often dream of the slaty shadow forms of the elephants gliding in silent formations through the sylvan glens, of the lion's roar through the starry tropical night, of that silent, noble child-like giant, the camelopard of the steppes and the thornbush, and of that nightmarish charge of the supreme fool among the pachyderms, the rhino.

We hate the hunting dog of Africa because he kills for pleasure, kills more than he can eat. Yet even he is nothing but a miserable bungler when placed side by side with so-called civilized man. There is no pack of wild hounds in Africa able to kill ten antelopes within an hour, the easy, frequent work of one white hunter. One wonders sometimes what compensation there will be in the general accounting.

The north and south of Africa, being dry lands, are quite healthy, but lack of rain there makes them of little value to the world's food supply. It is the torrid zone of the Dark Continent which, with its many forms of life, holds a wealth of food supply and a richness in mineral resources. How is it possible to make this deadly region livable for white man as well as black?

The British Government employs 167 medical men in her West African Colonies, and 119 in East Africa. France has 34 in French West Africa. There are forty-one hospitals in Nigeria, eight in Uganda, seven in the Kenua Colony and three in Zanzibar. Research work is being done at Sierra Leone, at Accra, Lagos, Dakar, and Khartum, and at ten other places in Belgian, French and British Africa.

A beginning has been made in teaching the natives how to fight diseases. At three places native students have been enrolled to study medicine. All the colonial governments are united in their desire to get the better of the tropical diseases and put an end to those dread epidemics of cerebrospinal meningitis, sleeping sickness, and the 360 tropical diseases for which we have no names.

If we wish to benefit from the wealth of Africa, if we wish to participate in the development of that continent which in all probability will come during the life of the present generation, indeed if we desire to avoid suffering from a lack of the products which Africa can supply us so abundantly and cheaply, then we must give thought to the eradication of Africa's diseases. Without stressing the opportunity here for a most magnificent altruistic service in the cause of humanity, we must give heed to this problem for the sake of our own health and economic welfare. This great source of sickness must be eliminated.

### The population of Africa in 1923 was as follows:

| | |
|---|---|
| British Union of South African Colonies and Protectorates | 58,224,000 |
| French Colonies and Protectorates | 42,500,000 |
| Belgian possessions | 14,500,000 |
| Portuguese possessions | 7,750,000 |
| Italian possessions | 2,000,000 |
| Spanish possessions | 244,000 |
| Abyssinia (Empire) | 8,000,000 |
| Liberia (Republic) | 2,000,000 |
| | 135,218,000 |

Of these 3,466,000 were Aryans and 131,752,000 belonged to African or mixed races. Roughly speaking, therefore, there were 3,500,000 Europeans in Africa and 132,000,000 people belonging to native races in 1923, 100,000,000 under the control of Britain and France and only 10,000,000 in Liberia and Abyssinia, independent.

The density of population is 12 to the square mile in the Dark Continent and varies between 1,000 to the square mile in the Nile Delta to .01 to the square mile in the Sahara. Africa, conservatively estimated, could feed 500,000,000 people, four times as many as live there today.

As Europe is the continent of peninsulas, so Africa holds the greatest desert in the world and the greatest forest region; but the orographical feature in which the Dark Continent differs most from the others is its plateau formation. Her northern and southern watersheds are not mountain ranges, but washed-off plateaus. The rapids, waterfalls and cataracts of her great rivers are caused by the escarpments of her plateaus. These escarpments, plus the Rift Valley that runs parallel with her east coast, have been barriers in the way of building railroads.

In 1890, the whole continent showed a railroad mileage of little more than 5,000 miles, and even in 1912 the whole continent had almost 5,000 miles less permanent railroad track than France, though fifty-five times as large in area. Little has been added to these railroads since.

There are but few coastal regions of Africa, whence railroads can be built cheaply into the interior. The line from Port Sudan to Berber, with an initial cost of $14,000 a mile, is probably the cheapest. The line from Mombassa to Lake Victoria, which crosses the Rift Valley, is more expensive, and cost $32,000 a mile, but even this is cheaper than the average cost of railroad lines in Africa, which is about $40,000. Certain mountainous regions such as the Atlas in Algiers increase the cost of railway construction until it reaches the figures of $134,000 a mile.

The African river systems are through the escarpments closed to ocean steamers and trade with the interior depends upon the railways. Transport by wagon and on men's heads is between five and ten times as expensive as by rail.

Road building in Africa. Above—Roughly leveled layer of rock. Left—The same road after top dressing has been put on.

# He Takes Tin Tacks From Tiny Throats

(*Concluded from page 15*)

safety pin. The child was rushed to Philadelphia when an operation by a local physician was unsuccessful. The pin had lodged in the throat, point up.

A few deft moves on the part of Dr. Jackson and it had been added to his famous collection.

Two days before the arrival of the Gillespie baby came Veralie Marian, the sixteen-month-old daughter of H. L. Marian, of Winston-Salem, North Carolina. Veralie gave up a piece of sharp peanut-brittle which had stuck in her esophagus.

Viola Zinn, of Geneva, New York, carried a carpet tine in her right lung for five years before it was discovered.

***Swallows Her Pet Goat***

Physicians treating the girl for a cold noted peculiar symptoms, and their subsequent investigations revealed the presence of the tack. Viola visited Dr. Jackson and the tack was extracted.

Anna McHale, of Ashland, Pennsylvania, swallowed her pet goat. It was a nice little metal goat and Anna mourned its loss. More important yet, it stuck halfway down her throat where the local physicians could not remove it. She, too, came to Dr. Jackson.

Not only did he restore the goat to the nine-year-old, but he did so with such ease that it was not even necessary to admit Anna to the Jefferson Hospital.

William W. Johnson, Jr., of Concord, South Carolina, was five months old when he swallowed an open safety pin. He made the hegira to Philadelphia, where Dr. Jackson relieved him of his pin.

A bean caused five-year-old Michaeline Tintieri, of Steelton, Pennsylvania, to make the trip to Jefferson. The bean stuck in her throat and defied all attempts to dislodge it.

Michaeline was first taken to Harrisburg, and after all efforts there failed, she was hurried to Philadelphia. Limp and gasping for breath she was carried into the clinic, almost dead from the strain. Fifteen seconds later she was breathing naturally and the danger was past.

But Dr. Jackson does not confine himself to children, even though they form his chief concern. One of his most interesting cases was that of Mrs. Blanche Tullock, of Schenectady, New York. For three years Mrs. Tullock carried a tooth in her lung, which all surgeons agreed was no place for a tooth to be.

The tooth found its way into the woman's lung while she was having dental work done by a Schenectady dentist. She

***A Tooth Lodged in a Lung***

was under an anesthetic at the time and the cause of the trouble was not discovered until an X-ray examination disclosed the tooth.

Then began a long journey to have the tooth removed. In almost constant pain she traveled from coast to coast, consulting surgeon after surgeon. Then in despair she entered a hospital in Albany for treatment.

Finally she heard of Dr. Jackson and sought his help. Two operations were performed, and then a third. The last was successful.

Dr. Jackson has been greatly honored for his work not only by the members of the medical profession but by his fellow citizens.

Not content with establishing the chair of bronchoscopy and esophagoscopy for him in its medical school, the University of Pennsylvania conferred upon Dr. Jackson the high honorary title of Doctor of Science.

'The new course in bronchoscopy and esophagoscopy,' said President Josiah H. Penniman, of the university, at the time of making the announcement, 'is the result of a widespread demand on the part of physicians and surgeons for a postgraduate course giving instruction in the methods which have made Dr. Jackson America's leading expert in the removal of foreign bodies from the lungs and air and food passages.'

Dr. Jackson attributes his singular success to his boyhood apprenticeship as a machinist, and to following his father's advice: 'Educate your eyes and your fingers.'

He was born in Pittsburgh 61 years ago, the son of William Stanford Jackson and Catherine Morange Jackson. In his youth he acquired the habits of early rising and retiring—habits which he keeps to this day. Much of his most brilliant work, in fact, is done in the early morning hours.

He was graduated in turn from the schools of Pittsburgh, the Western University of Pennsylvania (now the University of Pittsburgh) and Jefferson Medical College. In 1899 he married Alice Bennett White, of Pittsburgh.

Following his interneship he specialized in laryngology and to this branch of surgery he contributed many new thoughts, and instruments. He evolved the electrically

***Likes to Sketch in Oil***

lighted Jackson's laryngoscope, now in universal use in America, and later the distally lighted Jackson's bronchoscope, esophagoscope and gastroscope. These revolutionized the treatment for removing foreign bodies lodged in the bronchial tubes and reduced the mortality rate in these cases from eighty-five per cent to less than two per cent!

In his spare time, such as he has, Dr. Jackson likes to sketch in oil from nature. His drawings in black and white have been of tremendous help to students in his lectures.

Dr. Jackson is loved by his friends for his never-failing courtesy and kindness and consideration and for his desire to help others. His skill has caused him to be consulted by laryngologists throughout the world in regard to the difficult problems confronting them. He is the author of several medical works, some of which are considered classics. He has been given many medals and honors commemorative of his work.

But to return to Dr. Jackson's chief love—the saving of children's lives. It is fine, he believes, to be able to remove a safety pin that has found its way into a baby's throat, but how much better it would be to prevent the pin from getting into the throat. And so he has a warning to issue to mothers.

Not long ago in broadcasting an appeal over the radio for funds for Jefferson Hospital and its Medical College, he took his hearers for an imaginary tour of the famous Bronchoscopic Clinic Ward, and incidentally sounded some advice that every mother in the country should heed.

'We have not the time now,' he said, 'to visit all departments of the Jefferson Hospital, but please come with me for a walk down the aisle of the Bronchoscopic Clinic Ward—only one relatively small department of the many life-saving departments of the Jefferson Hospital.

'Look at this little child, emaciated to a skeleton with an abscess in his lung. For four years he had a double-pointed fence staple in his lung. We took it out; he will go home tomorrow and he will get well.

'Now look at this baby, only two years old. It has broncho-pneumonia from a

***Beware of Safety Pins***

peanut kernel. It is now on the road to recovery because we took the piece of kernel out of its lung with a bronchoscope, which is an electrically lighted tube, put in through the mouth.

'Now look at this little child, dear little cherub, eight months old, cooing and happy. Mother is coming today to take her darling home. This child would have been dead had we not removed an open safety pin that jammed in between the lungs halfway down between the mouth and the stomach, with the point of the open safety pin threatening to perforate the heart.

'If I could hear you I know you would ask: "But how could an eight-month-old baby get an open safety pin to swallow?"

'That is a pertinent question, and now restoring her baby to her arms we are going to chide mother a little. She will not mind it because she knows we have saved her baby's life; but we are going to tell her that it was all her fault—all her carelessness.

'When changing the baby's clothes she held some of the safety pins in her own mouth and laid others in the reach of the baby. Now whether you believe the human race descended from the monkey or not, you know that every baby has one of the monkey's characteristic traits, and that is imitation.

'When he sees mother put safety pins in her mouth he naturally imitates her bad example. He is surprised to find safety pins are not good to eat, and chokes and gags in his effort to get rid of the open safety pin, which is harder for him to disgorge than a fish hook.

'He rarely succeeds, and it will kill him if not removed by methods such as we use at the Bronchoscopic Clinic.'

*NEXT week Thomas L. Masson will tell us what 'Limelighters' are. It makes a good story, spiced with real humor.*

*Dr. William Barton will deal with the Higher Critics, and Judge Neil will give something more about his 'Bad Boys.'*

*Julian Hawthorne's article on Emerson will also appear next week.*

# New Phases of Changing China

(*Concluded from page 5*)

and dancing. The latter is rather alarming. Dancing is so far removed from the old idea of social contacts that it means an entire let-down from the old, without as yet a balanced idea and background of new relationships. Boy scouts are being formed in all the large cities and give the new boy an opportunity of self-expression unknown in the old days.

Time was nothing to old China, but since there are trains and boats to catch, or miss, the Chinese have taken to watches. A regular epidemic of wrist watches has spread over the country. Striking changes are taking place in the rural districts which have plodded with a crude sameness for four thousand years. Recently the birthplace of Confucius ordered twenty modern American plows. Last autumn an American threshing machine was operating just outside the city and attracted greater crowds than would a circus in America. In the city offices young Chinese, smartly dressed in Western style clothes, sit beside men dressed in the long satin or silken robes of old China. For both, the long finger nails have had to go forever, as incompatible with the growing business haste of the Orient.

The old fatalism of China is fast disappearing. Knowledge of strikes and unions is permeating China as is evidenced by student uprisings and strikes. The old lethargy regarding politics and patriotism is gone. *Ngai Kuo*, or 'love of country,' is the motto of the day. Formerly it was thought impossible to reach the masses because of illiteracy and lack of communication. This was overcome last summer by the students. They went out by the tens of thousands and burned patriotism into the rural people by their patriotic speeches. They created such a spirit of nationalism among the masses as newspapers never could.

*Great When Babylon Was Great*

In the past, Western writers found fault with the Chinese for their unchanging ways. Now the Westerner in China finds it difficult to keep up with the multitudinous changes. China was a great nation when Babylon was great. She advanced so far ahead of other nations of the world in invention, art, and literature that she felt, with reason, that she was 'The Middle Kingdom' and all on her borders were barbarians. Centuries of superiority and self-sufficiency and backward look brought China to a standstill. Young nations of the West sprang up, pounced upon her, took concessions, exacted unequal treaties, and treated her as an inferior. The West spoke in terms of military force and China was too stunned to answer immediately. A spirit of nationalism and 'China for the Chinese' gradually began to develop. The past few years have seen some of the most sudden and far-reaching changes in Chinese history. The new nationalism of China has come to stay. No force can stop it. Other nations must recognize it in their approach to China. The new nationalism will make errors, as did other nations in their transition period. It may be at times anti-foreign or anti-Christian in its varying moods. But China will never stop until she obtains her sovereign rights along with other nations of the world. She will no longer stand by and see unjust treaties made and her institutions violated by selfish aggressors.

# A Dance A Week

## DICTIONARY OF DANCE TERMS

'GENTLEMEN CONTRA BALANCE'—(8) First four lead to the right, gentlemen balance each other, cornerwise.

'HEAD COUPLE'—Usually the couple standing back to the music. When otherwise, the prompter will inform the dancers.

'HEAD COUPLE FACE OUT'—As used in the Lancers—(32) Gentleman takes lady's left hand in his right, and leads her half around so that they are facing in the opposite direction. Couple No. 3, on the side, falls in behind them; opposite couple falls in next, and number two or foot couple is already in place. All chasse. March; forward all and swing partners to place. (Note) When the chasse is used in the double lancers (eight couples) the first couple chasse to right, next left, etc., alternating. To march, the right hand couples move to the right, the left hand couples to the left.

'HEAD COUPLE PROMENADE BETWEEN OPPOSITE COUPLE'—(8) The first two couples cross over, the first couple join hands, the second couple separating to allow the first couple to pass between them. Returning to place, the second couple join hands and the first couple separate.

'HALF PROMENADE'—(8) Cross hands, and pass to opposite side of the set, as in Balance Four, and return to place as in Right and Left.

'LADIES HALF CHAIN'—(4) Dance by opposite couples at the same time. Ladies cross over, give right hand to each other in passing; give left hand to the opposite gentleman, and turn one-half around. You have now changed places with the other lady.

'LADIES CHAIN'—Ladies cross to opposite places giving the right hands as they pass each other, and the left hands to the opposite gentlemen—turning once around—give right hand back—left hand to partner and turn to place.

'LADIES GRAND CHAIN'—(8) Same as above with all four ladies. (Note: In some localities this movement is called Grand Right and Left.)

'LADIES PASS TO THE RIGHT'—(4) Four steps to right, balance four steps to that gentleman.

MARCH, USED IN LANCERS—(8) Ladies to right, gentlemen to left. Both lines turn and march to the foot of the set, pass each other, continue on to the head, the ladies passing inside the line of gentlemen. All have now changed sides, ladies in one line, gentlemen in the other, with both lines facing each other.

MOULINET—A wheel formation. Four ladies or gentlemen join right hands across, walk half around, turn, give left hands back, and return to place.

'NEXT COUPLE'—Count from the head couple going to the right.

'PROMENADE FOUR'—(8) Partners cross hands, right hands above, promenade across, passing to the right of advancing couple, and taking their places. Return to place in same manner.

'PROMENADE ALL'—(8) Partners cross hands, and promenade around in a circle.

'RIGHT AND LEFT'—(8) By two opposite couples; couples cross over, ladies inside, gentlemen in passing touching lady's right hand. When in opposite couple's place, gentleman take partner's left hand in his left and turn ha'f around, and repeat back to place.

'RIGHT AND LEFT SIX'—(8) Couple leads to right, circle four hands half around; now face as in 'right and left'—passing on through the two couples directly in line (six persons go through the movement instead of four).

'SIDES'—The Third and Fourth couples.

'THE OTHER WAY'—The opposite of the usual way.

'TURN PARTNERS'—(4) Lady and gentleman join both hands waist high and turn once around. To swing partners in the waltz position, the weight of the body of each should rest on the ball of the right foot, turning with the toe of the left.

'TURN CORNERS'—(4 or 8) Gentleman take four steps to lady on the left, join both hands, and turn. Repeat back to partner.

*Good Morning*, a dance manual of the Old American Dances, compiled for Mr. and Mrs. Henry Ford, contains 169 pages of calls, descriptions and some music of the dances taught in the Ford School. Price 75 cents.

Also, there are 20 orchestrations of 11 parts each—25 cents each orchestration, or $4.00 for the lot. Book and music will be mailed upon receipt of price.

Dearborn Publishing Company, Dearborn, Michigan.

# San Francisco Says 'Shoot to Kill!'

## Order to Police Creates Notable Decrease in the Volume of Serious Crime

By H. H. DUNN

SAN Francisco, California, a city of approximately 507,000 inhabitants, has just completed nearly three years of interesting experiment in the checking of crime by its police department. The effort has been directed mainly toward a reduction of the number of murders committed by burglars, holdup men, sneak-thieves, and similar violators of the law. The experiment was inaugurated by Daniel J. O'Brien, chief of police of San Francisco, when, late in 1923, he issued an order to all patrolmen, plain-clothes men, payroll escorts, detectives and watchmen to protect themselves at all times, to allow no criminal or suspected man to 'get the drop on them,' and to shoot immediately and straight in defending their own lives. What was literally a school of fire was established in the police department at San Francisco, and every man on the force taught to shoot.

Above—Daniel J. O'Brien, chief of police, San Francisco. Left—Captain Duncan Matheson, chief of detectives of the San Francisco Police Department.

The criminal world of San Francisco interpreted this order to mean 'shoot to kill,' and as a matter of fact that is just what it did mean. The result was a remarkable falling off in the number of attempts to kill patrolmen, detectives and watchmen, and a similarly notable decrease in the number of homicides in general. The majority of the murders in every American community are committed by men surprised while committing other crimes, mainly burglary. The idea that if a policeman came upon a man engaged in theft, occupied at breaking into a building, or otherwise invading private property, he could and would shoot to kill, has proved an effective damper, not alone on killings in San Francisco, but on burglaries as well.

The fiscal year of the San Francisco Police Department starts on July 1 and concludes on June 30 of the following year. For the year 1917-18 there were committed in San Francisco 54 murders. For 1922-23, there were 34 such crimes, policemen figuring largely as the victims. For the first six months of the 1923-24 police-department year there were only ten homicides. At the end of the police year in 1925 the crime percentage of all California had decreased 8 per cent under 1924 and that of San Francisco had dropped about 27 per cent. Up to 1923, the 'war madness' was supposed to have caused a number of killings, but statistics indicate that the war had little to do with crime, but that foreign immigration had a great deal to do with it.

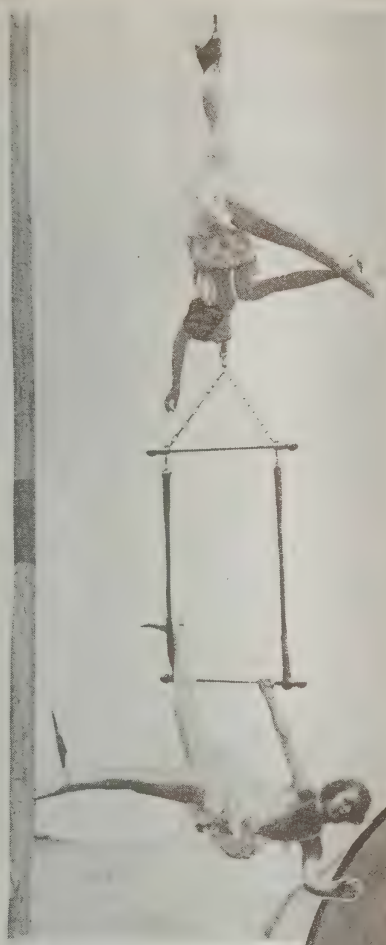
The 'shoot-to-kill' order—since the criminal world has adopted that name for it—also had another valuable result. It materially reduced the amount of stolen property, including automobiles, which went unrecovered, and tremendously increased the recoveries by the police of all kinds of stolen property. This was due to two factors: First, the burglar or thief, caught in the act, and knowing that the 'cop' would shoot and shoot straight at the first hostile motion by the criminal, in the majority of cases dropped his loot and threw up his hands; second, the criminal, caught either in committing the act or thereafter, knew that in dealing with the San Francisco policeman or detective he was in the hands of a man who had the power of life and death over him. In the hope of 'getting off easy,' a hope which seldom materialized, the criminal revealed the whereabouts of the stolen property. Possibly a third factor is the greater confidence every policeman and detective has in his own powers under this order.

Back of this order from the chief of police, and assisting mightily in the reduction of crime in San Francisco, as well as in other cities of California, stand two unusual state laws. The first of these is one to the effect that any and every person who enters any building, even a tent, with the intent to commit or attempt to commit theft of any kind, is guilty of burglary. The moment that such a person enters a building of any kind he commits a felony. That is a powerful weapon in the hands of the police and the criminal courts.

In 1923, the California State Legislature went even further, and passed into law a bill forbidding the manufacture, importation, sale, gift, loan or possession of blackjacks, slingshots, billies, sandclubs, sandbags, or metal knuckles within the state. This law further forbids the carrying of any explosive substance or any dirk or dagger upon the person, making such action a felony, and prescribing imprisonment of from one to five years as the penalty. It also prohibits any unnaturalized foreign-born person, and any person who has been convicted of a felony, from owning, or having in his possession, any pistol, revolver or other firearm capable of being concealed on the person.

Beyond this, the new law provides that any person attempting to commit a felony in California while armed with any of the weapons above mentioned, or with any other weapon which can be concealed upon the person, shall be punished, on conviction for the felony, with an additional term of imprisonment of five to ten years for the first offense, such term to begin at the expiration of the term inflicted as punishment for the felony.

Then comes the most important and valuable clause in the law. It is worth quoting in full:



> In the trial of a person charged with committing or attempting to commit a felony against the person of another while armed with any of the weapons mentioned in section one hereof, or while armed with any pistol, revolver, or other firearm capable of being concealed upon the person, without having a license or permit to carry such firearm, the fact that he was so armed shall be *prima facie* evidence of his intent to commit such felony.

Sob-sisters, sensation-seeking editors and other meddlers in the control and segregation of criminals, raised their wails to the blue skies of California when the following paragraph was inserted:

> In no case shall any person punishable under the preceding sections of this act be granted probation by the trial court; nor shall the execution of the sentence imposed upon such person be suspended by the court.

The law has materially assisted in the cleaning out of the stocks of blackjacks, sandbags, billies, clubs, daggers and brass knuckles formerly sold openly by the pawnbrokers of California cities. Further than this, it has given to the police the right of sudden and unexpected search of the dens maintained by these pawnbrokers for the convenience of their criminal patrons.

URBANA ILL

'OF THE two great parties, which, at this hour, almost share the nation between them, I should say that one has the best cause, and the other contains the best men. The philosopher, the poet, or the religious man, will, of course, wish to cast his vote with the democrat, for free trade, for wide suffrage, for the abolition of legal cruelties in the penal code, and for facilitating in every manner the access of the young and the poor to the sources of wealth and power. But he can rarely accept the persons whom the so-called popular party propose to him as representatives of these liberalities . . . On the other side, the conservative party, composed of the most moderate, able, and cultivated part of the population, is timid, and merely defensive of property. It vindicates no right, it aspires to no real good, it brands no crime, it proposes no generous policy, it does not build nor write, nor cherish the arts, nor foster religion, nor establish schools, nor encourage science, nor emancipate the slave, nor befriend the poor, or the Indian, or the immigrant. From neither party, when in power, has the world any benefit to expect in science, art, or humanity, at all commensurate with the resources of the nation.'

—*Ralph Waldo Emerson* (1840).

CHRONICLER OF THE NEGLECTED TRUTH

# *For utmost safety when women drive*

Steep roads, narrow turns, uncertain footing—all these conditions used to make the average woman hesitate to drive a car. But today, thanks to the safety features of Firestone Tires, all roads are alike to her confident hand, when her car carries this equipment.

She relies on the quick grip of the non-skid tread and its instant response to wheel and brakes. This prompt action is equally reassuring to her in city driving, where it saves the nervous tension of crowded traffic.

The Firestone exclusive process of Gum-Dipping is an important factor for the long mileage which users of these tires enjoy. This extra process gives extra strength and flexibility, insuring the comfortable riding of the low-pressure tire without sacrifice of wear. It provides also, the dependability which means freedom from delay and tire-trouble.

There is a Firestone Dealer near you—ready with helpful service and tires which, on all roads, in every season, give the security and saving of—

MOST MILES PER DOLLAR

## THE ESSENCE OF THIS ISSUE:

Mr. Ford's Page this week continues the study of the human parasite, his nature, methods and effects.

---

Wall Street picked Alton B. Parker for the Presidency *two years before he was nominated by the Democrats.* Parker was slated for the post by Pierpont Morgan. A friend told Roosevelt of the selection, and Roosevelt told the writer of this article. (p. 3)

---

It was the biggest news beat of a generation—*but no one would believe it.* Parker was an obscure New York judge, unknown to the country as a whole. He was unthought of for the nomination. Our author printed the story; but because he could not substantiate it with Roosevelt's name (being bound by newspaper ethics), people laughed at him. It was, they said, a preposterous tale. (p. 3)

---

But the story was true. Later events proved that. And now, for the first time, Roosevelt's confidant on that occasion tells the *whole* inside story. He takes us behind the political scenery where the stage managers are pulling the wires. He tells not only of Parker's nomination, but of Garfield's and Benjamin Harrison's. This is a most interesting political article. (p. 3)

---

We have a new Moloch in America—publicity. Hundreds fall down and worship before it. The limelight seems to measure reputation in this country. We don't care how a person gets there or who he is; the press-agent blah molds our opinion about him. (At least, that's the way it seems.) A little expert publicity, and nobodies become personages overnight; vapid faces stare out at us from rotogravure sections. Thomas L. Masson analyzes in a delightful way this latest phase of our national life. (p. 4)

---

Foursquare, painted white, eaves like serene brows shading the windows of the second story . . . set a little apart from the thoroughfare, among its own guard of trees, with a small porch on the north, approached along a straight path lined with white flagstones—this was Emerson's house of threescore years ago, remembered by Julian Hawthorne. And it is the house of today, shown on the cover.

---

Julian Hawthorne takes us into the home in the day of its glory. Famous persons from all the world are there, and the Lowells, the Holmeses, the Alcotts, the Longfellows from Cambridge and Boston. Emerson, one lank leg draped over the other, leans forward, smiles. Questions are asked, answered . . . Others have written of Emerson, the brilliant essayist. Hawthorne writes of Emerson, the man, seen through the eyes of boyhood. (p. 14)

---

Higher critics do not tear the Bible to pieces. That is, it is not higher criticism's business in the world to do that. As Dr. William E. Barton explains, the genuine critics seek to clarify the Bible so we can understand it better. There are also pseudo-critics. Criticism is the science of correct judgment. It is constructive study. The scholar who does not believe the Bible is in a distinct sense unfitted for critical work upon it. (p. 7)

---

This man catches rattlesnakes with a trout pole. He fishes them out in the blazing desert miles from the nearest stream. Snakes are his chief hobby, his life work. And knowing snakes, he says our conception of them is all wrong. They are really, he contends, the friends, not the enemies, of mankind, for they destroy vast hordes of rats and other pests. (p. 2)

---

The fall of the franc has made of France a spendthrift nation. With their currency at a new low level, the French, ordinarily a frugal people, are spending their money as fast as they get it. No matter how low the franc is, it can still go lower. *Buy while it's worth something*—that's the attitude of the people. The result is a false boom. Factories are working overtime; unemployment is almost unknown. But the people are dreading the future. (p. 6)

---

Tragedy stalked Magellan. But it was tragedy of his own making. Arrogant, domineering, he tried to rid himself of his more capable lieutenants so there would be none to question his acts. The mutiny of St. Julian Bay has been attributed by history to the hardships suffered by the men there. But Charles J. Finger is rewriting history in his series on the Voyage of the *Victoria.* Magellan, he shows in this installment, was himself largely responsible for the revolt. (p. 16)

---

The Arctic still holds in its grip the tragic story of the death of Sir John Franklin and his men. Bits of it have been pieced together by the rescuing parties that tried to save the gallant explorers, but the whole story has never been told. And it never will. (p. 20)

---

There is another article by Dr. Kumm this week on Africa and its marvelous resources . . . And a story on plagiarism, intentional and unintentional . . . And an interpretation of Jane Eyre, one of the dramatic characters of fiction.

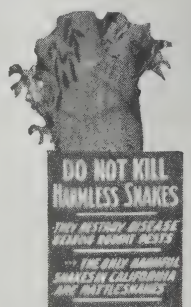
# A Good Word for Snakes

## A Spirited Defense of Reptiles by a Man Who Has Studied Them for Twenty Years

WILLIS A. ROWE, the snake-man, fishing in the desert for rattlers.

By JOHN EDWIN HOAG



THE very words 'snake' and 'reptile' have long been synonyms for cold, slimy villainy, traits utterly lacking in those creatures themselves, and therefore applicable only to certain members of the human race. Scorned and neglected by most students of natural history, shrouded in ignorance, superstition and prejudice, reptiles are the most misunderstood and maligned form of animal life on earth today.

In recent years, however, some scientists have so far managed to overcome their prejudices as to study the reptiles. They have already turned sufficient earth in their search for knowledge to put a charge of high explosive under nearly every one of our pet snake stories and theories. They have proved to us that reptiles are by no means the menace to human life they are popularly believed to be. On the contrary, they show us that snakes pay big dividends to mankind in return for any mischief they do. We are told that while poisonous reptiles do occasionally cause the death of a human being, they save thousands of lives, and millions of dollars' worth of property for every life taken.

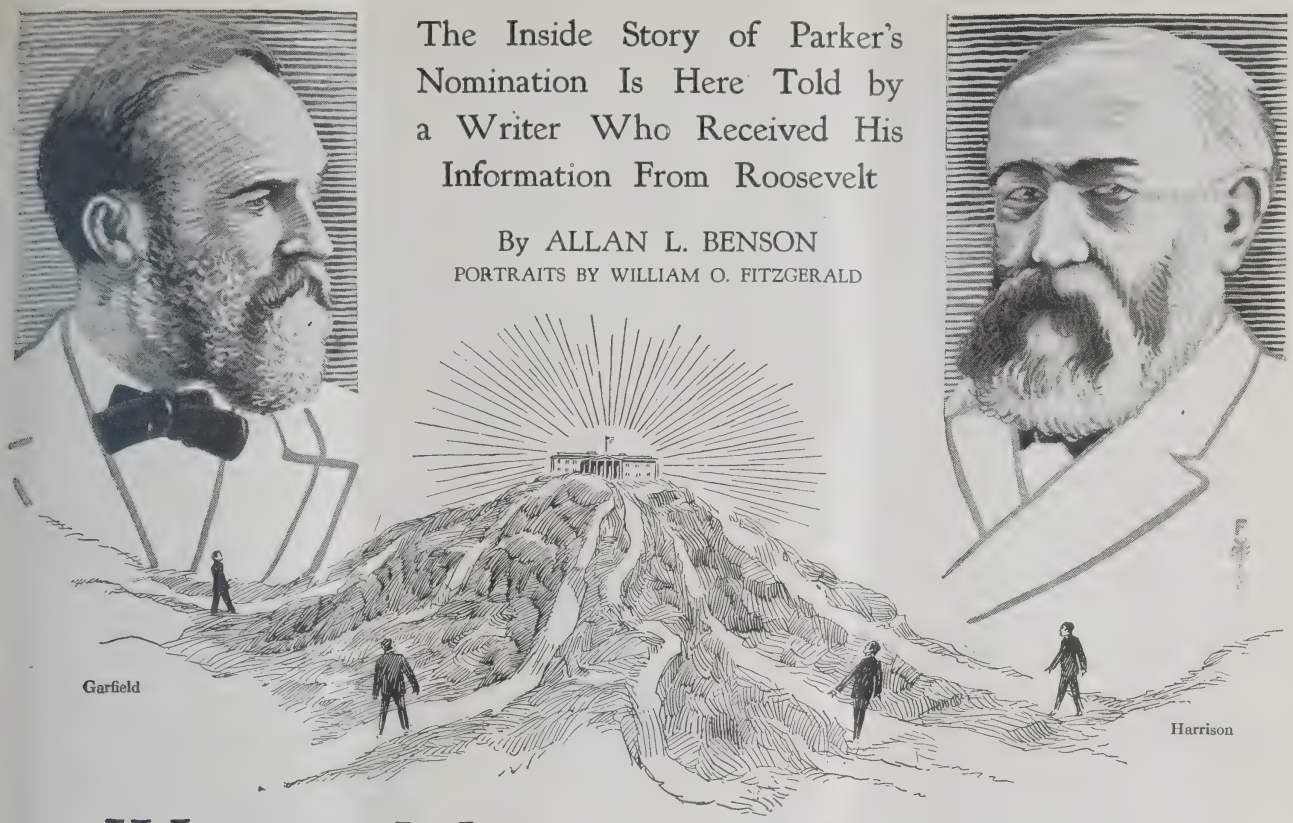
The writer is indebted to Willis A. Rowe, of San Fernando, California, for the inspiration and much of the material for the building of this article. Mr. Rowe is not a college man, nor is he connected with any institution or laboratory of biological research. He has no degrees, yet he enjoys the friendship and correspondence of many noted scientists, and is recognized by them as an authority on herpetology.

Twenty years ago he became interested in reptiles. He has studied them in the field, in his own laboratory, and in the reptile house which he established from his own funds upon his own property at San Fernando. His work is all the more interesting to the layman because he has concerned himself chiefly with the study of the life scheme and habits of reptiles, rather than with the number of scales on their backs, cellular structure of anatomy, and other details that would be uninteresting and monotonous to anyone but a student of zoölogy.

The chief harm man has done by foolishly killing every reptile he ever had a chance to kill, according to Mr. Rowe, has been to harm himself. It has been proved that the rattlesnake is dangerous to man only in self-defense. He helps man by killing off from 100 to 150 rats, mice, gophers, and ground squirrels every year. The rattler eats almost nothing else, and in doing this he helps man to feed himself through agricultural pursuits.

In the United States there are only three varieties of venomous reptiles whose bite may be considered dangerous or deadly. Ninety-nine times out of a hundred even a poisonous snake will retreat for the nearest cover at the sight of a human being. The rattlesnake may not always retreat but he plays a fairer game than a lot of people. Crowd him, and he coils, lifts his tail, and gives off that buzzing metallic sound, audible many feet away, from which he derives his name.

The different species of rattlesnakes are pretty generally distributed over the entire United States. California probably has more of them than any other state in the Union, with the possible exception of Texas. There was only one death from rattlesnake bite in the state of California during 1925. This fact is significant because it proves conclusively that no one source of danger to human life in the West has been more outrageously exaggerated than the so-called rattlesnake peril. Hundreds of thousands of persons sought recreation in the 'rattlesnake country' last year. Only one life was lost!



My mention of snake-bite kits to Mr. Rowe brought up a long list of inherited misinformation stories about snakes. This included the old, horsehair rope hoax. It started many years ago, being given motive power probably by somebody who had a lot of horsehair ropes to sell. Systematic propaganda, taking advantage of public ignorance, set in motion the story that a rattlesnake will not crawl over a horsehair rope. Just why the rattlesnake's 'tummy,' impervious to cactus thorns, sharp stones, and rocks heated to solar temperatures to repel the human hand, should be so responsive to the unknown magic of horsehair doesn't seem to be quite clear. But that's the story just the same.

Thousands of persons have bought the ropes, and probably have got their money's worth out of them by soundly sleeping in the belief that no rattlesnake would invade the horsehair bounded circle.

It was a little desert sidewinder, the small gray rattlesnake of the arid regions, that ruined my faith in horsehair. I was sleeping on the ground when the sidewinder called. He came (Continued on page 30)

Spiking the old horsehair rope tradition. A rope barrier was thrown about this rattler, but he glided over it as readily as though it were a piece of spaghetti.

The Inside Story of Parker's Nomination Is Here Told by a Writer Who Received His Information From Roosevelt

By ALLAN L. BENSON

PORTRAITS BY WILLIAM O. FITZGERALD

# WHEN MORGAN PICKED A PRESIDENTIAL NOMINEE

THE Presidency of the United States is a blinding white light set upon the highest political peak in the world, but the paths that lead to it are often hidden in shadows. Alton B. Parker, who died in New York last May, was once on a path that led to the Presidency, but the story of how he got there has never been told in such a manner that anybody could believe it. I told the story almost two years before he was nominated but nobody could believe it because it was impossible for me to disclose the source of my information.

What queer pranks fate plays! Here was the greatest newspaper story of its kind that I ever handled during all the years I was engaged in newspaper work, yet the press association that served our newspaper would not touch it and the readers of our paper were perhaps justified in regarding it as a fake. The article fell dead from the press, twenty-two years ago, because I was unable to state that President Roosevelt was the authority for it. No writer who knows his groceries ever quotes the President. It is against the rules.

This double-headed political and newspaper story may now be worth telling. In September, 1902, Theodore Roosevelt, who had been President just a year, came to Detroit. Inasmuch as I happened at that time to be managing editor of the Detroit *Times* (Detroit *Today* it was then called), I was one of those who were invited to a reception that was to be held on Sunday morning at the home of Senator Alger. There was a scurrying to the hat stores to buy plug hats. Men who had never before worn one nor ever afterward were thus arrayed disguised themselves so satisfactorily that the recognition of close friends required a moment's hesitation.

Merely to stand in line and eventually shake Mr. Roosevelt's hand did not much appeal to me. Young and greedy as I was, I wanted something more. I wanted to hear him talk. Knowing how bumptious he was, it occurred to me that perhaps the best thing I could do would be to say something that would jar him, so I determined to tell him that some of the people in the Middle West suspected that, in the matter of the trusts, he was carrying water on both shoulders. On my way to the Alger residence, I met a Washington newspaper correspondent who told me that 'Wall Street' had already selected a man to run against Roosevelt in 1904. I knew this correspondent was in a position to hear inside stuff, but I did not realize at the moment what a lead he had given me. Such stories, two years in advance, are seldom worth much.

So when I moved along the line until I reached the President, and General Alger introduced me with a little chaff about being a Democrat (I was working on a Democratic newspaper), I hurled the brick about carrying trust water on both shoulders. Roosevelt performed exactly according to expectations.

'Young man,' said he, 'anybody who had the slightest knowledge of my character would not suspect that.'

'Some men,' I replied, 'who believe they have considerable knowledge of your character suspect it.'

'What do you mean?' he asked.

'I mean that the Wall Street interests have already picked out the man who is to run against you.'

Never in my life did I ever see a man's face change so suddenly. A moment before he had been looking for trouble. After he heard what I said he was looking for information.

'What do you know about this?' he asked. His voice had fallen and there was no menace in it. The politician in him had run across a scent and wished to trace it to its source.

'All I know,' I replied, 'is that a man who is very close to Senator McMillan, of Michigan, told me that the Wall Street interests had selected a man to run against you.'

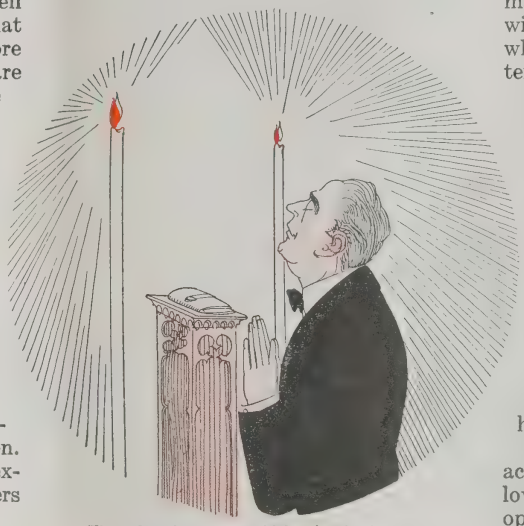
The President looked around the room to spot his secretary.

'Mr. Cortelyou,' he *(Continued on page 27)*

# America, the Limelighter's Paradise

## Passion for Individual Exploitation Has Created a Monster Commercial Octopus

By THOMAS L. MASSON



ILLUSTRATED BY W. O. FITZGERALD

EVERY observer of the human scene as it is unfolding before us today may well ask himself why it is that more nobodies than were ever before known in the history of the world are crowded to the front, amid the blare of saxophones and the din of headlines, while the men and women who are doing the real work of humanity are rarely if ever heard of. There are several answers to this question.

One lies in the extraordinary profits to be made by limelight exposures, from which have flowered the ubiquitous press agents. These persons, concealed in the background of every 'going' personality, have acquired an almost unbelievable skill in exploitation. Many of them are women. Some of these agents are employed exclusively by one individual. Others have a number of clients.

I recall quite vividly an interview I had but recently with a charming woman, who confided to me that she was responsible for a well-known psychologist; had, so to speak, 'brought him out.' A week later I met her in the private office of a motion-picture magnate. He said that he employed her for odd jobs. These women, clever, graceful, educated, continually make the rounds of the newspapers, sit in at informal luncheons, know everybody, and are of course known for what they do. But that makes small difference.

The number and variety of persons who are seeking to exploit themselves through these agents are incredible. To get their names in the papers, by hook or crook, is the great quest.

The only thing sacred which exists in the minds of publicity experts is their own pocketbook.

As far as the real people are concerned, we must not forget that to accomplish anything really permanent and worth while requires uninterrupted devotion to their work, and so great is the pressure for publicity, that most of them actually have to defend their seclusion. Men and women of the highest usefulness cherish obscurity as their bulwark against time.

Aside from the obvious money-making urge, we must go deep if we wish to discover the hidden causes which have given rise to what may be termed the most abnormal social condition in history, now going on in this country. For this cannot altogether be accounted for so much by the astonishing multiplication of the channels of publicity or the repressed love of excitement and adventure, as it is to the examples too often presented by our public men, and the cold, calculating efficiency of those master magicians of modern publicity who deliberately derive their enormous incomes from trading in the most shameless propensities of human nature.

Thus the so-called emotional reactions of a master criminal (as they love to call him), his trifling low-grade opinions, his posed photographs, his psychological drivel, all betraying as they do the unmistakable marks which go with the lowest mentality, are written up by 'super' women reporters in the tense phraseology of the sensation-monger, and a motion-picture actress, who conceives the brilliant idea of having a picture painted on her bare back or who decks out her chauffeur in a baker's chalk suit with ermine wrist bands, is a much more important asset to our national culture than those whose life labors have succeeded in alleviating for all time some hitherto incurable affliction common to humanity.

Every observer may well ask himself why it is that more nobodies than were ever before known in the history of the world are crowded to the front.

If a list were made of all the men who, during the last fifty years, have added not only to the comfort but have widened the mental horizon of the human race—say in commerce, medicine, art, music, mathematics, astronomy, radio, jurisprudence, and literature—no paper would think of printing it. But it must not be forgotten that these men have been lifted out of the obscurity natural to the genuine student and benefactor by the mere force of their genius, not because they cared for publicity but because they could not well avoid it. It is also important to note that these men, in many instances, were the culmination of a long succession of obscure workers. Darwin made no new discovery; he laboriously gathered the data, built up the evidence and confirmed the conclusions independently arrived at by scattered workers.

It may also be observed that, in some respects, literature is an exception to this rule. Some of the best-known writers of today are undoubtedly the best writers. Yet when we come to examine literature particularly, we soon see that the most superficial and decadent writers are the ones who make the loudest claims and are most clacked about by the crowd whose business it is to clack and be clacked about.

Thus each writer who has acquired what is known as his 'audience' and for the sake of this 'audience' is largely let alone by the proprietors of his particular channel of publicity, is not only a writer on his own account, but a logroller and press agent also. In many cases his sincerity is genuine enough. But it can easily be seen that where writers entrenched in paying positions have the constant opportunity to boost other writers and in turn be boosted themselves, this condition hardly conduces to any rigid moral standard. In these circumstances even a fight may be a frame-up.

The same thing is true when it comes to criticism.

At the start of a recent theatrical season I attended the opening night performance of a musical revue, by invitation of a well-known dramatic critic who had been presented by the management, according to a vicious custom, with two seats which were selling for eleven dollars each, and which he told me he could easily dispose of for twenty-five dollars each.

This performance, packed to the doors, was attended by many New York *notables*, a convenient name devised for the species I am attempting to define. Among these were the leading dramatic critics themselves, one of whom was at that time being advertised on billboards and elsewhere by a great metropolitan daily as a superman of literature and dramatic prescience. One of the refined features of this show was the presence, in an upper tier of boxes, of a notorious woman, accompanied by her cohort of cabaret dancers, whose chief claim to fame was that she had been raided more times by the police than any other of her class; and also, one of the features of this show was a burlesque stage setting of this woman's night club.

It is to America that the strange birds of all nations flock in search of prey.

As a combination of stupid and inane humor, of decadent and almost brutal vulgarity and revolting nakedness, all the critics with whom I talked agreed that the performance was unrelieved by a single original idea, admitting the beauty of the scenes and costumes (where there were any); yet with scarcely an exception the next morning's papers either passed over the banalities with an offensive raillery or else classified the revue as brilliant. Only one or two referred to the fact that it was an overflow from a previous show, duplicating many of the features.

One of the most effective byplays consisted in a discordant conversation between the lover of a married woman and her husband in which the husband apologized—amid roars of laughter from the clackers—for interfering. This is the kind of thing for which the most ostensibly intelligent people in the richest city in the world are willing to pay twenty-five dollars a seat.

The defense put up by one critic, not of this particular show but which will answer quite well as illuminative of the whole condition, was about in the following words:

'I admit the show is rotten, but the producers have put a lot of money into it and a whole lot of people are involved; it is hardly fair to pound it too hard, one has to be careful. Besides, the little girl who takes the leading part is trying to make good and she's a good little guy.' He showed a scrawl from her sent the day before:

'For Gods sake Billy remember I'm nervous and dont pan me.'

This instance should not be taken as a standard of the attitude of all dramatic critics. Ask yourself what you would do in their places. We may not condemn individuals, we must go beyond them to the social causes, not the least of which, as I have indicated, are greed and vanity, combining in an ingrained selfishness in which the importance of each individual is, in his own eyes, so magnified that he is unable to see that there is any responsibility on his part beyond it. It is all a part of the system of logrolling and buck-passing plainly discernible in all the avenues through which the public is reached.

It certainly does not take any seer to discover the fact that if superficial cleverness, shameless exploitation, common vulgarity and the stupidest commonplaces of a crass sentimentality are held up constantly as a pattern of conduct, the average public taste, already at a low ebb, has no chance to rise, by its own inherent craving, to better levels.

In other words, the men and women at the head of our social system are deliberately, if in many cases unconsciously, exploiting those beneath them in the scale, for their own purposes. It is quite true that through history it has always been the case that the leaders have thus used the led. But along with our expanded system of efficiency, symbolized by the apotheosis of the press agent, there has risen up the smug boast of an exalted altruism, whereby we proclaim ourselves the self-appointed saviors of humanity.

America is the only country in the world where the passion for individual exploitation has been *(Concluded on page 18)*

THE fact is that the franc can be worth its face value ***in proportion to its circulation of paper,*** if all other factors are equal. Roughly, there were about 6,000,000,000 francs in circulation prior to the war. The present circulation, it is believed, is between eight and nine times that number. Taking this fact alone into consideration, a paper franc can be worth a little less than one-eighth or a little more than one-ninth of its 1914 value.

# The Secret of the Franc's Collapse

## Politicians and Bankers Devise 'Remedies,' But the Common People Suffer

By A. R. PINCI

PRIVATE correspondence from French citizens reveals a situation in France which the 'exchange' news in the current newspapers has not depicted. With the franc reaching approximately three cents in American money—three cents as measured by the gold standard—the French people are worried. Between politics and finance, which together have influenced the descent of the franc, the French householder is in despair.

Those who were well off five years ago do not know how poor they are today, nor how much poorer they are going to be tomorrow.

Three and a half years ago, in an article in this magazine, I declared the true value of the franc was about half of its quoted value of eight cents, and said that a banker abroad told me 'it ought to be even less.' That statement was based, not upon the responsibility and thrift and honesty of the French people, but upon the merry-go-round of 'economic policy' which, after forty-two months, has failed everybody, including many of the politicians involved.

This summer is seeing vast hordes of American tourists descending on France just as they swooped upon Germany when the mark was at low ebb.

When a dollar can buy from thirty to thirty-five francs (perhaps an even greater number, should its exchange value drop further), and a tourist with $50 can do France for a month and still have a few coins left as souvenirs, the temptation to indulge in such cheap traveling is great. Moreover, there is the even greater temptation to buy luxuries and semi-luxuries, and trunks of the returning visitors will bulge with articles bought with depreciated francs.

*Artificial Remedies Have Proved Utterly Useless*

Meanwhile the prospect of a furious rise in the cost of living for the innocent French bystander becomes more ominous. By this time the people have learned that a change of cabinet, new ministers of finance, debt agreements, and Morgan 'stabilizing loans' are about useless. Having failed so far, the possibilities for success of artificial remedies of this kind are more remote than ever.

Our news columns frequently refer to the $100,000,000 Morgan loan to France. They refer to the fact that the French Government has either left it intact or used only a part of it. Its existence may be very comforting to bankers and exchange authorities, but the French citizen has learned that it has failed to stem the downward trend of monetary unit that would be all the safer today had it been permitted to find its natural level when the moneys of other countries began tobogganing.

*Employment Is at Highest Peak Since War*

With the mark and the lira and the krone fairly stable, the franc's vacillations will be sympathetically felt by those moneys. The French people are no longer thinking in terms of gold or silver standard; they are wondering what the franc will buy today and whether it will buy as much a month hence.

'We know what our income is in francs,' writes one friend, 'we do not know just what it will buy for us. The depreciation is not half as appalling as the uncertainty. Politicians and bankers talk and experts confer, but with the war now nearly eight years behind us we are undergoing another torture. Everybody seems to splurge, the era of luxury seems to have infiltrated itself in our midst. It begins to look as though the neighbors have decided to spend their money before it becomes useless.

'My husband has been explaining to me what it is all about financially, and of course the franc's ups and downs is the chief topic of conversation everywhere. We are all becoming talkers about money, as if talk could help us in any way! In francs and centimes the drop has been perceptible, since the franc has dropped two cents in American value in one year, and two cents is a heap of money when one must manage a house for a big family on a fixed income, but careful managing has enabled us to make the sacrifices at home imperceptible. But how much longer can we keep that up? And the fear of waking up some morning to learn from *Le Matin* that the bottom has fallen . . .'

The cost of living must be mounting, because according to reports June the official French estimate for workingman's family of four persor in Paris, gave the index number of 4 for the first 1926 quarter, or a thirt point rise over the previous quart and a fifty-one point rise over the thi 1925 quarter.

Employment is at high peak. C June 1 only 409 persons were drawir unemployment benefits in all of Franc compared with 1,705 in 1925 ar 91,220 in 1921. This year's are th lowest figures registered since th war.

But the employment figures may may not tell the right story. It d pends on how one studies figures. It obvious that if the French people ar becoming spenders, irrespective of th ratio, someone must produce the good or services, yet if the buying is inspire by the fear of a monetary decline th high employment is the precursor hastened unemployment, when th buying orgy will be over.

No one foresees or forecasts tha the franc will go the way of the mark but a readjustment is held inevitable When a London banker told me fou years ago that it would have been bette for Europe if the franc had been per mitted to drop to the bottom, he had i mind the outlook as the French peopl are visualizing i today. Betwee local politicians and the foreign 'ex perts' the fate of the franc has not beer reassuring. Millions upon millions ir premiums and speculative gains have been obtained during the four years which eventually must be footed by the French population.

*Franc Has Suffered From Bankers and Politicians*

The fact is that the franc can be worth its face value in proportion to its circulation of paper, provided all other factors are equal. Roughly, there were about 6,000,000,000 francs in circulation prior to the war, whereas now it is believed the present circulation of paper money is between eight and nine times that figure. Taking this fact alone into consideration, a paper franc can be worth a little less than one-eighth, or a little more than one-ninth, of its 1914 value. That would put it at a fraction above two cents. It was value on this basis that the banker referred to. (Continued on page 22)

# What's Wrong With Higher Critics?

## Because the Bible Was Written in Pieces Should It Be Cut to Pieces?

By WILLIAM E. BARTON

SEVERAL things are the matter with the higher criticism. The first is that most of the people who talk about it do not know what it is they are discussing. One can read or hear vehement and even violent discussions and denunciations by men who could not define either higher or lower criticism if the salvation of their immortal souls depended upon it. If people would take pains to learn what these are, there still would be room for profitable discussion, but heated argument and abuse would be at an end. The beginning, and almost the end, of our trouble is that we have so much heat in which there is no light. What is higher criticism and what is lower criticism, and what is the use, and what are the dangers of both?

Criticism is the science of correct judgment. It was an important event in my young manhood, just before I went to college, when there fell into my hands an old volume entitled, Kames' *Elements of Criticism.* Until that time, I think I had assumed that criticism meant small fault-finding. I found in that fine old book, which I still could recommend to almost anyone, that the science of criticism covers that whole field wherein the basis of knowledge is the faculty of sound judgment. There is no field for criticism in the proposition that two and two are four. But if we are to express the opinion that two particularly large sheep, which we see in one field, are about equal in weight and value to three somewhat smaller ones in another field, a wholly new faculty is called into exercise. Then we must exercise judgment criticism. It may call for more than a mere guessing at the weight and bulk of the sheep. It may require some examination of the length and quality of the wool, condition of health, and many other matters. A large part of our education ought to be given over to the science of correct judgment, a much larger part than now is given to that science.

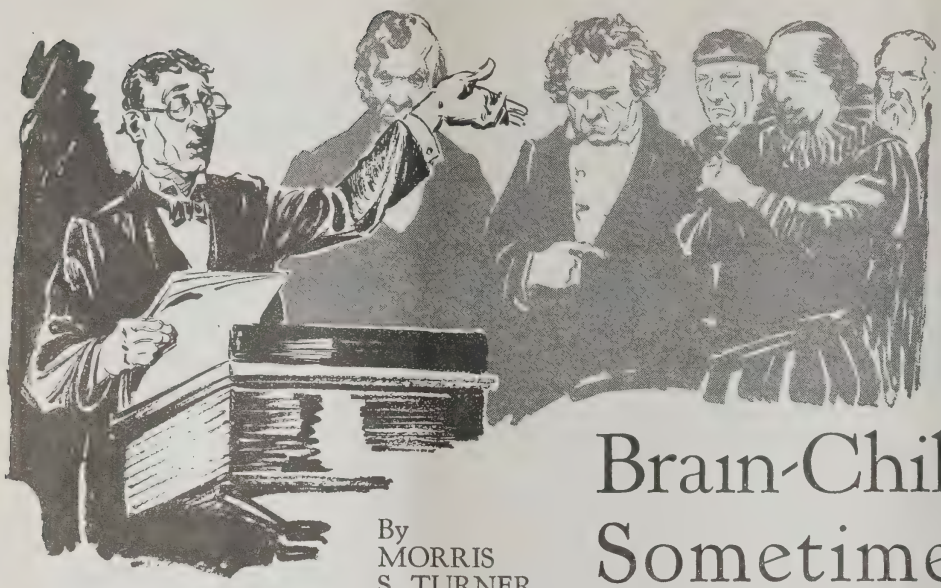
***Criticism Is Not Mere Fault-Finding***

Criticism does not of necessity mean fault-finding. Criticism may be favorable or unfavorable, may involve praise or blame. Criticism is merely the exercising of educated judgment. An amateur photographer may point his camera haphazard in any direction, east, west, north, south, or even up and down, and push the button. The skilled photographer must be a critic and judge the artistic values of objects, groupings and distances, lights and shadows.

As applied to the study of the Bible, criticism is of two kinds: one called lower and the other higher. Considering that these terms have come into popular use, they are rather unfortunate. They are not intended to mean that one kind of criticism is inferior to the other in value. They are assumed to be equally important, but one is built upon the other. The foundation criticism is called lower because it comes first.

***Higher and Lower Criticisms***

There were once as fierce and bitter fights about the lower criticism as there are now about the higher. These lie pretty well in the past. Practically no one now objects to the lower criticism. The lower critics have won the fight. Some time the same will be true of the higher critics. We shall wonder why there ever was so much fuss about an eminently useful and necessary kind of study.



The books of the Old Testament were mainly written in Hebrew, but it was an earlier form of Hebrew than is now used. All the copies that we have of the Old Testament are very late ones, and the text has been much edited. The older a book is and the oftener it is copied, the more variations there are in the text and the more difficult it is to tell just how the original text read. This is true of Homer's *Iliad,* and of Plato's *Dialogs,* and of Julius Caesar's *Gallic War,* and of Cicero's *Oratorios,* just as it is true of the Old Testament, and for that matter, though in lesser degree, the New Testament. But the original writings of the Old Testament were older than any of these, and our present texts are later than texts that we have of the New. Before we can have a correct translation of any ancient book into our own language or any other, we must decide what text we are to use.

The lower criticism of the Bible began under the painstaking study of a man now called a saint. His name was Jerome. He knew that the Bible texts of his day were very faulty. Greek had been the language of the early church, but nearly all scholars in Jerome's day were using Latin. Few of them understood Greek, and almost none of them could read Hebrew. He went to Palestine and spent long years at Bethlehem learning Hebrew and improving his Greek and trying to get an accurate text of the Old and New Testaments. Two faithful women, a widow and her daughter, accompanied him, made a home for him, and helped him financially. Did the whole church rise up and honor Jerome? Hardly anyone honored him in his own day. They said the most scandalous things about the two good women who were with him, and they called him every wicked name they could think of; but he persevered and gave to the church that superb piece of scholarship which has lasted for a thousand years, *The Latin Vulgate.* For centuries it was the sole Bible of the church. It was given to the church not by the authority of any council or supreme representative body, but by the incredible courage and persistence and devotion of a much persecuted man.

***When Men Had to Flee***

Did persecution end with Jerome? On the contrary, our own English Bible is a sorrowful reminder of the sufferings and martyrdom of the men who made it. The story of Wycliffe and of Tyndale is not one in which English-speaking Christians have any right to take pride. The lower criticism of the Bible, on which we depend for all our modern translations, has been wrought out in spite of the ignorant abuse of our scholars by men who thought they were doing God's service. It was honestly believed to be a shocking thing for Jerome to translate the scriptures from the Hebrew and Greek into the Latin. The men who translated the Bible into English had to flee from England and smuggle their copies back into their own country, and even then some of them were overtaken and killed for it. Facts such as these should

## Authorship of Famous Poem Precipitates Long Dispute

# Brain-Children Are Sometimes Stolen

By MORRIS S. TURNER

PLAYS and scenarios of photoplays are occasionally stolen. Often the suspicion of theft has little basis in fact, but the charges are not infrequently followed by recourse to the law, and once in a great while a verdict supports the accusation.

The next most fruitful field for literary dishonesty is, if all accounts are to be credited, the oratorical contest as staged by colleges and other educational institutions. Many immature and foolish students have appropriated, bodily or in part, forensic masterpieces and gravely spouted them as their own.

When, therefore, the respect for authorship is held in such light esteem it is small wonder that the creators of shorter poems of sentiment which capture public favor should often find the titles to their creations clouded and disputed. In fact it is rather surprising that more cases of this sort of gem theft have not become celebrated.

For many years literary magazines printed poems anonymously and too many writers, out of prudence or sensitiveness, resorted to sobriquets, or pen names.

These and other circumstances conspired to cast at least temporary doubt upon the authorship of that famous poem, *Rock Me to Sleep*, and to precipitate one of the most bitter controversies in the history of American letters.

*McGuffey's Fifth Reader* contained the near classic, credited to Elizabeth Akers Allen, with a note stating that 'five different persons . . . attempted to steal the honor of its composition.'

The poem appeared originally in the *Saturday Evening Post* in 1860, over the signature 'Florence Percy.' This was the pen name of Elizabeth Chase, a native of Maine and a young lady of education and refinement, then 28 years of age, who had contributed poems to and did other work for a newspaper of that state. She had visited Italy shortly before and according to some accounts had sent the poem to the Philadelphia weekly from that country, eventually receiving five dollars for it.

In that same year, 1860, she married Paul Akers, a sculptor of great promise, who was in precarious health and who died the following year.

*Rock Me to Sleep* soon became immensely popular. It was set to music by several composers and was, of course, widely reprinted, sometimes credited to 'Florence Percy' but, often as not, anonymously.

Of course its authorship became confused. Little attention was paid to two or three dabblers in verse who asserted, or did not deny to admiring friends, that they were 'Florence Percy.' The pretensions of one Alexander M. W. Ball, of Elizabeth, New Jersey, however, could not be ignored.

From time to time, during the next few years, the claims of the Bard of Elizabeth were pressed by his friends, who were especially chagrined when, in 1866, Mrs. Akers—she had married E. M. Allen, a successful merchant of New York, in 1865—published a small volume of collected verses and included in it this poem. *(Concluded on page 31)*

## Rock Me to Sleep

Backward, turn backward, O Time, in your flight!
Make me a child again, just for to-night!
Mother, come back from the echoless shore;
Take me again to your arms as of yore;
Kiss from my forehead the furrows of care;
Smooth the few silver threads out of my hair;
Over my slumbers your loving watch keep;
Rock me to sleep, mother, rock me to sleep!

Backward, flow backward, O tide of years!
I am so weary of toils and of tears;
Toils without recompense, tears all in vain;
Take them, and give me my childhood again!
I have grown weary of dust and decay,
Weary of flinging my soul-wealth away;
Weary of sowing for others to reap;
Rock me to sleep, mother, rock me to sleep!

Tired of the hollow, the base, the untrue;
Mother, O mother, my heart calls for you!
Many a summer the grass has grown green,
Blossomed and faded, our faces between;
Yet with strong yearnings and passionate pain,
Long I to-night for your presence again;
Come from the silence so long and so deep!
Rock me to sleep, mother, rock me to sleep!

Over my heart in the days that are flown,
No love like a mother's love ever has shone;
No other worship abides and endures,
Faithful, unselfish, and patient like yours:
None like a mother can charm away pain
From the sick soul, and the world-weary brain;
Slumber's soft calm o'er my heavy lids creep;
Rock me to sleep, mother, rock me to sleep!

Come, let your brown hair, just lighted with gold,
Fall on your shoulders again, as of old;
Let it fall over my forehead to-night,
Shielding my faint eyes away from the light;
For with its sunny-edged shadows once more,
Haply will throng the sweet visions of yore:
Lovingly, softly, its bright billows sweep;
Rock me to sleep, mother, rock me to sleep!

Mother, dear mother! the years have been long
Since I last hushed to your lullaby song;
Sing, then, and unto my soul it shall seem
Womanhood's years have been but a dream;
Clasped to your arms in a loving embrace,
With your long lashes just sweeping my face,
Never hereafter to wake or to weep;
Rock me to sleep, mother, rock me to sleep!

# MR. FORD'S PAGE

LAST week we spoke of the human parasite who fastens himself to persons or personal fortunes and whose principal business in life is not contributing a man's weight to moving the load but making himself 'solid,' as he would express it.

The presence of any parasite anywhere is always indicated by an abnormal reaction of one sort or another. If it is a barnacle on a ship, the ship moves with difficulty. If it is a parasite in the blood, the chemical changes which are caused by it result in fever, physical deterioration and disease. If it is a parasite in politics, the whole system becomes venal. If it is a parasite in industry, the industry becomes flabby and sags. If it is a parasite in society, society becomes corrupt.

In none of these cases is the parasite to be blamed. He is nature's scavenger whose place is fixed in the cosmic system, whose instinct it is to fasten himself wherever he can find hospitable footing. There are some places where he cannot gain foothold, because he is resisted. He cannot find footing in a healthy body, because health is resistant. Disease germs of all sorts parade back and forth in the bodies of all, but they can settle down and grow only in bodies that are weakened. Good health is more than good health; it is active resistance to disease. A healthy industry will naturally and automatically cast out the parasite; if he gets a hold it indicates that the temperature of that industry is below normal, its blood pressure weak. And so in society, and everywhere—a good condition offers no footing for a parasite.

Last week we spoke of the effect which the parasite exercises upon the sense of responsibility. He weakens that sense. His influence saps it. But we need not conclude therefore that he does this consciously and intentionally. There is nothing intentionally malicious about a typhoid-fever germ; he is perfectly harmless until he gets where he can do harm. Bulls have their place, but it is not in china shops; disease germs have their place, but it is not in the tissues of the human body. The human parasite may be unconscious of what he is; again he may be shrewdly, intentionally, consciously and ruthlessly malicious, the director of a far-planned scheme of self-exaltation at the expense of anyone or anything.

*PARASITISM is a great evil, but it may also serve as a good by exposing the weakness of a situation. The presence of an active parasite germ simply advertises that the victim thereof has permitted conditions which attract and nurture dangerous growths. Enmity toward the germ leads up to self-examination by the 'host.' What is wrong with society that it should harbor corrupting parasites? What is wrong with a business that it should offer footing to devitalizing parasites? These are exploratory and healing inquiries. The parasite begins as dependent and ends as master. He is best handled before he has bored too far.*

The main quality of his effect, whether conscious or not, is his power to weaken his victim's attachment to responsibility. It is probable that more old American families have gone the road to ineffectual existence by means of the frivolous emphasis, than by any other means. The younger generation which should have taken up responsibility and administered it for the benefit of the country, were headed off young—the devotees of the frivolous life caught them young; they did not become criminal or degenerate; just useless: and as a result we see low-type exploiters directing old American houses, and using old American names and reputations to conceal business practices which are the antithesis of American.

And it all began by slowly introducing the lighter side to the neglect of the responsible side of life. In our day, when the lighter side makes its appeal under so many guises —health, art, society, sport and even science—the wise young business man is on his guard.

The history of the parasite may be summed up in a sentence: he begins as dependent and ends as master. This is true of parasitism in all its forms. The germ which begins as a guest in the body, may end as master of it. In the story of the kings, the parasites who pandered to their master's lighter moods soon found themselves masters of his serious moods. In a conspiracy against society, the people are first weakened by extravagance and frivolity of living; then the very class that turned them into a light-headed, irresponsible generation, turns on them and masters them. It can be done; it has been done.

Dependence on anyone is a subtle form of flattery. And this flattery is the wicket gate through which the first tendrils of influence curl and grow. This influence tends to wean away from arduous cares, and this in turn gives the shrewd parasite opportunity to gain power for himself or, because of his influence with the master, exercise power over those servants to whom power is given. It is the passing of power from the hands that ought to wield it, to hands that ought never to have it. And the beginning of the passing of power is the weakening of the sense of responsibility; and the weakening of the sense of responsibility comes from the parasite's alluring power to the lighter, laughing side of life. This is the course so often regretted.

## *No Fight*

A RECENT writer has remarked that the differences of opinion and interest which now exist between the different parts of the United States are of sufficient intensity and importance to lead to war, were these parts of our country under separate governments. That is, the difficulties existing between European nations, that have frequently led to war, were not different in kind or degree from those which exist today between, say, the West and the East, the western coast and the rest of the country, the southern states and the mercantile power. But we live together in peace through it all and we strive for methods of accommodation because we are bound in a higher unity, the unity of the American ideal. Instead of mobilizing armies, we mobilize parties. Instead of embarking on war, we embark on campaigns of education and persuasion. Our threshing-floor is the forum, not the field. Our unity is worth more to us than all our differences can cancel. We are compelled to think of every question in its national aspects, and its national aspects are sufficiently important to create peace over a large part of the earth. The United States is the projection in miniature of what is universally possible, once the formula is found.

## *Is Russia to Be Blamed?*

GREAT BRITAIN'S protest to Russia against the sending of Soviet gold to British strikers presents an unusual situation. Here is the poorest of nations ostensibly offering charity to the working people of one of the two wealthiest nations in the world. There is no doubt, of course, that it is not charity which moves Russia, but rather a desire for Britain's downfall through the attachment of British labor to Bolshevik ideals. But the fact that there exists in Great Britain a class of people who are the subject of alms, a class of people who may be presumed to want bread, a class of people who are so neglected by their own fellow-countrymen that strangers are given the opportunity of offering their charity—that is a fact that government and people together should consider. Russia has only taken advantage of a situation; man's inhumanity to man has created it. If the Russian gift to British workmen will help to stab the British conscience wide awake, it will be another instance of wicked intentions being overruled for good.

## *To What End?*

THE investigations go merrily on, with much zeal and no small success on the part of the investigators, but with no great apparent danger to the investigated. No one is brought before the bar of judgment, no cleansing of public opinion seems to result, no abolition of wrong conditions is obtained. Enough evil has been uncovered to have shocked the country in other days; today it struggles for a place among the minor headlines. The Teapot Dome investigations have practically dropped from public memory, and only a few insist on knowing what is to become of the individuals indicted for what, if it is proved, is a crime equal to high treason. The war scandals seem to have been abandoned by common consent. Pennsylvania goes undaunted into the Sesqui-Centennial, and Illinois without a blush enters the sacred observances of the Holy Eucharist. There is no appearance of public repentance for our political sins, no sense of shame that unclean hands should officially handle the holy things of patriotism and religion. It is easy to say that if these investigations do not rouse us to a sense of national moral danger, nothing will. But perhaps the country is passing beyond the sphere of the old evils and their equally old exposures. Both may belong to a past era. We may be entering a new, where the whole machinery of political evil and its exposure may be completely scrapped, not by legal enactments, but by the emergence of a new spirit among the people.

## *Comfortable Penalty*

WOMEN of questionable ethics may now violate the laws of the United States with fair assurance that their most drastic punishment will be a pleasant country vacation for a specified term of months. A paternal Government has near completion in West Virginia a most comfortable 'prison' for erring ones. It is built on the cottage type, with thirty prisoners to a cottage. Each cottage will have its own piano, its own modern appointments. Prisoners will while away their time berrying, gardening, milking, churning butter, making dresses, hats. They will be taught to cook, to sew,

Those who peddle drugs, who commit forgery, who use the mails to defraud, who sell booze, will be eligible to this pastoral paradise. Those who resist temptation, who are too

honorable to break the laws of the land are barred! The mothers who struggle against poverty in a grimy, sweltering tenement may conjure scenes of this peaceful haven—but they are not for her: hers are only the wages of virtue, theirs are the 'cottage type' wages of sin.

Prison reform no doubt is needed in some places, but sentimental coddling of convicts is not! Punishment for crime has two elements —actual penalty for breaking the law, and warning not to break it again. We cannot discourage crime in America by making the punishment for it highly attractive.

## *Jeremiah Smith—American*

TO THOSE Europeans who delight in picturing Uncle Sam as a sharp, lean, rapacious individual whose chief pastime is squeezing money from his friends, Jeremiah Smith must come as a distinct shock. Mr. Smith is the Boston economist who has just completed two years' work reorganizing the finances of Hungary. When he visited Premier Blethen to bid him goodby, the Premier handed him a check for $100,000.

'Give it to charity,' responded the American. 'Your poor need it more than I do.'

'But it is your compensation for your two years' service to us,' Count Blethen protested.

'The only compensation I desire for my work is the appreciation and friendship of the Hungarian people.'

'But the vouchers already have been issued by the State and their entry cannot be altered in the treasury books.'

'Then re-enter it in your books,' said Smith, 'as a gift from the American people to the people of Hungary.'

And the matter was ended.

## *Philadelphia Manna*

IN CONCEIVING the Sesqui-Centennial celebration, Philadelphia had a glorious opportunity to do honor both to the nation and herself. If the celebration miserably fails —and there are not lacking those who say it has—it is because a certain group has been inspired with nothing higher than a desire to capitalize on patriotism. Management of the show from its inception has been a disastrous blend of bungling leadership, cupidity and cheap politics. The flavor of American idealism is conspicuously faint. The ideals of the nation's founders have been thrust aside in the mad scramble for concessions' profits and real estate kiting. But even with their liberal privileges the concessionaires were not satisfied. They demanded—and got—an order to keep the Exposition open on the Sabbath, although this is held to be in direct violation of Pennsylvania law. Certainly, the Signers of the Declaration, who are honored by the celebration, would not have gone so far in affronting public opinion and disregarding the law.

It was apathy on the part of the solid citizens of Philadelphia that permitted such a situation to come to pass. They left manipulation of a great patriotic commemoration to the manna-seekers, and the manna-seekers quite naturally followed their own bent. There is something woefully unnecessary in the situation that moves a great Christian church to denounce a supposedly American celebration as *un-Christian and un-American.*

## *The Great Hush-Hush*

THIS is the broad age of suave tolerance. The soft pedal threatens at times to become our national symbol. Tolerance is our shibboleth; intolerance our greatest dread —and yet these are names that have not the remotest relation to the qualities we indicate by them. We must ever compromise. We must not speak our minds lest we offend. Our words must be so innocuous as not to displease anyone. 'Be Bland' is the new commandment.

Pollyanna-like, we can see no evil. Crime is a disease; we must pity and pet the criminal, not denounce him. Personal culpability no longer exists. We flutter with trepidation that our harsh words pain some gentle soul. Objectionable social tendencies are not to be mentioned. Practices that have been condemned for centuries are nowadays condoned. Usury becomes respectable under the name of 'interest'; cupidity becomes praiseworthy ambition. Under the broad new tolerance, *Thou Shalt Not* becomes *Do As You Please.*

The man who holds a definite view and expresses it, is to be avoided: he is dangerous! Vacillation replaces the straight line. The successful politician is the adroit pussyfooter, the popular man the energetic gladhander. Talk all you will about the universal brotherhood of man or the lovely aspect of a spring flower. They are safe subjects. But beware of those that have been declared *taboo!* We are living under the smothering influence of the great hush-hush.

We had nearly $250,000 in gold, and as an additional guard we coaxed every dog on the lot in various towns to go along with us. They got to be a fierce animal pack.

# Under the White Tops With 'Gil' PART II

## The Dog Army That Once Guarded $250,000 in Gold

By HARRY E. BARNET
ILLUSTRATED BY GEORGE HARPER

SHORTLY before nightfall of a Sunday near the end of last July, Gil Robinson sat in a roomy canvas chair beneath a huge tree on the edge of the Cumminsville show lot, in Cincinnati, and contemplated the disarray of John Robinson's Circus. The menagerie top was up to provide shelter for rare beasts and their dens. Knee-deep in straw, the baggage horses loafed luxuriously in their own tent. The ring horses lounged in one end of the dressing room.

Held erect by heavy ropes, the bare big top poles stood in a row beside the menagerie top. Bundles of big top canvas, ready to be put up at Monday's sunrise, were lying about on the uneven, wind-swayed grass, like so many whitecaps atop the green of a tropic sea. In fancy it seemed a giant ship, submerged above its upper deck—the hulk of a giant ship that now was adrift among warm islands, and next moment was fixed in frigid bleakness. For wagons standing here and there, with white covers drawn closely about their fat sides, resembled icebergs, frosted with snow.

Sounds companioned the sights. Weird whinings of metal rubbing against metal came from the menagerie top as the springs of various cages responded to the twistings and turnings of the beasts they supported. An occasional 'thump—thumpity-thump—thump' of axle shoulders knocking against the heavy hubs of cage wheels bespoke playful lunges of menagerie creatures from one side to the other of their traveling homes.

Murmur of talk came from scattered groups of circus people. Mingled with it were hesitant words of the 'Pinheads'—strange human beings, whose appearance brought thoughts of evolution, whether one willed them or no. The 'Pinheads' were walking about the lot for exercise, closely chaperoned by a Fiji princess.

But in all the talk there was no profanity. For just as the verbal luridity that Mark Twain knew disappeared some time ago from inland streams, so also profanity has left the circus caravans. Nowadays it is taboo. And its absence makes holes in conversation that you're bound to notice, if you've known steamboat mates and circus men in other days.

Probably Gil noticed these holes. At any rate, he said suddenly:

'Along fifty and sixty and seventy years ago when we were traveling by wagons, we had an awful time getting this show over the country. Half the time there were no roads. The ones we found were bad, so that the most of the time we had to build our own as we went along. Sometimes we were a day and a night getting the show over a stretch of country that you ride over now in ten or fifteen minutes. And of course there was a lot of swearing done by almost everybody with the show, because building the roads and getting the wagons over them was an exasperating job. But no circus man of the better class ever swore from pure viciousness. There never was any intentional blasphemy. Swearing was strong language that seemed to help out in times of stress.

'There were a lot of rotten-sand and rotten-soil roads in Alabama,' Gil went on. 'Dried mud holes in these roads were bad places. When the wagons came along they dropped to their axles in these places, and dropped so suddenly at times that they jerked the horses to their haunches.

'One winter Sunday we were going from Tuskegee to Uniontown and we struck a lot of these rotten places. The wagons mired in them, and everybody with the show had to get around and help pry them out. We hadn't got very far by noon. Then one of the canvas wagons, with six horses hitched to it, broke through a bridge and fell, probably twenty feet, into the creek below.

'Performers and everyone came running up to help get the horses and the wagon out. A lot of cuss words were being used by everybody, and the boss hostler was doing a particularly big job of it. Circus men love their horses, and it riles them to see a horse hurt or in trouble, whether it belongs to the show or not.

'News of the accident spread and country people came from quite a distance. But none of them offered to help us. Instead they stood aside and heard the cussing. Finally, a big, six-foot countryman, with a nasty white beard, all matted and unkempt and streaked with tobacco juice and dirt, commenced to give the boss hostler a lecture on swearing. The countryman was a religious fanatic.

'The boss hostler didn't have very much time to listen, but the countryman was so insistent and he hampered our men so much in delivering the lecture, when our men were doing all they could to help those struggling horses piled up in that creek with the heavy wagon holding them down, that the boss hostler had to pay some attention to him. So he finally turned to him.

' "Who is the supervisor of this road?" the boss hostler asked him.

' "Why, I am," the fellow answered.

'With that, the boss hostler grabbed him and threw him through the hole in the bridge, right on top of the struggling horses. The countryman's friends had quite a time getting him out of there.

' "Now, you filthy rascal," the boss hostler said, when the man was up on the road again, "the next time that a show is coming this way, quit lecturing long enough to see that you have safe bridges, and I'll guarantee you that you'll hear no cussing." '

Gil chuckled and added: 'Sure enough, when we went over that road next year, all the bridges had been reinforced, and the roads were good. There was no cussing.'

Sights and sounds on the Cumminsville lot brought forth more reminiscences. And at this game Gil has no competitor, for he is the oldest living circus man—lone survivor of the romantic age of the American circus. More than a century ago his father founded the show that was spread across the Cumminsville lot—'Pa's circus,' he always calls it.

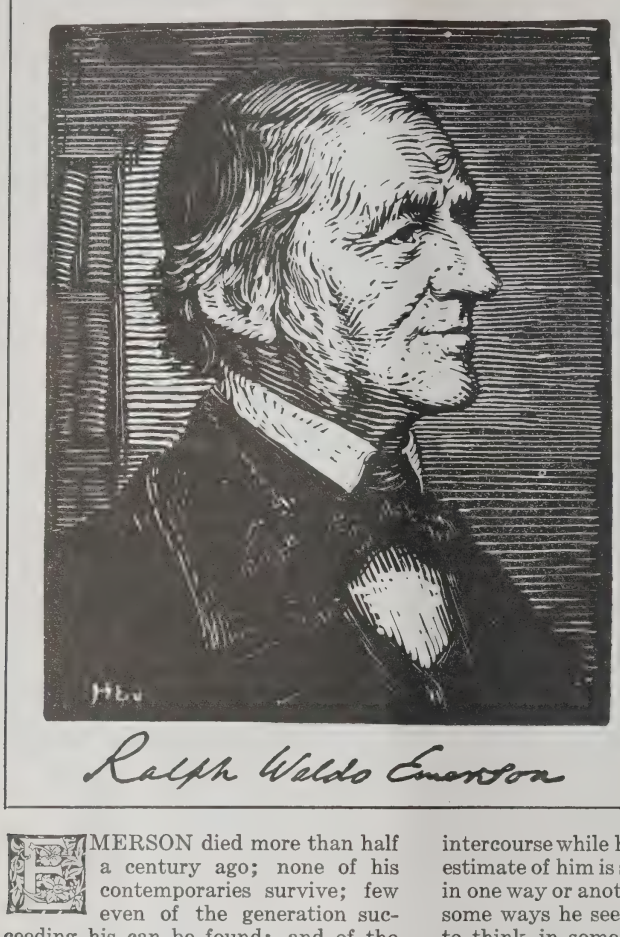
'A lot of ridiculous things have happened around this show,' he continued, 'but the occurrence that to this day makes me feel a little cheap happened on a Sunday many years ago when we were still traveling by wagons. About the middle of each season we always took a Sunday off to brighten the properties and varnish the wagons. That is, instead of following our rule of leaving the Saturday town on Saturday night, and spending Sunday in the town where we were to show on Monday, we stayed in the Saturday town until Sunday night, and did this cleaning.

'We toured the Middle States in the summer of 1866. About the middle of the season we showed Urbana, Ohio, on a Saturday, so we concluded to lay over there, and brighten our equipment. Saturday afternoon, one of these old-time circuit preachers—a kindly old man—hunted me up and asked if we would give him the use of the big top to hold a Sunday meeting. Well, I told him we had no objections. In fact, we were glad to help the good cause along, because our family was always religiously inclined, despite the general impression that old-time circus men were a heathenish lot. I made up my mind that I would attend the services.

'Sunday came, and the old minister came,' Gil went on. 'A big crowd of town people came. But the most of them, I'll always contend, came more to get a peep at the animals than to hear the preacher. The dens were open, you know, and these people hung around them, looking at the animals until long after the old minister had begun to talk. The only way we could get most of the town people to leave the cages and take seats in the big top was to close the dens. Of course, our people were around doing their work, and I told them when they got through with their jobs to come into the top and attend the services

'I sat close to the old minister, and about the time the services were well started, I looked over the crowd. There were the most of our men who should have been washing wagons and varnishing cages and cleaning properties, taking advantage of the services to get out of their work. One and two at a time they left whatever it was they were doing and came in and sat down in their shirtsleeves, with a paint brush or a sponge or a dirty cleaning rag in their hands

'The preacher was in the midst of a long prayer when I first noticed them, and I had to wait for him to finish before I could leave my place. Then, while the preacher was reading a chapter from the Scriptures, I slipped away, and made an inspection of the seats.



'Wherever I found one of our men who should have been at work I took him by an ear or by an arm, walked him off quietly, and put him to work again. By the time I had them all at work and was back beside the preacher, I noticed them sneaking in again, one and two at a time. So at the end of another prayer I had to inspect the seats again, and lead the men out. Well, I had to do that several times during the services, and I didn't hear very much of what went on.

'At the time, I didn't realize how ridiculous it must have been. I got to thinking about it afterward, and it seemed to me a little bit sacrilegious and irreverent. But the work had to be done that day so we could leave for the Monday town that night. And it struck me, also, as a funny situation for both the preacher and me. At that, I don't believe it did any harm. As far as the preacher looked and acted, it was a very enjoyable service.

'Who is the supervisor of this road?' the boss hostler asked. 'Why I am,' the fellow answered

Ralph Waldo Emerson

## *Julian Hawthorne Tells His Boyhood*

# Impressions of Emerson

DRAWINGS BY G. VAN DER HEYDEN

EMERSON died more than half a century ago; none of his contemporaries survive; few even of the generation succeeding his can be found: and of the writers who are now rediscovering him, all must necessarily speak from hearsay, and few seem competent to make their views weighty or convincing. It has been affirmed, indeed, that no 'historical facts'—and still less biographical facts—are quite trustworthy: in illustration whereof some humorist, years ago, wrote an essay to prove that Napoleon Bonaparte never existed.

The personal equation must enter into the stories of all who put pen to paper, no matter how truthful they may be in purpose: if we had stood in their places, our record would have been different. Nevertheless, the collation of many versions of the truth enables us gradually to come closer to actuality: and we of today probably know more of the real Julius Caesar, for example, than Antony, Brutus or Octavius did.

I feel under a certain obligation, therefore, to record something of my personal impressions of Emerson. What I derived from study of his writings is another story, and of less importance. But as child and man I was in contact with the man during a great part of the last forty years of his life. The families of Emerson and of Hawthorne lived on intimate and cordial terms during that period—except that Hawthorne died a score of years before Emerson; but the friendly relation was always maintained.

*Hawthornes and Emersons on Intimate Terms*

I saw and conversed with him very shortly before his death; and I stood among the reverent throng on the hill of Sleepy Hollow when his coffin was lowered into the grave.

But well as I knew him from personal intercourse while he lived, I find that my estimate of him is slowly being modified, in one way or another, since he died. In some ways he seems more than I used to think, in some ways less. In other words, I did not see him as he was, but only as my perception and judgment at given times made me think he was. And doubtless no one knows his fellow as his Creator knows him; perhaps he never knows himself.

*Emerson Had No Shadow of Pretense*

Shakespeare said that 'love lends a precious seeing to the eye,' and I suppose my affection for Emerson rendered him more transparent to me: moreover a child's intuitions are often penetrating beyond the deliberate estimates of maturity. Besides, there was in him no shadow of double-dealing or pretense; for all who could read him, he was an open book. He was never preoccupied with himself; he regarded himself merely as the best vehicle he could command for his own thoughts; he had no use for himself otherwise, nor any ambition for eminence. But neither was he any man's good fellow, or familiar; dignity was inherent in his nature, not as he was Emerson, but as he was a man.

In his innocent presence, vulgarity was dumb, or perished. Yet he abhorred being considered peculiar or isolated; and sometimes made amusing efforts to be like other men: he would try to smoke a cigar, for instance, and at public dinners he would have a glass of wine beside him, whether or not he remembered to empty it. He dressed punctiliously in the fashion of the time, though his clothes never fitted him, ar his voluminous stock and high coll must have distressed him. His feet ar hands were large, his shoulders narro and sloping, and his body had a slig inclination toward the left; his hea was small. His gait in walking was n academic; he shuffled along witho straightening his knees or throwir back his shoulders, but always wit head erect and forward-looking, nev with downward looks, as is the hab of most meditative persons. He ha the air of looking abroad to see th world, and to meet the eyes of passer by: a cheerful, steadfast; benign lool

His usual expression in repose was half smile, or a readiness to smile, an the furrow from the nostrils to the co ners of the mouth was marked, as smiles had made it; yet it was th furthest conceivable from a grin, or habitual simper. It seemed to say, Th world is good and beautiful, and ma is on the way to be worthy of it. Le us be glad and resolute and not los courage.—The lips were firmly joine and never parted except in speech; th chin was salient. The nose was dis tinguished and well arched; but fo his eyes, it would have been the dom inant feature. But what an exception One might as well speak of the sk without the sun.

There were no other eyes like Emer son's. They were not large, nor deep set under scraggy brows like Danie Webster's, nor even very brilliant o piercing. They were not black lik abyss, nor azure like the sky. They were yellowish gray, and of moderate size; but the lids had a graceful curve. Nevertheless, all Emerson was in them —beauty, wisdom, manhood, kindness, courage, poetry. And when he was aroused, as I have seen him in public speech, when truth or honor was in question, they had a radiance and power incomparable. They swayed and commanded, and his hearers would be awed and carried captive. We desired to believe him even when (as might sometimes happen) what he said was too deep to be at once understood. We felt he was right beyond our own comprehension of what right was.

*There Were No Other Eyes Like Emerson's*

But though he was a great orator—free however from the conventional tricks of oratory—and though I never

failed to be in the audience when he was to deliver a lecture or speech—yet it was not in this phase that I chiefly knew him, but in his homely or everyday aspect.

His house is still one of the landmarks of Old Concord, foursquare, painted white, with eaves slightly projecting over the windows of the second story; set a little apart from the thoroughfare, with a small porch on the north, led up to by a straight path paved with white flagstones. His study, book-lined and grave, though not solemn, was on the right as you entered the house: not high-ceiled, but spacious. The passage went on to the dining room, which communicated with the kitchen, and there was an exit to the east, which the family commonly used.

Opposite this exit, a few yards distant, stood a big pine tree, amid whose boughs Alcott had erected a giant Aeolian harp, framed and strung with boughs which he had selected in the forest. It was mute except in storms, when its mighty voice awoke and could be heard for miles musically shouting and booming. It lasted for years, but had fallen to pieces and vanished when I last saw Concord, a dozen years ago.

Emerson lived in this house all his life, after his Harvard days and a short period in Boston, and he died there. He may have built it, but I don't know; and when he made his last visit to England, the original house burned down, but Concord citizens, with a charming grace, built a new one for him which is a precise replica of the other. The place was his home, and in spite of its simplicity it was so associated with him that it seemed like him: he was too high for palaces; and Walden and Walden woods were near, when four walls should become too narrow.

He was always open to justified visitors in the study, and and one day of each week during the winter he would throw it open to all Concord and the world. Chairs for the accommodation of the company would be ranged in a circle, and the farmers and shopkeepers of the neighborhood, as well as the Lowells, Holmeses, Alcotts and Longfellows, would occupy them side by side. At the head of the ring would sit Emerson, one leg crossed over the other knee, and such was their length and flexibility that he could twine the one round the other, so that the upper foot caught behind the lower ankle. Then, leaning forward on his elbow, he would smilingly receive and answer all conundrums. But he did not permit himself monologues, as Alcott could not help doing, but was concise, courteous and genial, liking better to hear than to speak.

The best culture of New England was represented in that little circle, as well as the horse-sense of the everyday man; but there was a charming naïveté and primitiveness about the gatherings, as in an Indian powwow.

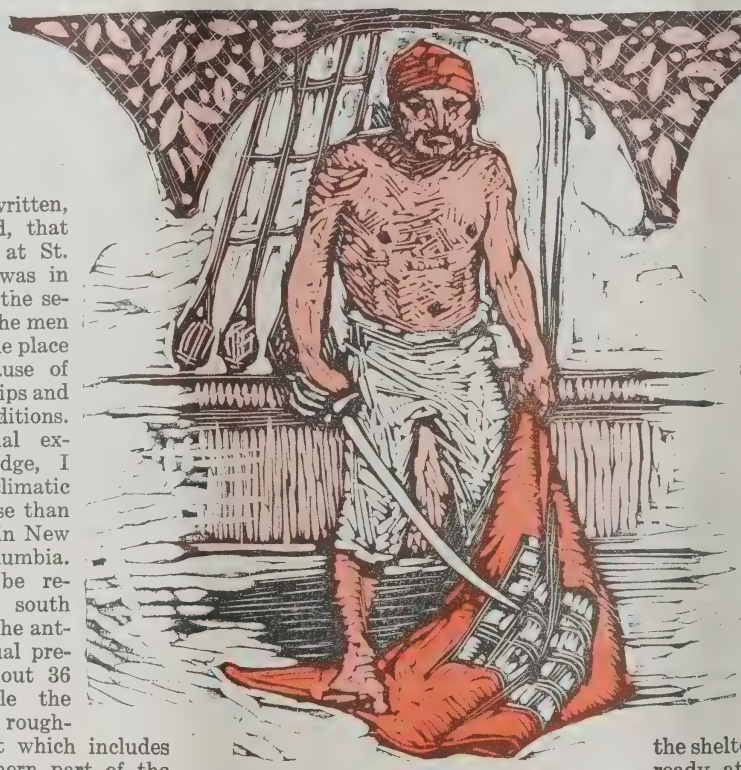
Ellen Emerson, his eldest child, sat next her father, not to take part in the proceedings, but to keep an eye on the guests' comfort. She was a young woman of the finest type, tall and straight, with quantities of hair, very dark brown, and clear, steady eyes.

On informal occasions, I liked to be invited to dinner at the Emersons. Roast mutton, potatoes, corn and turnips: Emerson and his wife at opposite ends of the table, and at the sides the three Emerson children and my two sisters and I: wholesome food and cheerfulness therewith. Edith Emerson, next in age to Ellen, and well aware that she was the handsomest of the three; her face was rather long with a high color—though rouge was unknown at that period in New England: fine blue eyes and a determined chin and lips. She had attended Frank Sanborn's school, and the good-looking young schoolmaster, a widower but still susceptible, paid respectful but ardent addresses to her; she encouraged him, though circumspectly, for a time, and they could be seen sauntering romantically beneath the pines; but finally she decided that Forbes, son of a very rich man (as riches went then), would suit her better: he married her and took her away to live in luxury and satisfaction. He looked like a beefy young English squire, and they were well mated.

Edward was too years my senior; we were schoolmates for three years and then entered Harvard. Emerson had a son before Edward, by his first wife, who died early, but the boy too died in his youth: his name was Waldo and he was said to have been of high promise. Edward was severely moral, with ambitious ideals, and as little priggish as the conditions permitted. His bearing was precocious but frank and honest; there was a boy in him, but uniformly suppressed.

But I return to the Emerson mutton, which was always good; and Emerson adapted his conversation to our youthful minds, and was a perfect host, though part of him must have been sipping nectar and eating ambrosia with his cronies, the Muses, and the other Olympians. But he was always keen to investigate 'the deep mind of dauntless infancy'; and he always treated me, for instance, as his peer, though I was at that time the rawest of urchins. I never heard him utter a moral homily, but the finest moral atmosphere surrounded him, and he was involuntarily beneficent: to meet the look in his eyes and to hear the music of his voice was to learn culture and refinement. More went with the mutton and turnips than I suspected.

He delivered one or two lectures every season at the Concord Town Hall, a large and dignified brick building which still dominates the green of Concord, and on the rostrum of which all the famous orators and high-minders of the day appeared, year after year. (*Concluded on page 26*)



Study in Emerson's home, the same today as it was when the great man worked there.

# The Voyage of the Victoria

## THE MUTINY

*Seventh of a Series*

Cartagena, sword in hand, burst into the cabin.

BY CHARLES J. FINGER

WOODCUTS BY PAUL HONORÉ

IT HAS been written, and accepted, that the tragedy at St. Julian Bay was in great measure due to the severity of the climate, the men refusing to winter at the place Magellan chose, because of the tremendous hardships and cold and storm conditions. Writing with personal experience and knowledge, I should say that the climatic conditions are no worse than those to be met with in New York, or in British Columbia. Patagonia, it must be remembered, is in the south temperate and not in the antarctic zone. The annual precipitation there is about 36 inches or less, while the isothermal zone would roughly correspond to that which includes the central and northern part of the United States. To be sure, there are storms in winter, but not storms more severe than those to which we are accustomed; certainly nothing worse than the gale of May, 1896, which did so much damage in Iowa and Illinois and Minnesota; or the storm in 1896, which destroyed Cedar Keys, Florida; or the cyclone in September of the same year which devastated Sherman, Texas, and wrecked part of St. Louis.

Magellan had chosen his wintering place with care. The fleet lay in a bay almost landlocked. There was fresh water to be had. Ashore there were deer, huanacos, armadillos, ostrich, geese, ducks and other game. In the bay was fish in plenty; along shore were mussels and shellfish. The men, in short, were in a sportsman's paradise, and that it was no desert might be inferred from the fact that there were Indians there who wore skin cloaks and lived in skin tents.

The mutiny was a revolt against Magellan's attitude in discriminating against Spaniards. We gather that from the account in *Navarrete* (Vol. iv, p. 288 and p. 291), where is found the evidence of Sebastian del Cano and of Francisco Albo. Neither Pigafetta nor the Genoese pilot give details. Pigafetta does not correctly name those who suffered death at the end. It is fair to assume that both chroniclers judged it wise to be silent on the matter, as they were near Magellan and valued their own safety.

Magellan's favoritism of Portuguese may have been due to nothing more than a narrow patriotism. But there is evidence enough to admit of the inference that he wanted to control, absolutely. And there was a suspicion that he intended to take the fleet to Serrao, that friend who had cast in his lot with the native monarch and to whom Magellan had written, 'I will be with you soon, if not by way of Portugal, then by way of Spain.'*

In brief, Magellan was regarded as a possible traitor who would betray the fleet. That he had placed Serrao, brother of Serrao the adventurer, in command of the *Santiago*, lent color to the suspicion directed at him. That he had refused to consider his appointed *conjunta persona*, Don Juan de Cartagena, in serious light, wrought against him. That he had deprived him of the command of the *San Antonio* and given the charge to his cousin, Mesquita, had an evil appearance. That he would not consult with Sebastian del Cano who had commanded a ship much larger than any in the fleet, seemed matter for consideration. So relations between Magellan and the royal officers were strained to breaking point; to such a pass indeed had things come, that on Easter Sunday, when mass was held ashore, neither Mendoza, of the *Victoria*, nor Quesada, of the *Concepcion*, attended, for conscience' sake, but worshiped aboard, another priest officiating. After the mass, Magellan dined with his cousin aboard the flagship.

That night there was a *coup de main* carried out by those who felt that they had been subjected to a long series of persecutions. Boats with muffled oars pulled to the *San Antonio*, gathered in the shelter of the counter; then all being ready, at a signal three parties boarded, among them Quesada of the *Concepcion*, Juan de Cartagena, Sebastian del Cano, a priest named Sanchez de Reina, Antonio de Coca, Luis del Molino, Quesada's servant, and thirty armed men. Juan de Cartagena, sword in hand, running risks as was his habit, burst into the cabin where Mesquita slept, a few supporting him, and in a minute Mesquita was bound hand and foot and locked in a cabin.

Soon the greater part of the crew was astir with men excited and planless running here and there, some of them caught with the contagion of a general fear, others standing sullenly waiting for a leader. But valor was not all on the side of the rebels against Magellan's rule. The ship's master, Juan de Lorriago, leaped at Quesada, accusing him with white hot passion of being a traitor and calling on him to surrender. Two Portuguese, Antonio Fernandez and Goncalo Rodriguez, chosen men of Magellan's, simultaneously threw themselves on Quesada and the four went down in a writhing heap. Then came pike men and men with swords, some of the invading crew, and Quesada was rescued. But Lorriago, brave and full of the lust of battle, again dashed at Quesada; a lithe brown body naked to the waist against an armed man. Down came Quesada's dagger then, driven to the hilt into side and back, and Lorriago fell to his death.

*Decadas, Dec. iii, lib. v, cap, viii. page 627.

The rest was easy. On the side of the invaders was power and a plan and discipline. On the other side was nothing; no central aim, but merely a masterless, scattered, confused body of men. So there was surrender; arms were gathered and placed under lock and key, and the flag of Magellan was hauled down. Don Juan Sebastian del Cano was appointed commander of the *San Antonio*. One man had fallen in the fight, and the priest was with him. The two Portuguese who had attacked Quesada were placed in irons and the remainder of the crew confessed themselves loyal to the new command, so there was what politicians call an era of good feeling. Then the storeroom was opened and on the deck was spread a feast of Jerez wine, of cheese and garlic, dried pork and honey, and hardly a man but was ready to hail the new master.

Of that sharp conflict in the night Magellan may, or may not, have known. In the morning a boat with a message from Magellan that preparations were to be made to careen the ships for cleaning went from ship to ship. Approaching the *San Antonio* they were warned off by Luis del Molino, who, from the high poop, called out that Sebastian del Cano was master, not Magellan, and there was no mistaking his meaning. Then the priest, Pedro de Valderrama, left the side of the dying ship's master, and, fearing the zeal of some of the mutineers, gave a straight account of how matters stood.

After that there were subtleties and stratagems, fraud and force, and all the concomitants of a struggle for the stranglehold. First a boat went from the *San Antonio* to the *Trinidad*, though such parley as was done took place with a stretch of water between the parties. Mutiny was guardedly admitted, but it was said that the act was more in the nature of a regrettable necessity than anything very desperate. It was pointed out that while Magellan had ideas and plans, others had well-founded opinions. Then came a suggestion. If the captain-general chose to meet his opponents on common ground, with a measure of sympathy for the views of others, he would find men tractable and willing. And Magellan's answer to that was that discussion was the best way to avoid friction, and that he would be ready to meet officers at once, with the *Trinidad* as the conference place.

Back went the boat, with no officer of consequence in it, for both sides were playing pawns. The message was that Magellan's hospitality was declined, for reasons good and proper, and the *San Antonio* was offered as the best place to thrash out differences. Then came what one side considered prompt and decisive action, the other side as desecration of a flag of truce. For the boat was seized by Magellan's men and its occupants held as hostages. While that went on, a boat left Magellan's ship, in it the constable Gonzalo Gomez de Espinosa, an ignorant fellow with a vast amount of the bully in his composition. Five men accompanied him, all of them armed with short sword or dagger, not in sight, but well concealed about their persons. That boat pulled for the *Victoria*, not the *San Antonio*, and Mendoza received them aboard. Espinosa handed the captain Magellan's letter, summoning him to a conference aboard the *Trinidad*, and, as he read it, the constable leaped at him and stabbed him in the throat. At the same instant other armed men drew their swords and slashed the man to death. For that piece of treachery Magellan paid Espinosa in money.*

Meantime, Magellan had taken measures to support his hired assassins, for no sooner was the skiff under way than a second boat, manned by fifteen armed men with Duarte Barbosa in charge, started. So short a distance separated the ships that the sixteen had boarded the *Victoria* before the breath was out of Mendoza's body. As if all that lack of chivalry was insufficient, there was an exhibition of vindictiveness, for the body of Mendoza was hauled mast high, head-downward.

Then came the final move, for which the ebbing tide served well. The *Trinidad* stood north, dropping to the mouth of the gulf, Barbosa following with the *Victoria* and anchoring to starboard, Serrao with the *Santiago* taking a position to port, thus Magellan held the key to the situation and the other ships were bottled up, with no move remaining but a dash out against odds.

Such an attempt was made during the night, but it was a half-hearted one. For there had been trouble and divided aims on the *San Antonio*, and when she came out it was with her sails in disorder and her anchor dragging as though there had been a refusal to go into attack, or a mutiny within a mutiny. But Quesada had his picked men, and won over the faint-hearted. Yet it was nothing but a gesture after all. Drifting out on the tide through the narrows, the *San Antonio* touched the flagship, rebounded and touched again. Then the bombards on the *Trinidad* roared, but the deck of the other ship was clear of men. They had fled to holes and corners, leaving Quesada on his deck, denouncing them for their black treason. Yelling men from the *Trinidad* leaped aboard and Quesada was carried before Magellan. A little later he was manacled and locked in a cabin, prisoner.

There remained then Juan de Cartagena and the *Concepcion* to

That night there was a *coup de main* . . . Boats with muffled oars pulled to the *San Antonio*; then at a signal three parties boarded.

*Evidence of del Cano and Francisco Alba before the court.

deal with. Magellan's plan of capture took advantage of the tide, so two boats were sent into the bay, one making straight for the ship, the other keeping well out of sight in the shadow of the low cliffs, and making a circuitous route. While the first boat engaged attention, parleying, the second slid alongside unseen, and the men in her cut the cable, so that the ship began to drift seaward. At that some were willing to fight, but Cartagena did not aim at the spilling of blood, and, seeing how matters stood, surrendered with the air of a good loser. On board the flagship there was a confession on his part—not of wrong-doing, but of disillusionment and disappointment. He stoutly refused to share any part in the ambitions of Magellan, and for revolt he stood foursquare. He was a king's man and a king's man he would remain. At the end he congratulated the 'Señor Capitan' on his victory and wished him all the joys of further adventure. But aristocratic polish and urbanity did not move Magellan, so Juan de Cartagena was heavily ironed and placed under guard to take his trial with the rest. Forty others were taken prisoner that night before Magellan considered his checkmate complete.

The day following, a trial was held. Magellan's insane vindictiveness did not stop at the living. By his order the body of Mendoza was taken ashore, drawn and quartered, and the parts spitted upon poles. Quesada was sentenced to be beheaded by his own servant. Juan de Cartagena and a priest, either Sanchez de Reina or Bernardo Calmeta, the chaplain of the *San Antonio*, were sentenced to be set ashore when the fleet left, and until then were kept in irons. Forty others were condemned to be hanged, though that wholesale butchery was not carried into effect, probably because they were necessary. So, due to economic considerations, as we suppose, and not to mercy, they were presently pardoned, but, according to Correa, Magellan 'kept the mutineer prisoners in irons and set them to the pumps during the three months that he remained in this river, in which he careened and refitted his ships very well.' But Magellan had gained his end at last. He was in sole command with none to dispute him, and the ships were officered with men of his own choosing.

Fifty years and more later, the men of the *Pelican*, commanded by Francis Drake, saw the gallows set up by Magellan, with human bones close by. Drake also had his mutiny there, his challenger being an Englishman named Thomas Doughty.

Others condemned to be hanged were presently pardoned and set to the pumps.

But Drake was of different mettle from the earlier explorer. Doughty had his choice as to whether he preferred marooning or execution, and chose the latter. When the day of execution came, Drake and Doughty took the sacrament together, dined together, then shook hands and pledged one another, after which Doughty walked out and bared his neck for the ax, while Drake hid his face in his arm in the manner of one who bore intolerable pain.

*In which American cities has juvenile crime increased?*

*Only four, Winifred Mallon writes in next week's issue of* THE DEARBORN INDEPENDENT.

*The younger generation has been the scapegoat of the uplifters; it is the class between the ages of 35 and 44 who are rolling up the crime wave, not the boys and girls of high school age.*

*Wide-wake readers will be interested in this investigation of the crime situation.*

# America, the Limelighter's Paradise

(*Concluded from page 5*)

reduced to a monster commercial octopus, whose tentacles extend into every home, literally snatching babies from their cradles and commercializing their facial innocences, while at the other end of the scale the erotic escapades of the idle rich are sickled over with the yellow cast of a putrid press.

The extension of personality so that it encircles the globe is peculiar to this country: thus Jackie Coogan and Mary Pickford and her agile husband. Anything is permissible. Will Rogers is hired at large wages by a tobacco company to advertise something which he naïvely declares he doesn't use himself. Thus anything, no matter how personally deterrent or useless, can be endorsed by anyone who scorns it, merely if he is 'prominent.' On this basis, a perfumed dandy who is well enough known might extol the merits of a special brand of garbage.

An obscure school-teacher who, framed up by publicity hounds, is tried for teaching evolution, becomes in a few weeks a national figure, while 'eminent' writers who attend his trial write columns of trash about something of which they have never before heard. A millionaire advertises for some girl to adopt, and the one selected is held up on the public spit and turned over and over, after which she is 'done' enough to make a meal for all kinds of press agents. The fact that whatever chance the poor girl had to live a life of obscure decency is obliterated is of no consequence. The only thing sacred which exists in the mind of the publicity expert is his own pocketbook.

It is bad enough for the main body of our people to have developed a national passion for hero worship (and this apparently in every degenerate form) never before approached except in ancient Rome, but it is still worse when the trustees of our national honor take advantage and use it for their own selfish purposes.

It is, as stated, quite easy to see that the main reason for this condition is economic, and inasmuch as there is more money in America than in any other country, it is to America that the strange birds of all nations flock in search of prey.

Within the past few years, the enormous success achieved (apparently through an accident of fortune) by the Spaniard, Vicente Blasco Ibañez, with his book *The Four Horsemen of the Apocalypse* has encouraged all the obscure writers of Europe to go into training for the American market. New books by Norwegians, Poles, Livonians and many others are translated and offered to the American public as masterpieces. Some of these books are undoubtedly of high merit. The real difficulty, as far as the 'system' is concerned, is the fact that the authors can speak neither English nor American, an obstacle which prevents their being broadcast here.

The disastrous attempt to exploit Maeterlinck, the Belgian, who spoke only broken English, is still recalled with pain by platform experts. This writer was engaged to deliver a series of lectures, but the audiences couldn't understand him and had not been sufficiently cowed to listen to a foreigner who couldn't talk their language, so the affair ended in a nasty row, a lawsuit and the failure of the platform promoter.

# CHATS WITH OFFICE CALLERS

'There are hundreds of different pigeonholes where you can fit a description of the "meanest man," ' said ***the Villager,*** 'but just at this moment I would say that he is the fellow who drops his cats and dogs for other people to care for. I live in a town about ten miles from a city, and every morning we find litters of kittens or puppies, or abandoned dogs and cats of older growth, roaming our streets. They are dropped by motorists from the city who decide that they can't be bothered with their pets any longer. It is really pitiable to see the home-bred animals suddenly cast adrift. And it is something of a study to observe their reactions to the sudden change in their circumstances. Some just give up at once, as if the betrayal of their confidence destroyed all energy to make a struggle. Some, with more spirit, start out to choose a new home. I got through with animals around the house long ago—I like to decrease the little annoyances of life as much as possible. But I have a dog now—though I didn't choose him; he chose me. He was a motor waif. He turned up one morning—the homeliest little brute you ever saw—and looked at us wistfully. We ordered him away, and he wagged his tail. We talked of sending him to the police for chloroform treatment, but he looked at us through the long hair that hung over his eyes, as if he thought we were joking. When we opened the car door, he was first in: we kicked him out. The first two days we did not feed him, hoping he would decamp and try another house. In the morning he was right there to give us greeting. Then we locked up the house and went away for two days. When we returned, he was lying on the porch waiting for us. Well, there is something in faith or confidence, even in an animal, that wins its way, and finally I said, "Well, old boy, I guess you've adopted somebody." The dog's a nuisance, but I think more of him than I do of the man who abandoned him in our town.

'My latest trouble was over a mother cat and two kittens. The way that mother rustled for those youngsters indicated a character that deserved a better fate. So I got them a home on the farm.

'If ever I get to be President I am going to make Abandonment of Animals a punishable offense.'

ɛ ɛ ɛ

'We have a history teacher in our town,' said ***the Citizen*** as he stormed into the office, 'who thinks nothing good happened in America until Mr. Mencken came along.

'According to him the founders of the nation had no ideals. The Puritans were a batch of fanatics, the soldiers of the Revolution a gang of scurvy ragamuffins. American traditions and American standards, he feels, are rubbish.

'He's a thorough "anti." He's against this and against that. He's opposed to churches and revealed religion. He thinks our governmental system is tommyrot. He admires communism, and Theodore Dreiser, and Havelock Ellis. His statements are very positive until one begins to challenge and analyze them—then he slips away onto other tacks. The humorous thing about the whole business is that he considers himself highly tolerant, and all who differ with him are bigots! I forgot to say that he is 24 years old and just two years out of college.

'He's entitled to his own opinions, of course. This is free America, and the patriots he despises died so people like him could hold their beliefs without punishment. The harm lies in the fact of his influence over high school boys who are not equipped to combat his ideas.

'It was only the other day I learned his secret. It's a matter of race, of course. Smith (that isn't his name, but it's one equally common) is an American only because his parents managed to get away from a country of Eastern Europe and immigrate here. He is American neither by instinct nor training. His is the mind of an East European peasant—and he is teaching American history to American children!'

ɛ ɛ ɛ

'Believe me,' said ***the Scout Master,*** 'it's no snap to be responsible for 300 boys in camp by the side of a lake.'

'Should think it's not,' we answered; 'it runs us ragged to watch our own youngsters. How do you do it?'

'We use the buddy system.'

'The buddy system?—what's that?'

'Oh, it's not a patent medicine, or bathing wings, or anything like that. We simply make it a rule that boys who enter the water must do so in pairs. It is quite a technical system. First, we have tags. Each boy is given an aluminum tag bearing his number. Each boy also has a buddy with a number. When a boy goes into the water, he hangs up his tag on a bulletin board on the beach. A glance at that board any minute will show whether any boy is in the water without his buddy.

'Besides that, we use caps of various colors to mark the various degrees of swimming ability possessed by the boys. Boys who cannot swim at all are given a yellow cap; the cap bears the same number as the tag. If a yellow cap is seen alone anywhere, the tag board is at once consulted. Boys who can swim under fifty yards wear a green cap. Those who can do more than fifty yards wear a red cap. Some of the better swimmers graduate into the "life saving class" and wear black caps, but they do not go beyond the 50-yard limit; they mingle with the other boys. Out on the swimming limits are the life guards whose business it is to see that the caps stay within the color zone where they belong, and that the numbers are in pairs. It makes the boys responsible for each other, and insures two of them being on the spot to give an alarm in the event of anything happening. That's our buddy system, and it is working out very well.'

'It's a good system,' we reflected. 'We think it could be used with advantage in other activities. It seems to me that somewhere in the Sermon on the Mount, the buddy system is given quite a boost.'

ɛ ɛ ɛ

'Sometimes I grow ashamed of my profession,' said ***the Michigan Newspaperman.*** 'There are newspapers out this way that should be denied the name. Partisan sheets of the lowest type; they never recognize a fact that goes counter to their policy. Detroit has two newspapers which are always on opposing sides. If the Supreme Court of the United States handed down a decision affecting a policy they were interested in, you would never be able to learn from either paper just what the decision was. The paper whose policy the decision opposed would modify every dissenting statement; the paper whose policy it upheld would go to extravagant lengths of exaggeration. The fact itself would never be permitted to appear in its purity. The reader would simply be helpless in the mass of coloration mixed with the facts. You would think that a big publication would be first a chronicler of facts, but in this section of the world color goes.

'In the contest for the governorship, for example, one big newspaper has charged day by day that the governor has prohibited inspection of state highway accounts. Now, if there is any particular thing that particular governor happens to be proud of, it is the state accounting system which he helped to establish. He invites everybody to examine it. As a reporter on the opposition paper, I have examined the accounts many times—any time I asked, any time of the day or night, without a quibble and with full knowledge on the part of the officials that I came from a hostile newspaper. Do you suppose that paper has ever permitted me to say in a single article that I have freely examined the state accounts, which are open to every citizen? Not once. I asked myself how can an intelligent newspaper staff hope to fool the people forever on this picayune stuff. And yet it goes on, with a pettiness of deception and unfairness which even gamblers would despise. The really fair papers of Michigan are not the big ones, but the little ones.'

ɛ ɛ ɛ

'Did it ever occur to you that the most preposterous thing in our boasted civilization,' said ***the Man from Milwaukee,*** 'is the payment of interest for money to make public improvements, when the only credit we can borrow is that of the people?'

And the visitor proceeded to expound the present policy of Milwaukee which is arresting wide attention by its program which eventually must free it from bond slavery. For Milwaukee is approaching the 'pay-as-you-go' system as rapidly as possible.

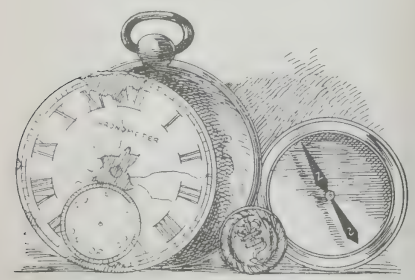
'We are now levying an additional assessment above our fixed bond and interest requirements to create an endowment fund which will be sufficient to redeem every bond at maturity, and the actuaries of other cities are studying our plan. The people, too, are awaking to the fact that the canker eating into the vitals of civilization is INTEREST, which in the case of public indebtedness is unnecessary and intolerable.'

# Eternal Snows Hide Arctic Tragedy

## Years of Searching Gave Only Meager Details of Disaster

By BURT M. McCONNELL
Meteorologist, Canadian Arctic, 1913-1914.

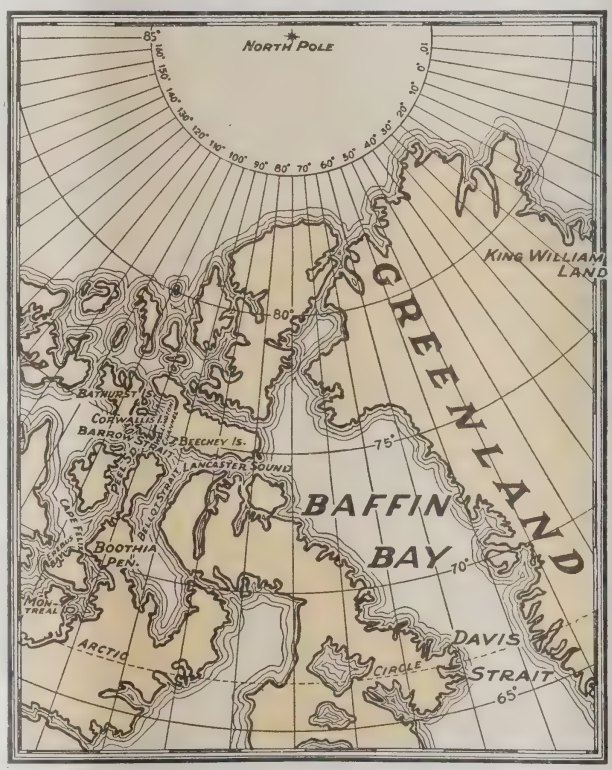
McClintock, commander of the *Fox*, found relics of Sir John Franklin's lost expedition.



### PART II

IT WAS the expedition of Captain Leopold McClintock, commanding the yacht *Fox*, which first brought to light, in 1860, the course and fate of the Franklin followers. McClintock had already served on three rescue expeditions. With a crew of twenty-four, the *Fox* expedition, outfitted by Lady Franklin (the eighteenth to be dispatched in search of her illustrious husband) set out from England.

They were beset by the ice late in the summer, and were marooned for 250 days in the ice packs of Baffin Bay and Davis Strait, during which time they drifted some 1,400 miles. They were freed the next summer by the breaking up of the ice, and returned to Greenland. Here they took aboard coal and provisions, then headed westward toward Lancaster Sound and southward toward King William Land.



Halfway down Peel Sound Captain McClintock discovered and passed through Bellot Strait and went into winter quarters at the eastern entrance. Early in February, 1861, he and Captain Young set out with two parties to establish, if possible, the route taken by the Franklin survivors in their retreat southward and to communicate with the Boothia Felix Eskimos in the vicinity of the North Magnetic Pole. At the end of eight or ten hours of steady traveling, the parties would halt, build a snow hut, Eskimo fashion, feed the dogs, cook and eat their supper, spread their sleeping bags on the snow or ice, and retire to rest.

Finally, near Cape Victoria, on the western shore of Boothia (latitude 69° 50′ N., and longitude 96° W.), McClintock found traces of the lost expedition.

Relics of the ill-fated Franklin Expedition. Broken watch, uniform button and compass, discovered by rescue parties.

There he learned from some Eskimos that a few years before a ship had been crushed in the ice off the north coast of King William Land, that all her crew had safely reached land, and that they had traveled across to the Great Fish River. But there, the Eskimos said, they had died. McClintock and one of his officers, Lieutenant Hobson, thereupon proceeded to explore King William Land, McClintock on the eastern and Hobson on the western side.

Some Arctic points touched by Franklin's expedition and following parties.

McClintock found no fragments of wrecks, no human skeletons or camp sites, until within ten miles of Point Herschel. There he came across a bleached skeleton, probably that of one of the stewards of the expedition who, having fallen behind his retreating companions, had perished of hunger and cold. But from the westernmost point of King William Land to Cape Felix, McClintock met with painful evidence of the sufferings and calamities that had overtaken the Franklin followers. At the end of their respective journeys, McClintock and Hobson came to the following conclusions:

The two ships passed their first winter at Beechy Island, after having previously explored Wellington Channel as far as 73° N., and had sailed down again into Barrow Strait, between Cornwallis and Bathurst islands. The next year, 1846, they appear to have fought their way through the drifting ice fields of Peel Channel until beset by the ice off King William Land. The ice did not break up; they were doomed to a third winter in the polar wilderness. By that time Sir John Franklin, nine of his officers, and fifteen men—a total of 25—had perished. On April 22, 1848, the survivors, 105 in number, under the command of Captain Crozier, abandoned their icebound ships and started for the mouth of the Great Fish River.

In the interest of accuracy, it should be added here that Lieutenant Schwatka was told by Eskimo witnesses that there were almost unmistakable evidences of the Franklin survivors having been compelled to resort to cannibalism. However, there seems to be little or nothing to warrant this assumption. The Eskimos said they had found a quantity of bones from legs and arms which appeared to have been sawed off. One box was filled with bones, and what little flesh still adhered to the bones was said to have been quite fresh. Two saws were found at the same place.

McClintock, in his search for evidences of the Franklin retreat, came upon an Eskimo village near the North Magnetic Pole. Here he found many relics of the lost expedition, consisting of silver spoons and forks, a silver medal, buttons, knives, and also bows and arrows made out of the wood and iron of the wrecked ships. None of these people had seen the white men. One native said he had seen their bones upon the island where they died, and that some of the deceased explorers had been buried. Almost all of the Eskimos had plunder of some sort from the wrecked vessels. One of them told McClintock's interpreter that a ship having three masts had been crushed by the ice out in the sea to the west of King William Land, but that all the people had

anded safely. This information bears out he principal statements of Dr. Rae: that he Franklin survivors landed on the west hore of King William Land, and that they llowed the coast line southward.

On their journey of less than a month, IcClintock, a sailor and an interpreter aveled 420 miles. In April McClintock et out with a larger party, traveling south-ard along the west coast of King William and. He was told at the first Eskimo illage that two ships had been seen by the atives of King William Land, that one f them was seen to sink in deep water, hile the other was forced on shore by the e. Thereupon, said the Eskimos, all the hite people went away to the 'Big River,' aking boats with them, and in the follow-g winter many skeletons were found there. he shipwrecks, they said, occurred in the utumn.

Upon receipt of this information, Mc-lintock set out to discover, if possible, ie stranded ships. The sea, however, had vallowed them. At Cape Victoria the arty was split into two parts, Hobson aking one toward Cape Felix, King William and, while McClintock with the other arty kept a more southerly course. Hob-n was directed to search the west coast of ing William Land. Traveling in such ose proximity to the Magnetic Pole, eir compasses, they found, were wholly seless.

Crossing Wellington Strait to an in-abited snow village, McClintock and his arty found thirty or forty natives. Here ey found and purchased from the Eskimos veral pieces of silver plate, bearing the est or initials of Franklin, Crozier, and hers. These natives also had in their ossession uniforms and brass buttons, hich were easily recognized as having elonged to the Franklin Expedition. One the old women told McClintock that any of the white men in their retreat from ie wrecked vessels had dropped by the ay as they went toward the Great Fish iver, that some of them were buried and me were not. She, herself, had not seen is, but her people had discovered their odies during the following winter.

At another place they discovered a *ayak* paddle constructed out of the blade an ash oar. The party continued on to a ttle bay upon the north side of Montreal land, in the delta of the Great Fish iver.

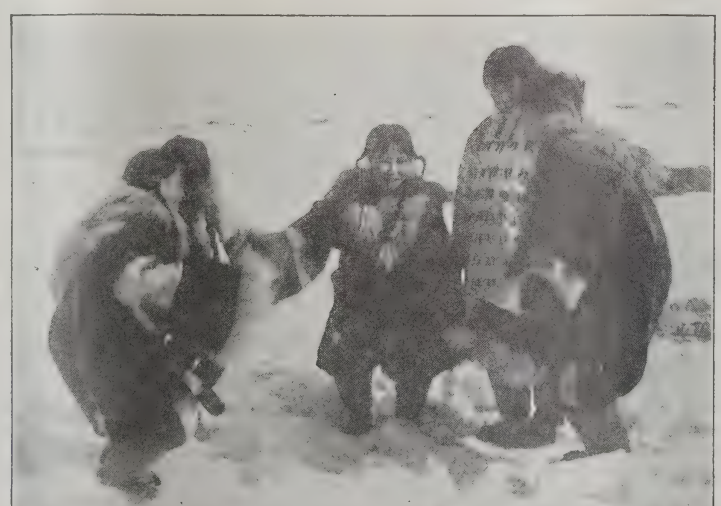
They found little here to reward them, nd soon crossed over to ing William Land, strik-g it a short distance from ie Peffer River. They were ow upon the shore along hich the retreating crews ust have marched. One ght, late in May, while alking along a gravel dge near the beach, which ie wind kept partially are of snow, McClintock me upon a human skele-n, with here and there a w fragments of clothing ppearing through the ow. Had it not been for ie snow which covered ie place, McClintock felt at a search would have rought to light many nother skeleton.

Concluding that the re-eating party must have rossed the lowland of ape Herschel, thus com-leting the discovery of the Northwest Passage, and that they must have left a record of their progress there, McClintock and his men made a diligent search of the vicinity. They found only a partly demolished cairn, however, and were forced to assume that the Eskimos had ransacked the cairn of its valuable documents and thrown them away as worthless pieces of paper. It is also possible that the natives, when they ascertained that famine, scurvy, and fatigue had caused many of the white men to die upon their fearful march, and heard of its fatal termination upon the mainland, lost no time in following in the footsteps of the explorers, searching every spot where they halted, and tearing down every mark they put up.

About twelve miles from Cape Herschel, McClintock found a small cairn which had been built by Hobson's party six days before. They had seen nothing of the wreck, or of natives, but they had found at Point Victory on the northwest coast of King William Land the only existing record of the Franklin Expedition. This was dated May 28, 1847, and told briefly that the two Franklin ships had wintered in the ice in latitude 70° 5′ N. and longitude 98° 23′ W. They had sailed up Wellington Channel to latitude 77° and had returned along the western side of Cornwallis Island.

At that time, May, 1847, Sir John Franklin was still alive. After sixteen years of silence it now became known that after the last news of the expedition was received, on July 26, 1845, from the whalers in Lancaster Sound, the expedition passed on and entered Wellington Channel, and sailed up that strait for 150 miles.

Whether Franklin intended to pursue this northern course and was stopped by ice at latitude 77° N., or purposely took a route which seemed to lead away from the coast of North America, probably will never be known. But the documents found by McClintock established one thing: that the expedition, having accomplished this examination, returned southward from latitude 77° N., which is at the head of Wellington Channel, and reëntered Barrow Strait by a new channel between Bathurst and Cornwallis islands. In 1846 they proceeded to the southwest, and eventually reached within twelve miles of the northernmost point of King William Land, when their progress was arrested by the approaching winter.



(C) *Brown Brothers.*
Eskimo girl fishing. After being frozen, the fish are eaten raw, and are considered quite a delicacy.

In two seasons they sailed over 500 miles of previously unexplored water.

The spring of 1847 found the two vessels within ninety miles of the known sea off the coast of North America. But in June, 1847, according to further entries on the records discovered by Hobson, Sir John Franklin died. In April, 1848, the two ships were deserted fifteen miles northwest of Point Victory, and the survivors bravely set out the next day for the Great Fish River. This, their last desperate struggle for life, was made rather than perish without effort on board their ships, which were still locked in the ice, and which were provisioned only up to July of that year.

When McClintock reached the westernmost point of King William Land, which he named for Captain Crozier, of the *Terror*, he came upon a large boat, which Hobson had found a few days before, but there were no records of any kind to be found in the vicinity. This boat was about the size of the ordinary whaleboat, but was of very light draft. Evidently it had been built for ascending the Great Fish River. Its weight was about 750 pounds, and it was mounted upon a sledge of unusual weight and size. The sledge alone, McClintock estimated, weighed 650 pounds. The total weight of boat and sledge must have been a heavy load for a dozen strong, healthy men. The emaciated and scurvy-stricken survivors must have found it a heavy burden.

(C) *Brown Brothers.*
The Eskimos' stories aided rescue parties to follow Franklin's route.

In this boat were portions of two human skeletons, one that of a slight young man; the other of a large, strongly built, middle-aged man. Wolves or other predatory beasts had destroyed much of the skeletons. Nearby were found five watches, two double-barreled shotguns—one barrel in each loaded and cocked—standing muzzle upward against the boat's side, probably as a protection against polar bears or wolves. There were a large amount of clothing and several pairs of boots of various kinds. There were towels, soap, toilet articles, twine, nails, saws, files, sailmaker's palms, ammunition, knives, sheet-lead, in short, a quantity of articles of little use, and likely to break down the strength of the wretched crews.

There was no food of any kind in the vicinity except forty pounds of chocolate, but a great deal of silver tableware was found in the boat. Of the many men, probably twenty or thirty, who were attached to this boat, it seemed very strange to McClintock that the remains of but two individuals were found. McClintock observed that this sledge was headed in a northeasterly direction, as if the party had abandoned their retreat to the southward, and were traveling back toward the two ships. The position of the boat was about fifty miles from Point Victory and 150 miles from Montreal Island.

Were the twenty or thirty men who must have been with the ship unable to drag it farther, and did they leave the two men whose skeletons were found, supplying them with such provisions as could be spared, to last until the return of the others from the ships with a fresh stock? Whether any of this party ever reached the *Erebus* and the *Terror* is unknown; all we know is that they did not revisit the boat, otherwise more skeletons would undoubtedly have been found in its neighborhood. On the other hand, the Eskimos say there was no one alive on the stranded ship, and that they found but one human body on board. This ship, by the way, was never found by the McClintock party.

***What Captain Hall Learned***

In the Franklin search, up to the time of McClintock, more than 40,000 miles had been sledged, including 8,000 miles of coastline. Later expeditions, particularly those of Captain C. F. Hall and Lieutenant Schwatka, were to add considerably to the total.

Briefly, this is what Hall learned from the Eskimos with whom he lived for two years: Late in the autumn, many years before, on the west shore of King William Land, the natives had found the graves of two white men to the eastward of Cape Herschel; five or six miles beyond this point another white man's grave was found; and on a small island two miles off the coast the remains of five other white men, making eight in all. The following year, Hall was told, a party of Eskimos had found a large tent, the floor of which was completely covered with the bodies of white men. Two graves were close to it. Two rowboats had also been found, and many skeletons were to be seen about them. Wherever the natives found graves they dug them open to rob the dead.

The accounts given of Franklin's ships were confusing. One of the vessels, the natives said, had been crushed by the ice and sunk in deep water. The other ship, beset by the ice, drifted near shore and was boarded by the natives. Later, this ship was crushed by the ice and sunk.

It was an American Army officer, Lieutenant Schwatka, who conceived the idea of examining the west coast of King William Land in the summer, when the snow was off the ground. The party consisted of Lieutenant Schwatka and three others. Equipped with only a month's provisions, and relying for food upon the game afforded by the region, the party, which had wintered in Hudson's Bay, set out overland by dog team for the estuary of the Great Fish River, early in April, 1879. These adventurers were accompanied by thirteen Eskimos, including women and children, and three sledges. The extent to which they availed themselves of the game the country afforded may be inferred from the fact that in the course of the expedition they killed 522 caribou, besides many musk oxen, polar bears, and seals.

On the way to King William Land, Lieutenant Schwatka once came upon an Eskimo village before which the men were drawn up in line of battle. An old Eskimo woman was sent to ascertain who the newcomers were and what they wanted. After a few friendly overtures, Lieutenant Schwatka found that it was the custom of the villagers to kill the first stranger who came among them, after a death in the village. But he was spared.

***Snow May Still Cover Relics of Franklin's Men***

Numerous knives, forks, spoons, pans, cups, plates, and other relics of the Franklin survivors were recovered by Lieutenant Schwatka from the Eskimos at King William Land. They also secured a valuable relic in the sledge seen by Sir Leopold McClintock in Erebus Bay eighteen years before, which at that time carried a boat with several skeletons beside it.

Much of the country through which they passed swarmed with caribou, so that on almost every hillside the breath of the herds rose like clouds of steam. The frozen caribou meat had to be sawed and broken up into lumps of a convenient size. When first put into the mouth, these were as hard as stone. Sometimes, however, the meat was cooked with moss gathered from the hillside. The luxury of warm food was possible only on the days when they stayed in camp, as it took nearly four hours to gather the moss and cook the meal.

After the expeditions of Rae, McClintock and Schwatka, we now know all that we shall ever know of the fate of the Franklin survivors. We know how the explorers perished, where, and, with some reasonable degree of certainty, when. All honor to their memory!

The reader perhaps wonders why so few of the bones of the lost explorers were found. Experts agree that these men, who were compelled to drag their boats and sledges upon the sea ice where there was a level roadway, and where the wind had packed the snow tightly, were left wherever they fell, and probably covered up with ice and snow. When overtaken by death and buried in this fashion, these bodies probably found their final resting place at the bottom of the sea when the ice thawed the following summer. It is not altogether unlikely that some of these bodies may still be held by the ice, for in this part of the world ice might drift to the northward and be held there a century. It is also likely that the snow which covers the coast line of King William Land concealed from the McClintock expedition, and may even conceal to this day, many traces and perhaps skeletons of the lost Franklin followers.

# The Secret of the Franc's Collapse

(*Continued from page 6*)

The Morgan credit of $100,000,000, at three cents, would mean a total of 300,000,000 francs. Assuming it would be used in its entirety, it yet remains a question as to how the franc's movement can be aided when the number of available francs for saving service is not only so low in comparison to total circulation, but has been borrowed to boot!

Frankly, the Morgan dollar loan is of little aid to the French people. As an arm in the hands of the French Government for punishing speculators and 'bears' on francs it is quite useful, since it enables the authorities to kill off all fiscal or financial intrigues against French money, but it has no force or efficacy in rising values at will. In other words, if the franc at 3.5 American cents were attacked by speculators and dropped half a cent, prompt action by the French Government, via the Morgan loan, would turn the tables on the speculators and restore it to its former level, or nearly so. But beyond that the government at Paris has no power. That is why the cabinet has fallen so often.

The recent downward movement of the franc is a natural one, judging by all available data. Observers who may be considered impartial, politically and financially, believe that speculators had no part in the recent decline. Two years ago, when the franc dropped to about 3.5 cents, government intervention raised its value to nearly seven cents, or 100 per cent. Dollars were freely used by the government to force speculative interests to disgorge.

It is an ominous declaration, however, which comes from Paris that the French Government this time sought to do nothing more than prevent 'a panic.' The fact that a panic was thought of is self-explanatory. It is the first time in post-war French fiscal history that the word has seriously been mentioned. Financial Paris professed to be satisfied with the government's attitude, as against that of 1923 when a spectacular recovery was forced.

The fact that speculators are now very cautious about the franc is a corollary incident worth noting. It may be an indication that economic laws are about to dictate future fluctuations.

One has been hearing a great deal about the fiscal reforms promised by French statesmen. One of these, about which we have been reading with almost daily regularity, is that the French people, having paid all they could for a terrible war and borrowed the balance, were not in the mood to be taxed more than their approximate 20 or 22 per cent. No French politician could survive who favored the imposition of a stricter tax, was the impression. Accordingly, politics was played that way.

The French people are thoroughly and fully taxed. It is their taxation policy and collection system that is at fault. It is the amount collected that is insufficient, and, most likely, the uncollected proportion is greatest in that group that can best afford to pay taxes. Of course, collecting taxes in a country which does most of its business on a cash-and-carry basis, so to speak, is much more difficult than in the case of a country whose chief business is on credit and therefore of record.

The government has now decided to intrust a 'committee of experts' with the

formulation of another plan for financial reform, with a view to placing it above political issues. As to these plans, singly or together, nothing can or need be said until they are formulated and tried. So far every reform has failed. Much was expected of the so-called debt settlement. News of the agreement failed to bring about that miracle of exchange upon which so many had calculated. It is now realized that the debt settlement, on paper or otherwise, cannot possibly stabilize the franc or any other creditor's money.

Exaggerated estimates have been made as to how much the American tourists leave in France. Last year one such estimate had it that $400,000,000 were left there. That is absurd. It would mean that 100,000 tourists spent *in France alone* $4,000 each in one year. It is doubtful if more than a few thousand spent more than $400 apiece. With a depreciated or falling franc the total is not likely to be much greater this year, unless the government takes radical measures, such as severe export taxes or balancing export fees, which would in effect yield the government the difference between the franc buying value and the 'gold' purchase value.

Germany, it will be remembered, established such an arrangement when it was found that foreign buyers began to empty the country of articles bought when the mark was virtually worthless. Germany had no precedent; France, on the contrary, may have the benefit of several precedents against the sorties of such visitors.

The French people are beginning to be worried because several years of promises have taught them that the silvery voices of politicians leave no residuum in their pockets.

They are perhaps ready to submit to the franc's stabilization. The hope is to get the politicians in Paris to see it that way. If they do not, something else may happen to them which they won't like. Rural France in particular will not be courteous or tractable if the franc's value dwindles further.

# What's Wrong With Our Higher Critics?

(*Concluded from page 7*)

make us very careful how we call down fire from heaven upon men engaging in some form of Bible study which we do not happen to understand or see need of.

The higher criticism is of quite another sort. It has nothing to do with all that complex series of critical questions which relate to the age and character of manuscripts. It takes the text where the lower criticism leaves it, and asks concerning each book who wrote it, when it was written, where it was written, and why it was written.

Now for some, perhaps, it does not make very much difference when parts of the Bible were written, or by whom. If the 23d Psalm had never been published until this morning, and appeared for the first time in the daily papers, it would still be a beautiful and inspiring composition. If the 13th chapter of *I Corinthians* could be proved to have been written, not by St. Paul in the First Christian century, but by Thomas Carlyle or Ralph Waldo Emerson in the nineteenth, that would not wholly take away the glory or the beauty of its sentences. Nevertheless, it is worth while to know, if we can know, who did write them.

***The Bible Was Written in Pieces***

There is only one way to find this out and that is by the higher criticism.

Higher criticism is a highly specialized science. In a certain sense, anyone who has an opinion concerning the authorship or the date of any book or part of a book in the Bible is a higher critic. If you have read the first Gospel through, and having read it believe it was written by Matthew, and have formed that judgment in any other way than by reading the title of the book, you are a higher critic, and the same if you believe that someone else wrote it. If you read the second Gospel and believe as I do that the Mark who wrote it was the same John Mark who traveled with Paul and Barnabas, you are a higher critic.

You may, if you like, ask what is the use of knowing or inquiring, and the answer is that if you think there is no use you are under no obligation to inquire, but you have no right to forbid other people inquiring and learning the answer if they can.

But someone will say, 'Higher critics cut the Bible to pieces.'

The Bible was written in pieces and distinctly says so. The very first verse of the epistle to the Hebrews says, 'God spoke in old time to the prophets in divers fragments and in divers manners.' We have a perfect right to find out, if we can, in what fragments the prophets spoke and who put the fragments together. We have not only that right. It is our duty to learn if we can.

***Fools Not All on One Side***

This process involves the necessity for historical and literary criticism, and of patience and skill. The men who do it do not do it for fame, for there is very little honor and far more abuse in the process. For the most part, they prefer not to have very much said about their work, because the large number of people who know about it know just enough to misunderstand and abuse them. They work diligently, painstakingly and laboriously. Nor do they work for money. Their salaries are small.

Are their results destructive? Do they take pride in finding how much they can throw away? Is there any danger that they will take away from us our Bible?

If the Bible were so feeble and faulty a thing that they could take it away, we should not lose very much by their taking it. They could not take it from us if they wanted to, and they do not want to.

'But they say Moses did not write all the *Pentateuch* and that the book of *Isaiah* was written by two men and maybe more.'

If they say that Moses did not write the whole of the *Pentateuch*, there is at least a chance that they may be more nearly correct about it, after their long study, than the people are who have never studied the question at all. As for the book of *Isaiah*, anyone who reads it can see that its prophetic parts are in two sections with an historical section in the middle. In the first part, the name of Isaiah is repeatedly mentioned, but his name does not occur in the second part. If these critics believe that Isaiah wrote the part which he says he wrote and did not write the part which he does not say he wrote, it is at least possible that they may be right. It would be better to read the book itself and see what is in it.

It is certainly true that a good many men who have learned something about the higher criticism have talked very wisely and foolishly and sometimes destructively about it. The fools are not all on one side by any means. On both sides, the less people know about it, the more likely they are to talk about it and the more angry they are likely to get.

One certain thing we might well afford to believe is that no discovery of any truth about who wrote the Bible or any part of it can ever take the Bible away from us, or make it any less sacred than it is. And another is that where there is so much to learn, and we know so little, we can all afford to be patient with each other and help each other when that is possible, and wait for larger knowledge.

***Not Religion But History***

And yet there is a danger in the higher criticism, and it is one for which those who believe in it are to blame. In many cases they have given us the results of their study in negative instead of constructive form. They have seemed proud of their learning and ruthless in the exercise of it. They have seemed to take delight in shocking sensitive people and in making light of things regarded as sacred. Theirs at times has been the sophomoric type of scholarship that belongs to the medical student when he cannot look upon another human being without thinking how nicely he would cut up.

But the remedy for this is not to close down the dissecting rooms or forbid the Biblical scholars to do their work, but insistence that they should go on through the course to the constructive part. For none of the questions of the higher criticism are religious questions. They are literary and historical questions. For instance, let me use an illustration that belongs to a part of the Bible where no one can think a difference of opinion vital.

The Jews were accustomed to write the Old Testament on sheets of skins, arranged as rolls. They wrote habitually the whole of the *Pentateuch* on one roll, a large one, and the little book of *Esther* on another, a very small one. To each of the major prophets they usually gave a roll, but they put all the minor prophets on one scroll together. They liked the number twelve, and they grouped those short books of sermons so that there should be twelve. They were thinking less about individual authors than of making a book of a sacred number. They had a little book of prophecies by a very useful though not brilliant prophet named Zechariah, and they had a little book with nobody's name attached to it which lengthened it out nicely, and they added these chapters. Now, just as soon as you read the book that bears the title *Zechariah*, you see that the first part of it was evidently his, and that the last chapters say nothing about him. Is there any authority that compels you to believe that those anonymous chapters also are by Zechariah? If so, why do they not say so? They might be by Zechariah, but whether they are or not is clearly a matter of judgment. Personally, I am confident that those chapters are a separate little book, and a very interesting one. They could add nothing to the fame of Zechariah, and it would puzzle us if we believed that the conditions described existed in Zechariah's day. We know there was a time when just such conditions did exist, and we are glad that God did not leave those times without witness. I certainly believe that the last chapters in that book were written by another man whose name we do not know. If we needed to know it, we should have it.

***Last Chapter of Zechariah's***

But this belief of mine is not an article of faith. It is a judgment based on thoughtful and reverent study. But it is not a religious matter. Another man equally religious might have an exactly opposite opinion.

This map shows the great continent of Africa. Where the trees are indicated was wild country, and we read in this story how men have explored it and made it known.

# Africa—Land of Ivory, Gold and Diamonds

By H. K. W. KUMM

WHEN Homer wrote the *Iliad* and *Odyssey*, the first great epics, he referred to the gods' holiday among the blameless Ethiopians. Theirs was a land fit for a visit of the gods.

After Troy had fallen, and the wanderer Ulysses sailed the deep in quest of home, he early found his way to Africa, the land of the Lotophagi, where luscious food tempted the visitors to forget their far-off homes and stay to eat the lotus all their lives.

It is a common saying in the land of Egypt that he who tastes the water of the Nile will drink again of that strange, muddy liquid. It was up the Nile to the far interior, so the priests maintained, that the souls sailed in the bark of death to the land beyond the grave.

Greeks thought of Africa as an earthly paradise, and Egyptians of the heart of the Dark Continent as their heaven.

Rich is this continent in memories of the past. Long before Troy was built and after Troy had fallen, Thebes stood, the City of a Hundred Gates, capital of the upper and the nether kingdom.

When Aeneas, the Trojan, fled from his ruined city, after long journeyings, he found his way to Carthage and from Queen Dido took land such as an ox's hide might cover, on which to build his new home in the land of Libya. Thin they cut the strips of ox hide and surrounded land enough to build thereon a city, thus, Virgil tells us, Carthage was founded long before Rome, the Eternal City, had been thought of. For a millennium Carthage stood, for 500 years Rome's rival, till Scipio Africanus and the younger Scipio dealt with the mistress of proud Mauritania. The younger Scipio plowed the ruins of that city, and with salt he sowed them, thus he cursed the land, and thought forever to have ended the life of Carthage. Never again need Roman senator proclaim his *'Ceterum censeo Carthaginem esse delendam'* (as to the rest, I think Carthage must be destroyed). Yet Carthage rose again out of her ruins like a phoenix out of ashes, and gave the world three fathers of the Christian Church, Tertullian, Cyprian and Augustine.

When the Anglo-Saxons lived, dressed in skins, in Northern Europe as savages of the ultramontes, North Africa had a brilliant civilization. The greatest library was in Alexandria. Both Arius and Athanasius were bishops of that city. Here the first Christian college was established, the Bible first translated. Here the first lighthouse stood, the first geographers wrote and made their maps.

Archeologically and historically North Africa has a rich past. Great also is Africa's wealth of flora and fauna. Man may scar the earth's surface in the tropics. He may burn down the wilderness, cut roads through the jungles and send villages up in flames, but six months later deeper green than ever will have hidden his handiwork. The measure of rain is the measure of the foliage and the food supply. Light and life in nature are closely related and as Africa is the continent of sunshine, *animal and vegetable life is prolific.

A rainfall map of the world and density of population map are curiously alike except when we deal with the maps of Africa. Here rainfall and food are no indication of density of population. The determining factor of human life in Africa is not sunshine and rain but health. On this question more will be said later.

If Africa is rich in her flora and fauna she is still more highly dowered by her mineral wealth.

The export of gold from South Africa during 1923 was valued at $130,000,000 out of a total of $340,000,000. Considerably more than a third of the whole export of South Africa consisted therefore of gold, and this gold output is still on the increase, despite its being spoken of as a waning industry. The May, 1924, output for the Transvaal exceeded 800,000 ounces and so created a record. Two important new mines have just arrived at the crushing stage. The fact that the Witwatersrand gold output has on the whole been steadily increasing, that the output for 1923 had been surpassed only once and that under pressure of war, that so recently as in May, 1924, a record production was returned, seems to contradict any arbitrary statements that the zenith has been passed.

The export of gold from the Gold Coast during 1922-23 amounted to 204,073 fine ounces valued at about $4,000,000. Africa supplies today half the gold of the world and there is gold in Southwest Africa, on the Congo, on the Upper Benue, in the Libyan Desert waiting for development.

The diamond industry has not yet reached its pre-war standard. The unsettled state of Europe prevents the poverty-stricken people from purchasing precious stones, and as the DeBeer's mines of South Africa throw only enough diamonds into the world trade to supply the need, we have in this diamond trade a fairly correct index of world prosperity. In 1912 South Africa exported 4,440,000 carats of diamonds valued at nearly $45,000,000. In 1923 the export was 2,428,849 carats valued at $32,000,000. As the South African diamonds provide four-fifths of the diamond output of the world, and indeed control the diamond trade, nothing further need be said about

*Mean daily sunshine in hours: Aberdeen 3,5; Rome 6,5; Cairo 8,5; Kimberly 9,3.

hese valuable African mineral assets hich can be almost indefinitely developed s the wealth and the need for diamonds in he world increases.

Far more valuable in world commerce ven than diamonds is coal. The coal mining n South Africa has reached 12,000,000 tons year and the mining is still in its infancy. he price of coal is as low in South Africa s anywhere in the world. Cheap negro abor has much to do with this. New coal ines have lately been opened in Rhodesia; thers in the Katanga and still others in outhern Nigeria. There is coal enough in frica for Africa.

A platinum riff has just been discovered n South Africa and radium-bearing ore is eported by the Belgian Government on the pper Congo. The Belgian Congo Governent goes so far as to say that these radium re deposits are rich enough to supply the eed of the world. The Katanga district, here the radium ore was found in close roximity to coal, has further become mous for a mountain of almost pure pper. To bring this copper into the world ade a railroad is being built from Lobito ay in Portuguese Southwest Africa to the atershed between the Congo and the ambezi at the cost of some $75,000,000. bout half the line is now in operation.

When in 1904 the writer rode on horseack across the Bukuru Plateau in West entral Africa he purchased from the natives etal ornaments that looked to him as ough they were made of lead. Two years ter the Niger Company sent an expedition f mining engineers to that plateau; what oked like lead was soft black river tin, nd now fifty-five tin companies are exloiting the tin deposits of the Bukuru.

I think the point is proved that Africa's ealth in minerals is very great, and iron as not yet been mentioned—that base etal basic of all developments today.

The backbone of Africa is known to the eographers as the Central African ironone plateau. A plateau larger than the nited States holds an utterly unexploited ealth of iron. If Carnegie could build braries for the world out of the iron dug Pittsburgh, some future Carnegie may ackle the virgin iron wealth of Africa and se it through medical research to put an nd to the diseases of the world.

We may gain an impression as to the mparative importance of the various arts of Africa in world trade by looking at he export figures. Egypt havg the densest population of frica, at least along the Nile and the Delta, shows an export of 300,000,000. †If we compare is with the export of America appears that the individual gyptian exports about half as uch as the American, but if we mpare the export and import Egypt and America with the ltivated acreage, the export of gypt per cultivated acre is far excess of America. Algiers exorted in 1923 goods valued at mewhat more than $108,000,-00. Tunis $27,000,000, the rench Congo $42,000,000, Brith East Africa about the same, outh Africa $320,000,000, Niria $47,000,000, the Gold Coast 37,000,000, Sierra Leone $6,-00,000, French Senegal $21,000,-00 and Liberia $1,000,000.

Africa, immeasurably rich in aw products, shares in export of world trade but to the extent of 3.3 per cent and 3.6 per cent respectively, and as her land volume is one-fifth of that of our globe, her world trade is but one-sixth of the average.

Many of the greatest harbors are river harbors, New York on the Hudson, London on the Thames, Hamburg on the Elbe, Buenos Aires on the LaPlata, Calcutta on the Ganges. Africa with the exception of the small town Boma on the Congo has no river harbor of importance. Her great cities, except Cairo, do not lie on rivers.

Health in Tropical Africa, unusually bad in the deltas and estuaries, prevented the development of river harbors.

In 1910, Africa's share of the shipping of the world was but seven per cent; shipping carried in foreign boats, and as the tonnage at the different harbors was aggregated to reach this figure without considering that the same vessel might call at three or four and sometimes more places for her cargo, even seven per cent is probably more than twice too high. Three per cent of the world's shipping would be more the true share that Africa has at present.

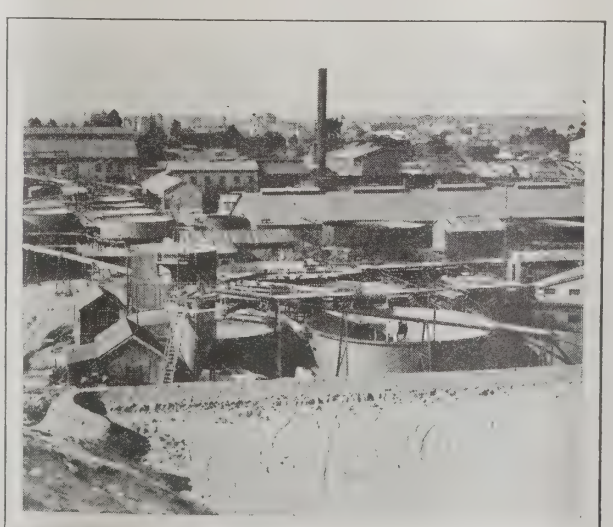
It is commonly held by geographers that on the East Coast of the United States, between Boston and Washington, will be found the densest population, and here will be established as the days go by the financial and industrial center of the world. There are various geographical reasons for this which may be found in Semple and Huntington's books. The East Coast of America will need more raw products.

In West Africa we have one of the greatest storehouses of the world, little farther from New York than San Francisco. Why send for our rubber to the East Indies when there is any amount of it nearer home on the Guinea Coast? Why send for our copra to the South Sea Islands when we can get it on the Ivory Coast, less than one-third of the distance? This country will need more vegetable oil. There is any amount of it on the oil rivers in Southern Nigeria. We are already going for our cocoa to the Gold Coast, and for our mahogany to the Ivory Coast. There is ebony on the West African rivers. There is gum in the Sudan, and much ivory in Ethiopia.

And—Rubber! At present only one-fourth of one per cent of the world's trade in rubber comes from Africa. We have under our wings, in West Africa, Liberia, a country where almost enough rubber could be secured to meet the needs of the United States.

—*Ewing Galloway.*

South African waterfall, one of many caused by escarpment of plateaus.



A rubber tree requires about six years to become tappable and ten years to bear fully. This fact causes the average American to hold back in investing in a project which will tie up his money over so long a period without return.

A great storehouse has been provided for us on the other side of the Atlantic whence we may draw cheaply and quickly most of the raw supplies we need. Millions of tons of kapok (silk-cotton) annually go to waste on the West African rivers. Why deforest our country when the tropical forests of the Niger and the Congo are so near at hand? To sum up, the Atlantic States of the United States will shortly be looking for nature's supplies to feed their mills and factories. They will naturally turn to West Africa.

What an opportunity for men of vision lies here before us—a continent to be developed. And there is but one drawback: Tropical Africa is held by dangerous defenders, the unseen miasma and microbes of deadly diseases.

Africa was first really opened to the knowledge of the modern world by Prince Henry of Portugal, called the Navigator. His victorious campaign of 1415 against the Moorish citadel of Ceuta roused his interest in the unknown continent, and he sent repeated expeditions down the coast to determine the extent of the continent. Finally one expedition returned with ten negro slaves and some gold dust. That blazed the trail for the demoralizing slave trade that followed during the next four centuries. Gradually the interior was penetrated, daring men lost their lives, as pioneers must, but the West African Coast became familiar through commerce and sailing charts.

English and other European explorers followed the Portuguese in the late 18th Century, and the 19th Century was marked by the entrance of the distinctly scientific spirit into African exploration. This promises to turn the key to African wealth and convert Africa into a continent whose riches are not only known but accessible—riches that may prove the solution to knotty problems.

# Boyhood Impressions of Emerson

(*Concluded from page 15*)

Emerson always drew an audience to the capacity of the spacious hall. We were in war time; and Emerson sometimes found his theme in contemporary events; but generally he invited us to consideration of the perfect good and fair and we forgot the present in the eternal.

I have intimated that he was not a model of physical symmetry; but as he faced his hearers and began to speak, the spirit gradually possessed him, and we saw him only as the transparent medium of his message. He would stand with the right hand gripping the fingers of the left as they hung in front of him, and with his manuscript on the desk before him, glancing down at it occasionally, though the sentences were obviously in his mind. But for the most part his head was lifted, and he looked, not at us, but over and beyond us to the invisible Muse who was the inspirer and confidante of his thoughts. His countenance was ennobled, and the light of his eyes beamed out under the sweep of the upper lids with the look of an eagle—of the eagle of Jove himself. Few and concentrated were his gestures; indeed he commonly confined himself to a single one: with elbow at the side, to bend his right arm tensely, with the fist clenched; then to bring it down again with power.

It was immensely effective; and once, long afterward, when it was my fortune to watch Billy Sunday going through his frenzied and farcical calisthenics for the redemption of souls, I remembered Emerson standing above us, and drawing the very souls out of our bodies by the strong and varied harmonics of his speech and aspect.

Men of mind, whose work is done in solitude, are apt to appear shy in public. But Emerson's modesty never took the form of personal self-consciousness, and his faith in the verity of his ideas was modified only by the feeling that he might not be giving them adequate expression. But, warmed by his theme, he soared unfaltering, and the big space was filled by the penetrating sweetness of his voice, a masculine sweetness, which kindled into flame whatever was worthiest in the hearer.

***His Modesty Was Never Self-Consciousness***

There was something in the manner and tone of his truth-speaking which was as convincing as the subject matter; so that persons who had not been able to fathom the depths of his argument, went home enlightened: they had breathed the atmosphere of the heights. And there was a freshness and surprise in what he said that made it seem not only new, but as if he himself were making his maiden utterance: none of the hackneyed tricks and devices of the accustomed orator. It came from him untainted, impulsive, like the powerful song of the thrush heard in the hush of dawn.

Sometimes absurd happenings would take place. Once, in the midst of an eloquent period, some chance gust of air swept the leaves of his manuscript from the desk and scattered them over the floor below. His face at once showed a sympathetic consternation, not for himself but for his audience. He hastened down the steps of the rostrum and began to gather up the fugitive petals of his flower of wisdom, and the people in the near benches scrambled hither and thither to give what help they might; when all had been collected, he climbed back to his place and, after restoring the pages, each to its place, resumed his reading with no sign of flurry or embarrassment. Again, one rainy night, his boots creaked horribly at every change of posture; there had been wet weather, and the soles had warped. Consequently every sentence was accompanied by a raucous noise utterly incongruous with the melodious passages. We groaned in spirit, but Emerson never flinched. Mind could seldom more thoroughly conquer the rebellion of matter. He said his say faithfully and composedly to the end, and would not be so shallow as to apologize for the mishap.

His lectures, I suppose, contained the substance of what was afterward to be published as essays. Whatever he put forth, either in speech or in print, commonly had the quality not of sustained and cumulative argument, but of a succession of insights or intuitions, arranged more or less consecutively. His was not what we would term a great intellect, but he had a nature, and organization, exquisitely sensitive to abstract impressions and ideas. These he would record as they visited him, and would bring together such as were accordant in their tenor; afterward he would review them, and link them by reasons into a fabric more or less harmonious. Thus his essays contain passages which we recognize as inspired, connected by others of a less elevated character. Isaiah, and some others of the Biblical prophets, made no attempt to unite and justify to human sense the accents of the Holy Ghost that came to them; but Emerson always did what he could to join the loose ends of his visions—to bring soul and flesh into some relation. Perhaps he would better have let them alone. We find ourselves quoting not his accommodations, but his insights—they are 'Emerson.'

***His Essays First Appeared as Lectures***

After a sojourn of several years in Europe, I came back to Concord to learn that Emerson was slowly fading out of bodily life: he had long since ceased to write for publication, or to speak in public; his external memory seemed to have been wiped clean of records. I called at his house therefore less with expectation of conversing with him, than of paying reverence to a man who had revealed to me high ways of life.

Ellen Emerson received me at the door. Her face, handsome and striking, was little changed, except that it was graver and more transparent; she had always been something of an enigma. She had applied herself to keeping the reins of the household firmly in her hands. She was a strong element in the life of the village, for she had sound judgment and kindness, and her sympathies were wide. Wordsworth says of Duty,

'Nor know we anything so fair
As is the smile upon her face'

and the principle and practice of Ellen's life was to win that smile. But when her father began to fail, she devoted herself to his personal service, in which duty and love united. Though her mind was cool and practical, and unable to follow her father's flights aloft, she lived in him—filled out his needs with her fullness, guarded him, spoke for him, was hand and foot for him. She divined his wants without speech, and silently and invisibly supplied them.

Ellen had never worn a hat or bonnet; her dense and long black hair smoothly drawn beside her face and mounded behind in a twisted braid was the only head-covering I ever saw on her. Now, as she stood in the doorway at my last visit, that sable crown had turned gray, though as thick as ever. She gave me her hand with a smile and said, 'Yes, you may see him.' For a year past, only a few old friends had received that permission.

She led me into the study, where Emerson sat in his chair, his hands resting inert on his knees; he seemed as if dreaming awake, tranquil and benign. For a moment, I could see no change in him; but as I looked in his face, I perceived that something had departed. He was only dimly aware of a visitor, and presently he said, 'Ellen, who is this gentleman who is kind enough to call on us?'

'This is Julian Hawthorne, father,' she replied.

'Julian?—or, yes, Julian—Julian Hawthorne—I am glad.'

His voice died away, I could not speak for a few moments, and there was silence. Ellen shook her head with a faint smile. But he roused himself and asked again, 'Who is this gentleman, Ellen?'

She repeated my name, and he tried to hold the recollection, but it flitted from him again. I made some remark; he listened, but lost the thread, and merely murmured vaguely in reply. Ellen gave me a quiet glance, to indicate that it would be best to withdraw, but I, remembering his friendship with Carlyle of half a century ago, mentioned the old warrior's name: Carlyle, at the time I left England, had been himself sinking into silence.

***Hawthorne's Last Visit with the Essayist***

A vibration passed through Emerson, and after a moment he straightened himself in his chair, lifted his head, and life flowed into his eyes and face. 'Carlyle—yes—Thomas Carlyle! I know him—we knew each other: I remember very well. I was in London: he had written *Sartor Resartus:* I found him better even than his book: we talked together.' And with his gaze fixed upon that long-past episode, he spoke with increasing vigor and point; he was Emerson in his prime once more. His words came slowly but firmly, with the old rhythm and music: it was wonderful and moving to see and hear him. But after a few moments, in the midst of a sentence, he hesitated for a word, and before he could find it, the inspiration had passed. He sank back in his chair, the veil fell again over his features, and presently came the mild inquiry, 'Ellen, who is this gentleman . . .'

My impression was, not that Emerson's mind had decayed, but that he had slowly, as the end approached, withdrawn himself from the outer world into a secret retreat where he was preparing himself for the end. But the name of his old and honored friend had penetrated to him there, and had drawn him back for a while to mortal thoughts. It was the final appearance: he died soon after I had bidden him farewell. His pure and beneficent spirit is still with us, however, and perhaps the help he gave mankind is better realized and more valued now than when the pine-shaded house in Concord still held him.

# When Morgan Picked a Presidential Nominee

(*Continued from page 3*)

called in his piping tone. Mr. Cortelyou stepped beside him.

'Mr. Cortelyou,' he continued, 'will you please make an appointment with Mr. Benson to call at my hotel at 2:30 this afternoon.'

My desire to say something that would occasion a little conversation with the President had succeeded beyond expectations. I told James Schermerhorn, publisher of our paper, about it, and he also was pleased. He went along with me to keep the appointment in the afternoon. His coming furnished a little humor to the situation. When he, Roosevelt and I were closeted in Roosevelt's bedroom, Roosevelt turned to me and asked if I wished to talk before Schermerhorn. Inasmuch as Schermerhorn was my boss, I let him stay.

*He Has Selected Parker to Run Against Me*

The President seemed subconsciously to know that I hadn't a word to add to what I told him at the Alger reception, because he immediately started in to do all the talking.

'What you told me this morning,' he began, 'exactly fits information that has come to me from other sources. Pierpont Morgan told the same thing to a friend of mine. Morgan has been over to Europe where he was entertained by the kaiser and is all puffed up with a sense of power. He told a friend of mine that he could stand everything about my administration except what he called my "intermeddling with the trusts." That he could not and would not stand. I understand that Morgan has selected Alton B. Parker to run against me on the Democratic ticket.'

Nobody outside of New York had ever heard of Parker—at least I hadn't—and I asked who he was.

'Oh,' replied Roosevelt, 'he is chief judge of the New York State Court of Appeals.'

Then Roosevelt, who had sought me in the hope of gaining additional information which I did not possess, proceeded to add to my information. The subject of who his adversary in 1904 might be seemed so to fascinate him that he liked to talk about it.

'I can see,' he continued, 'that Morgan has been talking to Senator Hanna. I asked Hanna a while ago, where he stood. "Mr. President," he replied, "I am for you now. I may be for you in 1904, but I cannot tell. I make no promises." '

*No One Would Give Credit to the Story*

That was that. Roosevelt left town the same evening. I went over to the office, wrote under a Washington date line (so as not to reveal the source of my information) all that Roosevelt had told me, giving no authority for the article, but vouching for its truth. We printed it on the first page the next day under eight-column headlines, but none of the other Detroit newspapers would even rehash it. We offered it to the press association that served us with telegraphic news, but they would not touch it.

This was in September, 1902. Nothing happened until about February, 1904. One wintry afternoon, a three-line telegram trickled in from some place in Texas to the effect that a Democratic county convention had instructed its delegates to the Democratic National Convention to vote for Alton B. Parker as the Democratic candidate for President. It was a moral certainty that not a dozen persons in Texas except lawyers had ever heard of Parker. I printed the dispatch under a good head and added to it the substance of the article we had printed a year and a half before. And again this news attracted no attention. Everyone thought the Democratic nominee was going to be somebody else. But along in the summer Parker was nominated just as Roosevelt, almost two years before, had told me he was likely to be. To this day few persons know that Morgan nominated him.

ALTON B. PARKER.

That is the only nomination that I ever saw from the inside, but the late Wharton Barker, of Philadelphia, told me of two others in which he pulled the strings himself and actually put his men in the White House. One of the men was Garfield. The other was Benjamin Harrison. The Garfield story is particularly interesting, because it is so in conflict with what passes for the history of the event.

Garfield was nominated for President on the thirty-sixth ballot at the time when the friends of General Grant tried so desperately to nominate him for a third term. Garfield went to the convention as the chairman of the Ohio delegation which was instructed to vote for John Sherman. Sherman always accused Garfield of betraying him, which of course Garfield denied. The fact that Garfield voted for Sherman for thirty-five ballots seemed to exonerate him.

Wharton Barker, however, showed me original letters from James A. Garfield, written as early as 1879 upon the stationery of the House Committee on Ways and Means of which Garfield was a member, in which Barker's plans for nominating Garfield were discussed. The letters did not prove that Garfield was plotting disloyalty to Sherman, but they did tend to substantiate Barker's statements to me as to how he had planned and brought about Garfield's nomination. Regardless of whether Garfield was trying to grab the nomination for himself, Garfield knew of Barker's plans, helped to put them into effect, and Garfield was nominated.

Barker had everything arranged very carefully, and every particle of the arrangements, so Barker said, was known to Garfield. Barker sat where Garfield could see him and was told to keep his eyes on him. Whenever Barker put his thumb in the armhole of his waistcoat, Garfield rose and spoke to the question at issue, always taking care to speak in such a manner as to offend nobody and to make an appeal to the patriotic and other noble sensibilities of the delegates. Groups of handclappers hired by Barker were stationed about the hall to start applause whenever Garfield arose and when he sat down. Grant's 306 delegates stood by him to the end, but when the rest of the convention became tired of the deadlock, Barker put Garfield over.

*How Garfield's Nomination Was Arranged*

Barker got the surprise of his life when, a few weeks after election, he went to the home of the President-elect, at Mentor, Ohio, to talk things over. Barker told me that Garfield had promised him, if elected, to appoint him Secretary of the Treasury. Barker had a particular liking for finance and came from a long line of Philadelphia financiers. Jacob Barker, an ancestor and a Philadelphia banker, helped Dolly Madison rescue George Washington's picture from the White House when the British set fire to it during the War of 1812. Barker came from good stock, was experienced in finance and much wanted the secretaryship of the Treasury.

But he didn't get it. Garfield, so Barker told me, flatly went back upon his promise, making no other excuse than that he could not keep it. Instead, he offered Barker the secretaryship of the Interior, which Barker haughtily refused. Barker never forgave Garfield for breaking his word.

Barker also told me that in 1888 he brought about the nomination at the Republican National Convention of Benjamin Harrison. I do not recall the details of this story so well, except that he had carefully planned everything as he had in the case of Garfield. One thing, however, I distinctly recall. The convention had adjourned in the small hours of a hot, sultry, Sunday morning, until Monday morning. Even at that late hour Barker hustled over to the Grand Pacific Hotel where Harrison was staying; but Harrison had beaten him to it and was in the bathtub. Harrison called to him to come into the bathroom, anyway, and there they talked, Barker sitting on a stool and telling the candidate what to do next, while the short, pudgy, bewhiskered

*Barker Told Harrison to Leave Town*

Harrison lathered his body with soap and splashed about like a small hippo.

What Barker was in such haste to tell Harrison was to get out of town at once.

'You will be nominated at the first session tomorrow,' said Barker. 'Everything is all set and there is no chance that anything can go wrong. At any rate, you can do nothing by staying here and it will be more dignified if you receive the news of your nomination at your home in Indianapolis.'

*Barker Was Once Candidate for President*

Harrison took Barker's word for it, clambered out of the tub, dressed and just had time to catch an early train for the Hoosier capital. The next day, at his home, he received the news of his nomination.

Barker, who, by the way, was a great old fellow and himself a candidate for the Presidency on the Middle-of-the-road Populist ticket in 1900, told me these stories and many others one wintry afternoon perhaps fifteen years ago when I had stopped off to see him about something on my way home from Washington. After telling me about the Garfield and Harrison nominations he switched to Czar Alexander I, whose representative in the United States he was whenever the czar wanted to order a warship in America, and from the czar he flitted to China where he had spent months at a time on business for the czar. Barker, on these visits, had met all of the great Chinese statesmen of his day and to hear Barker talk about China and the Chinese was a delight.

We began talking at three o'clock in the afternoon. The early afternoon shadows of winter began to fall, and as he still seemed to be interested in talking I stayed because I was eager to hear. Finally it became dark, but we were in China and it did not matter. Barker did not turn on the light, but enough came in from the street to enable us to see a little. As a matter of fact, I doubt if Barker realized that night had come. I did not care if it had. I got a late train back to New York that night, but it did not matter.

The next time I saw Barker was just before the Republican convention that nominated Harding.

*Age Did Not Dim His Interest for Politics*

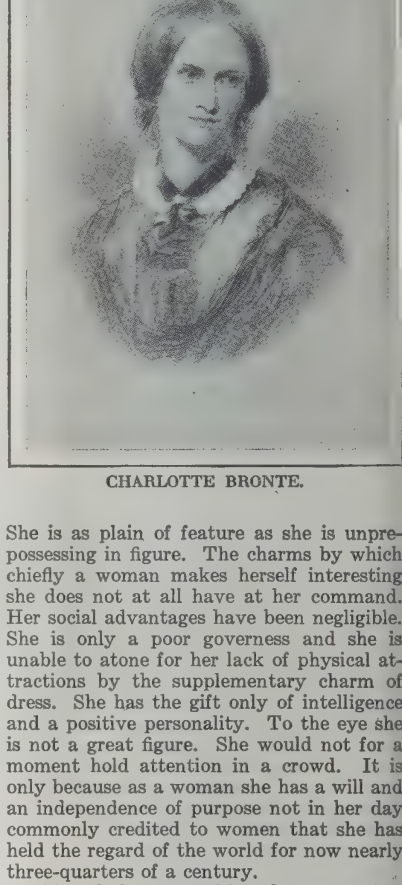
He was seventy-four years old then and the light was beginning to fade from his eyes, but his thirst for politics had not been slaked by all of his campaigns. He actually told me that the situation in the Republican party was such that if he were a little younger he could go out and in thirty days get the nomination for himself.

'How old are you,' he suddenly asked.

'Forty-eight,' I replied.

The old man looked at me long and at last a little sadly.

'It is a great age,' he finally commented.



I could see what was going through his mind. If he were my age he would be the next President. But he was seventy-four, and though he had made two Presidents, the man who most of all he would have liked to put in the White House had lost his chance because of his age. The next year he died.

Today's schoolbooks mention Wharton Barker only as the candidate of a minor party for the Presidency in 1900, but they are silent as to what he did to make two Presidents and there is not a word of the great regret that died with him that he could not be President himself. He worked in the dark and had no press agents.

# 'I Have as Much Soul—and Heart—as You'

## So Declared Jane Eyre, Rebellious at the Social Inequality of Her Time

By LEWIS WORTHINGTON SMITH

CHARLOTTE BRONTE.

FIRST and foremost Jane Eyre is a woman in rebellion; to the world it is a symbol of change in the ways of women with men.

If we are to understand what Jane Eyre means in the history of mankind, we must look back to Boccaccio's *Patient Griselda*, the tenth story of the tenth day in the *Decameron*. It is reported that to love the Lord thy God and thy neighbor as thyself is the whole duty of man. The whole duty of woman, in the days when Patient Griselda was the ideal of womanhood, was more narrowly limited. It was her place to

*It Was Her Place to Be Obedient*

love her lord and master within the bonds of marriage better than herself and to give to his slightest wish unquestioning obedience. That prettiness of feminine gentleness and submission was the other face of the adulation and adoration that chivalry flung down before her feet.

Jane Eyre asks for no homage of that sort. She wishes to love and to be loved, but she cannot accept a man's will blindly for her will. No more can she accept his judgment. Almost from childhood she has been a creature of her own resources. She has been compelled to fight her own way. Out of that experience she has achieved an independence of spirit to which women were supposed modestly and properly to be strangers. She has come to believe that it is her right to shape her life in agreement with her own understanding of what may fittingly be its aims and purposes. She believes that she should be as free to exercise that right as a man. The world does not agree with her.

It has decreed that a woman must not assume to be the mistress of her own destiny. She must turn to a man for guidance and subject herself to his leading. Jane Eyre does not have that conception of her obligations or of the limitations incident to her womanhood. She is consequently a rebel. She is not unduly violent. She does not go out into the streets proclaiming the evils of the current order. She does not demand that the world shall remake its codes to meet her necessities, but she refuses firmly to shut herself up in what it has set apart as the proper inclosure for women.

Jane Eyre lacks most of the qualities that are ordinarily to be remarked in the heroines of fiction. She does not have the commanding presence of, for instance, Hawthorne's Zenobia or Thackeray's Beatrix Esmond. She is, indeed, slight and mean of figure. Beauty too has been denied her. She is as plain of feature as she is unprepossessing in figure. The charms by which chiefly a woman makes herself interesting she does not at all have at her command. Her social advantages have been negligible. She is only a poor governess and she is unable to atone for her lack of physical attractions by the supplementary charm of dress. She has the gift only of intelligence and a positive personality. To the eye she is not a great figure. She would not for a moment hold attention in a crowd. It is only because as a woman she has a will and an independence of purpose not in her day commonly credited to women that she has held the regard of the world for now nearly three-quarters of a century.

After she has escaped from her apprenticeship to teaching at Lowood and has become governess in Rochester's employ at Thornfield, she passes through two crucial experiences. In each one of them she faces the opposed determination of a man to whom she owes much, upon whom in each case she

*The Rebel in Her Defied the Social Order*

is more or less dependent, and for whom she entertains in the one case a very high respect and in the other passionate love. There is a presage of the later scene with Rochester in an earlier scene in which Jane flashes the fire of a high spirit, the scene in which in his unique and startling fashion he proposes marriage.

'I have as much soul as you—and full as much heart,' she tells him. 'And if God had gifted me with some beauty, and much wealth, I should have made it as hard for you to leave me as it is now for me to leave you. I am not talking to you now through the medium of custom, conventionalities, nor even of mortal flesh—it is my spirit that addresses your spirit; just as if both had passed through the grave, and we stood at God's foot equal—as we are!'

This is the rebel in Jane defying that item of the social order of her day that denied the equality upon which she insists and that forbade to a woman the openness of speech in which she indulges. 'I am a free human being,' she declares a moment later, 'with an independent will, which I now exert to leave you.'

When the marriage ceremony has been halted by the revelation that Rochester has a wife, now for many years a mad woman, and when, after going back to Thornfield, he tries to persuade her to live with him, despite the bar, he says, 'Oh, Jane, this is bitter! This—this is wicked! It would not be wicked to love me.'

She has her response unfalteringly ready. 'It would be to obey you.' In the spirit of that response, the affirmation of her own judgment as an authority superior for her to that of a lover, she carries her affairs through. His plea that she has no family, no friends to be injured by what she does shakes her. It does not move her. To the temptation that it arouses within herself he has an indomitable reply: '*I* care for myself. The more solitary, the more friendless, the more unstained I am, the more I will respect myself.'

*His Plea Shakes But Does Not Move Her*

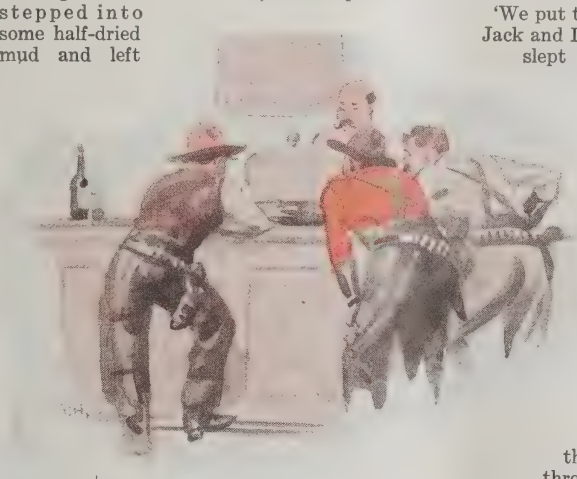
As the struggle between her will and his goes on she tells herself that she still possesses a soul, 'and with it the certainty of ultimate safety.'

For the moment her will opposed to Rochester's will is enough. She dares not trust herself for another twenty-four hours. Before morning she has slipped out of Thornfield and is on her way to concealment. She spends her last shilling that she may be carried as far as her money will take her. To fling herself upon the world so, to leave behind her every tie and every relationship to which she might cling for support, to become utterly helpless and alone, to do that as a woman of refinement and gentle nurture is to have a courage almost defiantly improper.

Poor Jane finds a haven, a second haven, and in this second haven she comes to her second crucial trial. Her second savior is St. John Rivers, who is a stranger when he and his two sisters take her in. He is later discovered to be a cousin, and he becomes a lover. His one great passion, beyond any passion that he can have for a woman, is to go to India as a missionary. With a hard and inflexible eloquence that she finds difficult to resist, he tries to persuade her to go with him in the double character of wife and missionary assistant. He forces upon her considerations of duty and obligation to which she cannot be insensible. She is almost overborne, but, as with Mr. Rochester, she insists successfully on being herself. 'I daily wished more to please him,' she has already confessed, 'but to do so I felt daily more and more that I must disown half my nature, stifle half my faculties, wrest my tastes from their original bent, force myself to the adoption of pursuits for which I had no natural vocation.'

*She Insists on Being Still Herself*

It is Jane's distinction that she both feels her situation and thinks about it. She thinks about herself, and she does that at once passionately and analytically. She is slight enough, insignificant enough, in every way humble enough. In her poor tortured heart she knows that all too well. None the less she will not lose what personality she has. It is in the reasoned recognition of her right to be herself and in the firmness of her will to maintain it that Jane Eyre, long-suffering and much-enduring, lifts herself out of the subjection to which woman in her day was born. So she shatters some of the social artificialities about her. So they do no longer bind her freer sisters of today.



# Under the White Tops With 'Gil'

(*Concluded from page 13*)

'And it's natural that many ridiculous things should have happened with this circus,' Gil kept on without a break, 'because it's so very old. We ranged the United States through the time when pioneer crudeness everywhere was changing into our present civilization. I saw the most of the changes at first hand. We toured Florida from one end of the state to the other in 1847, and many times after that year. I've seen every change in that state up to now, because I go there every winter. From the time my brothers and I were tiny boys we were taught to observe everything. Pa saw to that, because he wanted us to be good circus men when we grew up. And we were the first circus in many of the cities and towns of the United States, because we were always trying out new territory.

'Take Butte, Montana, for instance. We were the first big circus there. Everybody in town came down to see us unload. When our elephant stepped out of her car the people went raving crazy at the sight.

'Right close to her car, the elephant stepped into some half-dried mud and left a deep footprint. The most prominent saloon keeper in Butte got a spade and dug up that footprint, with mud around the edges of it like the mat of a painting. He sent to his saloon for a big sandwich platter, and the high glass cover that fitted over it to keep out dust and flies. Trimming that mat of mud down to size, the saloon keeper put the footprint on the platter, placed the glass cover over it, and carried it back to his saloon. He labeled it, "Footprint of the First Elephant Ever in Butte," and placed it on his bar. It remained there for a good many years as one of the town's curiosities.

The saloon keeper put the footprint on a platter, placed glass over it and placed it on his bar.

'We were, also, the first big circus in Texas—always traveling by wagons, of course. That was in 1857, and I was a good-sized boy. We went clear through to the Rio Grande and back, and then into Indian Territory, and into Arkansas, that season.

'Texas also reminds me of the dog army we recruited and maintained to convoy our money through the state in 1870. We toured, of course, by wagons. In Texas, gold and silver had been used throughout the Civil War; greenbacks and Confederate money didn't get into very general circulation there. We didn't know this when we started into the state.

'From the first day we began to accumulate gold at a great rate, and taking care of it soon became a problem, for up to that time no show had gone through the state without being robbed. It was in the days before railroads were plentiful. There were very few banks, no national ones, and the few were not always reliable. So buying bank drafts and sending the money home that way was out of the question. It cost twenty-five per cent to ship the money out by express, and then it was at our own risk.

'My brother Jack's family left the show and went home to Cincinnati just before we entered Texas, and they didn't expect to join us again that season. So Jack and I ripped the seats out of the four-horse bus in which the family rode, lined the whole inside (even the roof) of the bus with sheet iron, and built sheet-iron chests where the seats had been. We put quarter-inch iron on the floor, so nobody could bore through it. The bus was a traveling bank vault.

'We put the gold in the chests, and Jack and I rode in the bus at night—slept in it—while we traveled from town to town. Trusted performers and workingmen, armed with rifles and revolvers, rode ahead of and behind the bus when we were moving. During the day, the bus was backed into the dressing room so it was always guarded. And after a while the chests were filled with gold. We began to sack it, $10,000 to a sack, and we slept on the sacks. At the end of three months in Texas we had nearly $250,000 in gold, after paying all expenses.

'As an additional guard we coaxed every dog that came on the lot in various towns to go along with us; hired the dogs, in reality, because we coaxed them with good food, and we always fed them there at the bus. It was only a matter of a few days until we had more than fifty dogs hanging around the bus all the time. They never left it because they were always looking for something to eat. And they got to be a fierce animal pack. Jack and I could hardly get to the bus, let alone anyone else with the show, or a stranger.

'The average distance from one stand to another was twenty-five miles; and all of the dogs walked beside the bus whenever it was moved. It was a funny sight, the bus moving along in the center of about fifty dogs, going from town to town. After they had been with the show for a couple of weeks, and had been fattened up a bit, dogs dropped off, and new ones took their places, until it got to be quite amusing to hire and discharge, so to speak, the members of our dog army.

*The next of this series, narrating the comedy, tragedy and romance of this pioneer circus, will appear in an early issue.*

# A Good Word for Snakes

(Continued from page 2)

A horned toad being captured by Mr. Rowe's fishing pole.

misinformation pure and simple—great-grandmother tales, told to keep the children at home, and to scare them out of wandering away. Some of the most widely circulated snake stories undoubtedly originated from the contents of bottles and jugs.'

'How did you become interested in reptiles, Mr. Rowe?' I asked. To this the scientist replied: 'I've always been a student of biological science. Twenty years ago I began studying reptiles because they were the one form of animal life that could not be studied from books or other conventional sources. I realized that here was a tremendously interesting and important field for research almost untouched by scientific men.

'I went to work, and I regret to say that I soon found myself stumbling over the public prejudice against reptiles.

'I found even my friends regarding me as queer, morbid, or even mentally unbalanced.

'By others I was set down in a class with street fakers, patent-medicine quacks, side-show snake charmers, and similar gentry, who long ago learned the value of taking advantage of public ignorance and using reptiles to attract attention.'

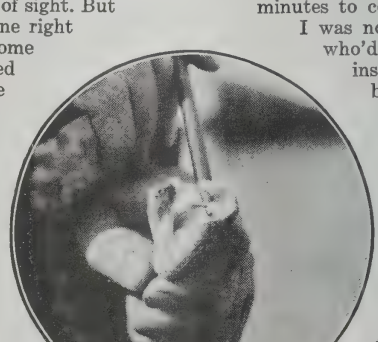
This drew out stories of some of Mr. Rowe's adventures in the field, several of which are worth repeating. 'I have long ceased to care what poor ignorant fools think of me,' he said. 'I used to go sneaking around trying to keep out of sight. But in recent years I have gone right ahead with my work. Some day those who have laughed at me will wake up to the fact that they were more ignorant than I am crazy.

'Perhaps the thing that has stamped me for a lunatic oftener than anything else is my method of catching reptiles for study. After trying all the conventional methods, I devised one of my own which I believe is the best. I catch my snakes, lizards, and other reptiles with a trout rod. I put a slip noose over his head. When the reel is wound up the snake is captured. It enables me to work at a safe distance, gives the reptile no possible opportunity for mischief, and is the surest way of bringing it to bag. I have also learned that there is no better receptacle for carrying live snakes and lizards than an ordinary trout fisherman's creel.

'Now, you can imagine what happens when people see me working out in the desert—perhaps miles from the nearest water—and casting about in the sagebrush and cactus with that kind of a rig. They take one look and say to themselves: "There's an enthusiastic trout fisherman who's gone nutty on the subject. Look at him. The poor fellow thinks this desert is a trout pool." Why! I even had a couple of deputies come out after me once. I was working just off the public highway in the Mojave Desert not far from Bakersfield. People in motor cars stopped to look, and I saw one man make a motion indicating wheels in the head.

'A little later a car rolled up from the direction of Bakersfield. Two big huskies got out and came toward me. One of the men with a kindly, pleading expression, said: "Come with us, Isaac. We'll show you a stream where you can catch bigger and better trout than you're getting here." When I assured them I was not interested in trout, one of them asked: "Then, what in helzbelz are you doing out here dangling a trout rod and line in this desert?" "Snakes!" I replied. "Bugs!" exclaimed the pair simultaneously. I then learned that the men were deputy sheriffs, sent out to capture the crazy man who had been reported at large in the Mojave Desert. But the joke of it was that it took me twenty minutes to convince those men that I was not one of three lunatics who'd escaped from a state institution several days before.'

'Were you ever bitten by a rattlesnake?' I asked. 'Twice,' he replied. 'Once I got nipped on the side of my left hand trying to catch a big diamond-backed rattler. I was miles from the nearest doctor at the time, and had no outfit for the emergency treatment of the wound. Gashing it with my pocket knife I made it bleed freely, and suffered no ill effects whatever. The second time I bled the wound and then injected potassium permanganate hypodermically. There were no ill effects, and in a few days the wound healed the same as any other minor injury should do.



'I've been bitten many times by non-poisonous reptiles—probably because I don't take the precautions in handling them that I do with the poisonous varieties. Their bites are merely

right into camp as if he'd been invited—and right over my barrier of horsehair rope, paying no more attention to it than a migrating waterfowl does to an international boundary. He stopped within about six feet of my blankets when I put down a barrage of lead from an automatic pistol.

Another rattlesnake story which Mr. Rowe exploded was the one to the effect that a coiled rattlesnake can be killed with a pistol without the weapon wielder taking the slightest aim at the snake's head. The story goes that as the coiled snake always holds his head in a direct line with the hole in the end of the gun barrel, it is necessary only to point the barrel in the general direction of the reptile and pull the trigger. Mr. Rattler, of course, gets his head splintered by the bullet!

When I asked Mr. Rowe about this, he laughed uproariously, and said: 'Go out and try it!' 'Then you don't believe the story?' I asked. 'Not by a jugfull,' he answered. 'I've tested that theory many times, and I can tell you for a certainty that unless you're a pistol marksman, you can miss your snake just as easily as you can miss the rabbit that you want for your dinner!'

This question suggested others. I asked the herpetologist about the hoop snake—the one that is supposed to take his tail in his mouth and roll at his victim like part of a keg. I asked him about the blue racer's propensity for chasing small boys out of the woods. I asked him about the joint snake—the snake that 'goes to pieces when struck—the pieces running in all directions, and later getting together again.' I asked him about the snakes that are alleged to swallow their young as a means of protecting them until they can be safely disgorged. I asked him about the snapping turtle's alleged propensity for biting a victim and hanging on 'until it thunders.' I asked him about the snake with his head cut off 'remaining alive until sundown,' and many other fool questions. To each of these questions, individually and collectively, he replied: 'There is absolutely no scientific proof to support a single one of the popularly believed snake stories. They are inherited

Above—The rattlesnake *strikes;* he does not *bite.* His fangs are joined at the base and muscularly controlled. Below—A captive rattler, just after the noose has been slipped over his head.

pin-pricks, requiring no treatment other than the application of an antiseptic to avoid the possibility of infection. Although I have demonstrated to my own satisfaction that the bite of a rattlesnake is not necessarily deadly, or even dangerous, herpetology, dealing with them as live specimens, is no pastime that I would recommend for an amateur.'

In summing up his twenty years as a specialist in herpetology, Mr. Rowe said: 'Experience has convinced me that about ninety-eight per cent of all fear is either superstition or ignorance. About two per cent of it is genuine, common-sense fear of a definitely known and established danger. I have no superstitions whatever because they have no place in science—particularly biological science.

'We are just now waking up to the fact that the reptiles are about the same sort of victims of misunderstanding, ignorance, and superstition as the birds were twenty years ago.

'While it is true that certain reptiles destroy the nests and eggs of a few game birds, they more than repay the sportsman by killing rodents that destroy far more game than the reptiles themselves ever eat. It may therefore be said that the reptiles are as much of a benefit to the sportsman as to the farmer.

'The only exception that should be made to permit the destruction of reptiles is in those rare instances where venomous species may become a source of danger by reason of being in populated areas.'

## Brain-Children Are Sometimes Stolen

(*Concluded from page 8*)

Thereupon a particularly zealous friend of Mr. Ball issued a book setting forth that even before the original appearance of the poem that gentleman had read various stanzas of it to a number of persons who recalled them and several of these added their testimony to that of the writer. Mrs. Akers wrote to Mr. Ball demanding that he repudiate his false claim and he replied calling upon her to desist from further deception.

The literary journal of the day took up the controversy and exchanged almost vindictive recriminations of the issue.

The Ball claim received much backing at the outset. His champion seemed to have made out a strong case. He had, however, made one fatal mistake. He included a version of the poem with fifteen instead of six stanzas and his case was ruined by the weakness of the 'internal evidence.'

Mrs. Allen had written a number of poems, none equal to *Rock Me to Sleep*, to be sure, but all manifesting culture, delicacy of thought and feeling and a distinct talent for versification. Ball had started much and finished little. His craftmanship was crude, his English bad, his thought and feeling commonplace. It was the mature conviction of competent critics that the nine extra stanzas afforded abundant proof that he was not even a good imitator. The more experienced and responsible editors gradually came to this belief and though the Ball claim was never withdrawn or disclaimed, it was, after the storm had passed, swept indifferently aside.

Mrs. Allen lived to a ripe old age, published another volume of verses when she was seventy, but never duplicated the success of *Rock Me to Sleep*

*Financing Foreign Trade*

The world's millions move through foreign trade.

The buying and selling of commercial bills covering exports of all manufactures and merchandise; the buying and selling of the world's currencies; the issuing of travelers' letters of credit and travelers' checks; cable transfers; dollar drafts on Europe—these are just a few of the daily functions of our Foreign Trade Department.

The CANAL BANK's complete international banking facilities are helping to finance the huge import and export commerce of the United States.

*Will Japan Fight America?* This is the title of the latest book published in Tokyo and selling like wildfire.

### *Wild Words From Japan*

The author declares that Great Britain will maintain a rôle of strict neutrality and that Japan will not go down to defeat unless the British Empire backs the United States.

Japan, he believes, will be able to occupy the Philippine Islands and Guam, and this will seriously impair the fighting efficiency of the American battle fleet.

'Our naval authorities seem to have no definite idea as to when war may break out between Japan and America. They have no real fixed policy with regard to warship building. They are apparently satisfied with a few new vessels to take the place of those growing obsolete. They are extremely backward as regards aviation, poison gas and other appliances of modern warfare.

'I intend to sound the first alarm against this stupid idleness. When are we going to fight the Americans? Which time would you prefer, soon or later on?

'From a Japanese point of view, the sooner hostilities occur between Japan and America the better. It is absolutely impossible to fix any definite date for an international conflict; but it is just as well to keep one's powder dry. If Japan thinks this is a convenient time for her to fight and tries to force the pace she will incur the blame of the entire world. So will America if she chooses to fight at a time she thinks best suited to her. Neither Japan nor America can reasonably challenge each other when there is nothing to justify such action.

'At any rate, Japan will not be defeated. Some are inclined to the view that Great Britain will back the United States, especially in view of the attitude of Canada and Australia; but I don't think Great Britain will interfere. If Japan is vanquished, America will be the eventual dictator, in a way, of even the destinies of the British Empire, and Britons are too proud to tolerate that. The British are an aristocratic race and look down on the Americans as upstarts.'

What Japan fears most in the event of war, according to Mr. Kawashima, are attacks from the air. To forestall such attacks, he says, Japan should forthwith proceed to occupy the Philippine Islands and Guam.

ɤ ɤ ɤ

Aviation is assuming an important rôle in transportation in Australia. Under encouragement from the government, six regular air routes have been established and 128 landing fields prepared for civil aviation purposes. The routes are from Perth to Derby, a distance of 1,442 miles; from Sydney to Brisbane, 550 miles; from Charleville to Camooweal, 825 miles; from Melbourne to Hay, 233 miles; and from Mildura to Broken, 189 miles. The services are subsidized by the government, and each airplane plying over a regular route is required to carry 100 pounds of mail, surcharged at the rate of three pence an ounce. Citizens are enthusiastic supporters of the air mail service.

### *Australia Has Regular Air Routes*

During the year just ended, nearly 5,000 passengers were carried by planes engaged in civil aviation without a single fatality and with only one minor accident. For-hire airplanes are available for physicians and others who are called on emergency trips into the 'out-back country.' A number of lives have been saved as a result of the new facilities. Owners of sheep and cattle ranches, in many instances, have landing fields on their property.

ɤ ɤ ɤ

Sir James Cantlie, the famous surgeon, who died recently in London, was noted for his good-humored philosophy. The following are a few of his characteristic sayings:

### *Dance Before Breakfast and Keep Well*

'Dance before breakfast—not a waltz but a hornpipe.'

'I wouldn't smoke a cigaret for a five-pound note, and that is saying a lot for a Scotsman.'

'Serious illnesses do not shorten life. I have had more serious illnesses than any other man of 70.'

'The brainworker expends more of the vital principles of his body in half an hour's work than a man engaged in muscular exercises does in a day.'

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set $1. THE DEARBORN PUBLISHING COMPANY, DEARBORN, MICHIGAN.

ɤ ɤ ɤ

A real religion does not take all a man's time, though it may influence all his life. Mammon, however, comes very near taking all a man's time. 'Their rest is scant with Baal.' Hence the fact that we were not-ing, that the average American does not have time to civilize himself completely. Leisure is not his; and the leisure that he gets he is too tired to employ in any valuable way. His experience, direct and vicarious, shows him that neither art nor letters, neither history nor philosophy, neither music nor sport, will help him to make money. Therefore, he has no time for them—only time for the kind of relaxation to which he does not have to contribute anything except cash: a drive in the car, a movie to look at, a radio to listen to, a game to watch whe professionals do the work. It is a commo place that the successful American bu ness man goes to pieces when he retires b cause he has not kept in reserve oth interests. He passes from his hectic ser tude to uselessness; does it often witho reason, without necessity, simply becau the making of money is supposed to be t only legitimate occupation for a man, a he has not dared intermit the process duri youth and middle age.—Katherine Fulle ton Gerould in *Harper's Magazine.*

### *American Men Find Little Time for Leisure*

ɤ ɤ ɤ

Much interest has been created by M Fowler's theories of Modern English usag To myself the most ill-used word in th language is 'only.' has been the victi of a great deal shockingly bad poetr though the rhymes it, including the i evitable 'lonely,' are few and far betwee while it is more frequently misplace thereby losing all its force, than any oth word in the language. I have been collectir examples of its misplacement from peop and papers that should have known bette the misplacement, of course, destroyin the sense:

### *The Word 'Only' Is Often Used Incorrectly*

THE ILLINOIS
URBANA
CHAMPAIGN ILL

AMERICA has abstained from interference in the concerns of others, even when the conflict has been for principles to which she clings, as to the last vital drop that visits the heart . . . Wherever the standard of freedom and independence has been or shall be unfurled, there will her heart, her benedictions, and her prayers be. But she goes not abroad in search of monsters to destroy. She is the well-wisher to the freedom and independence of all. She is the champion and vindicator only of her own. She will recommend the general cause, by the countenance of her voice, and the benignant sympathy of her example. She well knows that by once enlisting under other banners than her own, were they even the banners of foreign independence, she would involve herself, beyond the power of extrication, in all the wars of interest and intrigue, of individual avarice, envy, and ambition, which assume the colors and usurp the standard of freedom. The fundamental maxims of her policy would insensibly change from liberty to force . . . She might become the dictatress of the world; she would no longer be the ruler of her own spirit.

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses the popular fallacy that the higher price necessarily denotes the better quality.

Well! Well! So the 'wild young boys and girls' who have been rolling up the crime wave are between thirty-five and forty-five years of age! We personally have thought so right along, but never had the figures to prove it. But we have them now. (p. 3)

As a matter of fact—and figures—crime among the younger generation is *decreasing*, alarmists and pessimists 'to the contrary notwithstanding.' Our boys and girls are probably no better than they should be, but they're certainly not so bad as they might be either. Yet we have taken for granted that they were worse. Why? Because every theorist was saying so. Now, however, come the cold facts. They show up youth in another light. This is the kind of article you will be glad could be truthfully written. (p. 3)

The true knights-errant came back during the World War. They were the fliers. Against the drab background of trench warfare, theirs was a colorful, soaring, flashing quest. Many of their acts of heroism have never been related; others have been told only by word of mouth. This week we publish the first of two stories by one of the most valiant fighters of all—Captain Alfred Heurtaux of the French Army. (p. 16)

Heurtaux tells of his first pilot, grand down of the clouds, who landed upside down every time. He tells of the wild 'Penguin,' a plane with clipped wings in which the first fliers were trained. He takes us cruising into the air, through clouds or over sea or above No Man's Land. His story is vivid, graphic. It achieves a totally different impression from anything before written about the chivalrous war in the air. (p. 16)

Experiments in the business world are conducted secretly in the laboratory. In the literary world they are made in the full blaze of the public. That is one reason for much of the new verse seeming callow and ill-developed. It is experimental—and amateurish. Charles J. Finger, as writer and editor, knows poets and poetry. He lauds and lampoons both in a delightful way. (p.12)

An unknown darky gave the circuses the suggestion which netted them millions of dollars. A side show barker turned his chance remark into one of the most successful side show fakes ever originated. But the darky himself was lost to fame. The incident forms part of Gil Robinson's blithe circus reminiscences. (p. 20)

From Loughrea, County Galway, Ireland, comes this letter, commenting on a recent Office Chat about the supposed hypnotic power of weasels: 'Riding a cycle on a County Leitrim road, I saw a weasel running slowly in front, stopping from time to time to sit up and look ahead. He hid at the side of the road on hearing me approach; and about twenty yards farther I picked up a young rabbit, quite dazed, heart and respiration very slow, limbs almost rigid, eyes filmed. I had been a medical student and had not lost my powers of careful observation, so I am sure of these details. I put the rabbit in my jacket pocket for further observation and in about five minutes it began to struggle violently, and, on taking it out, I found it to be like any other scared rabbit, kicking and terrified, so I put the poor beast in a burrow and let it escape.—R. W. Talbot, Rector of Loughrea.'

'Is the President in? I've been sent from Heaven to tell him how to run the Government—' Many of the cranks who visit the White House are harmless; but others are dangerous maniacs. The Secret Service men whose duty it is to guard the Chief Executive day and night have a difficult job. Their experiences make interesting reading. (p. 6)

The chaplain shows us prison from the inside. It's a poignant glimpse he gives, but human. Behind the bars are men eager for a spiritual message that is sincere and practical. The Reverend William F. Hopp, of the Michigan State Prison, has a worth-while message. (p. 14)

People talk a lot about the busy little bees but they don't know much about them. Few of us realize that bees could supply a large part of our sugar needs if we would only help them a little. Bee-raising is an outdoor occupation, healthful and profitable. You'll want to read about it. (p. 2)

Bullets back up our missionaries. When they penetrate to distant lands nowadays they know that the guns of the Marines are not far behind. One facetious clergyman has even suggested amending the Biblical admonition to read, 'Go ye into all the world and shoot the Gospel into every creature.' But, to their credit, most of the missionaries themselves dislike this protection their Government affords them. They would rather take their chances, as did their predecessors, on the power of the Word they preach. (p. 7)

Honeybees in the act of pollinating fruit blossoms.

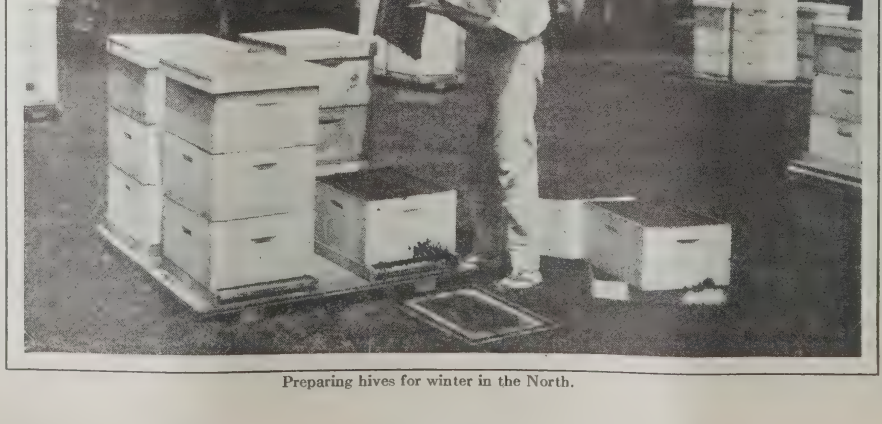
By C. W. SCOTT

# A Wasted Sugar Supply

THE honeybee produces in an entire lifetime no more than a spoonful of honey. Think, then, of the countless billions of these little workers who annually spend their lives in producing over 250,000,000 pounds of nature's most delicious sweet. This may seem like a tremendous amount, but it is safe to say that it is little more than a tenth the amount which could be produced.

When we consider that it is by no means unusual for an apiary of one hundred colonies or 'hives' of bees to produce more than twenty tons of honey, gathered within a radius of a few miles, and that vast areas of country contain no bees whatever, we begin to realize that tons upon tons of sugar are being lost annually for the lack of the agency to gather it.

Nectar, the material from which bees manufacture honey, is secreted by nearly every species of flower in larger or smaller quantities. Flavor and color are determined by the particular plant on which the bees work, for bees will seldom work on more than one kind of flower at the same time. Unfortunately, the nectar soon disappears and is lost, the honeybee alone being capable of collecting this sugar supply for the use of man. It is estimated that the amount annually secreted in this way exceeds many times the amount of cane sugar consumed.



Honey is the oldest of all known sweets, and until a few hundred years ago was the most common sweet substance available for human food. In early times men found that honey deposited by bees in hollow logs was a delicious food. Eventually they began to hunt for these 'bee trees' and appropriate their contents, and still later they found it possible to maintain permanent abodes for the bees, so that their precious honey might be more readily available. The ancient Greeks were well acquainted with honey and its use holds a prominent place in their writings. The honey of Hymettus is world-famous and still much sought after.

But it remained for the beekeepers of the past century to develop apiculture to a science whereby production on a large scale was possible. Today beekeeping is a highly develope profession, taught in the lea ing agriculture colleges. produces for its followers i comes equal to those of oth lines of agriculture. Becaus of its requirement that large amount of time be spe in the open air and to th absence of any strenu ous labor, the keeping bees has been adopted b many disabled World-W veterans, and in fact ha brought health and provide a means of livelihood f many forced by failing healt to seek a new line of endeavo

Few locations in the Unite States are unfavorable to th production of honey on more or less large scale, a though the clover regions the North Central states ar usually considered the bes Surprising as it may seem many bees are kept in citie and villages, on roofs of build ings and in back yards They produce fair returns i honey in addition to provid ing their owners an interestin hobby. Among the bee me it is a common expression tha 'bees board themselves an work for us at the same time.

The pollination of frui trees, clovers and other plant life i another very important duty whic bees perform. The yellow dust whic we see on a bee's legs is not honey, a some suppose, but pollen which is fe to the young bees. In passing fro flower to flower, much of this pollen i distributed by the hairlike covering o the bee's body, in this way pollinatin or fertilizing the flowers. Were it no for their uncon scious accom plishments i this way th fruit crop of the country would be only a smal fraction of what it is; in fact, horticulturists are so well aware of this fact that own ers of large or chards employ beekeepers to take their bees among the fruit trees while they are in bloom, thereby increas ing the yield and quality of the fruit.

(Concluded on page 19)

Preparing hives for winter in the North.

ONLY four cities where juvenile crime has increased: Philadelphia, Detroit, Minneapolis, Seattle. The Boys' Industrial School at Lancaster, Ohio, receives boys not over 18 nor under 10 years of age upon finding of delinquency by a Juvenile Court. It is a matter of public interest to know whether the commitments to this institution are increasing or not.

During the past four years (1922-1925) the total number of boys committed was 3,302, as compared with 4,272 during the preceding four years—a decrease of 22 per cent. The decrease among the younger boys was much greater than among the older boys. Of the boys committed in 1918, 40 per cent were under 14 years of age, but in 1925 only 24 per cent.

# *Wild Youth* Proves a Myth

## 'Boys and Girls' Between 35 and 45 Are Rolling Up the Crime Wave

By WINIFRED MALLON

**There has been in the past forty-five years a steady decrease in the relative number of persons under the age of twenty-five committed to prisons, reformatories, jails and workhouses in this country. Official statistics prove that the theorists are wrong in blaming the younger generation for all ills. They show that juvenile delinquency is, in fact, decreasing.**

Age distribution of adult population of prisons and reformatories, jails and workhouses, 1880 to 1923. (1)
Population of prisons and reformatories, jails and workhouses.(2)

| Age of prisoner | Number of commitments | | | Number of persons present on Census day | |
|---|---|---|---|---|---|
| | (3)1923 | 1910 | (4)1904 | 1890 | 1880 |
| Total | 330,457 | 414,681 | 138,901 | 77,360 | 56,249 |
| 18 to 20 years (5) | 31,086 | 35,119 | 13,629 | 9,326 | 6,659 |
| 21 to 24 years | 52,766 | 64,212 | 22,239 | 16,215 | 12,195 |
| 25 to 34 years | 100,007 | 129,974 | 42,451 | 27,426 | 20,805 |
| 35 to 44 years | 80,829 | 99,023 | 31,720 | 13,818 | 9,619 |
| 45 years and over | 65,769 | 85,355 | 28,862 | 10,545 | 6,941 |

(1) Compiled from published reports of the United States Bureau of the Census.
(2) Excluding population under 18 years of age and population, age unknown.
(3) Reported for first six months, estimated for last six months of year.
(4) Excluding commitments for nonpayment of fine.
(5) Not including persons committed to institutions for juvenile delinquents.

'WILD young people' between the ages of *thirty-five and forty-four* are rolling up the crime wave in the United States, and not boys and girls of high school and college age, upon whose young heads has been heaped by their complacent elders the accumulated weight of most of the sins committed in the last decade.

The World War and this perfectly terrible younger generation have been the convenient capegoats of our most prominent uplifters, who in the press and from the pulpit sadly wonder what the world is coming to.

And all the time the Pollyannas have been right about it, Loeb and Leopold, and the Bobbed Hair Bandit to the contrary notwithstanding.

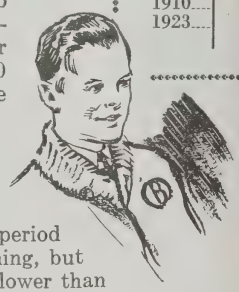
There has been, ever since 1880, a steady decrease in the relative number of persons under twenty-five annually committed to prisons, reformatories, jails and workhouses in the United States. This according to meticulous and dispassionate survey of juvenile delinquency statistics recently compiled by the Children's Bureau of the United States Department of Labor.

Miss Grace Abbott, chief of the Children's Bureau, has risen to assert: "Sensational statements regarding increase of juvenile crime do not have a basis in fact.

'We have new kinds of delinquency today,' explains Miss Abbott. 'It comes in new ways and new forms; but that is all that is new about it.

'When we were twenty-one, for instance, or younger, we did not steal automobiles. There were no automobiles for us to steal. Nor did we seek adventure on Rum Row, or in bootlegging on land. No adventure was involved in the sale of liquor in those days, and no sudden and glamourous rise to heights of affluence offered itself as a reward of industry in what then was a perfectly lawful commercial transaction.

'But we were not models of behavior, living simple and exemplary lives and going to bed at nine o'clock. Far from it. In our way we worried and distracted our elders quite as much if not more than do the young people of the present time. Indeed, so much progress has been made in understanding and supplying legitimate outlets for youthful desires and energies, in improving conditions and providing legitimate amusements, that many of the behavior problems common to our earlier day have been not only solved but eliminated.



'Naturally, the things we did which we ought not to have done were different from the present-day forms of delinquency among young people. The new forms often surprise and shock the public, and form the basis of judgments. We must keep up with them as they develop, and intelligently deal with new behavior problems as they rise to trouble us.

'But I think there is no question but that delinquency in the larger sense has decreased.'

From Juvenile Court statistics now available in fourteen cities, in most instances for a ten-year period, and from United States Census Reports since 1880 there emerges the fact that *the delinquency rate is downward*, and that *the percentage of young people between the ages of eighteen and twenty in penal institutions has been steadily declining.* There has been no increase since 1904 in the percentage of our prison population between the ages of twenty-one and twenty-four or for the age group between twenty-five and thirty-four, and the percentages are lower for recent years than for the years 1880 and 1890. The larger percentage of commitments at present as compared with earlier years is being contributed by persons between the ages of thirty-five and forty-four.

Of the fourteen cities, New York, Boston, Buffalo, Chicago, New Orleans, Providence, Richmond, St. Louis, Washington, D. C., Rochester, Detroit, Minneapolis, Philadelphia, and Seattle, for which the Children's Bureau was able to secure Juvenile Court statistics, *decreased delinquency rates were found* at the end of the period studied as compared to the beginning in the first-named nine cities; the rate in Rochester was practically stationary for the three years for which statistics were obtainable; and increased rates were found only in the remaining four cities, Detroit, Minneapolis, Philadelphia and Seattle.

There was a tendency toward higher rates during the war years, 1918 and 1919, and slight fluctuations from year to year, not regarded by the bureau as especially significant. In Chicago the rate has fluctuated around a lower level since 1920 than before. The decrease in New York has been quite marked. The Detroit figure was higher at the end of the period than at the beginning, but the 1924 rate was lower than the rates for the years 1918, 1919, 1920, and 1923. Providence and Boston, like Detroit, had higher rates during 1918 and 1919, the Providence rate having declined markedly and the Detroit rate slightly since 1919. The Boston figures also show an increase during the war years 1918 and 1919, but a marked decrease since that time except for a slight rise in 1923 and 1924 as compared with 1922. The Boston rates for the years since 1920 are considerably lower than the rates for any previous year. Philadelphia and Seattle rates increased rather consistently up to 1923, but declined somewhat in 1924.

These statistics, of course, are not complete. Adequate national statistics on juvenile delinquency do not exist, and the Children's Bureau now is working on a plan for the collection of figures from juvenile courts on a national scale. More complete data and greater uniformity in compilation are essential before delinquency rates in the cities reporting Juvenile Court statistics can be compared one with the other.

'The fact that for only fourteen cities in the entire United States can information be obtained on which delinquency rates can be computed over a period of years indicates the woeful inadequacy of statistical material regarding the work of an institution so important as the Juvenile Court,' comments Miss Abbott.

'However, the figures for these widely separated cities, covering in most instances the ten-year period from 1915 to 1924, doubtless indicate the trend in juvenile delinquency.'

Specifically they are of value in comparing one period with another and arriving at conclusions as to the increase or decrease of delinquency in a given city over a period of years. They have the further merit of disposing effectually of the loose statements constantly being made to the general effect that 'juvenile crime is terribly on the increase,' and that 'the dockets of juvenile courts everywhere are full to bursting.'

Age distribution of adult population of prisons and reformatories, jails and workhouses, 1880 to 1923. Per cent distribution by age groups.

| Year | 18 to 20 | 21 to 24 | 25 to 34 | 35 to 44 | 44 and over |
|---|---|---|---|---|---|
| 1880 | 11.8 | 21.7 | 37. | 17.2 | 12.3 |
| 1890 | 12.1 | 21. | 35.5 | 17.9 | 13.6 |
| 1904 | 9.8 | 16. | 30.6 | 22.8 | 20.8 |
| 1910 | 8.5 | 15.5 | 31.3 | 23.9 | 20.8 |
| 1923 | 9.4 | 16. | 30.3 | 24.5 | 19.9 |

Take, for instance, the case of Philadelphia.

According to the 1920 census for Philadelphia, the city had a population of 278,429 children between the ages of seven and fifteen years inclusive, the numbers of girls and boys being about equal. In that year the Municipal Court reported the number of 'children's cases' referred to the Juvenile Court on new charges of delinquency and disposed of formally through court hearing or informally by the judge, as follows:

| | Boys' cases | Girls' cases |
|---|---|---|
| 1920 | 4,645 | 516 |
| 1921 | 4,901 | 520 |
| 1922 | 4,768 | 595 |
| 1923 | 5,780 | 686 |
| 1924 | 5,663 | 715 |

There were 3,975 different children involved in new charges of delinquency during 1924, of whom 3,218 were boys and 757 were girls. Of these 3,975 children, 1,341 had been known to the court in previous years. *The new intake of delinquent children numbered only 2,634.*

Now it is submitted, not only that the increase in the number of court cases reported from 1920 to 1924 is fully accounted for by the increase in population within that period, plus the growing tendency of parents with troublesome children to report to the courts for the help they are led by hope or experience confidently to expect, but also, and furthermore, that the number of children passing through the courts is astonishingly small.

Using even the 1920 census figure of 278,429, and disregarding the certain increase in the next four years, it evident that 2,634 new juvenile d linquents, out of a total child populatio of nearly 300,000, is a small proportio the more so since the 'crimes' co plained of range all th way from the very s rious to the utter trivial.

So much for th record establishe by the children Philadelphi between th ages of seve and fifteen Equally ur alarming ar the facts co cerning th 'younger set' up to th age of eighteen.

As a service of co öperation with the Chil dren's Commission Pennsylvania, the Unite States Children's Bureau in 1924 surveyed th child welfare condition and resources of seve Pennsylvania counties Information was sought on every de linquent and incorrigible child unde eighteen years of age recorded as having been known to any kind of court o correctional institution during the yea July 1, 1923, to July 1, 1924.

This survey revealed out of a total (1920) approximate population of 732,000, only 1,169 cases of children charged in courts with delinquency, incorrigibility or crime, and only 363 in correctional institutions.

Again the range of offenses was varied and wide, including one murder, much petty larceny, numerous fights, many broken windows, a great deal of 'trespassing,' many more 'runaways,' one 'suspected of being a runaway,' one hundred cases of disorderly conduct and seventeen cases of 'suspicious conduct.'

All of which is admittedly vague and fragmentary as a picture of behavior, as all statistics must be, since conduct that causes one parent trouble will not especially bother another, that which incenses one neighborhood may be accepted with equanimity elsewhere, and what looks 'suspicious' to one policeman may mean nothing to another. The outstanding fact remains that even when the age is extended to eighteen years, and the turbulent sixteen- and seventeen-year-olds are included, these seven counties are far from furnishing the quota of court cases to which they are entitled according to Philadelphia experience and practice.

In view of these facts it would seem that serious revision must be made of the wholesale charges of juvenile incorrigibility and delinquency which have received confused credence with our people.

Incidentally, an- (Concluded on page 31)

# Making the Government Efficient

## Reorganization Would Cut 100,000 Unnecessary Employes From Federal Pay Rolls

By MARIAN BRUCE CLARK

SWEEPING charges of inefficiency among Government employes recently preferred by a member of Congress demand specific answer by facts instead of the usual recriminations and threats of political retaliation. On the other hand, blanket charges of Government inefficiency should not be limited to clerks and junior employes but must of necessity be held to include members of Congress as well as members of the Cabinet whose records show delinquency.

*Reorganization Need Felt for Many Years*

In no instance is a Government official other than a public servant. There is an area of low visibility around Washington in this respect which should be corrected.

That Government business methods have required reorganization has been recognized by political economists for years. As far back as 1910, when Government expenses were less than one-third the present budget requirements, Senator Aldrich, then chairman of the Senate Finance Committee, in an address to the Senate made the following statement:

'If I were a business man and were to be permitted to do it, I would undertake to run this Government on $300,000,000 a year less than it is now run for.'

'I will venture the assertion,' says Congressman Davey, who has a reorganization bill before Congress, 'that more than one-half of the civilian employes of the Government, not counting letter carriers and clerks, are the most expert loafers and time-killers in America. It is the spirit of Government service. Buck-passing is the favorite and accomplished practice.

'No private business, however well capitalized, could survive thirty days under the same cumbersome, slipshod, inefficient and hopelessly extravagant condition as that of the United States Government. It would easily be possible to dispense with at least 100,000 unnecessary Government employes and save not only their salaries but the overhead expense to house them and furnish them with the equipment with which to work, or rather to put in their time.

*100,000 Could Be Dropped From Pay Rolls*

*'But, let it be understood that while there are 100,000 or 150,000 unnecessary and useless employes, there are some 200,000 faithful, meritorious ones, many of whom are decidedly underpaid.* When a person of ability enters the service of the Government he leaves all hope behind. There is little or no chance for advancement on merit and no chance to receive salary increases that have been earned by honest and meritorious service.'

To the student of governmental efficiency it is apparent that it is not upon the high-salaried, politically appointed department or bureau head, but upon the routine, efficient and ill-paid employe that the successful operation of the Government revolves. Taking this into consideration, the Davey reorganization bill provides for salary increases for this class out of the savings to the Government accomplished by reorganization. It is a well-recognized fact that the high-salaried positions in all governmental departments go not to the experienced and efficient but to political appointees who invariably rely upon their subordinates to do the work. *This charge applies without distinction, from Cabinet positions right down through every major division of the Government.*

*Scientific Men Receive Small Pay*

A large number of both professional and scientific positions in the Government service which demand a high order of education, ability and training are notoriously ill-paid. Such positions are to be found in the Bureau of Standards, the Biological Survey, Bureau of Fisheries, the Smithsonian Institution, the Treasury, the Department of Commerce and other divisions of the Government, and while political 'rewards' are distributed for political services through the medium of high-salaried appointive positions to non-professional and non-qualified department and bureau 'heads,' the capable subordinate does the work. Under this system the qualified becomes the slave while the politician becomes the boss.

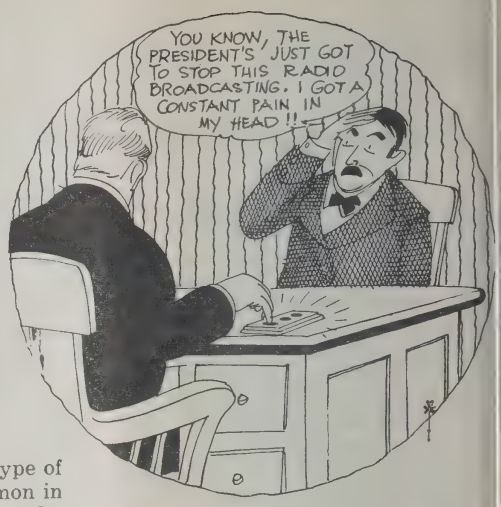
At the recent hearings on the tax bill, before the Ways and Means Committee of the House, the Secretary of the Treasury stated: 'Customs receipts are estimated by the Director of Customs *who is the practical operating man* . . . Income and miscellaneous taxes are estimated by Mr. McCoy, Mr. Riddle and Mr. Nash, Assistant Commissioner of Internal Revenue. *The last is the practical man* . . . Mr. McCoy has his own method of figuring. *I confess I do not always understand it,* but he certainly attains remarkably accurate results.'

At other hearings the press has frequently commented on the fact that Secretary Mellon answered no questions put to him by the committee but 'turned always to his assistant who answered,' and yet the secretary is, by virtue of training and experience, one of the best qualified men in the Cabinet.

Federal employes are organized; they are an affiliated branch of the American Federation of Labor. The Federation has challenged the proposal of Mr. Davey to remedy what he characterizes as an evil condition, and, instead of replying to his specific charges, has adopted the unfortunate procedure of attempting political reprisal.

*Threat Creates Bad Public Impression*

This action creates an unfavorable impression in the public mind as to the ability to refute the charges which, if the taxpayer who pays the federal salaries counts at all, they are in duty bound to meet. It is alleged at the present time that there is one United States worker to each ten citizens in the country. Senator Capper, of Kansas, makes the statement: 'When our grandfathers set up this Government, they got along with one public official to every 1,000 adults. By 1860 this ratio had increased to one to 100. In the late eighties and early nineties the proportion was one to ten. Today it must be greater. There are now ninety-four subdivisions of governmental bureaus. Twenty years ago there were fourteen.'



The president of the Federation of Federal Employes, in his 'Dear Sir and Brother' letter to the Ohio State Federation of Labor, has made the serious blunder of filing a complaint against an Ohio Congressman, speaking in support of Government reorganization on the floor of the House, with a local Ohio labor organization. Such action, to the writer at least, may be interpreted to mean but one thing—intimidation. The American taxpayer, not the Ohio State Federation of Labor, is paying the salaries of Government employes, and since the American taxpayer is arriving at the place where he demands value received for public service and where he insists upon an accounting for the disposal of tax moneys from his representatives in Congress, he is not likely to countenance any defense of loafing in Government employment.

*People Must Bear Cost of Government*

Mr. Davey says: 'I am not thinking in the terms of a hard task-master, but merely from the standpoint of a fair return to the American people who are paying the enormous cost of Government. Outside of the Post Office Department there are nearly 265,000 civilian employes of the Government. If you add to this (Concluded on page 22)

# The White House—A Mecca for Cranks

## Secret Service Men Must Ever Be Alert to Guard the President From the Unbalanced

By
E. B. JOHNS
ILLUSTRATED BY
W. O. FITZGERALD

OUT of the usual crush of visitors at the White House at the noon hour stepped an unusually attractive woman apparently forty-five or fifty years of age. She was richly dressed and had all the earmarks of wealth and culture.

Before the guards could interfere she had plucked an armful of flowers from a bed which has been annually the pride not only of the President but of the entire White House staff. With a 'please step aside' air she strode up to the entrance of the executive offices where she was met with an inquiry from Sergeant Dalrymple: 'My dear lady, who gave you permission to pick those flowers? I do not think that the President himself would have torn up that beautiful flower bed as you did.'

For a moment the woman seemed speechless with astonishment. Then drawing herself up with a haughtiness only queens are supposed to command and pointing toward the heavens she exclaimed:

'God Almighty gave me permission. How dare you question His authority. More than this, the Almighty has sent me to see the President and I have no time for further words with you. Unless I see the President promptly, I shall report your conduct to him.'

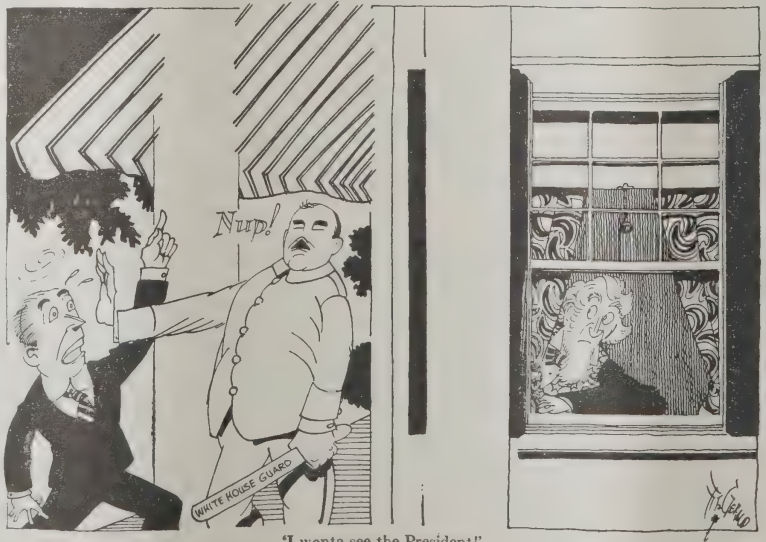
'Oh yes, you are the lady that the President has been expecting,' said the sergeant at the entrance of the lobby. 'Please be seated, and I will call the President's secretary so that he can be informed that you have arrived.'

When Dick Jarvis, chief of the White House Secret Service, appeared he was introduced with great formality as the secretary to the President and the sergeant explained that the visitor was no ordinary person. The chief of the Secret Service immediately became sympathetic and expressed regret that she was late and that the President had been compelled to admit a few Senators and members of the House when he had expected to receive her.

Mr. Jarvis is not the movie type of secret service men who are common in the blood-curdling and thrilling detective stories. While he was on the platform with President Harding an amateur photographer snapped him for the President. One of Mr. Jarvis' assistants has been charged with impersonating President Coolidge in dealing with a crank, while it is a common occurrence for him to assume the rôle as secretary to the President.

Mr. Jarvis immediately escorted the lady who was sent to the President by the 'Almighty' to the old cabinet room, where he obtained her name, address and telephone. In the course of his questions she snapped, 'Why are you asking all of this information? The President knows that I live in Washington and all about me.'

Mr. Jarvis hastened to explain that he wanted it so that if she became impatient and went home he could call her up and put the President on the wire. Then as he slipped this information to one of the officers, Mr. Jarvis suggested to the lady that she might want to look through the President's home. This appealed to her and Mr. Jarvis guided her slowly through the beautiful rooms of the mansion to the eastern entrance where the guardhouse is located. There her folks were waiting for her in a machine. With the assistance of Mr. Jarvis, they persuaded her to go home and wait until the President could get rid of some troublesome Senators, members of the House, and his Cabinet. There was no doubt, Mr. Jarvis insisted, that the President was greatly disappointed at not being able to see her.



I happened to be standing beside Sergeant Dalrymple when the woman appeared at the entrance of the executive offices with more flowers than a June bride, but neither he nor Mr. Jarvis could recall the instance until they had looked up the records. It occurred only last summer. But such incidents are only a part of the day's work for the detail of secret service men and metropolitan police who are on duty at the White House. When I stepped into the press room on the day that it occurred, one of the correspondents inquired, 'Is the lady a nut?'

'Yes,' I answered. 'She says that the Almighty sent her up to see the President.'

'The Almighty is getting busy with the White House,' he remarked, 'for Dr. Cadman, of the Federal Council of Churches, is in with the President now with a message from the Lord.'

There was a time when the appearance of a crank at the White House was a front-page story for the correspondents. Now they are not interested. The constant agitation, both in and out of Congress, of what the Government should do for the people or for a group appears to be having a widespread effect upon men and women of weak or deranged mentalities.

'I wanta see the President!'

# Missionaries and Machine Guns

## Many Preachers of the Gospel Do Not Want the Protection of Bullets

By JAMES H. LEWIS

'AMERICAN Warship Saves Missionaries,' joyfully proclaimed a headline in the *New York Times* a few months ago.

'Allied Cruisers Clear Taku Bar,' declared another article a few days since. In fact, battle cruisers and marines have for many years played a more or less important part in the lives of missionaries throughout the world.

The other day some Chinese students held a demonstration in Peking, protesting against submission of their government to the insistent demands of the foreign powers that the gateway from the sea to Peking be kept open. Chinese guards fired into the crowd and some thirty students died as a result.

A delegation of American missionaries immediately called on the American minister and stated that they did not desire military measures taken against China for their own protection. Their idea seems to be that their lives are a fair gamble in the hands of the Chinese, though many other American nationals have differed violently from this opinion.

*Protection by Armed Force Is Not Wanted*

This matter of armed protection for the proclaimers of the gospel has been stewing around in my mind ever since I lived under it. I shall not say that an American or any nation's citizen may not be entitled to all the protection his government can give him by armed force or otherwise if that citizen goes to another country for legitimate business reasons and conducts that business properly, and scrupulously observes the laws of that country.

Of course my missionary friends will say: 'Isn't the missionary engaged in a legitimate enterprise? Do not he and his family deserve the protection of his government?' And I shall reply: 'As a citizen, yes; as a missionary, no.'

I happened to be one of those young men who, in the first decade of the present century, was thrilled enough by the heroic stories of Adoniram Judson, Horace Tracy Pitkin and others, not only to want to go but actually to go to another country. I went to see if I could help, and though I am not there now I have a sister there; my father was a missionary for sixteen years, until his death, and my brother was invalided home.

Among my friends have been many of those besieged in Peking during the Boxer Uprising. Despite all heroism of defense, however, witnessed in those dark days of 1900, all the stories of the survivors combined never had the force to move me as did the story of the death of Horace Pitkin during that same Uprising. He was a young man and he probably would have been doing great things today had he lived, but I am willing to bet my life on it that Pitkin's death sent more missionaries to China and India than his life ever would have done. I am not saying that the one great use of the missionary is to go out and get killed by more or less unique means according to the peculiar whims of those whom he would spiritually serve. But I do say that gunboats and marines, though useful in their sphere, seem to me to change the wording a bit (for a missionary) of two or three old hymns:

'I'll go where you want me to go, dear Lord,
O'er mountain or plain or sea'. . .

'God will take care of you' . . .

and I cannot find in the New Testament any addition to the great 'missionary challenge' of the 'Great Commission' which reads: 'Go ye into all the world.'

I am reminded of a story which Bishop Francis J. McConnell, of Pittsburgh, sometimes tells. It seems that during a time of revolt, either in India or China, a religious meeting was being held and one of the morning papers brought word that foreign armies were pushing back the native troops with very great loss. The clergymen who announced this fact with great joy used it as a text to declare that God was a great avenger and that He would in this way show righteousness to those native peoples. Another man, however, got up shortly afterward and stated that on this basis he thought it would be wiser to change the words of the 'Great Commission' to read: 'Go ye into all the world and shoot the gospel into every creature.'

*'Shoot the Gospel Into Every Creature'*

There is a tender bit of missionary interest in the journal of Columbus, which reads: 'I have no doubt, most serene Princes that were proper devout religious persons to come among them and learn their language, it would be an easy matter to convert them all to Christianity, and I hope in our Lord that your Highnesses will devote yourselves with much diligence to this object, and bring into the church so many multitude, inasmuch as you have exterminated those who refused to confess the Father, Son and Holy Ghost.'

Right here it must be said that the missionaries themselves, as a group, have taken the lead in a change of attitude toward physical protection by their governments. Last summer the strongest protest against the Shanghai shooting came from many missionaries throughout China who themselves asked that they be released from the protection of extraterritorial agreements, and expressed their desire to rest their safety with the Chinese authorities. Some missionaries, of course, do not agree with this point of view and there is no unanimity of opinion on the matter. But the people most concerned for the safety of the missionaries are not the missionaries themselves, but their thousands of friends and acquaintances in their home lands.

*Those Most Alarmed Are Friends*

Most church groups still think of their foreign missionary work as being to help the heathen who 'in his blindness bows down to wood and stone.' To those who like their missionary stories with tears, it will be a blow to discover that those good old days are gone forever.

There are just as many heroic missionary lives being lived as there ever were. Long continued absence from one's own country brings heartache difficult to endure. Endless days and nights of working among people who seem so slow to change and among conditions which seem almost impossible to change bring discouragement and disappointment. Children come into the home, grow up into their school years and are sent back to their home land for their advanced studies. Loneliness for one's own

(Concluded on page 27)

# Tom Learns to Play the Game

## Story of an American Boy Who on Mastering Himself Was Able to Direct Others

By JUDGE HENRY NEIL

LAST autumn I took particular pains to run out one Saturday to a New Jersey football game. On a small-town field two high school teams were settling old scores.

That was a day when many big colleges played their critical games. Favored elevens, East and West, went down to defeat before underestimated rivals. Championships, national and sectional, were won. New stars shot brilliantly into the firmament of football fame.

Under the eyes of a hundred thousand clamoring partisans, the teams of Yale, Princeton, Dartmouth and Michigan were fighting for gridiron glory.

But though tickets were offered me, I went to none of those great games. Instead, I went to see New Providence high school's annual game with Elmtown. The scores and winners in the famous games of that day are alike forgotten. Even the glorious honors for which they fought are dead until next autumn. But the outcome of that high school game that I saw in New Providence is still fresh and glowing in my mind, and the issues that were there at stake will never die.

With my friend, the leading banker of the town—it was he who had insisted on my coming to the game—I went down into the dressing room of the New Providence team between the halves. Playing raggedly, nervously—each trying to shine in some brilliant free-lance exploit—those boys had let Elmtown run up a score of 12 to 0 against them. At the moment of our entry the dressing room was a place of dressing down, for them. Nobody paid any attention to Banker Moore or to me.

The boys, huddled in blankets on the benches, or rolled up like mummies on the floor, silently took the lecture that was coming to them. The coach lashed them mercilessly. Individually and collectively he berated them.

'What do you think you're playing this game *for*,' he cried, 'yourselves, or New Providence? You've each of you been trying to play the star. You aren't *any* of you stars. You never will be! You're part of a team—a *team!* Do you get that? What have I been teaching you for two months? To play football, or to play to the gallery?

'You, Meade, you've pretty near lost this game already, with that spectacular run you tried. It *was* a spectacle all right. Lost you the ball, and gave Elmtown a touchdown. Why didn't you follow your interference? Your backs were giving it to you that time.

God knows it's the only time this bunch of prima donnas we've got in the backfield ever *did* put up the interference I've taught them. What in Hades is the matter with the whole gang of you? You all thought you were going to be heroes out on the field, and now you're a bunch of sniveling children. Can't you see that the only thing you can possibly be under God's sun is a *team*?'

As the coach went on, his tirad seem to magnetize the sullen group He wasn't giving them just words he was giving them part of himself His face was pale and set; he seemed t be suffering physically as he drew fron his own soul a fiery spirit of team pla and wrapped that crowd of youngster tightly up in it. When the lecture wa over, most of the boys gathered aroun Meade, the blond captain. A murmu of voices talking in deadly earnestnes rose.

The quarterback, Tomlinson, sa apart, brooding upon his sins, his fac white, his hands clenched. Shorty the left end, who had been taken ou in the middle of the second quarte after several misplays and a costl fumble, was weeping on the floor in corner. The coach moved abou speaking to the boys one at a time sometimes with violent scolding, some times with an encouraging thump o the back. I heard bits of phrases, sav him demonstrate positions.

He crouched on the floor beside th broken-hearted Shorty, and talke quietly. 'What's the matter—stil thinking of yourself? How about th *team*?' These were the only words heard.

He dropped onto the bench be side the shaken quarterback and pu his arm around his shoulder. Hi voice was gentle now. I could almos see the overwrought tensity of tha youngster's nerves relax. 'Let's se you save that energy (Continued on page 23

Shorty was over the line as a tackler from behind threw him heavily.

# MR. FORD'S PAGE

IF WE should say that there is too much selling and not enough buying in this country, we should make a statement that would be so true that it would need interpretation. The truest things are rather harder to see than the others. What is meant is this: our people have ceased to become buyers and have become largely 'the sold,' if such a term may be used; not 'sold' in the sense of being deceived, victimized, cheated, but 'the sold' in the sense of not being 'the buyer.' Our people's purchases are largely directed by salesmen, which has led, as previously remarked in these pages, to an overgrowth of sales domination of the motives of manufacture, which is not good, and the dangers of which are too serious to be disregarded.

The reaction from this condition should be an increase in 'buying.' That is, in the habit of buying for oneself, of knowing *what* it is that one is buying, and *why* it is that he is buying. In short, a buyer's independent knowledge and thoughtfulness to put up against the salesman's expert concentration of appeal and drive.

The people's abdication of their buying privileges has led to certain fallacies which seriously cripple them in their ordinary daily economic life. One is the fallacy that high prices denote good quality and low prices denote cheap quality. That false proposition has been hammered into the minds of the American people so persistently that the business world is full of stories which tell how, for example, excellent five-dollar shoes had to be labeled ten dollars before people would buy them. There is nothing 'cheap' about the American people. That is, they stand for quality. Tinsel and make-believe have no appeal to them. 'The real goods' is one of their characteristic sayings. Their readiness to pay the higher price is due to their desire to get 'the real goods.'

In the old days people knew what goods were. Many who are living today carry pictures in their minds of their mother's shopping. Mother was not at the mercy of any clerk for her knowledge of textiles. She drew the fabric through her fingers, tested its weave, and when she was through with her inspection she knew the quality of the goods and what the price ought to be. That is what is meant by 'buying.' No one 'sold' the old folks; they bought.

It was the same on the other side of the house. The men-folks knew the things pertaining to their world. In wood and metal, horses and cattle, land and grains, they had their own knowledge. While there were occasional deceptions, they were usually due to trustfulness, not to ignorance. It is one thing to rely on a man's word because you trust him, and another thing to rely on his word because you have no knowledge that enables you to look into the matter for yourself.

In the early state of the nation, when the relation of quality and price were known to everyone, it was undoubtedly true that the better quality went hand in hand with the higher price. But this nicely balanced relation soon vanished in the age of experiment and speculation which descended on the country.

Everything new must pass through a period of imperfection and experimentation, and for this the public pays. It is this fact of their bearing all initial costs which entitles the people to every possible advantage in materials and prices after the commodity is successfully established. But it was during the transition period, from the old, settled method to the new, that the false idea slipped in that *because* an article was higher-priced it was *necessarily* of better quality. The old mental conviction remained, but the actual situation was changing.

Moreover, the people became less competent to judge of quality and price, because specialization came so swiftly upon them. Today it is rare to find shoppers who really know what they are buying. Their standard of quality is the price tag, not the goods. If an article is marked $5, they take it to be better than a $2.50 article. Often it is not. If an article is marked $1,000, they are sure it must be better than an article marked $500. Often it is not.

So with the changes that have come in one way or another, and with the consequent decrease of common knowledge in buying to serve as a check upon possible deception in selling, our people have almost completely succumbed to the fallacy that price equals quality. Often it does not.

No better economic education of a practical kind could be given the American people just now than some teaching that would emancipate them from the hold which this false principle has on their mind, that the higher price necessarily denotes the better quality. Sometimes management in manufacture contrives that the lower-priced commodity is of highest quality. In that case the purchaser should 'buy' and not merely be 'sold.'

*IN earlier days the higher price usually denoted the better quality. It was a time when buyers knew how to buy and were not merely sold. They knew quality, hence also price. Times have changed. Buyers tend to become mere purchasers; they assume that the higher-priced article is the better quality, but do not know it. What they assume is not always true. Under standardized manufacture, the lower-priced artic'e may easily be the higher quality. To determine this the buyer should read quality instead of price tags, should study to know quality, and should buy quality. He can buy other things, but quality is an economic necessity.*

## *Making the 'Movies' Dry*

IT WOULD be ungracious to cavil at Will H. Hays' order to the movie magnates to lay off their film war on prohibition, and it would seem more than guileless to hail it as a signal moral reformation on the part of the aforesaid magnates. But any way it is considered, the significance is undoubted. Something has dawned; just what may not be clear. It may be that the anti-prohibition stage joke was wearing out with the public. It may be that, true to its type, the anti-prohibition stage joke had descended too rapidly to other lawless and immoral planes, tainting the entire theater atmosphere.

Or it may be that the 'wets' have at last taken counsel of common sense and have decided to revise their plan of campaign. For the last twenty-five years they have been constantly changing campaign methods, with no observable increase in their knowledge of American psychology. As they were going they gave rise to a popular quip: 'If the wets keep on at this rate they'll soon make the country dry.' So it may be that Mr. Hays' order simply means that the 'wets' have decided that it is bad policy to insult the people and degrade the Constitution of the United States daily on thousands of miles of film before the eyes of millions of Americans.

This, however, would be to imply that Mr. Hays is interested in helping the 'wets' in their campaign, and there has never been the slightest evidence that he is. He is, however, very much interested in the Republican party. If, as some say, the next national election will involve the issue of 'wet' and 'dry' with the Democrats vociferously 'wet' and the Republicans ostensibly 'dry,' it could scarcely be expected that Will Hays would like to see the movies clacking along Democratic lines. Some clue to his action may be found there.

We should prefer to believe, and this in all sincerity, that Mr. Hays' action was just his own for no particular reason other than that he grew personally very tired of heading an organization which daily and hourly flashed 'wet' propaganda and scorn of the Constitution into millions of eyes. He knows best what his reason was. We are glad of his order, hope that he will see it obeyed in spirit as well as letter, and trust that the evidence of this will speedily become visible on the screen. This definite stroke will go far to convince people that it is possible for common sense to Americanize the movies.

## *The Value of Vulgarity*

ONE of the remarkable features in connection with the celebration of the 150th anniversary of American Independence is the amazingly bad taste displayed by ad writers, press agents and all the lesser ballyhooers who have seized upon the occasion to exploit their own particular product, person or project.

A baking company recasts the famous 'Spirit of '76' painting to emblazon the name of its 'Sunshine Bread' upon the drum. An actress whose current Broadway success is the portrayal of a negro harlot is shown as Dolly Madison. A newspaper prints a movie company's conception of 'How to Celebrate the Glorious Fourth.' It pictures a girl, skirts drawn above knees, a-straddle a skyrocket headed into a background of sickly looking stars. Another newspaper (one which should know better) also employs the skyrocket theme; its girl—the spirit of independence or some such thing—is garbed in a one-piece bathing suit. Accompanying the picture is some wretched doggerel in which Independence Day is made to rhyme with the good old U. S. A.

First honors for effrontery, however, undoubtedly go to the cigaret companies. Here's an excerpt from a copyright ad: 'When Fourth of July bands are playing—and the cannon are roaring out their celebration of Independence and Freedom—have a Camel!' On second thought there's really something quite stirring about this. It brings back so clearly that fine old era when the brewers were wont to decorate their beer advertisements with the American flag—until prevented by law.

---

## *Down With Prophets!*

IN ITALY, so the report goes, Mussolini has forbidden an earthquake prophet to prophesy, because his forecasts have been only too true. He was frightening the populace. Better to have evil descend unannounced, than to live in expectant terror.

It is not only in Italy that this is done, much as we may incline to smile at the method of Mussolini. Department stores object when newspapers foretell rain for the coming day, and deeply resent all doubts cast upon the 'fair and warmer' outlook at all times. Business men denounce all analyses of events which indicate that American Business is pursuing with customary stupidity its unintelligent road to a salutary check. It is 'good business' to talk up loud and strong about prosperity,

with never a word of the influences which undermine it or the sound principles which uphold it. Anything else than ballyhoo is to be banished. Down with the prophets who warn of a depreciated dollar! Down with the prophets who warn of an overwhelming national burden of debt! Down with the prophets who cry without ceasing that we are building into American economics the same penalties which brought about all previous calamities! Down with them—shut them up, *a la* Mussolini—their prophecies have too much the sound of being true!

But disasters never come to people through warnings heard—only through warnings unheeded.

It is earthquakes in Italy that are taboo; in America it is equally real and ominously eruptive facts that are taboo—race, religion, powers and principalities of evil, social justice, money reform.

After all, these are the real earthquakes. But every tremor signifies the nearing birth of the new era.

---

## *Tests for Ministers*

BRUCE BARTON, in *Collier's* for July seventeenth, writes an interesting article wherein a fictitious character, easily identified with many thoughtful persons, proposes certain qualifications for the examination of prospective ministers of religion. Among them are these:

'1. Could you conduct a successful carpenter shop? The Master did conduct one until He was thirty years of age. Most of the disciples had been active in business before becoming disciples. Recognizing that the ministry is a far more difficult profession than any other, would it not be an excellent preparation if you were to demonstrate success in one of these lesser employments before assuming the greater?

'2. If confronted with the task of entering the outer court of the temple alone and unarmed, and driving out a horde of greedy money changers, could you do it?

'3. Do little children love you and follow you?

'4. Do common people hear you gladly?

'5. Do sick people in your presence feel new health and courage?'

These are practical tests. Their application to the ministry is not imaginary. And the strange thing is that many ministers could successfully pass them. They are not always the men of whom we hear most, they are not always found in the biggest pulpits. But they are there, and they are the salt of the ministry.

## *Not Political, But Real*

MOST discouraging of all the reactions of Washington to the criticism of the country, is that which shows an incapacity to think in other than political terms. The criticism of some of Mr. Coolidge's acts and tendencies, which has lately been apparent in the country, is not political at all. The people do not think of Mr. Coolidge in a partisan or political sense. They are not judging his acts by their political bearing. They have deeper interest in the matter than that.

Yet at Washington, this criticism is immediately ascribed to political motives. It is partisan—that is, inspired by members of other parties against Republicanism. Or it is factional—that is, inspired by Republicans who would like to succeed Coolidge. Everything is measured by its probable effect on two things—Mr. Coolidge's chance to succeed himself or the Republican party's chance to hold the Presidency.

Shortsighted men! It is not Mr. Coolidge's next term that the people are thinking about, but his present administration. It is not candidates and campaigns that they are thinking of, but forthright leadership at the present moment. If Mr. Coolidge himself has been influenced by his surroundings to gauge with political eye the growing restlessness of the people, then he is grievously misled. For this is preëminently a time when those who are willing to lose their political souls are the only ones who will save them.

It is urgently necessary that it be repeated that criticism of Mr. Coolidge is not hostility, but alarmed friendship. No President can be wiser than the people. No Presidential advisers can take the place of the people. The Presidential term is slipping away. Some mistakes have been made. Some bad tendencies have been increased. Misleading advisers have been continued in power. The wall which prevents the President seeing and hearing the people grows higher and thicker. If the name and fame and service of Coolidge is to be brought to fruition, it is time action was taken. And the political advisers of the President are not advising this: on the contrary, they are lulling him to sleep. When an occasional alarm does break through, it is interpreted politically, and thus neutralized.

*There is nothing political in the present national situation.* Let the politicians consider that.

---

There is only one United States and its value to the world consists in its being and remaining American in spirit, ideal and action. Any deletion of its Americanism would increase the international calamity.

# Writing Verse for Composite Readers

## Some Versifiers Cultivate Eccentricity; Others Are Themselves, and Therefore Poets

By CHARLES J. FINGER

ILLUSTRATED BY W. O. FITZGERALD

MY EXPERIENCE with some of those who wing their way over the meadowlands of song, with an eye to Parnassus, is this: For more than four years I have edited and financed a little independent paper by way of keeping up the Reedy tradition for one thing, and, for another, because I wanted to say what I thought and felt and saw.

In that paper I have printed more than three hundred poems, the choice of some two thousand offerings in free verse form and metrical rhymed form. From all corners of the country and from abroad the contributions came, sent by poets austere and poets ornate, by poets whose work was debilitated by mannerisms, by poets who possessed felicity of language and fancy, by poets markedly derivative, by poets who seemed to be stumbling along strange philosophical byways, by poets egoistic or self-assertive or self-conscious, by poets naïve in an artful kind of way, by poets quite uninspired but with a knack of writing verse at a moment's notice, by poets of deliberate eccentricity, and by some who were not poets at all who tried to put across wild and bizarre stuff with the sheer desire of seeing their lucubrations in print.

Out of all that came a by-product of value. For my paper being a personal affair, I came to touch and exchange ideas with subscribers until the resulting correspondence grew so burdensome that I had to desist. In great measure those with whom I thus came into contact were thoughtful men and women engaged in affairs in the world commercial, masters of men, captains of industry, managers and also men on pay rolls. They were, for the most part, inarticulate when it came to writing for publication, but expressed themselves most excellently in personal letters. So I came to see the viewpoint of a kind of reader of high intelligence, one who listened to the cognoscenti but held firmly to his own opinions. Some of them I had known personally when I was an executive, but meeting in offices or hotels, we did not talk of literature, but of railroad rates and the cost of ties, of taxes and locomotives, of coal and steel rails. I do not think that we suspected one another of literary leanings, or of a liking for music.

That composite reader, as I see him, stands neither with those who hold that free verse is no poetry at all, nor does he stand with those who cling to free verse as the only logical vehicle for vitality and sincerity so would pitch all metrical forms on the scrap heap. He stands on different base. His view is that the free verse form is a kind of anastomosis; in plain

The reader will have nothing to do with the literary madman.

words, the result of a running together of the two streams of poetry and of prose. He sees poetry as poetry, prose as prose. In the new form he sees something apart from either, but with marked tendencies toward one or the other. That is, there may be a marked dependence upon the music as well as appeal to the intelligence and feeling as in the case of John Oscar Beck's 'A Plea to Indiana,' or, better still, in Ezra Pound's *Ballad of the Goodly Fere*—or there may be an almost entire abandonment of the music and an appeal to the intellect as in John V. A. Weaver's 'Drug Store.' To take more familiar examples, the production may lean to the beauty, music and ecstacy of the 45th Psalm, or it may lean to the vigor and fire and intensity of that most notable passage in the sixth chapter of Carlyle's *French Revolution* where Louis Tournay, cartwright of the Marais, is pictured battering at the Bastille.

Here is another viewpoint of the composite reader, and a valuable one. He holds that much that passes as free verse is something of a triumph of ineptitude over ability. Too many 'experiments' are flung in the face of the public. In the commercial world, experiments are things of the workshop, not of the market. Put the idea in another way. Before a writing can be good poetry, it must be excellent prose, but so much that is foisted upon the world literary has all the earmarks of incompleteness, in poetry just as in prose where writers, indolent or else incompetent to follow out their theme or thought, cast off responsibility with a row of dots, *a la* H. G. Wells, Ben Hecht, Sherwood Anderson and others. To carry that a little further, any man who has glanced through Shelley's notebooks must have been struck by the evidence of the poet's most patient industry. There are to be seen passages of excellent prose, passages with a flow both easy and limpid. At these the poet hammered and wrought and polished until out of them grew things of strange beauty such as the 'Ode to a Skylark,' or some of the stanzas from 'Adonais.' Under the stress of emotion and by hard work the prose became poetry and music, and fell into regular cadence. First the thought, then the rough expression, then the finely finished thing.

That composite reader, habituated to a 'therefore' for every 'because,' looks upon the new form with serenity. He considers that it is the natural and unavoidable outcome of our modern life with its haste and hurry, its fierce pressure, its immense forces, its swelling tide of human activity. The adoration of beauty is not for those who live in cramped cubicles, who spend hours of their weeks on cars and subways and underground places and electric lighted offices, who never by any chance see the rising sun or know the pageantry of the seasons.

But though modern life has taken new and strange forms, yet the man of elasticity continues to find everything alive and significant. The Ruskinian dislike of all the modifications that machinery has wrought is not in him. On the contrary, he looks for an expression of all that mechanical rumbling and whirring and rolling in contemporary literature. So activity becomes a kind of ideal.

Some, being articulate, turn to descriptions of the life that they know; the composite reader that I have in mind reads and enjoys them.

That is why Carl Sandburg, singer of the wholesomeness of activity, stands today as the most popular of the moderns. He has taken the popular fancy just as Robert Burns took the fancy of his day.

He may be looked upon, it seems to me, as America's folk poet just as Burns was looked upon as the representative of Scottish folk poetry. There are qualities in him which delight the average man of action. He is direct. He is forceful. There is ecstacy in him. He is full of freshness and courage, infinite courage. That he lacks elegant refinement is as an asset, because there is no elegant temperate refinement in a life of pushing and crowding. So manner and subject and style are all gloriously consubstantial, exactly as manner and subject and style were consubstantial when Burns sang of his rascally beggars.

Perhaps that composite man of mine is moved by enthusiasm more than by analysis. I do not know, nor does it matter. In his list of likes, strange fellows rub elbows. He likes Edwin Markham, for instance, though Markham is not of the new school.

That human sympathy voiced in 'The Man with the Hoe' caught his fancy. But he also likes Arturo Giovannetti because of the poet's shining fervor and courage, though my composite reader himself is by no means a denouncer of capitalistic society and is suspicious of the reformer. He reads and reads again Edgar Lee Masters, finding him truthful and genuine but narrow, for the *Spoon River* man, while accurate and sometimes microscopic in his vision, seems to overlook the fact that prejudices and conventions are very solid things that break those who try to break them. Amy Lowell mystifies with her experiments and her theories. Her swift and sudden changes too are disconcerting. The man I have in mind has no love for borderlands, as it were. His men must be men, his women women. But Amy Lowell sometimes seems to hover between the two. That average man of mine seems to like essays in verse, descriptions on little incidents of town and country life, almost conversational in style. Something like Robert Frost at his simplest tickles him. This, for instance:

> What I like best's the lay of different farms.
> Coming out of them from a stretch of woods,
> Or over a hill or round a sudden corner . . .

which, when you come to think of it, in spite of its modernity, is very much like William Cowper. The wistfully cynical Helene Mullins is a favorite, and when she stepped from my columns to the New York *World*, my composite reader followed her career. Then there is Marjorie Meeker, so absolutely lucid and unpretentious in style, who seems to shun fame with as much assiduity as most writers cultivate it; she has her audience because she possesses the gift of presenting some passing mood or emotion in such fashion that the feeling is reproduced in the reader. Her *Memorial Sonnets*, so replete with delicate suggestive harmonies, won her many friends.

Vachel Lindsay, my man enjoys on occasions, just as he enjoys on occasions a Sousa band concert, but that vigorous brass band rhyming soon palls; nor does the composite man see anything new or wonderful in those odd rhymes and comic opera choruses, for he has more than a passing acquaintance with Gilbert's *Bab Ballads*, with *Pinafore* and the *Pirates of Penzance*. For Charles Erskine Scott Wood who wrote the 'Poet in the Desert,' a work of true poetic beauty in which the tragedy of the human soul is figured, the ideal reader as I know him has the greatest respect and admiration.

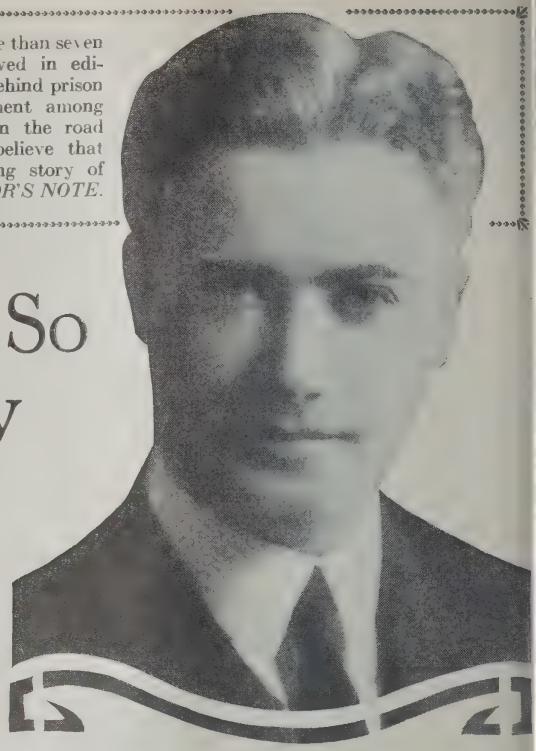
There are other minor poets who do not write free verse who, according to my experience, are read with interest.

The Californian, George Sterling,

So we come to the free versitiers and others.

for instance, felicitous in rich ornamentation; John McClure, of New Orleans, always sincere and scholarly and thoroughly modern in tone of thought; Glenn Ward Dresbach, hunter and trapper, whose pictures of the West are full of true poetic beauty; John Hall Wheelock with his air of going about the world like a knight, strong, courageous, interested; Sara Teasdale so skillful in calling up concrete images by short passages; William Griffith who leaves his editorial desk to write poems characterized by a peculiar vein of pleasantry and delicate fancy; William Rose Benet because of the subtle beauty of his 'Land of Giants'; Edna St. Vincent Millay whose love lyrics are like etchings on pearls; Edwin Ford Piper and Jay G. Sigmund both unsung by the anthologists, both modern border balladists, simple and direct but with occasional touches of tenderness and pathos extremely attractive to that composite reader of mine.

All these, and more, interest the reader that I know, but with the literary madman he will have nothing to do.



If he considers him at all, it is as a case for the expert medical officer. The marvel is that his productions should be anywhere received as something mysterious and marvelous, something so full of the enigmatic as to be received with bated breath. But that attitude, I think, is akin to the attitude in which the utterances of the *non compos mentis* were received by the superstitious in the Dark Ages. The intelligent man today, as then, estimates them with accuracy at their real value.

Some versifiers cultivate eccentricity; others are themselves, and therefore poets. Some are crows who aspire to be birds of paradise but are betrayed by their voices. Those who sing naturally and for the love of singing sing the truest and sweetest.

The literary madman is received by some with bated breath but that attitude is akin to the attitude in which the utterances of the *non compos mentis* were received by the superstitious in the Dark Ages.

WILLIAM F. HOPP has been chaplain of the Michigan State Prison for more than seven years. He was formerly a newspaperman, and the training which he received in editorial work has been of great value to him in observing life as it is lived behind prison bars. Mr. Hopp's work among the prisoners has caused widespread comment among penal authorities, and he is credited with having started many convicts on the road toward a better and brighter life. In connection with this article, he writes: 'I believe that the time has come for me to share my experiences with others.' It is a moving story of actual contact with the men who live for one thing alone—the future.—*EDITOR'S NOTE.*

# Sad Men Who Look So Wistfully at the Sky

*By* WILLIAM F. HOPP

IT IS Sunday morning. A prison is a quiet place on any day, but on Sunday it seems more quiet than ever. With the exception of the few men who are working in the mess hall, the kitchen, or some of the offices, the prisoners are all in their cells.

Sundays and holidays are the worst days for the prisoner because the hours are many and long. An ominous hush seems to hang over the prison. The convict paces back and forth in his cell, three steps, turn, three steps, turn. The walls are bare. Over the table hangs a calendar with a picture of Christ on the cross, his expression full of sorrow—a sorrow which the prisoner understands.

The man in the cell tries to read a book from the prison library. The reading is desultory and fitful. Or he writes a letter. His thoughts wander. Home, mother, wife, children. What a fool he has been! Oh, what he would give if he could be with his little boy, his little girl, on this Sunday morning. Perhaps he has no home, like the boy who tried to escape over the wall the other day. His parents died in the San Francisco earthquake and there was no home for him after that. A tramp befriended him, and he became a roamer, until he came here.

It is nearly ten o'clock, almost time for the chapel service. The sharp sound of an electric bell interrupts the stillness. Other bells in various cell-blocks take up the sound, the signal for the unlock. Guards go along the tiers, three or four stories high, and unlock hundreds of iron-barred doors. There is the rattling of keys, the sound of subdued voices, the clanking of cell doors. Another signal and the men step forward. Quietly, in single file, they march along the gallery to the stairway down to the hall of their cell-block, up the winding stairway which leads to the chapel. They file into the chapel, silent, serious figures, filling row after row. Their suits are gray and their faces sad. Everything is compulsory except attendance at the Sunday services, but the men fill the chapel

The chapel resembles somewhat the meeting place of other congregations, except that here the windows have heavy iron bars rather than stained glass. Along the aisles and in the rear stern-faced men in blue uniforms stand guard. For years the walls were gray, the dominant color scheme of all prisons. But when the new warden came, he shattered all precedent. 'Too much gray,' he commented when he first saw the prison chapel, and now the walls are painted a light cream, a clean and happy color.

The organist, a life prisoner, plays the prelude—a medley of hymns, old favorite hymns, reminders to some of better days, of church and Sunday school, of home and mother. If the men had been true to these! I sit on the platform watching their faces, conscious of the opportunity to arouse in them the desire to be better men and perhaps, in this prison gloom, to bring into their darkened lives a ray of sunshine. What a wonderful privilege. Many a minister of the gospel who is discouraged because of the apathy of his respectable congregation would be happy if he could face this audience.

To some of the men I have talked during the week in the privacy of my office as one man talking to another, one man being neither preacher nor prison official, but a friend, and the other neither convict nor saint but just a man who has bared his soul.

There is Jimmy Hawkins, who has already served four years of a five-year sentence. Five days ago he received a message that his mother had died. He is a strong man, big, muscular, square-jawed, not at all given to tears, but when I told him that his mother was dead, he broke down and wept like a child. She had visited him two months before, a plain little woman who believed in him and loved her son as all mothers do. He did not see her again, and yesterday they buried her in the city where she lived, 200 miles away, and he could not be there. And there, in the second row, is Louis Fraser, whose gambling spirit finally got him into prison. His wife wrote him last week that she is getting a divorce, and I know his heart is heavy because he really loves her and his three small children.

In the rear sits 'Happy Jack' Brennan, who is serving a life sentence for killing his father. He does not look like a murderer, this boy in his twenties. Friends in his home town feel sorry for him; they say his father was a drunkard who brutally abused Jack's mother and Jack had just returned from France—.

Among those who have come to the chapel service sits Dan Sherman, who has been in this prison thirty-nine years; he, too, is serving a life sentence. Some years ago some prison officials took pity on the old lifer and one Sunday afternoon they showed him a little of the outside world which he had not seen during all those years spent in this living tomb. They put him in an automobile, and for two hours Sherman saw with his own eyes some of the changes time had wrought in the outside world, which had been pictured to him many times by other convicts. It was his first ride in an automobile, and he marvelled at the miles of smooth pavement in the country. He laughed at the style of women's dresses. The women he remembered wore long skirts trailing in the dust.

As I write this, I have before me a crime census of the prison, a directory of my prison congregation. What a

catalog of human weaknesses, of passions uncontrolled, of misdirected energy, of all the shortcomings of the human race. There are 207 men who took human lives, some maliciously, some in self-defense and some unintentionally. There are 269 burglars, 95 forgers, 59 pickpockets. Many are serving time for some form of larceny. There are 331 confined for robbery.

For more than seven years I have talked to these men from the chapel platform and in my office and I know some of their thoughts—thoughts of resentment, self-pity, lonesomeness, hate, anxiety, self-accusation and general discouragement. What a depressing atmosphere!

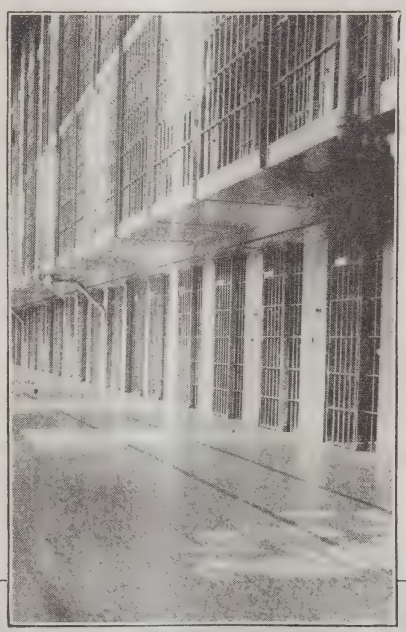
We begin our meeting, as all church meetings begin, with a song. I wonder if some good church people would be shocked now, for the opening song is not a hymn, but some good popular folk song, not always classical, but full of optimism. If we lack copies for distribution, I have a slide made and the words thrown on a silver screen above the platform. The first verse does not go so well; we start it once more and the singing improves as we go along. After some singing the tenseness is noticeably relieved and while the men maintain perfect discipline, they feel more at ease. We are now ready to sing a hymn.

On Thursday, an old lifer died in the prison hospital. He was eighty-four years old, had served nineteen years and had been ailing six weeks. He was a kindly old man and a sincere Christian. In this crowd, where being a Christian does not always serve as a recommendation, he was well liked by all men. On the day before he died he told me that he missed the chapel service. 'I can hear the singing up here,' he said, 'the singing of the good old hymns. If I could only go to chapel once more.' Then, after a pause: 'There is a hymn I always like to hear; I wonder if the boys would sing it for me next Sunday. I will be listening for it.'

This was the hymn he wished to hear—

> What a fellowship, what a joy divine,
> Leaning on the everlasting arms.
> What a blessedness, what a peace is mine
> Leaning on the everlasting arms.

Yesterday he died and this shall be the hymn today, a memorial hymn in honor of 'Daddy' Blackburn. As I announce it, I tell my prison congregation that it is the old lifer's wish that they sing this hymn. I ask them to stand and they sing with much earnestness and force. As the song is ended there are moist eyes, for death in prison is very real to them. What if death came to them before their release.



I read them the 90th Psalm, that ancient meditation of one who knew the vicissitudes of life and who had come to the conclusion that in all generations, in all uncertainties of life, there is only one sure refuge—God. That becomes the text and theme of my talk today and as I speak to them, appealing to them as real men who wish to do the right thing, who desire success rather than failure, freedom rather than bondage, I can feel their responsiveness. They pay close attention. I tell them that God created them in His own image and likeness, and that God, even as their own mothers, is interested that they play fair in the game of life. I show them in one way or another that they are capable of success; that deep down in their hearts they wish to do the right things; that the kingdom of heaven, the happy kingdom of freedom and friends and everything that is worth while in life, is within their own souls.

We sing another hymn. The men rise, and with bowed heads receive the benediction. They file out one by one, down the winding stairway. I hear the cell doors clank shut, keys are turned and all is quiet again.

Back in my office I cannot help but think of the mothers back home; their heartaches on this Sunday morning; their thoughts of the boys who were babies once, when all the world loved them. But I know the unconquerable faith of mothers, and I pray that we may have wisdom to straighten crooked lives and stem the awful tide of young men who are prison-bound.

The other day a business man remarked: 'I cannot see how the religious appeal can reach these men. You might as well try to

Prisoners marching into the mess hall under surveillance of guards. Inset—A prison cell-block.

# DUELISTS *of the* SKY

## A Tale of Knights-Errant and Their Deeds—of Their Light-Heartedness, and Their Gallant, Tragic Fate

By CAPTAIN ALFRED HEURTAUX

THE first three times I ventured into the air over the fighting lines ended in disaster. At that time I was an observer. Aviation was a new arm of the service, untried, hazardous, considered in official circles as highly undependable. It was the general opinion that only fools and the irresponsible would choose it, their lives being of little value.

My pilot was an enthusiast, excellent as long as we were flying, but highly repugnant to me when it came time to regain the cows' floor.* Grand humorist, he landed upside down every time.

'You know,' he told me before our first flight, 'that not yet have I ever killed any baggage (the term used to designate the observer). But in order that I may not have your death upon my conscience, it is prudent to follow my indications. When we still are at six hundred feet, put your head into the fuselage, roll up yourself, and hold fast to the bottom. Do not move until the crashing arrives; then, if you can, take again the liberty of your actions.'

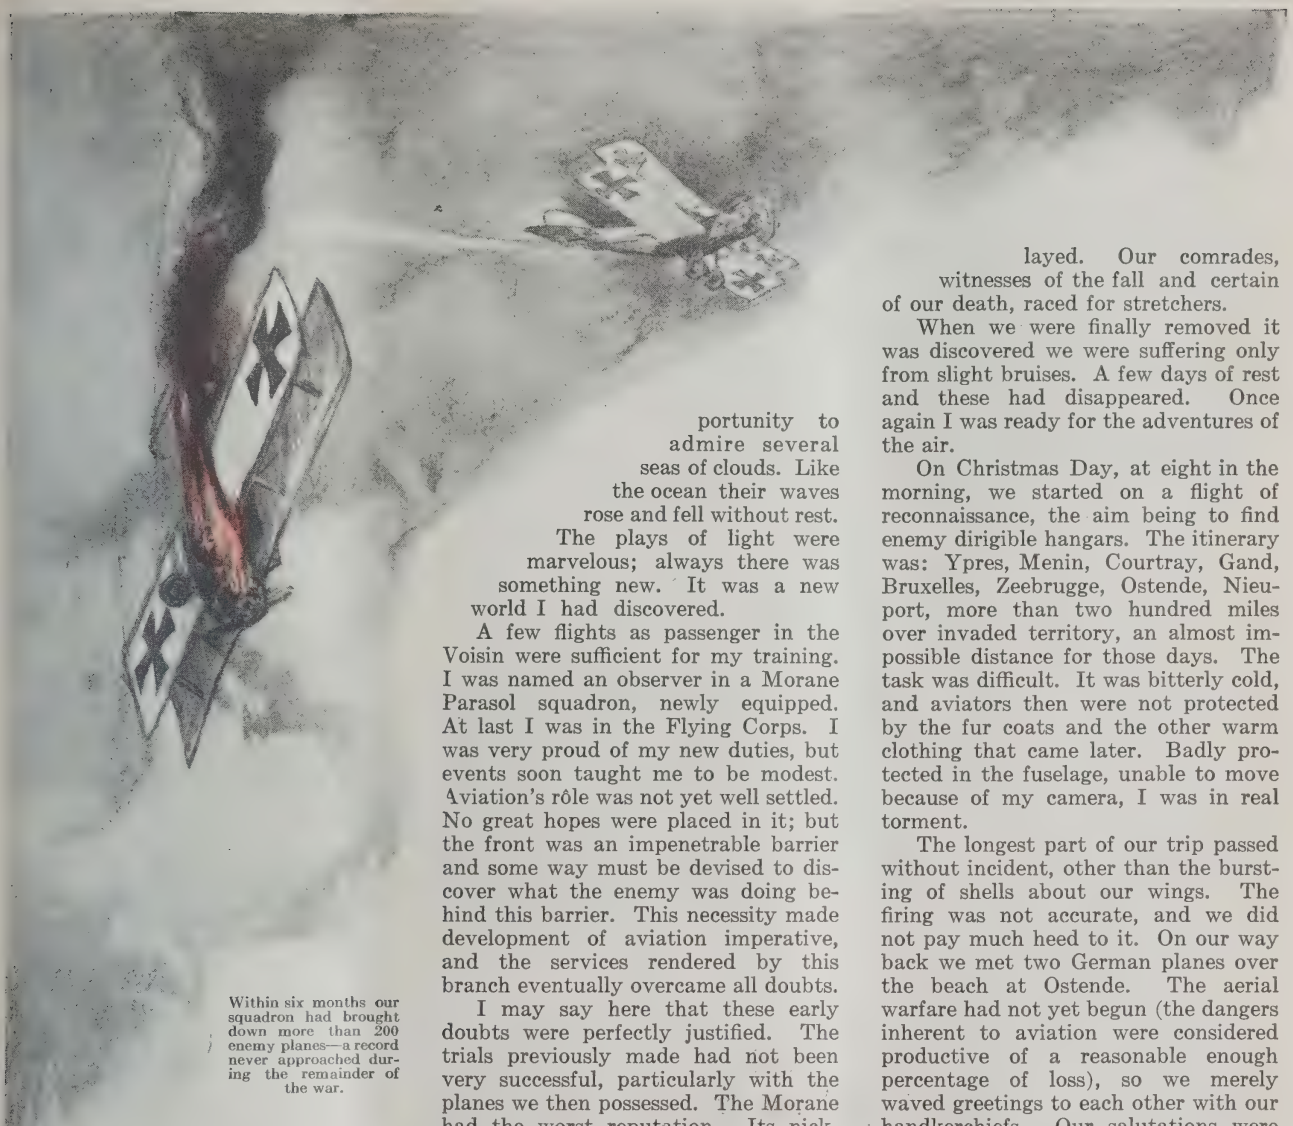
No doubt my surprise was a trifle evident for he added:

'The landing is a delicate affair and the birds themselves do not always succeed. Remark the raven pitching into a field when the wind is blowing hard! He often loses his equilibrium and is in the necessity to give a stroke of the beak against the ground to find it again. That is what I do—but with less style!'

Less style! The man had not even the remotest conception of style. After he had imitated the raven for the third time I decided to become a pilot myself. Surely I could do no worse; possibly I could do better. At all events, if I were to be killed I preferred to accomplish the matter myself!

At the outbreak of the war I was at the Military Academy at Saint Cyr. For days wild rumors had filled the air. Then one morning reveille sounded at three o'clock. We knew what it meant. The days of uncertainty were over; the days of war lay ahead.

Six hours later farewells had been said. We had received from the officer-instructors our sealed orders, little envelopes that decided our fate. Many of our comrades we were never to see again; others were to become world-famous in the years to follow. Some were to die in the first grim days. Good luck—till we meet again!



I was appointed *sous lieutenant* of the 9th Regiment of Hussars at Chambery. I joined my regiment the next day and we immediately departed for the region of the Vosges Mountains. Five days later we met the enemy. For a month we battled in the woods on the slopes of the mountains. The fighting was hard, and it was with real satisfaction that, at the beginning of September, we were transferred to the Somme. Here, at least, we were able to see before us and we did not find snares at every step.

The aim of our first attack was the taking of 'Le Quesnoy en S-auterre'; afterward came the battles of Hallu, Chilly, Fougues-court, la Basée, Mount Kemmel. The month of October we spent in the trenches of the line of Ypres Nieuport, where we remained until the end of the battle of the Yser River. Our regiment had suffered heavy losses in this race to the sea, and in November it was removed from the line of fire and sent to the rear to await the arrival of replacements.

This inactivity did not please me. Moreover the war of maneuver had given way to the war of trenches, and this new phase was not at-

*French aviators' slang for ground.

Within six months our squadron had brought down more than 200 enemy planes—a record never approached during the remainder of the war.

tractive to me. So when a circular was published asking for volunteers for aviation, I was an eager candidate. My request was not received with enthusiasm; I had had three citations and my colonel attempted to keep me with him. But my insistence overcame the obstacles, and a few days later I received my transfer.

Of aviation I knew nothing save the current opinion that it was a dangerous sport. But my first flight enraptured me. I had a sense of absolute security and it seemed impossible that an accident could occur. As we rose into the air the earth took on new shape; the irregularities of the ground lost form; everything became without relief, like the maps I had before me. It reminded me of the days of childhood, of those little sheepfolds, made in the East Mountains, whereon trees and houses are a few inches high, where fields and meadows are bits of colored paper and where a silvered wire takes the place of a brook.

Hundreds of feet below men moved like microscopic ants. I had the opportunity to admire several seas of clouds. Like the ocean their waves rose and fell without rest. The plays of light were marvelous; always there was something new. It was a new world I had discovered.

A few flights as passenger in the Voisin were sufficient for my training. I was named an observer in a Morane Parasol squadron, newly equipped. At last I was in the Flying Corps. I was very proud of my new duties, but events soon taught me to be modest. Aviation's rôle was not yet well settled. No great hopes were placed in it; but the front was an impenetrable barrier and some way must be devised to discover what the enemy was doing behind this barrier. This necessity made development of aviation imperative, and the services rendered by this branch eventually overcame all doubts.

I may say here that these early doubts were perfectly justified. The trials previously made had not been very successful, particularly with the planes we then possessed. The Morane had the worst reputation. Its nickname, 'The Flying Coffin,' gives an idea of its reliability. Rare were the pilots who, like Garros or Brindejoue, were able to master the machine. I did not have the chance to ride with men like that—far from it! My training over, I was assigned to this pilot who shall remain nameless. The advice he gave me proved very good, as later events showed.

Toward the end of December, a visit from the President of the Republic compelled us to make a flight of protection. The wind was blowing tempestuously. Our difficult departure permitted me to foresee an equally difficult return, and my expectation was not unfulfilled. On the way back to our field the engine stopped completely. This so distressed my pilot that he lost control of the plane. A gust of wind turned it upside down. A fall of nine hundred feet began!

A few seconds—that for us seemed like hours—brought us to the ground with terrific force. I was caught in the debris, unable to unfasten my belt, my head bobbing up and down in a pool of muddy water. Help was delayed. Our comrades, witnesses of the fall and certain of our death, raced for stretchers.

When we were finally removed it was discovered we were suffering only from slight bruises. A few days of rest and these had disappeared. Once again I was ready for the adventures of the air.

On Christmas Day, at eight in the morning, we started on a flight of reconnaissance, the aim being to find enemy dirigible hangars. The itinerary was: Ypres, Menin, Courtray, Gand, Bruxelles, Zeebrugge, Ostende, Nieuport, more than two hundred miles over invaded territory, an almost impossible distance for those days. The task was difficult. It was bitterly cold, and aviators then were not protected by the fur coats and the other warm clothing that came later. Badly protected in the fuselage, unable to move because of my camera, I was in real torment.

The longest part of our trip passed without incident, other than the bursting of shells about our wings. The firing was not accurate, and we did not pay much heed to it. On our way back we met two German planes over the beach at Ostende. The aerial warfare had not yet begun (the dangers inherent to aviation were considered productive of a reasonable enough percentage of loss), so we merely waved greetings to each other with our handkerchiefs. Our salutations were rudely interrupted by the sudden cessation of our engine.

My pilot, for some reason too deep for me to fathom, turned his back to the land and headed resolutely out to sea. Motionless as I was, it was impossible for me to protest. Our machine not being a seaplane, it seemed to me much preferable to attempt a landing on the earth, perilous as it was, than to dive into the North Sea.

Luckily our engine had the good thought to start again when we were but a few feet above the surface of the water. At this low altitude, and running parallel to the coast, we again headed for our lines. The journey, nearly thirty miles, seemed much longer to me because the enemy coast battery did not conserve their projectiles, but aimed them at this new target. Moreover, they were aided by two motor cars equipped with guns. A dozen holes were ripped in our linen wings, but we ourselves were not struck. Laboriously we flew over the water dam of Nieuport. The engine, wearied by so long a struggle, soon stopped definitely.

Our trip ended on the beach of La Panne, where we crashed down at the feet of seven nurses of the Belgian Red Cross. Their fright over, they came to our aid. Once again we escaped with minor injuries, but our plane was demolished. The camera and the plates were also destroyed. Nothing remained of the fruit of our labors.

Our sorrows, however, were not of long duration. A Belgian commissary welcomed us and helped us to forget our misfortune. When, late in the evening, we went back to our field, we had recovered a happy indifference, so dim was the remembrance of the morning's emotion.

If this last adventure had not diminished my zest for aviation, it had certainly destroyed the last vestige of confidence in my pilot. The future—with him—appeared very uncertain, and I was sure that some day soon one of his favorite landings would prove fatal. (I was mistaken. This man flew all during the war and is still alive. Surely aviation cannot be as dangerous as it is reckoned!)

I stated my desires to my commandant. My reasoning seemed logical, and I was authorized to send my request to General Headquarters. Although my regular duties ceased while awaiting a new plane, I was not inactive. I accepted the invitation of a friend to fly with him. He was making the first experimental night flights and wanted me to help him. So I made some aerial bombardments in the neighborhood of Ostende. The only remarkable episode of this period occurred one night when we lost our way during a snowstorm. We were carried over the sea, but after half an hour of search we again found the coast and landed without difficulty. But we had a narrow escape.

These experiences soon ended. My friend preferred to replace me with an equivalent weight in bombs. Not long afterward I was sent to the Pilots' School at Pau; there I arrived the beginning of February. Pau is a small city in the south of France, located on the lesser chain of the Pyrenees Mountains. It is well known to foreigners who often winter there. The mildness of its climate, the scarcity of winds, and its favorable location combine to make it ideal as an aviation center. The field was on a broad upland a few miles north of the city.

My training began at once. I was fortunate in many respects. There were not many machines, numerous accidents destroying them frequently, and we often were obliged to wait some time for new ones. This gave us opportunity for more intensive training, the value of which was fully realized later. The airplane with double control had not been devised and the old method of teaching was still in vogue. This system was more slow and expensive because of frequent breakage, but the results were superior and the pilots' quality much better. Moreover it was of tremendous advantage to us to know every stage in the improvement of aviation. It was the urgent need for more pilots and quicker training which afterward caused the abandonment of the old system.

Our first machine was a Bleriot, similar to the one which first flew over the Channel. Its wings, however, had been clipped so that it was impossible for it to leave the ground. This characteristic gave it the name, 'The Penguin.'

To render 'The Penguin' absolutely inoffensive and to prevent it turning upside down, two long skates were fastened to the landing gear. We had to learn to go straight by using the rudder. Our first attempts were like a drunkard trying to walk on a sharp slope. 'The Penguin' was a facetious animal, full of unexpected ruses for the unskilled pupil.

One of its favorite tricks was to run away. Enraged by ill-treatment, its soul—a three-cylinder Anzani—often rebelled and refused to obey the throttle control. The unfortunate and powerless pupil would then cry out for help. All his comrades would rush onto the field and try to catch the tail of the fuselage, and so stop the beast. But 'The Penguin' did not permit itself to be so easily tamed. Under these circumstances it put at stake all its desperate expedients.

More than once, as soon as one of us had laid his hands upon the body, the machine would make a quick turn and charge vigorously at the adversary, who had barely time enough to drop flat to the ground to escape the propeller. Frequently a quarter of an hour was spent in hunting before we were able to master 'The Penguin,' which thereupon docilely resumed its good services.

Four days were sufficient for me to be sent into the 'upper class.' There I found the same type Bleriot, but equipped with its entire wings. For the first time I left the ground depending solely on my own abilities. These flights were very timid, and only a few feet above the ground. The aileron, engine and tail controls were rapidly mastered, and I was given a Bleriot similar to those in use at the front during the first months of the war. This was the decisive moment; I struggled with turns and landings; but I passed the tests satisfactorily. Then came the monoplane, Morane, and later the Morane Parasol, so called because the wing was located above the body. A few days later I received my military license and departed for the Pilots' Reserve at Le Bourget near Paris, where I must choose my plane. While waiting for my transfer to a squadron at the front I continued to improve my flying, and when I learned that I must replace the great Brindejoue des Moulinais, without pretense of having his merits, at least I felt I should be able to render fairly good services.

Of my arrival at the squadron there is little to say save that no one shouted for joy. I looked so young and had had such short practice at piloting that it seemed a useless risk to add me to the natural hazards of aviation. Small wonder my observer's heart was full of uneasiness. Even my chief was not very pleased to have such a boy, and before allowing me to perform any mission he ordered me on look-out duty.

For a month I flew with only my faithful mechanic as a passenger; he was the sole person who trusted me. If the attempts did not give very good results, they at least gave me the advantage of learning the country in every detail. Thereafter I had no need of a map and, free from the care of orientation, I was able to help my observer in his work.

Following this quiet month came a period of intensive activity. We were preparing for the attack of Champagne and every day was

CAPTAIN ALFRED HEURTAUX is generally recognized by the French Government and people as one of the greatest living French aces. He was graduated from the Military Academy at Saint Cyr (the West Point of France) at the outbreak of the war. His exploits as an aviator brought him world renown. He was acknowledged even by the Germans as one of the most gallant fighters of the war. Though scarcely more than a boy, he was eventually placed in command of the famous Stork Escadrille, mighty fighting unit, which numbered among its members such fliers as Georges Guynemer the Ace of Aces, de la Tour, Deullin, Auger, Raymond and Dorme, the 'friar.' When Heurtaux was finally shot down for the last time, he was in number of victories second only to the great Guynemer, his comrade and closest friend. At the death of Guynemer, his mantle passed to Heurtaux. Subsequently one or two other fliers passed him in the number of planes to their credit, but as their victories were gained in formation fighting (in vogue only in the latter days of the war), they are not regarded so highly as the victories of Guynemer and Heurtaux, gained in single-combat duels.

Heurtaux is an officer of the Legion of Honor. He was cited twenty-one times for bravery in general army orders; he has the Croix de Guerre with seventeen palms and two stars, the Belgian War Cross, the Cross d'Leopold, and fourteen other distinguished service medals from England, Russia, Italy and the other Allies. Following the war he was elected a member of the Chamber of Deputies as running-mate with Andre Tardieu, former French High Commissioner to the United States. In the two articles he has written for THE DEARBORN INDEPENDENT, Captain Heurtaux gives for the first time an actual personal account of the great battles of the air. Of the great French aces who were in the aviation from near the beginning, he is the only one left. He tells a story that can be told by no one else.

very busy. It was in the course of this battle that our planes were changed. I did not abandon my old Morane without regret; in spite of its faults I had fond memories of it. To be sure, it was necessary to be careful in taking off and landing with it, but in the air, for stunt flying, what a marvel!

However, we needed a faster machine for the aerial warfare which was just beginning. In September we received the Nieuport machines. These were the first especially designed for fighting. Being the youngest pilot, I was obliged to wait until December before taking possession of one. The bad weather did not permit me to practise as much as I wished, and I still had much to learn when the battle of Verdun began. For me that was the best school. When the attack had ended, I was transferred to Squadron No. 3, already known under that name which later became famous the world over—'The Stork Squadron.'

Arriving there almost unknown, I had the good fortune for my debut to succeed beyond all my hopes. The first month I officially shot down five German planes. The President of the Republic conferred on me the grade of Chevalier of the Legion of Honor. Soon afterward, our captain, Brocard, having been given command of a fighting group, I was placed in charge of the squadron. This promotion did not please me immensely. I feared that the new duties would not permit me to fly as often as before. There were so many things to do. We had a greater number of planes than the other squadrons, each pilot having two or even three of them. These machines obliged us to assume important duties. Their maintenance employed 250 mechanics; we had, too, one section of photography and one section of meteorology.

I had fifteen pilots, among them Guynemer, Deullin, de la Tour, and Dorme, names so often to appear in official communiques.

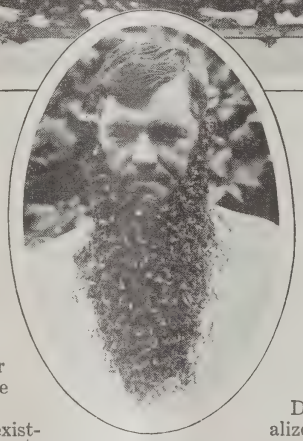
The longer the Battle of the Somme lasted, the more important was the part we had to play. Our chief anxiety lay in the fact that our machines were of a type already old, equipped with imperfect armament. We still had the Lewis machine gun, located on the upper wing. It was with the greatest pleasure that we got the new Nieuports with the Vickers machine gun shooting through the propeller.

Even this system was far from perfect, and before it was perfected we were shot down many times through having our weapons fail to function during battles. Nevertheless we had mastery of the air, and we were to keep it more easily when, in September, 1915, there came out the first two S. P. A. D. machines with the Hispano-Suiza engine. Adoption of this plane was not accomplished without difficulty. Most of the pilots had grave misgivings about the fixed cylinder motors. This opinion resulted from the fact that the German planes very often caught fire in mid-air if they received bullets in their engines. On the other hand, with our rotary motors, in spite of bullets shot through a cylinder, fire was an exceptional event. We attributed to the engine this grave fault, and we were hesitant to adopt such a hazard for ourselves.

Guynemer and I were designated to test out these new planes. Our conversion was rapid. The freedom and facility of flight caused us to adopt immediately the S.P.A.D. as a chaser, and the other pilots were not long in following our lead. The results confirmed our first impressions. Within six months our squadron had brought down more than 200 enemy planes—a record never approached during the remainder of the war.

*To be concluded*

# A Wasted Sugar Supply



(*Concluded from page 2*)

Brood comb containing honey, eggs, larvae and brood. Oval—Bees are friendly with Jay Smith, fancier of the insects.

Contrary to current opinion, bees have no desire to cause trouble and they seldom sting unless molested. Were this not true, professional bee-keepers would be unable to work with them for hours unprotected by gloves and often without even a veil for the face.

Among the uninitiated it is commonly thought that bees 'know' their keeper. This is not true. They do recognize fear and nervousness, however, and this accounts for a sting being their usual response for a blow struck at them, while if apparently unnoticed they cease their investigations and fly away about their business. They are busy little creatures and would much rather be at work, though if the need arise they are ready to sacrifice their lives for the defense of the colony.

Unlike most insect life, existence of the honeybee as an individual is impossible. The colony is necessary for the perpetuation of the race. The honey which a bee stores is consumed by generations yet unborn, for the normal life of a honeybee in the busy season seldom exceeds six weeks.

The queen, who is the mother of the colony, lays the eggs which maintain the large force of workers, as many as four thousand a day being not unusual at times. This is her life work. Seldom does she leave the hive, food being carried to her and fed her by the workers.

The workers, who are really undeveloped females, do all the work. They build the comb, gather the stores, keep the hive clean and feed the young. Untiring in their ceaseless labor, they virtually work themselves to death. Worn out, with their wings frayed and torn, they die usually in a vain attempt to return to the hive with their last load of nectar. During the summer a number of drones, or male bees, are also present in the hive. Big, lazy, harmless fellows, their presence is tolerated rather than welcomed, for the queen mates but once in a lifetime. With the advent of cold weather these useless members of the colony are driven out and allowed to starve, or less frequently are killed outright.

There are still some people who are skeptical as to the purity of honey. As a matter of fact, man has never been able to manufacture or imitate so much as an ounce of comb honey. Even were this possible, the laws pertaining to adulterations are such that the little difference between the cost of cheap syrups or sugar and that of the genuine product would easily discourage any such practice.

Honey as a food might well be more generally used. Its cost has never been prohibitive and it is the purest of all sweets, retaining enough of the perfume of the flowers from which it comes to have a distinctive flavor unlike that of any other article of diet, making it a food to be prized. Doctors are fast coming to realize its value and advise people to use it in place of the cheaper and less wholesome sweets of which some are so fond. Sufferers from diabetes or serious digestive disturbances often can eat honey when they are unable to touch any other form of sugar. Being in reality a predigested food, honey is readily assimilated by the system. Children, who naturally crave sweets, can eat all the honey they want with no harmful results. In fact, modern doctors recommend it as an ideal children's food.

In Europe the use of honey in cooking is much better known than in America, although at present hundreds of carloads are used in our larger bakeries and progressive housewives have found that some of the finest cakes and cookies are greatly improved by its use. It combines well with almost any recipe and imparts a delicate flavor of distinctive quality. Its use in this respect can be much increased.

Various candies, in which honey is combined with nut and fruit, have recently appeared on the market. These have met with the approval of all who have tried them, and this superiority over the cheaper glucose combinations cannot be questioned.

With the present trend toward the elimination of waste and the conservation of our natural resources, Americans might well look toward honey as one of the great natural food supplies and one which is being utilized to only a small fraction of its possibilities. Here nature has provided a potential source of great quantities of sugar which may be had for the taking. All that man must do is to supply the medium whereby it may be collected. The busy little bee is in all the world the only agency which can fulfill this mission.

# Under the White Tops With 'Gil'

## The Story of the Big Snake and the Little Dog—and How a Darky Made Millions for Circus Side Shows

ILLUSTRATED BY GEORGE HARPER

By HARRY E. BARNET

All Rights Reserved.

'"Culled fo'ks," he said, "we're going to feed this dog to the big snake in ten minutes. He haint been fed all day."'

*PART III.*

LITTLE more than the husk of John Robinson's Circus remained on the Cumminsville show lot in Cincinnati of a bright Monday morning, near the end of last July, for the parade was threading its way through the downtown streets, and nearly all of the show's life was with the beguiling cages and wagons.

Gil Robinson, the world's oldest living circus man, was settled in a roomy canvas chair in the main entrance. For a long time he was silent, thinking of the eighty-odd years he had passed with the circus, founded by his father more than a century ago. The quietude became irksome. John G. Robinson, Gil's nephew, who spent the greater part of his half-century of life beneath the canvas of the show, sat where he had a clear view of the tall, gently swaying side-show banners, and it was he who broke the spell.

'A poor, illiterate farm-hand negro down in Goldsboro, North Carolina, made a suggestion one afternoon many years ago that started one of the biggest stunts ever used with a circus side show,' John G. said, pointing to a painting of the show's enormous python among the side-show banners. 'That suggestion made millions of dollars for this circus, and no one can tell how many millions of dollars for other shows.

'Show day was always the negroes' own day in the South. But on this particular day few of them were going into the side show. Usually they kept it packed all day, looking at the same performance over and over again, until we'd have to shoo them out to let in a fresh crowd.

'But that was a bad year in the South. The negroes were hard up. Although we were only charging a dime admission to the side show, instead of packing it, the negroes packed themselves in front of the ballyhoo stand, and stood and listened to the manager while he talked and talked to them. From time to time, he brought out every freak he had; and the band played almost continuously—but the negroes merely stood where they were.

'Two or three old negroes stood listening at one place all morning and the biggest part of the afternoon. The manager had brought out the Circassian beauty with the big python wrapped around her neck several times, and a little while after the afternoon big show performance started he brought her out again, and was telling the negroes all about the big snake.

'"Say, mistah," one of the old negroes said, "You all gwine t'weah out dat snake. Why doan you all give him somethin' t' eat? He haint had a chance t' eat all day. You all jes drag him in, an' drag him out."

'Our manager caught the idea. He whistled to a dog that had been lying around the side show all summer, and the dog came up on the ballyhoo stand. Then he called out the Circash and her snake again.

'"Culled fo'ks," he said, "we're going to feed this dog to the big snake in ten minutes. He haint been fed all day."

'That was all he said. But it emptied the lot of negroes. They rushed to pay their dimes, and all of them crowded into the side show. The three old negroes who had been listening, and the one who made the suggestion, dug up their dimes and went in.

Of course, we didn't feed the dog to the snake. The negroes got so interested in seeing the other performances that they forgot what they came in for. We worked that stunt every day during the remainder of the season: and kept it up for several years. Other shows adopted the idea. We soon did away with the dog and bought a big billy goat, with tremendous horns, so that his appearance would give the suggestion of a possible battle between the snake and the goat. That possible battle was a good talking point—the side show manager worked up a terrible story about what might happen.

'And that was the start of this side-show "feeding" business as an attraction. It drew tremendous crowds. Next, we started to "feed" the wild man. And we had one for a while who actually bit a live snake in two every afternoon, and swallowed the flesh.'

This story brought Gil out of his reverie.

'Especially in the 1850's and along into the 1870's, when this show was traveling by wagons all over the United States, almost every town and village had its bully,' Gil

said, 'and these bullies had the notion that if they could whip a circus man, no matter how small or puny he might be, their reputations as bad men would be established forever. Consequently as soon as we got into a town and commenced to put up the show here would come the bully, and he would go right to work to start a row. Nearly always he was accompanied by some of his admirers to see that the odds were in his favor. Some towns had three or four bullies who would band together to raid the show.

'We always tried to avoid trouble. It interfered with getting the show up and the performance started. Furthermore, news that the town bully and his friends were around the tents and in an ugly mood kept a good many people away. They were afraid of innocently getting mixed up in a big row. So we lost a great deal of money that way.

'It got so bad that we had to carry fighting men to care for the bullies and their admirers as soon as they appeared, for we could expect little or no help in the majority of cases from the town authorities. Occasionally, the peace officers were active enough after the bullies started something, and got the worst of it. Then they wanted to arrest anybody who had a little authority around the show, if they could find the slightest excuse to do it.'

Gil paused, chuckled, and went on: 'I'll never forget one occurrence when I was a very young man. Despite my youth, I was pa's ticket seller and treasurer. We had been having a tough time getting the show through some swamps for three or four nights, and one night I was up all night helping to build roads and getting the wagons through. I hadn't been able to check the money and the tickets until the next morning when the show was going up.

'I was in the ticket wagon when I heard a big commotion outside. I knew what it was so I put the money and the tickets away—I had a pistol in a holster on my hip—and jumped out of the wagon to help stop the trouble. But it was over by the time I got there.

'A bully had pulled a knife and started a fight with one of our men. The man caught the knife in his hand, and the keen blade laid his hand wide open. Then the bully ran toward the dressing room, waving the knife, and when he made a lunge with it at one of our men who was standing in the dressing room door, the man shot and killed him.

'I got back into the wagon and commenced to count the money. Glancing out of the ticket window, I saw the bully's friends, guns in hands, hunting around; they said they wanted to arrest somebody, they weren't particular who.

'"The man in the ticket wagon is in there," I heard one of them say. "I seen him go in there. He had a pistol. Let's arrest him."

'Well,' Gil went on, 'that meant an attempt at lynching me. These men insisted on searching the ticket wagon. While they were working at the door in the back I jumped through the ticket window and streaked it for the woods. The men searched the wagon; even pulled out all of the little drawers in which I kept the tickets and money, thinking I had a hiding place behind the drawers. Nobody saw me go through the ticket window.

'This party of men followed the show from town to town for several days looking for me. They swore I was in the wagon, because they hadn't seen me leave. We made short jumps in those days and I knew where the show was going. I followed along in the woods after it—I couldn't go near the lot, nor into any little town, nor to a farmhouse to get anything to eat, because the show was playing every little town along the way, and if I, a stranger, showed myself anywhere, somebody would be sure to tell these men where I was. So I lived for three days on two little sacks of raw peanuts that pa dropped along the road, knowing that I'd follow the show through the woods close to the road. Finally the men got tired of following the show and I got a square meal again.

'I've often wondered why people in these towns and villages put up with constant terrorization by these bullies, for all of them were cowards at heart. If you met them with some determination they almost invariably turned tail and ran. For many years we didn't have a camp on the lot; we put our people up in the few hotels and boarding houses in the towns. And many a night when we were getting ready for bed we would hear the bully and his crowd coming toward the hotel, shooting and yelling, just to terrorize people. They weren't hunting showmen to fight with; they were just plain drunk and ornery. When we heard the commotion we would pile all the furniture in the rooms on the beds and get on top of it, because the bullies would shoot through the ceilings of the hotels and the bullets would come up through the floors of the rooms, and into the beds. We would try to sleep on that furniture.

'Whipping bullies and their gangs as soon as they appeared on the lot was a part of our everyday work for a good many years. With that end of it out of the way, we could go ahead and attend to our business, unless, as it frequently happened, the rough element later in the day, or that night, turned in and tried to whip the show for revenge. In that case, we had a "hey rube." [A general fight, in circus language, a 'clem,' was often called 'hey rube,' because that was the rallying cry of circus men when trouble began.] In only a few instances did we get the worst of it. We got the reputation all over the United States for being a pretty tough proposition to tackle. For a good many years it was quite an event to go through a town without a rumpus caused by bullies looking for a fight.

'Sometime after we started feeding our people on the lot, and had a private camp for the family, we lost one of the best cooks we ever had because of a string of "hey rubes" in which several men were killed.

'This cook was a superstitious old darky. A lot of our people got to playing tricks on him, and he attributed the tricks to the ghosts of the men who had been killed in the "hey rubes." He believed they followed the show trying to get even. The antics of this darky in trying to avoid the ghosts were laughable to us, but they were serious to him. The tricks preyed on his mind. One night he suddenly quit, and nothing could persuade him to stay. He said he wouldn't be where he was always bothered by ghosts, and as he thought the fights and deaths would likely continue and the farther he traveled with the show the more ghosts he would have to contend with, he was clearing out while the clearing out was good.

'When electric lights first came along, Gil said, 'we carried them on the show not only to light the tents but as a curiosity. We were the first show to do this, and for a couple of seasons the lights were the biggest kind of novelty.

'Those seasons we lighted with gasoline torches until just before the night performance began, then the announcer said: "Ladies and Gentlemen: We will first show one of the world's newest inventions, the electric light." We shut off the gasoline lights, and turned on the electric lights (we made our own electricity with a portable outfit). In some places we showed, people had never even heard of the new light.'

While Gil Robinson is the circus world's most picturesque figure, he is not of the dime novel, motion picture, lurid fiction type of circus man. He is a true gentleman of the Old South.

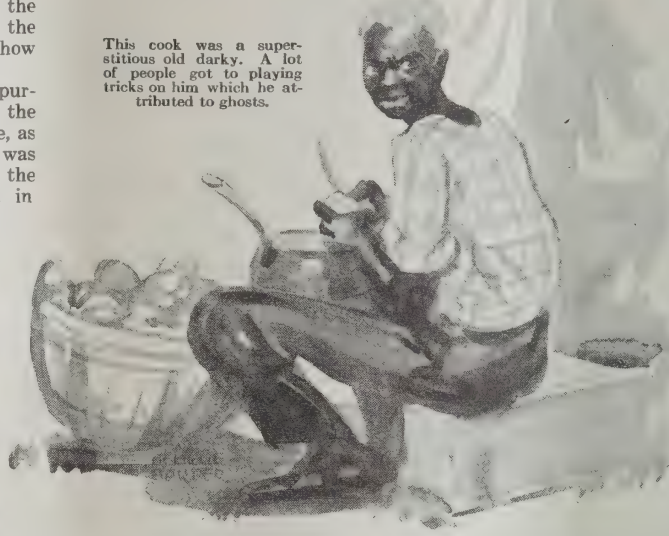
I heard a big commotion outside. A bully had pulled a knife and started a fight with one of our men.

The Old South a-wheel was John Robinson's circus. Gil and his five brothers and sisters were born south of the Mason and Dixon Line. For years the show was essentially a Southern institution.

'Pa had to take it South when he started it, and stay in the South for a long time,' Gil once said, 'because circuses weren't then looked upon very favorably in the East. Connecticut, for instance, put the license so high that a circus couldn't show in the state.'

Their circus was to all intents and purposes the Robinson family home. In the Old South it filled a peculiar social niche, as if it were a wandering plantation. This was because of the gay visiting done by the aristocratic families. Almost always, in the days of long ago, the show was a cross section of the best of the human elements of that part of the Old South it was touring at the time.

Family after family—the Tates of the Carolinas, and President Polk's southern kin, General Fairfax, grandson of Lord Fairfax, of Virginia, and Colonel Boyd, of Carolina, come to mind at the moment—bundled themselves, and hordes of black servants to wait on them, into carriages and carry-alls, piled their baggage on big plantation wagons, and joined the show for visits of two and three weeks at a time, while the show wended its way through their regions. These 'quality folk' endured the hardships of the show, and counted the mishaps as so many high spots of a huge lark.



'We showed once at a place they called "The Agency," on the Canadian River, in the Creek Indian Nation. The Government was paying off the Creeks while we were there, and each Indian, from the tiniest baby to the oldest member of the tribe, received a twenty-dollar gold piece and ten cents in silver. Thousands of people were there, and needless to say among them were all the gamblers, blacklegs and crooks in the Southwest. There was a heavy fine and imprisonment for bringing any liquor into that country, or for selling it, but never have I seen so many drunken people, both whites and Indians, as there were that week. The liquor was brought in in small bottles, labeled "hair oil." Of course, the officials and everybody else knew of the fraud, yet it all went.

'When I was a boy, we used to show on plantations and at crossroads in the South a good part of the time. There were no roads; we just cut across plantations, and we couldn't go more than twelve or fourteen miles a day.

'We had a world of friends among the wealthy planters, and the best of the old southern families. They entertained the whole show at their homes for at least one meal. Even if we were just to pass their plantations they would have breakfast ready for us, and we would have to stop and eat with them. As soon as these families knew we were coming they commenced to make great preparations, baking pies and cakes, and hams, and the like.

'An old doctor lived at Jekyl Island, near Savannah, Georgia. He not only owned a big plantation, but also an island, on which he raised Sea Island cotton. He had about 3,000 slaves, and was an intimate friend, so we never failed to show there. The old doctor always entertained the whole show for a meal, and he bought tickets for all his slaves.

'I remember the day we showed there in 1859. The doctor gave us a magnificent stallion, an imported thoroughbred, and a great runner, named "Hardscrabble." But the horse was a man-killer and an animal-killer, so vicious that no one could handle him. He was really demented. He had to be kept muzzled and hobbled all the time, and the doctor thought that maybe somebody with the show could do something with him.

This cook was a superstitious old darky. A lot of people got to playing tricks on him which he attributed to ghosts.

'We had an awful time trying to take that horse over the country with us. Finally, we had to leave him in winter quarters up along the Ohio River. When John Morgan came along on one of his raids in the Civil War, he took "Hardscrabble" with him, and that's the last we ever heard of him. I've often wondered why some of Morgan's men never made mention of him.

'These southern families who went along with us used to have a taste of adventure,' Gil went on. 'We were coming along one time, with about a hundred wagons and cages, and buggies and carriages of our own, besides the buggies and carriages and baggage wagons of several southern families, when we struck a river. A farmer told us about a good ford a short distance upstream. The farmer didn't go with us to point it out, and when we got to the place where we thought, from his description, the ford must be, the river was about a half-mile wide, with an island in the middle of it.

'I had a strong horse, and was riding in a buggy, so I drove into the stream and all of the wagons, cages, buggies and carriages came right along behind me. I got into rapid current right away. In addition, the river was filled with tremendous boulders, with their tops just under the surface of the water so we couldn't see them. My horse struck the first big boulder and commenced struggling. Finally, he climbed on top of it and pulled the buggy up with him. The horse stood there trembling. I gave him a couple of touches with the whip, and he slid down on the other side, dragging the buggy with him, and commenced to swim. In a few minutes he struck another boulder and the same thing happened.

'I looked back and the river was filled with wagons and cages, buggies and carriages, and struggling horses. The caged animals were screaming and squalling from terror and that's an awful sound—men were shouting, women and children screaming—pandemonium broke loose. The boulders had broken the straight line in which our show always traveled, and all these conveyances of every kind were scattered everywhere. The lead bars floated out of the neck yokes, and let all of the horses except the wheel horses loose from the wagons and cages. The wheel horses were trying to pull the wagons and cages and couldn't do it. The men had to jump into the stream, and get hold of the lead bars, and get the lead horses back to where they could put the bars in place again under the water. In a minute or two the bars would float out again, and away went the lead horses, swimming every which way.

'We finally managed to get everything to the island, and there we rested a bit. But a storm came up and the river began to rise very rapidly, so we had to hurry on.

Fortunately, on the other side of the island the water was quiet and shallow, and there were very few boulders. Just as the last wagon pulled up on the opposite bank of the river the stream had risen so fast that the island disappeared beneath the flood. No human being or animal was drowned, and we offered up thanks to our Maker for the escape.'

(*To be continued next week.*)

## Making the Government Efficient

(*Concluded from page 5*)

number the 40,000 overload in the Post Office Department you have something over 300,000. I am convinced that more than 100,000 of these could be dispensed with and not hurt the Government one particle. This does not include the enlisted men in the Army and Navy.'

The Director of the Budget reports that there were 114,696 fewer employes on the federal pay roll on December 31, 1925, than on December 31, 1920, with a corresponding reduction of $138,000,000 a year on the pay roll. On Armistice Day, November 11, 1918, there were 117,760 employes on the federal rolls in the District of Columbia alone, while as of December 31, 1925, this number had been reduced to 61,509, or approximately 33 per cent more than the pre-war complement of 39,442. A still further reduction is announced for the end of the present fiscal year but these reductions must not be confused with Government reorganization.

Real reorganization of the business of Government must begin at the top, with the abolition of duplicating and overlapping bureaus, boards, commissions and of their unqualified bureau-heads, commissioners and directors, who are of the figurehead type of lame ducks or political hangers-on without qualifications for their jobs.

# Tom Learns to Play the Game

(*Continued from page 8*)

you wasted, slamming your helmet on the ground, for a good pass next half.' The boy's face glowed as he stood up and joined the group around the captain.

Then Shorty came over too, and gripped the hand of the boy who was taking his place. He seemed to be tipping him off to some of the tricks of the opposition. There was a ring of self-forgetful encouragement in his voice.

The New Providence boys had come off the field a battered mob of bickering individuals, sore at themselves and sore at each other. They went out onto the field again a united team, a closely welded unit of glowing determination. They weren't thinking now of their own failures and ambitions, nor of the faults of the others. They had been kneaded together by their coach's skill into a single fighting spirit. As conscious cogs in a living machine, they went out to face a heavier team, to win back the good will of their rooters, to attempt the impossible job of holding Elmtown's heavy rushes, and of piling up three touchdowns into the bargain.

New Providence wasn't destined to make three touchdowns that day. I was sure of that, as Moore and I went back to where his pretty daughter, Louise, awaited us in the bleachers. But the drama that I had just seen had deeply thrilled me. It seemed to prove how disciplined sport may guide growing youngsters to manhood along that path of self-abnegation, courage and coöperation that is known as 'playing the game.'

I knew now why Moore had insisted on my coming to see that high school contest. For, a number of years before, in this same little town of New Providence, he and I had first been led to think seriously of the rôle of organized recreation in boy life.

***The Banker Recognizes His Property***

During that earlier visit to the wealthy banker of New Providence, I had gone with him one day to court. Instead of a whole eleven, a single boy was on trial, that day. I shall call him Tom. As accusing witness, Moore testified that he occupied a cottage at the neighboring seashore resort each week-end. Driving over to it recently, he had found the place cleaned out of nearly everything except the furniture. Food and clothing and trinkets, and even the phonograph, had been taken.

Back in New Providence a few days later, as he walked down Main Street to his bank, Moore recognized one of his lost golf sweaters approaching him. On closer inspection the boy inside the sweater seemed clad in a familiar silk shirt, a well-known necktie, and even an unmistakable cravat pin. Moore had collared that boy—who was Tom—then and there. Tom swore that he had been to the resort with two other boys and that they had bought the things from a fellow they met there; a fellow who had said he was leaving town and didn't want them any more. Tom admitted having brought the phonograph back with him also—it had been found in his barn—but asserted he had bought that too.

Tom's lawyer argued plausibly about questions of reasonable doubt, and about what an unjust conviction would do to this growing lad. There was no evidence to show that Tom had actually entered the banker's cottage. His story was unshaken, and he was acquitted.

My stay in New Providence was prolonged and I got acquainted with Tom's people. His father was a close-fisted retired farmer, an invalid from rheumatism. The family now lived on the outskirts of the town. A mother and two daughters ran the house. Tom ran wild. He was about fifteen, and one of those good-looking boys with flaxen hair, blue eyes and a naturally pallid complexion. He worked in a local garage.

***How Tom Came to Town***

'Dad wanted me to go to high school,' he told me, 'and then to learn a trade. But I couldn't stand the school. Couldn't see that it was doing me any good. I didn't like it. I quit, and got a job in old Reicher's bakery. I saved quite a lot of jack, and bought a used car with it. Bought a bulldog, too—a great little cuss. Gee, I was sick when he was run over by a truck.

'Dad didn't know until spring that I wasn't still going to school. Then I quit the bakery. It was hard work, and too hot, handling those loaves with long shovels. I'd learned a lot by tinkering with my car, and I got a job in the garage. It's easy. I work when I want to. When I've saved enough money, I go over to the shore for a spree. You can sure have one grand time on fifty or sixty dollars.'

Tom's father had sold the farm when Tom was still in grammar school. 'Farming isn't what it was when I was young,' he had complained. 'My boy will never be able to do what I've done. Best he gets a job in town.'

Now that town of New Providence was just as dead and dull and dreary a place as are thousands of others of the same size. There was not a solitary thing for the boys to do when they weren't in school. There was a movie show once a week, and a couple of pool tables in the back of Louis' confectionery store.

If Tom had been kept on the farm he would have had hard work and responsibilities. He'd have gone hunting, when he needed adventure. He'd have had animals to care for. But through all his boyhood in town there had been nothing for him to do but hang around at Louis', or to loiter with the crowd in front of the drug store. Instead of learning about crops, he learned to play craps behind the garage. Instead of going hunting over the fields and woods, he hunted other forms of adventure over at the coast resort. Boys will seek adventure somehow. On summer evenings the furniture store would keep a phonograph going, or a player piano, and sometimes the boys would pick up the girls who sauntered by and dance with them on the sidewalk. Tom became sophisticated beyond his years, and superficial, aimless and irresponsible.

Tom's father had lost his grip on life; his mother was overworked. They let Tom go his own way, and gave him no ideals at home. His standards of life he picked up from the crowd of rough boys who hung about Main Street with him. It was in their company that he took to going over to the shore, and there he fell in with a tougher crowd. Tom had a pleasing personality; he was sociable, and liked the people around him as much as they liked him. He was easily led and fell in naturally with the ways of his associates. But I felt that Tom, with his likable personality, could have become a leader as easily as he came to be led.

After he had gone to work, and had a little money, he began to bring back things from the shore. He bought them from some of the fellows he met there. There was an epidemic of petty thievery in the resort. Tom knew well enough that the things he bought from these other boys weren't just 'found,' the way they said. But that only added to the darksome excitement of his adventurings. He'd buy things he had no conceivable use for, and keep them awhile in the corner of the barn under a pile of old junk, and finally sell them again at a profit. He'd come home in the small hours of the morning, sleep until noon, and never tell his parents where he had been. He always seemed to be able to get tires for his car, whether he had much money or not.

That was the way things were going when Tom was arrested and I got acquainted with him. He was a receiver of stolen property. He was undoubtedly going on the downward track. A few more steps and he'd have been sneaking into houses himself. He had found the only life of adventure that his drab surroundings seemed to offer him. There were no books in his family; he had never been given an interest in reading. There were no sports in the town, no playground, no tennis courts, no Boy Scout organization—no community interests of any kind. The high school had no gymnasium or athletic director. The region had no hills for coasting in winter; the stream was too small and muddy for swimming in summer.

I know of few graver problems affecting young boys than the emptiness of small-town life. The average city offers its youth infinitely more in the way of recreation, with its park playgrounds, its public tennis courts and golf links, its school athletics. The young boys of New Providence just 'hung around,' in front of the stores on Main Street, both afternoon and evening, and picked up gutter standards from the older boys who also just 'hung around.'

I took to Tom at once, and grew to like him better. I decided that he must be lifted out of the grip of this aimless, drab, disheartening environment. Despite his acquittal, he was under a cloud in New Providence, and had been badly scared by the trial. I got him enthusiastic about going to high school in a neighboring city. His father had a brother living there, and finally Tom was sent to stay with his uncle. Tom's father was really prosperous. He had made a good deal out of his farm and out of the sale of it. I talked with the penurious old codger at length and finally he agreed that if Tom made good in the city high school, he could go to college.

***He Goes to High School***

So one day Tom went his way from New Providence, and I went mine. As I saw the last of him on the train, I hoped that the new environment, the sports of his coming high school life and the possible college associations after it, would make the man of him that I suspected could be found under that flaxen head. Tom said he might come back to New Providence for his junior and senior year in high school.

I had kept Banker Moore, my friend and host, in touch with the developments of

Tom's story. And I told him what I thought of the menace of the empty life in a small town such as his. Moore was a typical small-town banker—the wealthy man of the community. He lived alone with his daughter Louise in a big brick house.

He was deeply impressed by what I said, and corresponded with me for several years afterward. He told me that he was giving a gymnasium to the high school, and reported to me on the way his plans for community recreation were developing. He told me about the high school band and its open-air concerts in the bandstand he had built; and about the community dances Louise had organized, and how she had put her own private schooling to use by teaching the high school girls physical training and classic dancing.

*The Brawn of the Football Field*

Moore wrote me last summer that the school had hired a new athletic director for the boys, on his recommendation, and told me of further changes in the town's spirit. Then in the autumn he invited me up from Philadelphia to see the big game with Elmtown. He said he thought it would interest me.

So it was that when I came back to New Providence again, the memories of my earlier visit were vivid to me. And as I watched that remade team of high school youngsters trot out onto the gridiron after going through the smelting process of their coach's oratory during the intermission, I felt that my theories of the power of wholesome, regulated sport were partly justified. For I had seen a group of disheartened boys, whose morale was going to pieces, molded by a plea for teamwork into a courageous unit of coöperation.

The brawn of the football field is a negligible asset. But its spirit, like the spirit of all sport, is an eternal value in life—and woe to the community where that spirit does not prevail. Every town, large or small, has with it the boy problem that New Providence had. I cannot help thinking that if we would set out to solve it as New Providence did, we would have healthier boys, happier homes, less crime and fewer inmates of reform schools. The rest of the game that I saw last autumn is historic—at least in the annals of New Providence.

With the kick-off the boys of New Providence drove into action. Their play was tight and steady. Meade, the blond fullback whose attempts to star in the first half had failed disastrously, grabbed an Elmtown fumble and carried it sixteen yards. Then New Providence was held three downs for little gain. The coach sat tense on the sideline, seeming by mere force of will to be trying to steady his charges. The signals seemed to call for a kick, but to Elmtown's undoing it was a double pass, to right and then to left. The little quarterback, Tomlinson, threw coolly and surely, over the lunging forms of the Elmtown tacklers, and a ten-yard run went down the sidelines.

*The Coach Wore a Smile*

Elmtown began to get nervous. They were facing a new team, a team that seemed to grow in strength with every play. Again the home boys failed twice to gain through the line; again they gained around the end. Failure no longer disheartened them. Success did not excite them, but merely hardened their determination. Their coach wore a smile of set intensity. He was playing with them, with each of them, in every move. His nerves and muscles were as tense as theirs. His spirit seemed to be reaching out to them. Down the field, by the airline, they went. They were battered, they were outweighed, they were checked now and again, but they were playing football—playing it as a team.

Meade went through the line for five yards to the Elmtown ten-yard line for a first down. The quarterback went around the end for five yards more. There was no more thrilling moment in any big game that day. Elmtown stiffened, and held twice. The stands were roaring. Meade took the ball and fumbled as he was tackled. Little Tomlinson, whose nervousness had now become cat-like alertness, scooped it up as he ran, dodged two Elmtown backs and was over the line for a touchdown.

The dignified banker at my side was pounding my back and shrieking something incoherent full in my face. His dainty daughter was standing on her seat like a hoyden and waving a flag insanely. But her eyes, queerly enough, were not on the field but on the sidelines where Shorty, the boy who had seemed yellow in the first half, crouched beside the coach and the other substitutes. I imagined that the coach at that moment was thinking much the same thoughts that I was. He was glorying in a sense of victory in defeat. The boys couldn't keep the pace they had been going, but they had retrieved themselves for all their first-half folly.

*Some Tense Moments*

But the New Providence boys didn't share that feeling, apparently. They were inspired by the sense of victory itself. Weight was still telling against them, but a conquering spirit was on their side. The game seesawed through the rest of the quarter, while Elmtown played desperately.

The last half of the last quarter saw New Providence on their own forty-yard line. Elmtown tried a pass that failed. A second was broken up by the New Providence line. The next play was an eight-yard drive through tackle. Elmtown had two yards to go. They tried to make it rather than punt, and the New Providence line held. It was the home team's ball. Their very first play was a brilliant dash through center by Meade. He dodged two Elmtown backs, straight-armed a third—and his helmetless head, like a yellow comet, was off down the field forty yards.

The motionless coach on the sidelines was running with him.

New Providence made first down twice in succession, now, but were tiring. My interest centered on Tomlinson, the quarterback who was limping and white, but barking his signals with inspired fury. Elmtown was playing for time, New Providence for a score that would tie the game. In the next play the left end was hurt, and Shorty, the boy who had been taken out in disgrace in the first half, went back in his place. He carried a message from the coach, and a spirit of redemption in his soul.

New Providence formed for another kick, on their fourth down, and on the Elmtown fifteen-yard line. But as Shorty slipped by his opposing end, and went down the field, Tomlinson ran back to the right and, receiving a pass from the punter, hurled it to Shorty. No fumbling this time. He caught the ball fair and sure, dived between two tacklers, and was off diagonally across the field with three Elmtown players at his heels, and their fullback in front of him. The New Providence stands were on their feet howling, and the coach again was playing the game with the runner. Shorty dodged, stumbled, recovered; two simultaneous tacklers met head-on in the spot where he had been a second before—he was over the line as a tackler from behind threw him heavily.

Shorty did not get up. The message he carried from the coach was never delivered. He was carried off the field, after his one play in the game. He had wiped out the yellow streak, and the score was tied!

Moore and I were down on the sidelines with the coach, now. He spoke to us, but he was really talking to himself. 'They've done it,' he said. 'It's all they can do. It's out of my hands now.' He could do nothing but watch the final few moments of fighting play on the part of the team that he had created.

*It Was a Famous Victory*

'Young Jones is too nervous to kick that goal,' the coach's voice went on. 'He can't make it in this wind. I wish they'd got my message.' Jones, the right half, had entered school as a junior from out of town. This was his senior year and his first chance with the regular team.

The ball was snapped back as if for a placement kick, but the quarterback rose as he received it, and tossed it to Jones, who ran back with it, turned, and hurled it brilliantly twelve yards to Meade who went straight through the whole Elmtown team over the line for an extra point. The single point that won the game!

'They played it—they played it! They used their heads. We've won!' I could hear the coach despite the shrieking from the stand at our back. 'They did just what I wanted Shorty to tell them. I believe in telepathy. I'll make men of those boys yet.'

The coach grabbed my arm in a convulsive grip, just because I was the object nearest him. And my eyes came back to him from the blond youth whose triumphant rush to victory had fascinated me. A sort of hysteria seemed to clear from the coach's face. He looked straight at me for the first time. Then he smiled.

New Providence was wild that night. The names of Meade and Tomlinson and Jones and Shorty were echoing in every gathering. They were heroes of the day.

But an hour after the game, at an oilcloth table in a dingy lunchroom, I sat down to dinner with the real winner of the game—the unsung hero of the day. I broke bread with the boy whom, a few years before, I had seen with hanging head in the prisoner's dock of the courthouse across the street.

*He Was Still a Boy to Me*

'Tom,' I said, 'Moore never let on a word about you. You've changed a lot since then, but I knew you as soon as I saw you.'

He was still a boy to me, a boy reclaimed from the verge of viciousness—a boy who had risen to the leadership of other boys, and had this day proved his powers by turning eleven panicky youngsters into a fighting football team.

'I knew *you*, too,' said Tom, 'as soon as I saw you. But I didn't see you until it was all over. I haven't seen anything at all today, except that team. And except a fur coat up in the stand,' he added, with half-embarrassed truthfulness.

'Tell me all about it,' I urged.

'There's nothing much to tell,' said Tom. 'They gave me another chance, here, when I came back last September. And I wanted to make good. I wanted to do something for this town. I nearly disgraced it once. I've been trying to do for all its boys what somebody did once for me. You know who.'

# CHATS WITH OFFICE CALLERS

It was the ***Lady Secretary of a well-known Senator of the United States*** speaking:

'I am sick and tired of the way these Senators have to be told how to vote.' I was sitting in the Senate Gallery the other day when a provision affecting one of the farm bills came to vote. As usual, there was a hurrying and scurrying of Senators to find out how to vote. Not to find facts upon which to base an opinion, but to learn how somebody else wanted them to vote. In this instance I believe they were waiting on the word of President Coolidge. I saw Senators Fess, Lenroot, Keyes, Shortridge, Butler and Willis all put their heads together. When Senator Butler first came in and his name was called he ignored it. Evidently he wanted a little more time to be sure how to vote, because he voted before the vote was announced.'

'Well,' said I, 'it is a fine way for a Senator to exercise his responsibility. Some independence.'

* * *

'I wonder if the name Tuck means anything to this generation,' said ***the Man from the Other Room,*** laying down a paper. 'Perhaps not. Yet he gave it the picture post card, or, as at first, just the picture card. It began with Christmas cards. That is rather curious, too, since Adolph Tuck was a Jew. He was the son of Raphael Tuck. In 1879 the first Christmas cards were placed on view, and from that time on their popularity increased. The first Christmas cards were things of beauty and seasonable fitness. A very great difference existed between them and the modern Christmas cards discussed in THE DEARBORN INDEPENDENT several years ago. It seems that Tuck started the business off on a high plane, but imitators of his own race have been steadily engaged in debasing the picture post card business until the American public called a halt. They tell me that the Christmas and Easter trade over the United States became rather critical of quality after THE DEARBORN INDEPENDENT made its exposé, and an improvement in the cards was observed.'

* * *

'The farm situation,' said ***the Country Preacher,*** 'isn't nearly so bad as it might be.'

'How do you make that out?' we inquired. 'Why all this farm relief talk then?'

'Well, that noise when you hear it on the farm—notice the "when" please—is apt to come from a certain group of farmers who have lively imaginations, and when heard off the farm it's pretty apt to be politics. The farmer is producing more than enough to feed the country and making a living besides.'

'So there's nothing to worry about?' we ventured.

'I wouldn't say that. Do you know,' and the Preacher leaned forward in his chair, 'the thing that strikes me as serious about this movement away from the farm is not the barren acres nor the deserted farmhouses nor the fear that the farmers won't raise crops enough, but that they are no longer raising up men. A friend told me about some sort of book naming America's great and near great.'

'*Who's Who*—' we suggested.

'That's it. Well, in this *Who's Who* it seems that a goodly percentage of the folks listed were reared in rural communities. Now the question is with the young folks leaving the farms where's the next generation of Who's Whoers coming from?'

'That is something to think about,' we answered.

'Yes, but that's not all. What effect is it going to have on the social and economic life of the country?'

This was the question the Country Preacher asked of the Future which holds the answer.

* * *

'One of the interesting phases of the political upheaval in Canada,' ***the Traveler*** declared, 'is the report that Mackenzie King—who is highly wroth at the Governor-General for the manner in which his Government fell—is strongly in favor of union with the United States. Of course it will come to nothing more than talk. On the other hand, it will probably bring about closer relationship between the two countries if nothing more.

'Union would be of greater benefit to the United States than to Canada. But as the United States is not aware of that, and Canada is, the sentiment for union does not exist south of the line, and is strongly anti north of it.

'Last summer I toured some 4,000 miles in Canada. The Canadian does not have too high an opinion of the Englishman, particularly in the western provinces. It is not a bitter spirit of hostility, however. But many Canadians feel that the English have no adequate understanding of their problems. They feel more closely akin to the United States, that here we have met and in many instances solved the same problems that are confronting them. They feel that we could bring a more sympathetic comprehension to the study of these problems.

'Americans have $1,019,280,743 invested in Canada. Englishmen have $305,863,275. That tells part of the story. Commerce between the two countries is a natural thing, yet it is hampered by artificial barriers. With American capital and American initiative, development of Canada's undoubted resources would proceed apace. Two great things are needed by the Dominion: capital and population. England either cannot or will not furnish them. The typical British attitude is well illustrated by the recent proposal of an English judge that the United Kingdom's criminals be shipped in wholesale lots to Canada, as was done in the early days of Australia. His naïve suggestion created somewhat of a furor in the Dominion.

'There are strong sentimental ties between England and Canada. This is entirely as it should be. But the demand for progress is sometimes stronger than affection for tradition. The present talk about union between the United States and the Dominion may result in nothing. But it at least gives rise to interesting conjecturing.'

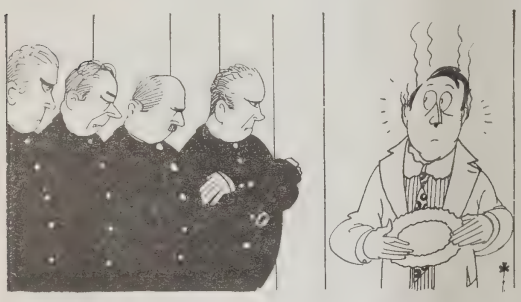
* * *

'It's a hot midsummer day in a newspaper office,' said ***the Newspaperman*** as he waxed reminiscent. 'Congress is adjourned, political fervor burns low, the world jogs serenely on a placid course. Editorial topics are few and far between. The editorial writer dozes in his chair, dreamily wondering what he is to write about. Suddenly the wires hum. The sea serpent has been seen!

'There's remarkable regularity in the annual appearance of this strange dweller of the ocean. He always comes in the dog days of summer when other news lags and the imagination runs rampant. And—marvelous to relate—he comes just in the nick of time to save the day for countless editorial writers.

'Livy started it all some 2,000 years ago. With great solemnity he described a sea serpent which made its lair on the banks of a river near Ithaca during the Punic Wars, and which swallowed the Roman soldiers with amazing ease as they tried to cross the stream. The Romans finally trundled up their catapults and killed the beast; but he did not stay long dead. All through the Middle Ages he bobbed up at regular intervals. Norse seamen returning from their venturesome voyages brought back tales of a monster which swept sailors from the decks of their ships and carried them to secret caverns of the sea, there to devour them at leisure. Sailors of other nationalities also saw him. A ship master and four of his crew took oath before a Liverpool magistrate to having seen the serpent seize and strangle a sperm whale.

'Captain McQuhae, of the British frigate *Daedalus*, and Mark Trelawney, quartermaster of the American brig *Daphne*, saw him at separate times during the summer of 1848. "It was an enormous serpent with head and shoulders kept about four feet constantly above the surface of the sea," said Captain McQuhae in his official report, "and as nearly as we could approximate there was at least sixty feet of the animal under water, no part of which was, in our perception, used in propelling it through the water either by vertical or horizontal undulation. It passed rapidly, but was so under our lee quarters that had it been a man of my acquaintance I should easily have recognized his features with the naked eye. It was most assuredly no ghost."



'And now comes word from Prince Rupert, in British Columbia, that the monster has again been seen. In the face of evidence such as this, who can doubt the existence of this mighty serpent of the sea? Surely no editorial writer, with a column of space to fill before deadline.'

# The White House—A Mecca for Cranks

(Continued from page 6)

Never before have there been so many men and women taking real or fancied troubles to the Government. This applies to local and state governments, as well as the Federal Government in Washington. Men and women of this character who appear at the White House generally relate how they have appealed to local and state authorities and to Congress without relief. Their final appeal is to the President and they are generally all gone when they reach the White House. Some alienist will acquire fame by classifying this form of mental affliction as Governmentaiditis, with suggestions for treatment that might relieve those in authority of the trouble of dealing with them.

While the subject of alienists is up, it may be remarked that the entire White House staff of secret service men and guards is a corps of alienists. Long service in dealing with poor unfortunates who come to the White House has made it possible for them

The face of every stranger is carefully studied by members of the White House staff.

to detect mental defectives by a look in the eye, nervous conversation, and even by their walk. Night and day the force is on guard against dangerous cranks. Two Presidents, Garfield and McKinley, were assassinated by men of disordered minds. These tragedies are constantly in the minds of the men who are responsible for the safety of the President.

The face of every stranger who appears on the White House grounds is carefully studied by members of the White House staff who are stationed at every approach to the Chief Executive's home. The work of handling cranks is not done obtrusively. If a stranger gives any evidence of being under undue mental pressure he will be approached quietly by the guards, usually before he reaches an entrance to the building. Conversation will be opened with him by questions about the weather or any topic that is of general public interest.

One visitor recently revealed that his mind was unbalanced when an officer got him into a conversation about the squirrels that roam about the White House grounds. In another instance, an inquiry as to what he thought of the appearance of the historical Executive Mansion brought out the fact that the visitor was on his way to demand money of the President. He claimed that the President owed him a million dollars and that if he did not give it to him promptly he would take possession of the White House himself.

Of course, the officer was ready to help him get his million from the President and took him to the guardhouse to talk the matter over. He said that he could get a number of boys to go along with the plan if he would divide up the spoils. A doctor was called from the Gallinger Hospital when it was found that the man came from Texas. While the doctor and the secret service men were in consultation, an attempt was made to communicate with his relatives.

The general policy is to take the mentally unbalanced to Gallinger Hospital for treatment while they are awaiting the arrival of relatives from out of town. At this hospital there are a number of specialists who treat patients affected with mental disorders. If he does not respond to treatment in the hospital he is eventually sent to St. Elizabeth's Government Hospital for the Insane. No one is summarily thrown from the White House grounds or allowed to drift about if he gives evidence that he cannot take care of himself. The Government takes care of these unfortunates if they have no relatives and friends.

It is not always the wild and rough looking man that is dangerous or really mentally unbalanced. Some of them are laboring under nervous depressions and in the excitement around the capital act rather strangely. Late one evening a shaggy-haired rather wild and rough looking man came up the steps at the west end of the White House and turned abruptly into the executive offices. He made demands to see the President in very surly tones and looked as if he would be a bad man to handle.

'Here is some trouble for the secret service folks,' remarked one of the correspondents as the guard at the door sent a messenger to the chief of the secret service.

With the secret service and 35 of the metropolitan police, the guarding of the President is simple.

'Unless I see the President promptly, I will report your conduct to him,' said the lady.

Mr. Jarvis came impersonating the secretary of the President. He took the man into the old cabinet room. About an hour later the man came out and as he shook hands warmly with Jarvis, he said: 'You do not know how much you have helped me.'

Mr. Jarvis explained that there was nothing really the matter with the visitor. It was really an easy case. Mr. Jarvis had discovered that he had an honorable discharge from the Regular Army, having not only served in the World War, but a term of enlistment since the close of the war. When discharged from the Army he went into the coal mines and in the first week was seriously injured. When Mr. Jarvis examined his leg he declared he did not blame him for becoming desperate in seeking relief. When Mr. Jarvis asked him why he had come to the President, he showed him some Army orders which read, 'by direction of the President.' He took this literally and when he was in need of help he made an effort to go to his former commander-in-chief. After Mr. Jarvis explained that his case should go to the Veterans' Bureau and offered to write him a note, he went away perfectly satisfied. This is typical of a great many men and women who come to the White House for one purpose or the other, who would be promptly arrested and thrown into an asylum if they were not handled by men specially selected for this work.

A man came clear from Oklahoma to see the President and was very insistent upon his demands. Under the questioning of Mr. Jarvis he explained that he had a constant pain in the head. He accounted for it by the many radio waves that are being broadcast in the air. It was insisted by the visitor that he could get relief only by persuading the President to stop the broadcasting of so much poison through the air. During the conversation the gentleman from Oklahoma kept eyeing Jarvis closely. Finally he blurted out: 'Say, you are not the President's secretary. I believe you are the President.'

'You have a sharp eye,' replied Mr. Jarvis, much amused by the peculiar delusion of the visitor.

'Now, come on, Mr. President,' he pleaded, 'take all of this poison out of the air.'

'All right, as you seem to be a good fellow, I will

stop this radio broadcasting, for I am getting tired of it myself, replied Jarvis.' The strangest feature of it is that several weeks after the man had left the White House he wrote a letter to the President thanking him for closing up the broadcasting stations. He declared the 'pain in my head has gone.'

A tall and powerful negro came to the White House one evening not long ago, asking for protection against a neighbor who had not only threatened but attempted to do some artistic carving with the familiar razor. He explained that there was a woman in the case and she was the wife of the irate neighbor. He was clearly a subject for St. Elizabeth's because it was impossible to engage him in a connected conversation.

Mr. Jarvis sat down at the table in the lobby of the executive office and began to make out a report on the case. He was trying to get his name and address. The colored man kept raving on, but Jarvis paid very little attention to what he said. He was busy filling out the report. An exclamation from one of the members of the staff who came into the lobby from the rear caused Mr. Jarvis to glance up at the visitor. He did it just in time, for the negro had been disrobing and at that time had about as much clothing on as a bathing beauty. He wanted to show where the enraged husband had started to carve him with the razor.

They come early as well as late. There is a correspondent at the White House who has farmer habits. He is almost invariably in the press room long before business opens in Washington. One morning after he had read his paper a very well-dressed and pleasant-looking young man dropped into the press room. He proved to be an entertaining conversationalist who was well informed on many subjects. The conversation naturally drifted to politics and the correspondent asked him if in his travels he found that there was a general approval of the President's policies.

***'The Country Is Behind Mr. Wilson'***

Dramatically, the young man exclaimed: 'I want to tell you that the country is behind Woodrow Wilson.'

Thinking that it was a mere slip of the tongue, the newspaperman attempted to correct him by saying: 'You mean Coolidge.'

This appeared to enrage the visitor and he became so thoroughly aroused over the suggestion of the correspondent that Wilson was not still President that the newspaperman welcomed the appearance of the secret service man. Knowing how the White House staff operates, and to keep peace, he delivered the man to him with the remark:

'There is Mr. Wilson's secretary now.'

During the Wilson Administration, when only the executive office was open and the entire establishment was closely guarded, a very keen appearing young man turned up and inquired for his friend, 'Joe Tumulty.' The secretary to the President happened to be out at the time and the visitor lounged about the outer office and the press room for an hour or so, gossiping about the war and national affairs. He told some entirely new stories about his friend 'Joe' which were very entertaining to the members of the White House staff and correspondents. That the stories were new to the correspondents was no doubt due to the fact that they were creatures of the visitor's imagination.

There was nothing in his conduct to suggest that he was not a perfectly normal man. He did not lose his mental balance until he attempted to get by an officer who guarded the way to the main building of the Executive Mansion. It was then that he resented the officer's efforts to keep him out of the White House and expressed his determination to see the President immediately.

One of the secret service men came forth promptly and impersonated the assistant to Mr. Tumulty. He was dealt with in the usual manner, while awaiting the arrival of his father from upper New York State. His father had wired that the young man had escaped from a private sanatarium and warned the White House force that he was a dangerous man to handle.

By their usual gentle methods they succeeded in getting him out of the White House without the least disturbance. He was not taken to the guard room, but was placed in a limousine and quietly driven to Gallinger Hospital. It was explained to him that they had heard from Mr. Tumulty and that he had directed them to entertain in his quarters at the hotel until he arrived. But at the hospital the young man discovered the ruse. He laid out two of the attendants there before he was subdued. There was no doubt that he was dangerously insane. This was the nearest approach that the White House staff came to the use of force and handcuff in handling cranks that are constantly endeavoring to see the President.

***No Easy Task to Handle All Visitors***

It is no easy task to handle the long line of visitors who come to the White House when the President holds a public reception. Those who are received at other times must be vouched for by a member of the Cabinet, a Senator or a member of the House of Representatives. Under precedents established years ago this is the only way to obtain the privilege of shaking hands with the President.

At the door through which visitors enter the room of the secretary is stationed P. E. McKenna, whose official title is the President's Doorkeeper. He passes on all letters, vouching for those who are to enter the reception line. Mr. McKenna came to the White House with President Roosevelt, and on account of his memory of faces is one of the key men of the White House organization. No member of Congress or any important official of the Government who has business with the President need introduce himself to Mr. McKenna. He recognizes him when he approaches and the door appears to open to him automatically. Mr. McKenna also knows the political visitors at the White House. Few men can call by name so many of the great and near great men of the country.

The serious work of the secret service detail comes when the President in response to insistent demands from various sources makes a speaking tour. They are not without employment when the President is in Washington, as is brought out by the typical incidents just related. With the assistance of thirty-five members of the metropolitan police assigned to the White House the guarding of the President is a comparatively simple problem.

Less than a year ago at a public affair a man, evidently suffering from some mental disorder, insisted upon edging his way up to the Presidential stand. He was spotted by the police and Mr. Starling was detailed to take care of him. Starling gave him the shoulder, but he attempted to get by and break through the police line. A short arm jolt put him out. The local police picked him up and spirited him away.

There was an item in the papers that a man fainted in the crowd near the President's stand. He might have been a harmless loony or a Booth, a Guiteau, or a Czolgosz.

# Missionaries and Machine Guns

(*Concluded from page 7*)

family and 'old friends' and the inability to meet but a fraction of a great and seemingly endless need constitute the two great sacrifices of the missionary's life today.

The policy of all the Mission Boards forces the missionary to live on a most meager salary with no opportunity for improvement in his financial state. The drawing appeal made by the Mission Boards has been that of sacrifice and the appeal of sacrifice continues even today the most potent of any appeal—more potent than the appeal of gain. It is possible that sometime the great Mission Boards may change their appeal and open the way for an even greater work than is now being performed.

In the old days, distance, unfamiliarity with peoples, and accumulated 'sailors' tales' formed a forbidding aura around the missionary's task. Today distance has been eliminated and nearly every foot of the countries of the 'backward peoples' has been explored; steamer lines, cables and telegraphs, and railroads, airplanes, the wireless and the many other modern means of communication and transportation have knitted the scattered parts of the world together more closely even than were the states of the United States fifty years ago. India today has more miles of railway than any other country in the world except the United States.

***Missionaries Are Worth How Much in Trade?***

But this very elimination of distance is one of the contributing causes to the subject under discussion. An Englishman once figured out that each missionary was worth £500 annually to British trade. Wouldn't it be interesting to analyze each missionary's worth in American typewriters, soap, socks, garters, shoes, shirts, cereals, canned goods, lumber, cement, and so forth. Such an analysis reminds one of the chemical value of man, which is about sixty-seven cents.

American foreign trade is a great thing. We do not have as much of it as we should. Certainly we do not get our proportion of the Far Eastern trade, but the missionary does not go out for trade purposes. He is supposed to go out to help bring a better point of view about everyday life to the persons with whom he works, and it may be a debatable question as to whether one is a better person spiritually if he uses a typewriter instead of writing by hand, or if he rides on a wheelbarrow instead of in an automobile.

In 1913 my father stopped in Germany on his way to China and had proposed to him by responsible parties close to the throne the proposition that German missionaries should take over the work of some American missionaries and that under this new arrangement they would be given adequate financial backing indirectly by the German Government. The territory of Kiaochow itself was seized as a reprisal for the death of two missionaries a quarter of a century ago. Is it any wonder that sometimes there is suspicion of our pure and undefiled motives?

There is probably a place for gunboats in foreign waters; there may even be a place for companies of soldiers, though I doubt it. But there certainly is a place for missionaries of the right sort and there is need for much more adequate support of them and their work. When it comes to putting these two together, however, the missionaries and the machine guns do not mix.

# The Virginia Signers

## Men From the Old Dominion Were Among the First to Declare for Independence

By CARL SCHURZ LOWDEN

Copyright, 1926, by Carl Schurz Lowden.

WHO would be the fearless individual to bring before Congress the resolution for independence? It was quite generally thought that Great Britain would regard him as the arch rebel of all the colonists, and would use special efforts to mete unto him the fate that awaits every traitor unlucky enough to be captured.

Richard Henry Lee, of Virginia, was the man. No quailing, no squirming, no compromising, Lee was a fiery advocate of separation from the mother country. Having urged such action for more than a year, he arose from his seat in Congress on the seventh day of June, 1776, and calmly and deliberately moved:

'That these united colonies are, and of right ought to be, free and independent states; that they are absolved from all allegiance to the British Crown; and all political connection between us and the state of Great Britain is, and ought to be, totally dissolved.'

Congress postponed action upon the resolution; but Lee, as its mover, was slated for the chairmanship of the committee to be named for drafting the momentous declaration. He would have written the document if he had not received word of his wife's serious illness and departed on the tenth day of June for his home. After all, I am inclined to regard this as a truly fortunate occurrence; for Lee was brilliant as a speaker and much less capable as a writer whereas Thomas Jefferson, who prepared the immortal paper, did not speak fluently but wrote in a masterful style.

Lee was back in Congress on the first of July. As he was not a member of the committee named to draft the document, he stayed on the floor and spent his time in forcefully urging the adoption of his resolution. He proved himself to be such a glowing orator that John Adams, of Massachusetts, called him the 'Cicero of Congress'; and the man who afterward served as our second President always knew an orator when he saw one.

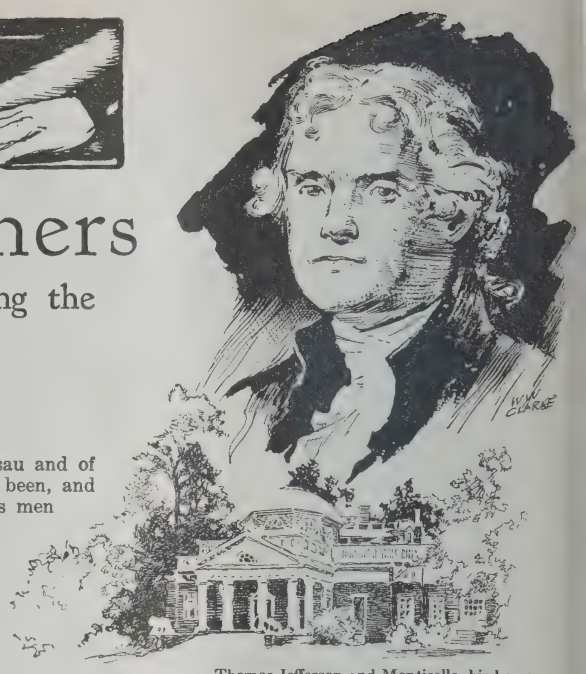
'Why do we longer delay?' Lee dramatically asked in closing one of his strenuous speeches in behalf of his measure. 'Why still deliberate? Let this happy day give birth to an American republic. Let her arise, not to devastate and to conquer but to reëstablish the reign of peace and law. The eyes of Europe are fixed upon us. She demands of us a living example of freedom that may exhibit a contrast in the felicity of the citizen to the ever-increasing tyranny which desolates her polluted shores. If we are not this day wanting in our duty, the names of the American legislators of 1776 will be placed by posterity at the side of Theseus, of Lycurgus, Romulus, Numa, of the three Williams of Nassau and of all those whose memory has been, and ever will be, dear to virtuous men and good citizens.'

His plain, solid common sense helped to make Richard Henry Lee a distinguished personage. Tall and spare, graceful, striking in his features, with a voice rich and clear, he spoke briefly and to the point. Whenever the situation called for speedy action, none could be swifter than he.

In the four years that ensued after he introduced his famous nation-making resolution, this man from Virginia held membership in nearly a hundred committees. Richard Henry Lee was most arduously engaged. His work in Congress so impaired his health that he had to go home at intervals, varying with the stress of his duties, to rest up and recruit his strength.

'His mind,' aptly asserted Dr. Benjamin Rush, a signer from Pennsylvania, 'was like a sword too large for its scabbard.'

An absolutely honest man was this high-minded patriot of Virginia. When the legislature of his state basely proposed to repudiate all debts contracted before the war by its citizens with British merchants, he most bitterly denounced the movement.



'Better be honest slaves of Great Britain,' he stoutly maintained, 'than dishonest freemen.'

He had a long political career as a member of the United States Senate. Poor health, for many years his trailing bugaboo, forced his resignation in 1792. He retired to his estate at Chantilly where his infirmities compelled inaction during the two years before his death. But his lifelong friend and faithful coworker, Patrick Henry, did not forget him in this watchful-waiting time.

'Your age and mine,' Patrick wrote, 'exempt us from the busy scenes which now present themselves.'

One of the dandies in Congress was Francis Lightfoot Lee. I do not mean that he lacked a virile manhood; but he liked to dress well, and he loved pleasure and the easy life of a country squire. Francis and Richard Henry were closely attached and they worked harmoniously together; Francis had more interest in the army than in the great document he signed.

Certain persons charged that 'the Lees of Virginia' were inimical to General Washington. Francis happened to be the only one of the family then in Congress. General Charles Lee had been court-martialed for using improper language to the commander-in-chief. Francis made no reply to the accusation, but he voted for a confirmation of the sentence when the matter was brought before the national legislature. In consequence of this action General Lee would never speak to his relative again. Francis was an enthusiastic admirer of Washington, and invariably stood back of the great leader in whatever program or plan he proposed.

Thomas Jefferson and Monticello, his home.

In the spring of 1779 Francis retired from Congress to take life easy thenceforth on his estate. Virginia needed the services of its ablest men at that time, however; so Francis soon found himself in the Virginia senate not because he wanted to sit there but because his fellow citizens wanted him there to look after their interests.

Eventually the signer did really retire. As he had no children, he read, farmed and entertained company during the rest of his days. One of the coldest winters ever known in his native state caused both him and his wife to suffer severely from pleurisy, and they died within a few days of each other.

Thomas Jefferson ranked among the ablest political leaders of his time, and some commentators consider him the ablest. A large share of his public work was done with his pen, an instrument which an English poet declared to be 'mightier than the sword.' The Declaration of Independence stands as probably the most important paper in all modern political history; certainly Jefferson's pen work solidified and made the public patriotism truly potent.

Congress modified the Declaration, and then adopted the revised draft. Jefferson was not wholly pleased with the changes that were made; he had written it as he thought it ought to be. He was an idealist. He disliked slavery, and he would have killed it then if he could have had his way. To him it seemed 'politically and morally wrong.' He made an unsuccessful effort in the House of Burgesses to confer on the masters the right to free their slaves whenever they wished. When the government of the western territory was being organized he presented a measure providing for the 'total abolition of slavery after the year 1800.' Congress agreed to all of his other proposals, but refused this one.

Very few men ever left a deeper impression upon our government and nation than

did Thomas Jefferson. His entire life consisted of service to mankind. He retired early from Congress; then he became governor of his state, later a member of Washington's Cabinet, vice-president during the administration of John Adams and next succeeded him to the presidency. During the latter part of the war he had replaced the aged Franklin as the American minister to Paris. While staying in the French city he wrote his famous book which was published under the title, *Notes on Virginia*.

His political life closed in 1809 at the end of his second term as the new nation's chief executive. He went back to his quiet home at Monticello to spend the remainder of his days. He gave a large amount of his time, thought and money to establishing the University of Virginia at Charlottesville.

Even when Jefferson was President he disliked to be addressed in any formal manner; he did not relish the use of 'Mr.' with his name. He believed in naturalness and no posing and, unlike many persons, he carried his beliefs into his daily life. He practised strictly as he preached, and abhorred hypocrisy.

During his term as governor of his native state the British seriously invaded it three times. On one of these occasions Jefferson himself narrowly escaped capture. He was not a military man; so he refused a second term, and General Nelson, of Yorktown, succeeded him.

The general found himself greatly hampered by a new law requiring the governor not to act without the advice of of the council. Of the eight men composing the council two had been captured by the enemy and two had resigned; only four remained, and four was the smallest number to constitute a legal council. In the torn-up condition of the state it was almost an impossible task to keep these four together. General Nelson decided to risk public censure to the extent of meeting emergencies without the council's advice whenever that body could not be speedily assembled. Due largely to this course the army was kept intact until it could deliver the finishing stroke of the war in the battle of Yorktown.

General Nelson had signed the Declaration of Independence along with Jefferson and the other patriots. And, by the way, his patriotism was put to a particularly severe test during the siege at Yorktown. He observed that his own house had not been damaged by the fire of the American artillery. When he brusquely demanded to know why, the commander said it had been decided to spare the governor's own home.

'Spare nothing!' the governor and general protested. 'I'll wager it is occupied by the principal officers of the British army. Get them out immediately.'

Two cannon were accordingly aimed at the Nelson home, possibly by the general himself. The very first shot went through the house and killed two of the officers then dining at a table. Other shots soon dislodged the hostile tenants. The destroyed residence was ample evidence of the signer's patriotism.

Nelson had means, but he loved his country more than he loved his money. His horses were unhitched from plows to move munitions. His granaries were opened to the starving fighters. His purse was drained when the credit of Virginia was not good. He spent a fortune in his country's service; yet when he died, honor and love were about all he left behind. His widow, eighty years old, suffered because republics are rarely grateful.

A bill for the sequestration of British property was introduced into the Virginia legislature while Nelson served as a member of that body. He strongly opposed it.

'I hope the bill will fail,' he asserted, 'but, whatever its fate, I will pay my debts like an honest man.'

The principal joker among the signers was Benjamin Harrison. Even at the time of signing he had to have his joke. Elbridge Gerry, of Massachusetts, happened to be thin and wiry, whereas Harrison possessed an excessive bulk. Perhaps he loomed as large physically as he did humorously. He attached his name to the document and then turned to Gerry who stood beside him.

'Well,' the Virginian chuckled to his lanky compatriot, 'when the time of hanging comes, I shall have the advantage over you, Mr. Gerry. It will be all over with me in a minute, but you will be kicking in the air half an hour after I am gone.'

Early in the Revolution the British authorities extended amnesty to all the colonists, excepting John Hancock and another, who would cease their opposition and be 'good boys.' Harrison remembered this fact when the selection of a president of Congress demanded the attention of the delegates. With evident relish of a practical joke, the ponderous Southerner seized the modest candidate and placed him in the chair.

'We will show Mother Britain how little we care for her,' he told the other members, 'by having as our president a Massachusetts man whom she has excluded from pardon by a public proclamation.'

One evening at Berkeley, the place of his birth, the patriot was sitting with a neighboring family when his servant maid ran over to inquire what clothes she should put up for a journey he expected to commence the next day. Harrison looked very seriously at her; then he replied:

'Why, you may put up my black velvet suit, my green trimmed with gold, also the blue and silver.'

The poor girl was plainly astonished, perhaps puzzled. With an attitude of uncertainty she lingered until Harrison commented:

'Now she knows well enough, except what I have on, but one decent suit belongs to me, and yet she comes for a list as if I had the wardrobe of a king.'

Though Benjamin Harrison ever showed himself to be a fun-loving person, he ranked as one of the foremost of the fifty-six patriots that signed the Declaration of Independence. He headed the department of foreign affairs in Congress, and the board of war; thus he was at the same time a diplomat and a tactician.

Toward the close of 1777 he retired from

Francis Lightfoot Lee.

the Congress because he needed to rest from his arduous labors. At once, however, he became a member of the state legislature.

Rather a remarkable distinction adheres to the memory of George Wythe, another of the Virginia signers. Some of the greatest luminaries of that state at the bar and in the senate were instructed in science or in other subjects by Wythe. In the list of his pupils were two Presidents of the United States and one Chief Justice. He founded a private school and gave instruction free, his only reward being the satisfaction of seeing the accomplishments of his students. Thomas Jefferson was one of his pupils; Wythe, having introduced him to the bar, virtually became his mental godfather. Our third President ever had a high regard and affection for his preceptor. When the older man died, the younger told the world how truly admirable his instructor had been.

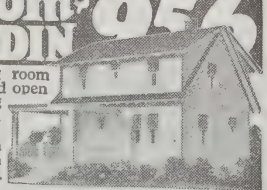
SEND for ALADDIN CATALOG of NOT SECTIONAL HOMES

You can buy all of the materials for a complete home direct from the manufacturer and save four profits, on the lumber, millwork, hardware and labor. WE PAY THE FREIGHT.

5 Room Aladdin 478

Nine different floor plans of this house are shown in Catalog. 2 and 3 bedroom designs—grade and inside cellar entrances.

6 Room Aladdin 618



Living room, dining room, 3 bedrooms, kitchen, bath. 3 other plans in catalog. Very high grade lumber throughout.

Story and Half Aladdin 789

Story and a half semi-bungalow, with second floor available for 2 bedrooms. Two floor plan arrangements. Any handy man can erect these houses.

7 Room Aladdin 956

Large living room with circle-tread open stairway, dining room, kitchen. 3 bedrooms, each with closet. Bath on second floor.

Price includes all lumber cut to fit; highest grade interior woodwork, siding, flooring, windows, doors, glass, paint, hardware, nails, lath, roofing, with complete instructions and drawings. Freight paid to your station. Permanent Homes —NOT PORTABLE. Many styles of year 'round dwellings, summer cottages and garages to choose from. Write nearest mill today for FREE Money-Saving Catalog No. 161

The ALADDIN Co., BAY CITY, MICHIGAN
Wilmington, North Carolina; Portland, Ore.; Toronto, Ont.

Wythe was frequently spoken of as 'the fountain of justice.' He had high standards as a lawyer, and never supported an unjust cause if he knew it to be such. He required the oath of a client if he doubted the man's statements; if deception was practised upon him, the fee would be returned and the case abandoned. This kind of conduct brought him universal esteem and confidence. An evidence of this fact lies in the circumstance that he was made chancellor of Virginia at the organization of the new government, and held this office until the time of his death.

He emancipated his slaves because he believed in freedom for all mankind. He gave them enough to keep them from want; furthermore, he taught them valuable habits of thrift and industry.

Carter Braxton, the seventh signer from the 'Old Dominion' state, was the richest man of all the fifty-six that bravely inscribed their names beneath the Declaration. His wealth came to him through inheritance and not by the sweat of his brow. He lived in splendor; his cellars had the rarest wines, his dining room the finest plate and his home held a proud array of the finest furniture. His house was the resort of the gay, fashionable and wealthy. Strange as it may seem, he died deeply in debt and embittered by his desperate downfall.

'Soon after the Declaration had been approved,' says one of Braxton's biographers, 'he entered upon commercial life. His first move was to place his entire fortune in ships with which he hoped to engage in exporting and importing relations with France. History shows that the vessels were all captured or destroyed. Braxton found himself in poverty. His lands were seized by the sheriff, his slaves were sold, lawsuits galore were directed at him and he became so involved in debt that he died a broken-hearted man. His life was a lesson of the uncertainty of all earthly things.'

## Sad Men Who Look So Wistfully at the Sky

(*Concluded from page 15*)

make a parlor cat out of a skunk as to talk religion to these criminals.'

That man does not understand the prisoner. My experience has taught me (and prison chaplains everywhere will bear me out) that there is a great eagerness behind the walls for a spiritual message which is sincere and practical. Unlike the pastor of a parish in the free world, every prison chaplain sees heart-broken prodigals on their knees in despair and much happiness comes to him in his difficult work from the fact that he is really helping men to find the path that leads from the ugly, crooked past to a happier, cleaner and more abundant life. A parole agent expressed his joy to me over the fine record of the men in his charge and he added that the majority of them had confided to him that they had found the inspiration to lead clean and upright lives in the prison chapel.

It seems that the public does not realize how many former prisoners make good. This, I believe, is largely due to the fact that newspapers often carry stories about prisoners who fail to make good. It should be kept in mind that the names of the many who succeed honorably must, of course, as far as the public is concerned, go unmentioned.

It is true that in every prison some inmates profess religion to impress the chaplain and gain the favor of officials. Fortunately such men are few and the prison chaplain soon develops the faculty of recognizing this form of insincerity. On the other hand, some men display a faith so sincere and profound that Christians in the free world will admire the fine courage of their conviction and urge others to pattern their lives after that of these regenerated men.

*Former Convict Now Serves in Ministry*

Some time ago a prisoner whose sentence will soon expire frankly confessed a crime which he had committed three years before. He understood fully the probable consequences of such a confession, but was ready to suffer for the wrong committed and eager to make restitution to those who had been defrauded by him. Here is his reason, as contained in a letter received from him after the interview: 'I have become a Christian and, as far as I can, I shall righten what was wrong in my life. If I have to do more time, I feel that I deserve it. With God's help I want to start life all over again with a clean slate.'

A former prisoner who heard the call of the Friend of Sinners is devoting his life to the work of the Christian ministry. He is a man of education and because of his ability and the success of his earnest work was ordained by one of the larger denominations. With tears in his eyes he told me of the happy moment when he found himself able to return money to a bank in Rhode Island which he had obtained through forged checks some years ago. The bank officials generously returned the amount to him saying that they knew of his fine work and that it was their wish that he accept the money and apply it to his work.

Deep down in their hearts these men had become ashamed of dishonesty and uncleanness and they yearned to satisfy the hunger for goodness which, after all, exists in every human heart. And there are a multitude of others everywhere in this land who, on the wreckage of the past, have built lives of Christian usefulness, and even a few who have climbed to the top of the ladder of success against tremendous odds.

*He Must Never Lose Faith in His Men*

Prison life brings opportunities to the chaplain for a thousand little acts of personal service—the writing of a letter to a heart-broken mother, words of comfort for those who receive a message of death and sadness from home, the straightening out of domestic difficulties which imprisonment almost invariably brings, visits to the bedside of prisoners in the hospital when their courage is utterly crushed. Often when the most eloquent and appealing sermons fail, these ministrations help to bring about changes in the prisoner's view of life which, though permanent, are not recorded in court documents and prison records.

It is said that work with delinquents has a tendency to harden the prison chaplain. True, the years bring him bitter disappointments; he finds that men betray his trust. But no matter how many times men may have failed him, he must not lose faith in the prisoner. To him every prisoner, like his more fortunate brother outside, is after all a son of God, and underneath the surface, often crooked and detestable, he sees the man who was created in the image and likeness of God. There is an important work for sociologists, psychologists and criminologists—success to them! —but the mission of the prison chaplain must ever be to take the fallen brother by the hand and help him to find within himself the kingdom of God in which all men are brothers.

# Wild Youth Proves a Myth

(Concluded from page 4)

other popular delusion is shattered by statistics proving that child labor does not after all 'keep children out of mischief,' and that certain forms, particularly street trades, have a tendency to produce juvenile delinquency. A study made by the Department of Labor and published in 1912, of cases committed to reformatory institutions in seven cities, Indianapolis, Baltimore, Boston, Newark, Philadelphia and Pittsburgh, showed that 56.5 of the 4,278 boys involved were working at the time of their latest offense.

Regarding delinquents in the Manhattan Children's Court in 1916, it is reported:

> About 38 per cent had been employed prior to court proceedings, though only about 10 per cent of the children of Manhattan in general were employed; these boys came almost equally from homes rated as good, fair, or bad.

The working boys, also, had committed more serious offenses, and 43 per cent of them were 'repeaters' as against 28 per cent of the non-workers.

Obviously one of the accompaniments of the broken home, poor home conditions, and downright poverty, is child labor, and equally obvious is the fact that lack of money coupled with the natural desire for the things that money will buy is the principal factor in juvenile delinquency. By far the largest proportion of juvenile offenses are against property—larceny or petty larceny. In the year 1910, of all commitments of juveniles, 33.4 per cent were for such offenses, while 29.5 per cent were for incorrigibility, truancy, and minor delinquencies. While it is not alone among the poor that juvenile delinquency occurs, it is poverty's child who most frequently comes under observation through the court.

***Poverty's Child Visits Court Most Frequently***

All the more encouraging is the fact that, popular opinion to the contrary notwithstanding, *juvenile delinquency is not increasing.*

The truth is, delinquency has decreased, as public interest in the juvenile delinquent and the operation of machinery to discover and study him has increased.

For according to the survey of statistics recently compiled by the Children's Bureau, much more reliable figures than those obtainable from the juvenile courts—figures based on census reports covering the entire country—indicate a decline in the number of delinquent children committed to institutions, if the growth in population be taken into consideration, and reveal no significant increase in the number committed for the more serious offenses, homicide, robbery and burglary.

Published census reports of juvenile delinquents in institutions or committed to institutions are available for the years 1880, 1890, 1904, and 1910, and a report covering the first six months of 1923 is now in press.

'Differences in methods of taking the census make the figures for the earlier years only roughly comparable,' the Children's Bureau explains, 'but the statistics for 1910 and 1923 are not seriously affected by such differences. The figures include persons in or committed to institutions for juvenile delinquents and persons under eighteen years of age in or committed to prisons and reformatories, jails and workhouses.

'The number of persons ten to seventeen years of age enumerated on a given date in institutions of the kind specified per 100,000 population of the same age was 143.4 in 1880—149.2 in 1890—and 154.5 in 1923.

The relatively slight increase reflects the more adequate provision of institutional care especially adapted to juvenile delinquents in 1923 as compared with the earlier period. It is not possible to present similar ratios for 1904 and 1910, but considering only persons in institutions for juvenile delinquents, and not persons in penal institutions, the ratio per 100,000 population has been practically stationary since 1904. The growth of the probation system has come mainly within the period since that date.

***Commitments Are Highly Significant***

'A more significant figure is the number of commitments during a given period. The total number of delinquent persons ten to seventeen years of age admitted to institutions of all types during the entire year 1910 was 24,854, or 171.7 delinquents per 100,000 of the same age. The corresponding figure for 1923 (estimate based on exact figures for the first six months) was 25,565, a ratio of 156.5 per 100,000 population of the same age. (The ratio in 1923 would have been 161 if the small number of dependent children admitted to institutions for juvenile delinquents had been included as it was in 1910.) There has thus been a decline in delinquent children committed to institutions if growth in population is taken into consideration.'

That is, juvenile delinquency has fallen far behind population increase.

'Comparable figures for offenses are available only for those committed to penal institutions as in many cases of commitment to institutions for juvenile delinquents the only record of offense is the general term, "juvenile delinquency." In the first six months of 1923, 16.3 per cent of the commitments to penal institutions of persons under eighteen years of age were for homicide, robbery and burglary. For the entire year 1910 the corresponding percentage was 8.5. However, the larger percentage in 1923 committed for grave offenses is largely due to the fact that increasing numbers of children who commit the less serious offenses are now being sent to institutions for juvenile delinquents instead of to penal institutions.

***Serious Crime Also Is Considered***

'There has been no significant increase in the actual number of children committed for the three offenses specified.

'The total number of children committed for such offenses in 1910 was 1,011. The estimated number for 1923, based on exact figures for the first six months, was 1,104.

'In 1910 the number of persons ten to seventeen years of age committed for these three serious offenses was 7.0 per 100,000 children of the same age, and in 1923 it was 6.8.'

But even so, dismally insists the elder generation, what about the real crime situation? Juvenile delinquency after all is not the most serious menace. Look at the number of young people in penal institutions.

Well, look at them.

According to the Children's Bureau, *the age of commitment has not decreased as has been so frequently asserted.*

The United States Bureau of the Census has published statistics of prisoners for the same years as those for which they have published statistics of juvenile delinquents.

The last census report of this character is entitled 'Census of Prisoners, 1923 (Preliminary Report).' From it the Children's Bureau has compiled tables showing the age distribution of the adult population of prisons and reformatories, jails and workhouses, 1880 to 1923, and the per cent distribution of commitments and persons present.

These tables show:

That between the years 1880 and 1923, the percentage of the prisoners of eighteen to thirty-four years of age to the total prison population decreased from one-third to one-fourth, while during the same period the percentage of prisoners thirty-five years old and over increased from 29.5 to 44.1! (See tables printed with this article.)

***Children Are Not So Bad as Painted***

The significant fact, of course, is not that the greater number of commitments are of offenders under thirty-five, led by the age group twenty-five to thirty-four. This has always been true. It is also true that young offenders are more likely than the older ones to be given probationary treatment, and the growth of the probation system may affect the percentages. The significant fact is that *there has been a decrease in every age group up to thirty-five since 1880,* and an increase in the age groups of thirty-five to forty-four and forty-five years and over.

'Contrary to opinions which have been expressed,' comments the Children's Bureau, 'there seems to have been no marked decrease in age of commitment. On the contrary, only 9.4 per cent of the commitments in 1923 were of persons between the ages of eighteen and twenty years, as compared with 9.8 per cent in 1904 and with percentages of 11.8 and 12.1 based on persons present in 1880 and 1890 respectively. There has been no increase since 1904 in the percentages of persons between the ages of twenty-one and twenty-four years, and the percentages for this age are lower for recent years than for the years 1880 and 1890. The same may be said of the age group twenty-five to thirty-four years. Persons between the ages of thirty-five and forty-four are contributing a slightly larger percentage of the total commitments at present as compared with earlier years.'

All of which would certainly seem to prove that while young people of the present day are no better, perhaps, than they should be, they very certainly are not so bad as they are accused of being; and that the older generation may not be quite so good as it thought it was.

# I Read in the Papers

A remarkable tribute was paid the United States by J. L. Garvin, editor of the London *Observer*, in connection with the 150th anniversary of American Independence.

### *When They Say What They Think*

'In the supreme business of bringing labor and capital into practical partnership,' said Mr. Garvin, 'America is acting while Europe is theorizing. Nothing but a United States of Europe could insure to the peoples forming it a general wealth and well-being fully equal to the prosperity of the United States of America.

'Let no man imagine this is a spectacle merely of triumphant materialism. Those who take that view understand nothing. In an increasing amount the wealth is going just where it should. America spends as much on education as all the rest of the world put together. In architecture she leads grandly. That kind of excellence has always been akin to progress in other arts.'

The London *Times* was also laudatory. Editorially it said:

'It was our forefathers whose pens wrote this momentous page of history and from the loins of those forefathers had sprung the great Nation which today we salute across the Atlantic. The British Empire and the United States share a common heritage, come down to both alike from ancestors bred in English soil. The Anglo-Saxon races have the same ideals, and their power for good in the world today and tomorrow will be doubled if the two work together, but it must be much more than halved if they pull apart.'

❦ ❦ ❦

The impossibility of Jewish assimilation is acknowledged by Nathaniel Zalowitz in a frank article in the *Jewish Daily Forward*, which interestingly reveals the Jewish attitude toward Americanization.

### *Jews Will Not Be Assimilated*

'Although the Ghetto was never instituted in this country,' he says, 'a voluntary Ghetto has practically existed since the first large influx of East European immigration began in 1882. It is a belief of mine that this voluntary Ghetto will exert a tremendous influence on the course which Jewish history will take in America, that it will serve as one of our greatest bulwarks in our struggle against absorption in the maelstrom of Anglo-Saxon civilization, but that at the same time it will be one of the potent causes of anti-Semitic feeling and will produce perhaps as much harm as good . . .

'In each of these boroughs (New York) there are Ghettos large and small, new Ghettos springing up almost overnight. There are Ghettos for foreign-born Jews and Ghettos for native-born Jews; Ghettos for poor Jews and Ghettos for middle class and for rich Jews, for Russian Jews and for German Jews. The East Side is one kind of a Ghetto, Washington Heights another kind, West Bronx a third, Riverside Drive a fourth, Broadway between 72nd and 96th streets a fifth, upper Fifth Avenue a sixth, and Brooklyn has a dozen different kinds and styles of Ghettos of its own. Today you have a Ghetto for the Jew who owns a Rolls Royce and half a dozen other cars besides. The rich Jew no less than the poor one prefers to live among *unsere leute*—and the Gentile thinks so, too. People used to imagine years ago that as soon as the Jews will shed their "greenness" they will mix with Gentiles, be accepted in Gentile society, move into Gentile neighborhoods, and be absorbed in a decade or less. Nothing of the sort has happened. The Jews, in their northward march from the dingy and sordid East Side, did move into Gentile sections—and the Gentiles immediately began to get out . . .

'Four-fifths of all the Jews in the United States practically have no social contact with the Gentiles who constitute 99 per cent of the population of the country. This is a fact of the greatest significance. It means that for the overwhelming majority of Jews in America assimilation in any true sense of the term is absolutely out of the question. It signifies that we are no nearer understanding our Gentile neighbors in this country than we were in the Old World. It means that despite the fact that we have attended American public schools and universities, read American papers and books, patronize the same theaters and subways and busses, we are kept and keep ourselves at arm's length from the bulk of the American population.'

❦ ❦ ❦

An interesting example of the newer jurisprudence, imported into this country from Southern Europe by certain classes of immigrants to supplant the old-fashioned American practice of trial by a jury of peers, was revealed in a recent New York trial. The conservative *Times* described the incident as follows:

### *Hush! Don't Criticize Our Aliens*

'The Camorra death threat—the index finger drawn across the throat—is believed to have been made yesterday in the Brooklyn supreme court, for witnesses suddenly developed a surprising lack of memory. Paul Punzone and "Buffalo Mike" Notaro were two of the State's witnesses in the trial of Antonia Paretti for the murder of Charles Ubriacco and Nicholas Morello.

'Punzone was called to the stand to testify against Paretti, who is known to the police as "Tony the Shoemaker." He answered, "I cannot remember" to all questions asked him. Notaro was another who could not remember anything connected with the case. He said he even forgot any of the testimony he gave against Pellagrino Morano in 1918, although his testimony was read to him from the court records. While on the witness stand Notaro betrayed extreme nervousness. The nervousness increased when Mr. Cuff took up the court records and, turning to Notaro, began to read the testimony he had given in 1918. It was his account of the ceremony into the Camorra by Morano. He testified then that Morano had slit a vein with a knife and had sucked from the wound a small quantity of blood. This, he had said, was a sign of the "Brotherhood of the Blood."

' "That was your testimony?" asked the prosecutor.

' "I can't remember." '

❦ ❦ ❦

Charles MacVeagh, American Ambassador to Japan, is credited in newspaper dispatches with advising Japanese to go to England rather than America, if they would learn the English language. Addressing the Intercollegiate English-Speaking Societies of Japan, according to the Baltimore *Sun*, Mr. MacVeagh declared:

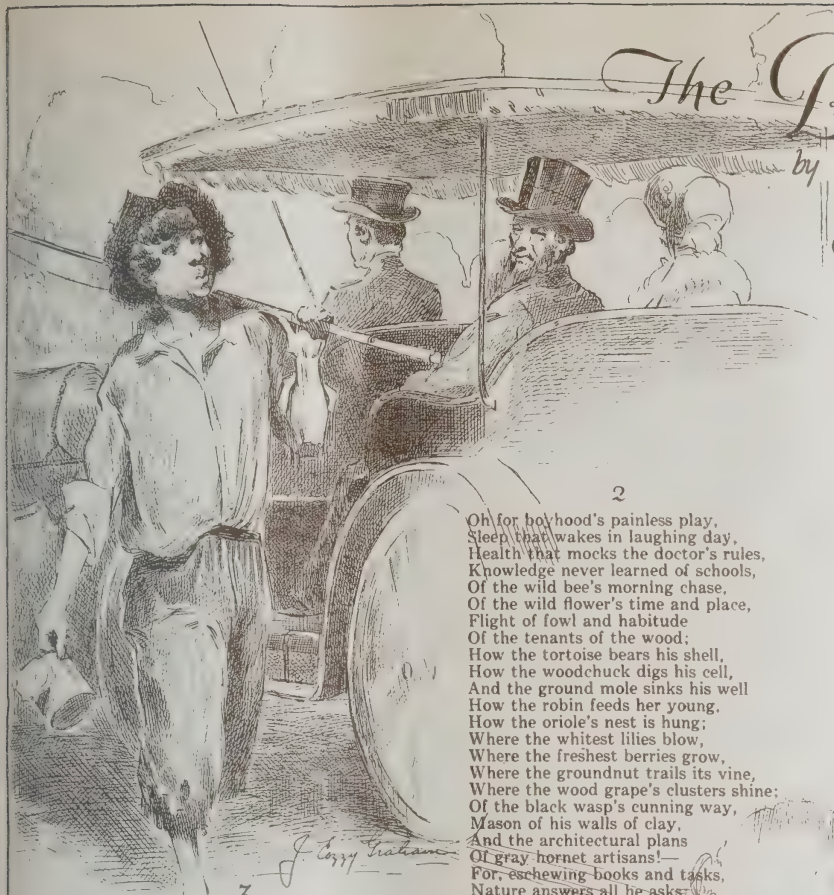
### *Where Best to Learn English*

'Americans that we are, nevertheless we are mostly British stock, and England is our mother country in language as well as ideals of government. This fact will make it evident to Japanese that there is still much in America of value to them, but I admit at the same time that one must get back to the land of the English for the English language. I admire the British people and feel that Sir John Tilley, the British Ambassador, would be right in telling students here that in order to study English efficiently one must go to England, because it is the only true source of the language.'

The dispatch adds that 'the speech surprised Americans of Tokyo, who recalled that Mr. MacVeagh did not speak at the American school commencement, although Tilley did.'

❦ ❦ ❦

Babylon is falling all over again, according to Dr. William T. Ellis, of Swarthmore, Pennsylvania, who returned recently from the Near East.



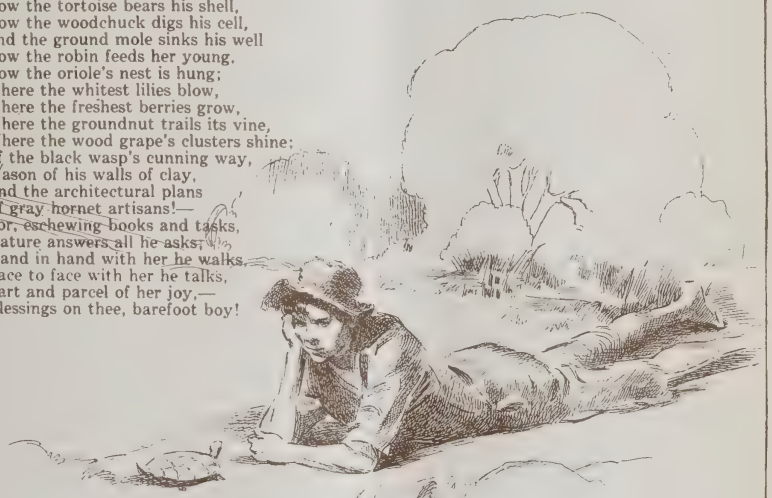
### *Babylon Again Is Falling*

'The remains of the ancient city,' he declared, 'so carefully and expensively excavated throughout a long course of years, are entirely neglected and unguarded, and the priceless and irreplaceable bas-reliefs along the Sacred Way are being broken and pilfered by the Arabs. In a few years there will be nothing to show of the unearthed remains of the grandeur of the city of Nebuchadnezzar.

'The Iraq Government has a department of antiquities, which apparently confines itself to seizing for display in the Bagdad museum the choicest of the finds of American and British archeologists, at such new sites as Ur of the Chaldees and Kish. It totally neglects the preservation of one of the greatest archeological treasures in all the world, the uncovered ruins of mighty Babylon, once ruler of the whole world.'

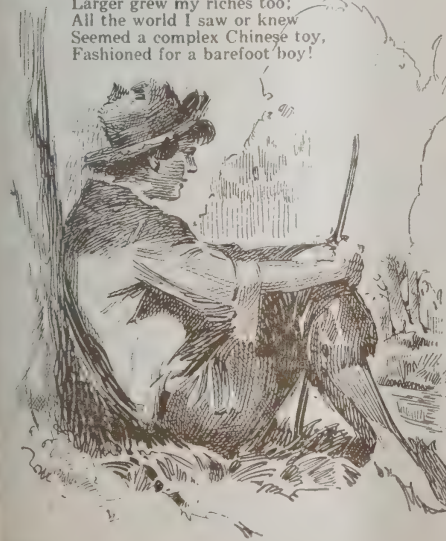
# The Barefoot Boy

by John Greenleaf Whittier.



1

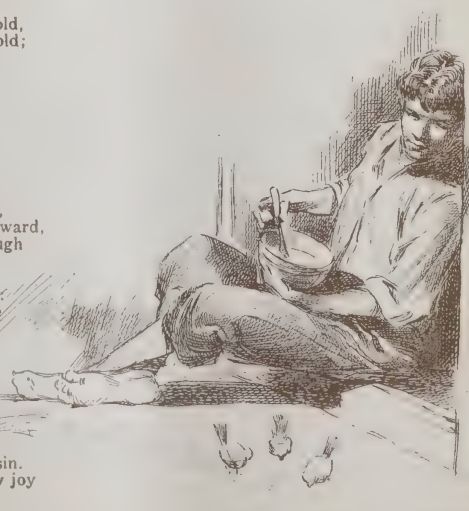
Blessings on thee, little man,
Barefoot boy, with cheek of tan!
With thy turned-up pantaloons,
And thy merry whistled tunes;
With thy red lip, redder still
Kissed by strawberries on the hill;
With the sunshine on thy face,
Through thy torn brim's jaunty grace;
From my heart I give thee joy,—
I was once a barefoot boy!
Prince thou art,—the grown-up man
Only is republican.
Let the million-dollared ride!
Barefoot, trudging at his side,
Thou hast more than he can buy
In the reach of ear and eye,—
Outward sunshine, inward joy:
Blessings on thee, barefoot boy!



2

Oh for boyhood's painless play,
Sleep that wakes in laughing day,
Health that mocks the doctor's rules,
Knowledge never learned of schools,
Of the wild bee's morning chase,
Of the wild flower's time and place,
Flight of fowl and habitude
Of the tenants of the wood;
How the tortoise bears his shell,
How the woodchuck digs his cell,
And the ground mole sinks his well
How the robin feeds her young,
How the oriole's nest is hung;
Where the whitest lilies blow,
Where the freshest berries grow,
Where the groundnut trails its vine,
Where the wood grape's clusters shine;
Of the black wasp's cunning way,
Mason of his walls of clay,
And the architectural plans
Of gray hornet artisans!—
For, eschewing books and tasks,
Nature answers all he asks;
Hand in hand with her he walks,
Face to face with her he talks,
Part and parcel of her joy,—
Blessings on thee, barefoot boy!

3



Oh for boyhood's time of June,
Crowding years in one brief moon,
When all things I heard or saw
Me, their master, waited for.
I was rich in flowers and trees,
Humming birds and honeybees;
For my sport the squirrel played,
Plied the snouted mole his spade;
For my taste the blackberry cone
Purpled over hedge and stone;
Laughed the brook for my delight
Through the day and through the night,
Whispering at the garden wall,
Talked with me from fall to fall;
Mine the sand-rimmed pickerel pond,
Mine the walnut slopes beyond,
Mine, on bending orchard trees,
Apples of Hesperides!
Still, as my horizon grew,
Larger grew my riches too;
All the world I saw or knew
Seemed a complex Chinese toy,
Fashioned for a barefoot boy!

4

Oh for festal dainties spread,
Like my bowl of milk and bread,—
Pewter spoon and bowl of wood,
On the doorstone, gray and rude!
O'er me, like a regal tent,
Cloudy-ribbed, the sunset bent,
Purple-curtained, fringed with gold,
Looped in many a wind-swung fold;
While for music came the play
Of the pied frog's orchestra;
And to light the noisy choir,
Lit the fly his lamp of fire.
I was monarch: pomp and joy
Waited on the barefoot boy!

Cherrily, then, my little man,
Live and laugh, as boyhood can
Though the flinty slopes be hard,
Stubble-speared the new-mown sward,
Every morn shall lead thee through
Fresh baptisms of the dew;
Every evening from thy feet
Shall the cool wind kiss the heat:
All too soon these feet must hide
In the prison cells of pride,
Lose the freedom of the sod,
Like a colt's for work be shod,
Made to tread the mills of toil,
Up and down in ceaseless moil:
Happy if their track be found
Never on forbidden ground;
Happy if they sink not in
Quick and treacherous sands of sin.
Ah! that thou shouldst know thy joy
Ere it passes, barefoot boy!

THE LIBRARY OF THE
UNIV. OF ILLINOIS
URBANA ILL

'OUR earth is only one among the six principal satellites of our sun. As all the fixed stars are suns, one sees how small a place among visible things our earth takes up, since it is only a satellite of one among them. Now all these suns may be inhabited by none but happy creatures; and nothing obliges us to believe that the number of damned persons is very great; for a very few instances and samples suffice for the utility which good draws from evil. Moreover, since there is no reason to suppose that there are stars everywhere, may there not be a great space beyond the region of the stars? And this immense space, surrounding all this region . . . may be replete with happiness and glory . . . What now becomes of the consideration of our Earth and of its denizens? Does it not dwindle to something incomparably less than a physical point, since our Earth is but a point compared with the distance of the fixed stars? Thus the part of the Universe which we know, being almost lost in nothingness compared with that which is unknown to us, but which we are yet obliged to admit; and all the evils that we know lying in this almost-nothing; it follows that the evils may be almost-nothing in comparison with the goods that the Universe contains.'

CHRONICLER OF THE NEGLECTED TRUTH

*Harvey S. Firestone, President, addressing the 25th Annual Stockholders' Meeting of The Firestone Tire & Rubber Company; held in the Firestone Clubhouse Auditorium, Akron, Ohio, December 15th, 1925.*

# One of the Reasons Why Firestone Tires Are Better

HERE are the designers and builders of Firestone Tires, over 14,000 strong. Every one is a stockholder, sharing responsibility and rewards with the active head of the Company.

The annual Stockholders' meeting, shown above, is a tribute to the spirit behind Firestone's success. To these men and women the figures relating to sales and profits mean more than mere material gain. The tremendous increase in public demand for Firestone products gives each one that satisfaction which is life's richest accomplishment—the knowledge of a job well done and the tangible demonstration of public appreciation.

There is intimate contact, a pulling together—that intangible something in the Firestone organization that makes for efficiency, economy and outstanding progress—and is one of the reasons why Firestone builds better tires.

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses debt as a help or hindrance to independence.

Issues gone! Statesmen gone! Leadership gone! The old-line parties are in a bad way these days. It is almost impossible to tell whether or why a man is a Republican or a Democrat. Worse, it's almost impossible to tell when he's either. The parties are so generally agreed now. Politics is in the doldrums. The personal element has been lost. (p. 3)

But the nation gains what the parties lose. Too much politics is bad for a country. An issue is a sign of national ferment. Old-world countries are desperately ill; hence they have many issues, many remedies, many politicians. America is healthy. And because it is, the nation has few issues, few remedies, few politicians. Maybe this is the right view. Whether or not it is, one thing is sure: Samuel Crowther brings a welcome, fresh light to his analysis of the situation. (p. 3)

Tom Masson lived for years among the wild American humorists—and he survived to tell the tale! He tells it here—a jollier, livelier story we haven't encountered in a long time. Masson tells of Mark Twain walking on lower Fifth Avenue, where the passing crowds would point him out in awe to his open disapproval and secret delight . . . of Phil Welch, who earned $6,000 a year by selling jokes at $3 apiece . . . of du Maurier, then an illustrator . . . (p. 12)

The English look at the American installment plan and are puzzled. Never before in history has any country known a general standard of living comparable to the American. But the English wonder if this prosperity, based as it is largely on credit, is sound. Is America pawning its future to enjoy the present? Or has it discovered the *open-sesame* to continuous production and continuous prosperity? Many persons in this country are asking the same questions. This view from overseas is thought-provoking. (p. 6)

Here's a suggestion for farmers: Make paper from waste wheat straw. The plan is practical. It is working in Germany, and it could be worked here. A community paper mill is built, just as community grist mills are. Wheat straw and chaff possess many chemical qualities. Not alone paper but other valuable by-products can be obtained from them—wood-alcohol, acetone, molasses, various oils. (p. 7)

Farming must become an industry, not merely an occupation. It must eliminate waste. The place to start is with waste products. Scores of things now thrown away could be utilized. In fact the time may come when the by-products of the farm will be of first, and food of secondary importance. The writer of this article is a scientist. The view he presents is with very little doubt a picture of the future of farming. (p. 7)

Few people know what mental tests are. Fewer still know how to apply them. And yet nearly everybody talks about them, and many charlatans pass themselves off as mental-test *experts*. That's one reason the tests often seem so senseless. And there's another. Psychologists use language common to everyone, *but they use it with a different meaning.* This makes for misinterpretation and sensationalism—the last thing the true psychologist wants. (p. 8)

*The pulpit*—this minister declares—*must be rescued from propaganda!* It must not be made a cat's-paw, even for worthy purposes. Its fundamental function is religious, not legal. It must of necessity deal more with the *spirit* of law than with law itself, else it ceases to be a power. (p. 5)

The pressure of propaganda on the pulpit, making ministers mere missionaries of all sorts of subsidized movements, is becoming an open scandal in the churches. Dr. William E. Barton handles the subject deftly, admirably. He brings to the discussion a lifetime of active experience in the ministry. His conclusions are carefully weighed, mature. The pulpit, he fears, is becoming a bulletin board upon which almost any reform agency can tack its placard. (p. 5)

Islam aims at world domination. It is the old delusion that always foreruns ruin. Dormant, lethargic for years, the Moslem countries are awakening to new race consciousness. Two leaders stand out, the dynamic Kemal Pasha of Turkey, and the powerful but little-known Ibn Saud, of the fanatic Wahabis, who punish drinking or smoking by death. (p. 14)

For the present, Mohammedans are content merely to build up the Faith. Tomorrow they may want to spread the Faith, as in the past, by conquest. The man who wrote this article knows Mohammedans. He has lived among them. By the time this appears, he will be on his way again to the East, 'where things are stirring.' (p. 14)

Gil Robinson tells the story of the ostrich feather that paid a ferry bill. (It's part of his reminiscences of old-time circus days.) And the story of the Shakespearean clowns, who formed so integral a part of the early shows. And of the slave traders who traveled through the South with the circus. And the great billposter fight. They make great reading, these circus tales. (p. 20)

# A Sailorman Poet—*Spins Yarns of the Sea*

By W. TEIGNMOUTH SHORE
PORTRAIT BY WILLIAM O. FITZGERALD

OUGHT there not to be an international law, with heaviest penalties for infringments, decreeing that famous writers should look their parts? Should carry outward and visible signs of the character of their inward genius? Never have I seen any man more unlike what a poet of passions and romance should have been than was Robert Browning; a dapper, spruce man-about-society he looked; Henry James, producer of protracted and too-finely-written prose, was mistaken by me at a party when I was introduced to him for a successful financier or genial man of business; and—to take a very much alive example—there is no one less like Sherlock Holmes than Sir Arthur Conan Doyle: genial, generous-hearted Irishman, whose sense of fun evaporates when he takes to his pen. And so on.

I had seen portraits of John Masefield and had formed a mental picture of the man, which in some few details proved to be correct, but which in essentials was woefully astray. My imagination painted what the author of so many virile tales, plays and poems should be, and over this fancy portrait I pondered as I made my way through the busy streets of Oxford—all gay with the zest of youth, with the exhilarations that come when at last, after weeks of dreary rains and dismal winds, May comes into her sweet own: when the air is summery and 'all the world is young.'

John Masefield lives some few miles out of Oxford. Uphill all the way, along a typically English country road I went; hedges snowy with May blossom, the scent of which hung heavy in the air, and delicious; fresh green fields smothered in golden buttercups, with here and there a touch of yellow gorse; to right and left blue distances of tender, mellow countryside, fields, woods, lush meadows, hills, the glint ever and anon of rivers and streams; overhead masses of gray-white clouds moving slowly across the misty blue. Through the village to the farther brow of the hill, where is a group of modern and seemly houses, and the home of John Masefield, of which my first impression was a splendor of glorious-colored tulips in the flowerbeds that border the path from the gate to the front door. I pulled the old-fashioned bell-pull and was dismayed at the clangor that I had aroused. Then into a cool hall (the afternoon was sultry), through which I caught a glimpse of a further garden of flowers. Into the cool drawing-room, filled with brightness; through the broad windows trees and flowers and green lawns; a room of books and pictures; on top of a high shelf a fine model of a hundred-year-old merchantman made by the deft fingers of sailorman John Masefield; a grand piano; flowers and flowers; a very comfortable chintz-covered sofa upon which I made myself at home and looked amazedly at John Masefield as he sat somewhat more upright than do most men in a snug chintz-covered armchair. Could this slightly built young man—he conveys the impression of youth, despite his fifty years—with those dreamy eyes, really be John Masefield? Where were any traces of the varied experiences he has had up and down the world, by land and sea? Where any indications of the masterfulness that is in so much of his work? The soft, gentle voice, too, and manner of speech? Everything almost as I had *not* expected it to be! But, as we talked, there grew upon me the certainty that I was in contact with a man of large mind, of big knowledge of men and books, of wide and wise vision. An occasional emphasis of words and voice, an occasional eagerness in the eyes, betrayed that beneath this boyishness of manner was an intense vigor of imagination and seriousness of thought.

'Don't you find it a bit dull here in the depth of the country?' I asked him.

'No, no, not at all. There are plenty of pleasant neighbors, and we're close to Oxford. There's the Bodleian Library there, a delightful place to read in. No, why should I find it dull here?'

Really I had no reason why.

'After twenty years of it,' he went on, 'I grew tired of London; then my farm was taken from me during the war by the Government and used as a place of enforced entertainment for German prisoners, and I came here. Dull? No.'

He was surprised at my asking him why he took to the pen, what was the impulse that directed him to authorship, evidently not agreeing with me that many successful writers have adopted literature simply as a business, which was likely to prove more or less profitable. I knew that not to be true of John Masefield, but wanted to hear him say somewhat about it.

'Isn't every writer driven from within?' he replied, looking at me as if I'd asked a fool question. 'I, as a boy, and always, passionately longed to tell tales; hungered to do it. I used to tell them in the dormitory at school. And at sea? When (Continued on page 28)

# What Has Become of Our Parties?

## What Has Happened to Politics in the U. S.? Coolidge Puts Last Democrat Doctrine Into Republican Creed; Reduced Now to Liberals and Conservatives

By SAMUEL CROWTHER

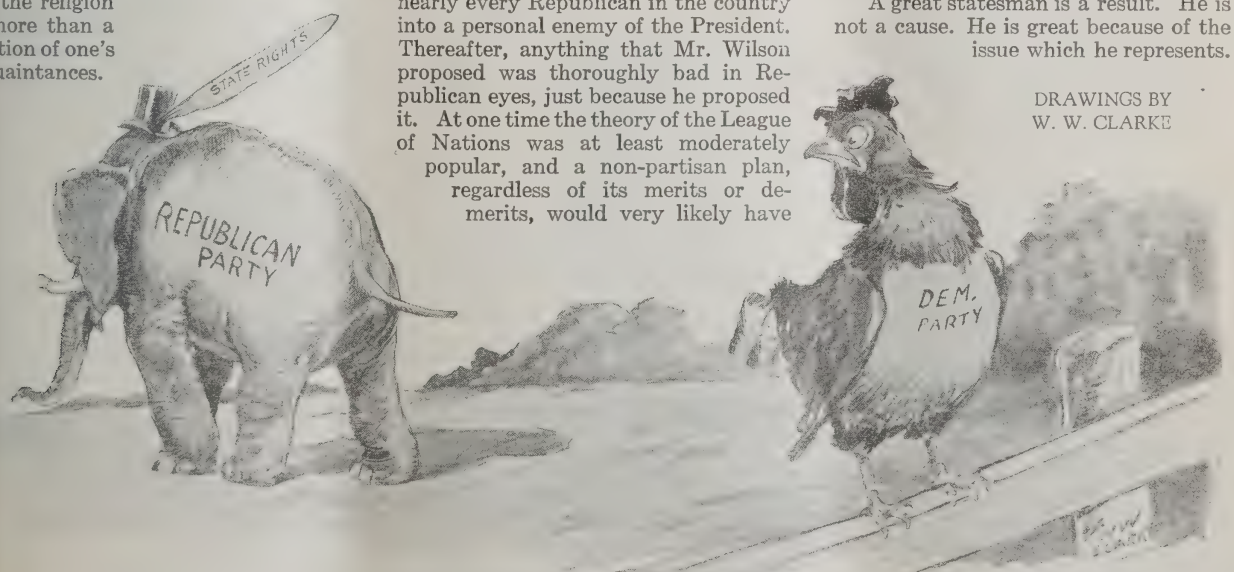
BY WHAT visible signs can a man in these days know whether he is a Republican or a Democrat?

The handful of surviving Democratic welkin-ringing orators say the Republican Party is just naturally the inclusive and exclusive custodian of iniquity—of money power, of vote buying, and of corruption generally. When a Republican orator of the same school lets loose, we find that the Democrats are principally distinguished by an incapacity which is at least criminal, and in addition stand for low wages, long hours, child labor, the disfranchisement of the negro, and the annulment of the Constitution. Republican votes, it appears, are always bought and paid for. Democratic votes come by default—that is, Democratic states are such because only sworn Democrats are allowed to approach the polls.

However well this rough division into iniquity and incapacity may have satisfied our fathers, it does not today seem quite to do. For politics is no longer personal. A Democrat is still an oddity in Pennsylvania, but he is freely conceded to be human, while even in Mississippi there is some opinion to the effect that a Republican may be human. Thirty years ago a Republican and a Democrat might have been friends—but they rarely were. Today politics does not count. Excepting in small communities, one knows neither the politics nor the religion of more than a fraction of one's acquaintances.

The real reason why we cannot get personal about politics is not merely because we have better taste than did our forefathers. It is true that we have better taste and much more common sense in political affairs than we used to have. Our forefathers insisted on having bunk served to them by the bucketful. They also liked muck. We should not today tolerate such stuff as was smeared over the country during the Jackson period.

We insist that the personal life of a candidate shall not be an issue. If his personal habits are such that they can be made an issue, then he automatically becomes an ex-candidate. If Daniel Webster were living today, we would not accept him. We no longer have outstanding political personages about whom no men are lukewarm, whom men either tremendously like or dislike. We have no really eminent Republicans or Democrats. Men cannot come to blows over Calvin Coolidge as they could over Theodore Roosevelt, Woodrow Wilson, William Jennings Bryan, Robert M. La Follette, or any of the long line of their political ancestors back to Alexander Hamilton and Thomas Jefferson.



The country has not been worked up over a man with an issue since President Wilson's statement on the eve of the fall elections in 1918 to the effect that the Democrats had done so well with the war that they ought to be continued in power. That turned nearly every Republican in the country into a personal enemy of the President. Thereafter, anything that Mr. Wilson proposed was thoroughly bad in Republican eyes, just because he proposed it. At one time the theory of the League of Nations was at least moderately popular, and a non-partisan plan, regardless of its merits or demerits, would very likely have been accepted, but Mr. Wilson made the League his own and therefore it could not be accepted. The late Senator Lodge led the fight against the League, and under ordinary circumstances the country would have been against anything that Lodge was for. But it was not possible to dislike him as much as it was possible to dislike President Wilson!

Since Roosevelt and Wilson, we have had no personal politics. The overwhelming vote for Harding against Cox was not for Harding nor against Cox. The candidates were only names to the great mass of the voters. The vote was against the Democratic Party of Wilson. The Coolidge-Davis-La Follette campaign did not touch the country. The ballots went for Coolidge because the country was prospering and no candidate had any attractive changes in management to suggest. John W. Davis had only a few minor suggestions, while Robert M. La Follette, although he announced that he had something to say, never said it.

Does all this mean that we have lost our strong men in politics? The outstanding man of the day is Senator Borah, but he does not stand out clearly, and no one, including the Senator himself, can tell just what it is he stands for. He is more often trying to block the procession than to lead it. Our political figures do not size up with our industrial and financial figures. Quite the contrary is the case in England. There the politicians overshadow the industrialists.

A great statesman is a result. He is not a cause. He is great because of the issue which he represents.

DRAWINGS BY W. W. CLARKE

THE HEN: 'There goes my last tail feather!'

He is never greater than that issue and it never originates with him. The issue is always present before him; it has been forming for years. The leader steps in and becomes great when the issue has formed itself. A new idea cannot be an issue because it is not possible to interest enough people in a new idea to make an issue out of it. Prohibition is just now becoming an issue because up to date only a few people, barring the professionals, have really cared enough to fight on one side or the other. The surest proof of this is that neither the Drys nor the Wets have a leader although there are plenty of willing candidates for either job. An issue does not become an issue until it is capable of personifying itself in a man so that the voters can think in terms of men. For instance, if I ask an anti-League man if he believes in the League of Nations, he will probably answer:

'No, I never did like Woodrow Wilson.'

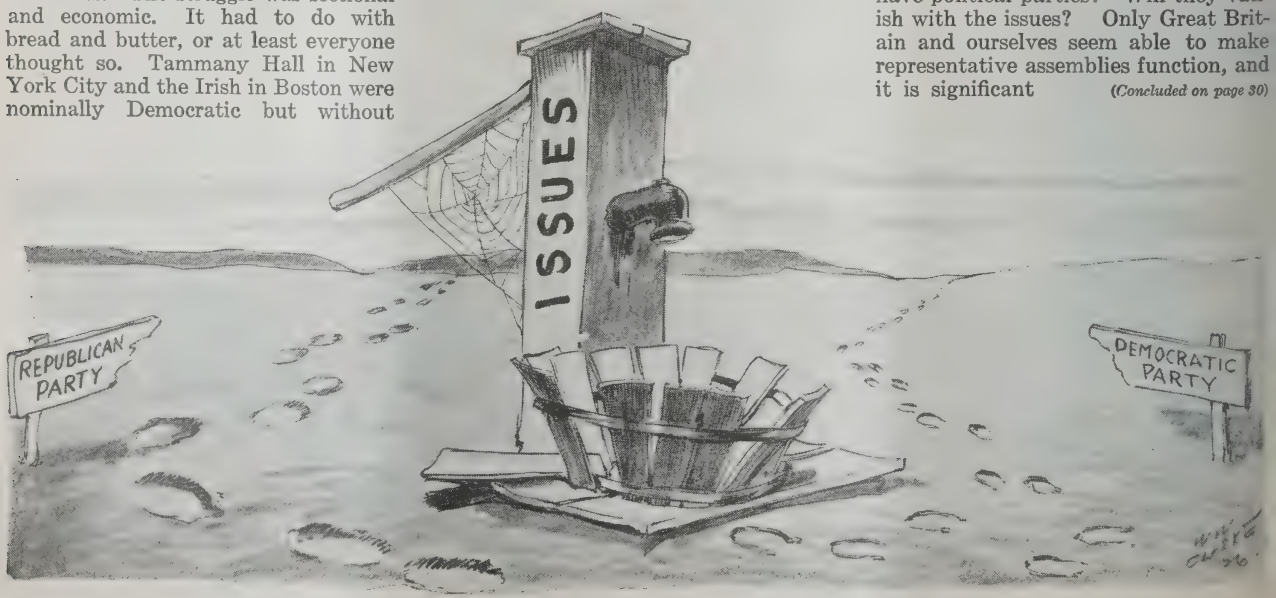
And his answer is perfectly sensible, although on the face it seems absurd. He has thought of the League in terms of a man.

This country has had only one big fundamental issue—States Rights. The Constitutional Convention left the question unsettled, and left it bitter. The Civil War had to be fought to decide that a state might not leave the Union, but the war did not decide just what were the rights of the states. And the Democrats became the party of the South and the Republicans the party of the North. The war held over in these parties. General Grant who won the war became President. A generation had to die before the parties forgot the smell of gunpowder.

The North grew industrial and wanted the protection of a tariff; the South had cotton to sell and wanted free trade so that it might buy in the cheapest market. Thus the tariff replaced slavery and continued the bitterness. The struggle was sectional and economic. It had to do with bread and butter, or at least everyone thought so. Tammany Hall in New York City and the Irish in Boston were nominally Democratic but without giving more than lip service to the principles of the party. They were the creatures of local conditions and called themselves Democrats because they could not be Republicans; and they have always been more interested in local than in national elections. The vital division was sectional.

> Have we quit breeding statesmen? Is the cradle of liberty empty? Not at all. We have ability of every kind in this country, and whenever there is a need we find ready at hand the man to minister to it, but there is not enough in politics today to occupy the brain of a really able man. We have no really great political figures because there are no great political issues.

Until the war the tariff was the main issue between the major parties, but it was a dying issue, for the conditions which brought it about were changing. The Democrats made an excursion into Free Silver under Bryan but it was hardly a real party movement, being much more of the West than of the South.



Now we have no issues. The other day President Coolidge formally plucked from the Democratic breast what was left of the States Rights feather. The Prohibition Amendment, regardless of its merits, is an encroachment upon the powers of the states, but it is most opposed in the old Federalist states! The South is for national prohibition and is keeping mum about the violation of its party principles. The tariff is not an issue excepting with those who make their living out of talking about it. For the South is becoming industrial, while New England is becoming a summer resort. Perhaps the next great surge for Free Trade will come from New England! Both parties agree that the Government ought both to keep out of business and to keep its hands off legitimate business. The 'trust busters' are dropping away. The farm situation has not divided along party lines. Taxation is not a party issue. Both parties claim the credit of lowering taxes.

A man today may think he is a Republican or a Democrat from principle but actually his party allegiance in national politics is purely one of habit or of birth. We just naturally divide into Republicans or Democrats and no third party seems able for long to keep a following. Its members drift back into the parties from which they came.

Is this dimming of party issues a sign that we are losing interest in government? Great Britain is all astir with politics and so are the countries of Continental Europe—that is, those which have not already a dictator. And why do these countries have so many politicians and so much politics? Because the people take so much interest in government? Not at all. The countries are all desperately ill and the politicians are doctors rushing up with remedies. When the doctors begin to crowd the patient too much—as in Italy, Spain, and Poland—then a dictator doctor thrusts them aside and takes over the patient himself. Having an abundance of political issues seems scarcely to be a sign of health.

And it is because we are so healthy in a national way that we have no issues. Prohibition is not an issue. The farm situation is ephemeral. We cannot have a clash between capital and labor because industry is becoming too enlightened to bother with such distinctions. We have no proletariat.

But if we have no issues, why do we have political parties? Will they vanish with the issues? Only Great Britain and ourselves seem able to make representative assemblies function, and it is significant (Concluded on page 30)

# Is the Pulpit a Bulletin Board?

## Is the Preacher a Prophet or a Propagandist?

By WILLIAM E. BARTON

IT WILL be difficult to say what I want to say in this article and not be misunderstood: that, perhaps, is the very reason why the article ought to be written. I begin this discussion with a clear realization of the danger that I may grieve my friends and be applauded by those from whose approbation I shrink. I am writing of what I regard as the very great danger that the pulpit at the present time may forsake the Gospel for the law.

The church is the only organization on earth which makes its appeal to men on the basis of their moral and spiritual natures. There are other organizations whose duty it is to *educate* people, to *elevate* their esthetic taste, or *compel* them to submit to legal requirements, but there is just one organization which approaches men with a clear understanding that they are endowed by Almighty God with moral natures and that they are to find the real significance of life in willing coöperation with the God who made them. Other organizations can bring to men the terrors of the *law*, but, if the church fails to teach men the *Gospel* and bring them to acceptance of it, the failure is total and beyond remedy.

And the Gospel is not merely another form of law.

This brings me abruptly to consider one of the ways in which Christian leaders have been doing what seemed to them a necessary thing, but doing it, as I sometimes fear, at too great cost. I speak particularly of the methods in recent years of opposing the use of alcoholic liquor. I am myself a lifelong total abstainer from liquor in all forms. I have upheld and do uphold the 18th Amendment and the Volstead Act. I believe that the saloon had proved a hopeless outlaw and that prohibition had become a necessity. I believe that, now that we are thus far on, we must go through and make it effective. I am not frightened when I am told of the extent to which that law is not enforced. It is perhaps about as well enforced as the law against murder, and safe as it now appears to be for one man to kill another without fear of the gallows, I do not hear of anyone talking of repealing the murder laws.

*Dropping Moral Suasion*

But I deplore the fact that, with our emphasis on legislation, we have so nearly dropped the moral suasion with which at one time we attempted to meet the evils of strong drink.

I can remember in my youth the days when we did not talk about prohibition, but about temperance. We tried to teach people that the use of liquor was harmful to themselves and dangerous to others and to lead them voluntarily not to indulge in it. We asked them to sign the pledge to abstain from the use of all intoxicating liquor. In the days of Francis Murphy, we asked them to wear a little blue or red ribbon to indicate that they were pledge-signers. There was not very much discussion about legislation. We assumed that, if people wanted liquor, they would get it and that the best way to keep them from getting it was to induce them to let it alone. It is a long time since I have heard of anybody signing a temperance pledge. I cannot tell how many years since I have heard an old-fashioned temperance lecture in which people were asked cheerfully and of their own free will to let liquor alone. For a whole generation now we have been talking about getting laws passed to make it harder if not impossible for liquor to be obtained.

*Doing It by Law*

I myself have participated in all these movements and have no apology to make for it. I believe the time had come when it became necessary to take drastic action against an evil that was threatening to undermine society. I think we had to meet intemperance in the use of liquor by a certain degree of intemperance in our hostility to it. Nevertheless, I am sorry we had to do it in that way and I am sorry because in doing it after this fashion we have so nearly given up the moral appeal.

I hear on every hand much talk of the young people of the present day as drinking and carousing and having no conscience in the matter of the use of liquor. I am wondering a little if we good people are in some measure responsible. We have not been teaching them that it was their high duty and cheerful privilege to let liquor alone, but we have been trying to make it legally impossible for them to get it.

In coming generations, this present time is likely to be remembered as an age in which we have been endeavoring to do everything by law. We have provided for safety in the use of machinery by compelling the factory owner to protect his workingmen. We have tried to insure to children proper nourishment by passing laws against the sale of milk that was either diluted or adulterated. We have passed laws telling parents how many hours a day, how many days a week and how many weeks in the year their children must be in school. It is difficult to name any sphere in life now which is not a subject for legislation.

Aristotle taught that the multiplication of laws was the decay of the state. I am more and more convinced that Aristotle was right. The body of legislation under which we now live is burdensome and ineffective, and I think it is ethically unsound.

I am not in favor of the repeal of the Volstead Act. I do not believe in modifying it in the least degree so long as its repeal or amendment is demanded by the crowd who now are howling for it. I think we are under moral compulsion to fight that battle through; but, with it all, I believe the time has come for a new emphasis on the moral aspects of this whole question. I can remember in my later youth the time when temperance lecturers began to sneer at moral suasion and insist upon making people temperate by law. I do not think the sneer was justified. Moral suasion is what we now are lacking. I am aware that there is much emphasis on what is called religious education, but too much of our education, religious or otherwise, is content with imparting information, whereas education is futile or worse if it does not form character.

I have been speaking about the method of dealing with the liquor evil by law because that is at present the outstanding legislation, but it is not by any means the only example of what I am endeavoring to discuss.

*No Time for the Gospel*

The pulpit at the present time is well fitted with propaganda.

We have built up such a number of special agencies that depend upon the church for the support of their paid officers and for the distribution of their publicity that there is not very much time left for the average minister to preach the Gospel.

I know that many good people say that very thing is the Gospel. The prohibition of the liquor traffic by law, the prohibition of child labor by law, the prohibition of milk adulteration by law, and compulsory education by law —these are the Gospel or there is none.

I answer that I do not think any of these is the Gospel. These various reforms, in my judgment, are desirable, but they are not the Gospel.

Moreover, they offer wide opportunity for *the dissemination of machine-made thought and the pulpit becomes in too many cases a bulletin board upon which almost any reform agency can tack a placard.*

Ministers' meetings and church gatherings abound in resolutions prepared by outside

# An English View of American Installment Buying

IT HAS recently been given out on high authority that the total number of passenger motors in the world is rather less than twenty-one millions, and that of these twenty-one millions over seventeen millions are owned in the United States of America. As the population of the United States is probably about 110,000,000, we are led to the amazing conclusion that apart from motor omnibuses there is one passenger car in use for every six and a half members of the population—men, women and children. If in imagination we can transfer these figures from America to England, and apply them to our own neighborhood—suburb, village, or country town—picturing to ourselves what the place we live in would be like if every household of six people owned and drove a car, with the whole working-class population—laborer, mechanic, typist, daily girl—riding to work in a private motor—if we can envisage that, then we can conceive the social revolution that lies behind these extraordinary figures. Never before has any country in the world known a general standard of living comparable to this.

Such universal enjoyment of what elsewhere in the world is still regarded as a luxury indicates a very high degree of prosperity and a wonderfully high level of wages. But even prosperity such as the United States possesses and wages such as the workmen earn would not in themselves turn a population of 110,000,000 into motor owners, and the change would not have been possible but for the intensive development of what we know in England as hire-purchase—a commercial device that we have associated until quite recently with many branches of the furniture trade, although the practice has extended to clothing and books. It is possible, for instance, to obtain a complete edition of Kipling by making a small initial payment. During the last few years motors in this line have outdistanced furniture, and both in England and the United States there has been an enormous growth of car-buying by installments. In England it is estimated that sixty per cent, and in America, according to the Index published by the New York Trust Company, about seventy-five per cent, of the new cars sold change hands on these easy terms, the sales by this method in 1925 being put at 2,800 million dollars, out of a total of 3,750 million; but whereas in England only about one person in a hundred owns a pleasure car, in America, as we have seen, one person in every six or seven is an owner, so that about thirteen million people buy cars by easy stages.

*Hire-Purchase Plan Grows in England*

> Is American business, which is built on credit, a healthy growth? Here is an English view that will give grist to the mill-wheels of your thinking. Our widespread 'installment,' or 'deferred payment' or, as the English say, 'the hire-purchase system' is worth critical examination. The article here printed appeared in the London *Economist.*

And where the motor trade with its enterprising salesmen has blazed the trail, other industries of choice or necessity follow on. The mechanic who has paid down his forty-five dollars for a car and committed himself to regular payments for the balance has naturally gone some way to deplete his cash resources, and does not find it as easy as before to buy either the minor luxuries or the necessities of life. He has learned the trick of easy payment from the motor salesman, and is ready to accept the same kind of accommodation from those who supply his other requirements. The fashion has been set, and all sorts of other commodities begin to be bought and sold in the same way. Exact information is unfortunately not available, but the system has grown to such an extent that it is recognized as one of the vital economic facts of the country. Colonel Willey and Mr. Locock, for example, in their report on their visit to the United States which was published by the Federation of British Industries, thought it important enough to be signaled out in a memorandum of only twelve pages. They say:

*One Purchase May Lead to Others*

> The deferred payment or installment plan of business has increased by leaps and bounds, and includes now not only automobiles, furniture, and pianos, but every range of commodities, including clothes, radio sets, and even paint for the house. The financial risk is not taken by the producer, but is insured, and special finance corporations have been formed to take this class of business, which is widely reinsured. The system has certainly acted as an incentive to work in view of the necessity of keeping up regular payments.

Every Victorian instinct that one possesses rises up in protest against this theory of prosperity, with the consumer pawning his future to stimulate output and toiling at his daily task, not to build up laborious savings as future capital, but to pay for the luxuries that he is at present engaged in wearing out. It may be that the old nineteenth-century ideal of the thrifty workman, saving for old age or for the glorious possibility of passing himself into the ranks of the employers, is out of date, and certainly these two experienced observers were sufficiently impressed with the results to suggest that the hire-purchase system might with great advantage to this country be far more widely adopted here.

But whether installment-purchase is fundamentally sound or not, one thing is clear—that it has set up an entirely new situation in America, and that no one can foresee exactly what will result from it. Colonel Willey and Mr. Locock mention the possibility of a reaction in trade and the complications that may arise when the change comes, but they are so convinced of the firm basis on which American prosperity rests that they say there is at present but little danger. Nevertheless, trade does ebb and flow. From the beginning of time it has ebbed and flowed, and there seems no reason to believe that the Almighty has by dispensation set the United States free of the ordinary laws of action and reaction. The reform of the banking system and the control exercised by the Federal Reserve have gone a long way toward stabilizing trade, but surely no one, however optimistic, can discard the possibility or the likelihood of trade in America at some time receiving a check and a setback.

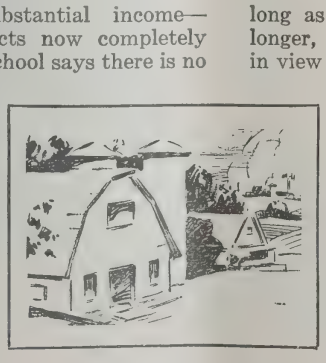
*Trade Slump Must Come in Future*

And if and when this setback comes, the country (Concluded on page 29)

# *A Scientist Urges Farmers to* Utilize Waste Products

## Paper Can Easily Be Made From Wheat Straw

MILLIONS if not billions of dollars are wasted annually in one of the greatest of all our industries—farming.



In all its branches it is inefficient. The farmer derives benefit and revenue from only a fraction of the material raised on his soil. In any branch of agriculture, the same condition exists. More is left on the ground to rot away than is actually harvested and marketed.

The way of it is simple enough. The great outstanding weakness of agriculture is that it is looked upon as a food industry alone. It is an industry with only one outlet for its product. This is, of course, a mistake.

Take, for example, wheat growing. The cartoonists depict the trials of the wheat farmer. His life, as portrayed, is not a happy one, and his future prospects are still less encouraging. Shall he curtail his acreage? Perhaps! But not until he makes use of every pound of chaff and straw he grows, and that in such a way as to derive an income—and a substantial income—from these products now completely wasted. The old school says there is no value in them. The chemist says there is. Sun and soil have accomplished in ninety days, more or less, a chemical work that scientists have been trying to duplicate for as many years with only slight success. In ninety days of growth, a straw has been produced carrying at its tip a head laden with grain. The whole plant has to be handled in harvesting but the grain, a small percentage of the total growth, is all that is preserved. Yet the straw has a great potential value all its own; it is composed of cellulose and other substances capable of yielding, under modern treatment, paper, the quality of which depends only on that of the straw.

Chaff and straw, wasted today, could be made valuable.

*By* JAMES W. BECKMAN

Why should not the wheat-growing industry come to be regarded as one that grows straw for paper manufacture, with wheat grain obtained as a by-product? And why should not extensive experiments be carried on for the purpose of developing a wheat straw which would yield a fiber as long as that obtained from wood, or longer, a not impossible development in view of what has been done in other fields of agriculture. Indeed, no less an authority than Luther Burbank was quite satisfied that the problem need present no special difficulties. In a letter, written shortly before his death, Mr. Burbank said:

'Mountains of cornstalks, wheat chaff and straw, rice hulls, sawdust, and a long list of materials classified as waste should be made into useful products.

'More than sixty years ago I hauled numerous loads of rye straw from my father's farm to a paper mill in a nearby town before wood fiber had been used for paper making.

'Plants, like human beings, are most successful as specialists. The wheat plant has through centuries been trained to produce an enormous amount of plant eggs in a short space of time with a small amount of foliage. A short wheat plant is most desirable as being less exposed to fungous diseases and its ability to stand up instead of "lodging," as most tall wheats often do. It needs to specialize still more in many respects, and the production of a specially long straw is only a matter of specialization. Meanwhile the enormous waste of straw and chaff should be saved. Mountains of cellulose in sawdust about the lumber camps, and the mountains of rice hulls which are now a nuisance about the rice-hulling mills are useless until someone can make them useful through the aid of chemistry.'

In our national economy, we have been profligate; we have devastated our timberlands, our main source of paper supply, without making any effective demands for replanting. But even if we were now to make such demand, it would take fifty years for us to grow a crop of trees suitable for paper manufacture. Ninety days replenishes in abundance in the wheat fields the potential cellulose needed in the paper-making of the country.

Using straw as a raw material in the manufacture of paper is not a dream. In Germany for some time a paper plant has been operating along these lines. It not only produces paper, but the liquors resulting from the cooking processes are treated in such a manner as to cause them to yield by-products, such as wood alcohol, acetone and various oils. These can be used as fuel in the farmer's gas engines.

The quantities of such by-products obtained in the manufacture of paper from straw are very considerable. When one ton of straw pulp for paper is produced the fol-

# Mental Tests Make Us Seem Foolish

## *Because*

## Quacks Rush in Where True Psychologists Fear to Tread

*By* DONALD A. LAIRD

The psychologists tried to write for the general reader, forgetting he was not accustomed to weighing little phrases. Naturally enough, the reader gobbled up the threatening prophecy.

ARE we really a nation of morons?

Do we have to believe that education does not improve intelligence?

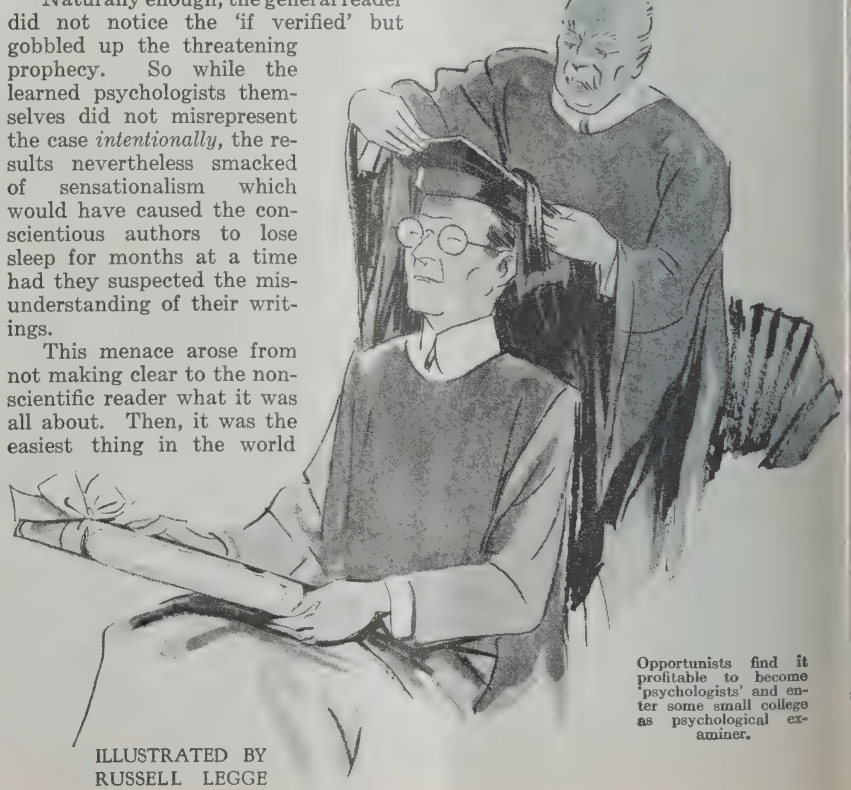
Are psychologists trying to force us to accept a monarchy of the divine right of rule by 'superior' intelligences?

Do they have the public schools in their grip, foisting democracy-killing beliefs and practices into the courses of study and in the promotion of our children?

It would seem so, if we believe the various articles about mental tests with which the press was glutted shortly after the close of the World War. It would seem so as we listen to a group of persons discussing these 'contraptions which perhaps half a dozen of the world's greatest geniuses could pass.'

These questions reveal the twofold menace of mental tests, aside from the threat of the questions themselves.

For thirty years psychologists had labored in their laboratories, untroubled by the newspaper reporter. Many of them plodded along studying dry-as-dust matters of only the remotest practical concern. With the coming of the war these psychologists were lifted into the limelight of curiosity through their great contributions to the war. They tried to write for the general reader, forgetting that he was not accustomed to weighing carefully such little phrases as 'within the limits of the present experiment,' or 'if verified these experiments will force the remodeling of the present school system.'



Naturally enough, the general reader did not notice the 'if verified' but gobbled up the threatening prophecy. So while the learned psychologists themselves did not misrepresent the case *intentionally*, the results nevertheless smacked of sensationalism which would have caused the conscientious authors to lose sleep for months at a time had they suspected the misunderstanding of their writings.

This menace arose from not making clear to the non-scientific reader what it was all about. Then, it was the easiest thing in the world for the general reader to understand what was being written about, so it appeared to them as they browsed over the week's pages.

When the general reader read about the extraction of insulin from the Islands of Langerhans and its subcutaneous injection into phyloridinized animals affording a basis for the cure of diabetes they read the half-dozen new words without ever batting an eyelash and remarked, 'Wonderful! Now another disease is conquered!'

When the same reader turned the page and read in much plainer language that half the men in the army drafts could not pass a mental test that the fourteen-year-old child in school could, they probably remarked, 'Of all the nerve! These psychologists make me tired. I'd like to see them try one of their own mental tests.'

This illustrates the second menace: apparent understand- (*Concluded on page 27*)

Opportunists find it profitable to become 'psychologists' and enter some small college as psychological examiner.

ILLUSTRATED BY RUSSELL LEGGE

# MR. FORD'S PAGE

LAST week we discussed the fallacy which is being built into the thinking of the American people, that low price necessarily means cheap quality. This fallacy, the result of exalting the salesman's philosophy of business, has made the average person a 'sellee,' if we may coin a term, instead of a buyer. There is an important difference between buying a thing and being sold a thing. As it is now the expert buyer is usually the seller, whereas in other days the domestic consumer was the expert buyer. He knew quality first, but his descendants know mostly price tags.

Along with this intense sales urge comes an increase of the credit system which means an increase in the people's debt. Credit is a subject which has been studied entirely from the angle of risk to the creditor, without reference to its effect upon the economic health of the nation. There is a point up to which credit is constructive, but beyond that point it becomes destructive.

There has always been constructive and healthy credit. In other days the seller gave credit, but he seldom does so now. It is one of the amazing developments of our times that though nearly everything is sold on credit, installment plans, deferred payments, and so forth, few manufacturers and merchandisers do anything but a cash business. The explanation is that credit is seldom now a matter between the seller and the customer, but between the customer and a credit company. In brief, debt has become a business in the United States. It has reached the dignity of a separate status. Credit was once an accommodation based on deserving; now one must deserve it and pay for it too. The manufacturer may do his utmost to reduce the cost of making an article, but all this saving and more may be lost to the user who prefers the credit plan. There has been little study of the system from this point of view.

It is not with any view of sounding an alarm that these aspects of the matter are brought into view. It is wiser, perhaps, to look on all such developments as another chapter in our economic experience. To theorize about such a condition in advance of its existence is futile, and perhaps it is too early in its development to theorize very fully about it now. But all of our people, from big business to domestic purchasers, should be intelligently aware of what is going on.

Besides that, there are certain principles which must remain true however fair or false the present great debt system may prove to be. The American has always been proud to stand on his own feet. He instinctively knows that debt is rather to be feared. Even the credit men have a higher personal respect for the man who controls his own credit by virtually paying cash than for the habitual debtor. Not 'tight-wads' but thrifty people make the country what it is.

Our Economic Constitution was written by Benjamin Franklin under the style of Poor Richard, who holds that if 'the second vice is lying, the first is running in Debt.' 'When you have got your Bargain, you may, perhaps think little of Payment! But Creditors have better Memories than Debtors. Creditors are a superstitious Sect, great Observers of set Days and Times. The Day comes round before you are aware, and the Demand is made before you are prepared to satisfy it, Or if you bear your Debt in Mind, the Term which at first seemed so long, as it lessens, appears extremely short. Time will seem to have added Wings to his Heels as well as Shoulders. Those have a short Lent, who owe Money to be paid at Easter.' 'Pride is as loud a Beggar as Want, and a great deal more saucy.'

We need some modern statement of these principles. Frugality is not the ideal for a people like ours to cherish, but thrift is. We should have all that we need, and more than the necessaries. There should be no class boundaries in the enjoyment of those things which make for comfortable and decent living. The Gospel of *Do Without* is not for our people or our country at this time.

If there were necessity, we could practice it, as we have always done, but there is no necessity. We only need to regain and maintain our sense of personal independence by riding or controlling what credit we may use, not by letting it ride us.

*Buying and paying* is the best education in quality and use, for where quality and use fail us we gain definite skill for buying next time. But the habit of never wholly owning anything we use, never having that personal attitude toward quality which use and ownership give, is simply to cease working for oneself and become something like a mortgaged servant.

This is a situation for which no good word whatever can be spoken. The only possible treatment of it is to quit it.

*WHERE credit loses buoyancy and becomes leaden debt, where it ceases to lift and becomes a drag, is a point not fixed by the wise. They know as little of it as they know where interest leaves off and usury begins. Yet with a swift and wide credit current threatening always to sweep us into the River of Debt, intelligent unselfish thought on the subject may accomplish much. Between the extremes of Extravagance and Frugality there is the American middle ground of Thrift, where one is a buyer and not a mere 'sellee,' where one controls his credit and is not controlled by it. It should be kept within reach by all.*

# EDITORIALS

## *House Surplus*

WE AMERICANS are extremely sensitive and vocal in regard to our difficulties, but we have little to say about the rapidity with which we deal with and remove them. Most of us would find it hard to tell just how long ago it was that the country suffered and complained under a housing shortage with its consequent high rents. Yet we have slipped out of that difficulty, hardly realizing that we have done it. It required only three or four years to completely reverse the situation. There is now in most large cities a surplus of houses and apartments. In one of our largest cities, houses and apartments by the thousand are for let with no prospect of occupants.

What has occasioned this? High rents sent workingmen back to the old American custom of building their homes. Around the edges of all large cities, new young cities are springing up. Tens of thousands of families began with a garage on the back end of the lot, which served as a home while a house was building. Thousands of these houses were erected during evening hours and half-holidays. Building bees, once so familiar in the country, became familiar again in the cities, workmen in groups helping their comrades to rear a habitation. Thus the pressure of high rents worked its own cure and drove multitudes of apartment dwellers back to the separate home. It is an impressive illustration of American prosperity and resourcefulness, but it passes hardly noticed in the various interesting phases of our times.

## *Guard the Gate!*

IT SEEMS that Mr. Abraham Rothfeld applied for naturalization and the court not only refused it but issued an order that Mr. Rothfeld should be restrained from applying again for ten years during which good behavior must be shown. The district court reversed the order, saying that no court possesses that discretion. The decision is doubtless in accordance with the law. But the order of restraint was doubtless in the public interest. The case seems to indicate the need for a new method. As the law stands, objectionable persons need only keep applying in the chance of sometimes slipping through. The gates of citizenship should stand wide open, but their portals should be rigorously guarded. And one who is not admissible at one gate should not be able to obtain entrance at another.

## *Shall We Nullify?*

IF THE statement may be made without its being interpreted in a political sense or as preliminary to a presidential 'boom,' Senator Borah is one of the few men in our Government who speaks like a statesman. Regardless of his personal predilections, he seeks a constitutional basis for his positions. In all the welter of 'wet' and 'dry' discussion, his is the farthest carrying voice which lifts the whole matter into its proper present sphere, that of constitutionality. He calls persons of all shades of opinion to consider that ours is a constitutional government, that our national life begins to disintegrate upon the first breath of nullification, and that nullification is the inevitable result of what the liquor interests are urging today. It is not to be supposed that all the political leaders of the liquor interests take this course deliberately and in full knowledge of its end; it is not to be supposed that they are determined to have their liquor at the cost of the national life of the United States; but it is rather disquieting to observe that simultaneous attack was begun by the 'wet' press upon Senator Borah immediately he brought the constitutional bearings of the question into view.

Occasionally a reader of THE DEARBORN INDEPENDENT writes that the only fault he has to find with this paper is that it stands for Prohibition. This paper was not in existence when Prohibition was established in the nation. Coming upon the scene as a magazine, THE DEARBORN INDEPENDENT found that after nearly a century of public discussion in this country, the states, by a great and unusual majority, had adopted the Constitutional Amendment making Prohibition part of our basic law, and we knew as a matter of history that many states had previously adopted that rule by popular vote. Finding the Constitution as it is, this paper has no alternative but to uphold the Constitution. If, as the liquor interests say, the people do not want Prohibition, they may remove the amendment by the same means which they used to adopt it. That is what Senator Borah is telling the country. But nullifying the Constitution is another thing and, as Senator Borah points out, a cowardly and debasing thing, compared with which revolution is manly and courageous and upright. The reluctance of the liquor interests to trust to the constitutional method very clearly indicates their conviction that the people will not withdraw the amendment.

## *Not a Dollar of War Debt*

THE Scriptures record that the debtor who was forgiven most, loved most. According to Secretary Mellon, it is the nation which has been forgiven most in war debts that complains most. In a statement which is important for all who desire to steer a straight line of thought on the subject of the war debts, Secretary Mellon declares that *the United States is not asking nor collecting a dollar from France for any advance made during the war*. The war debt, in fact, has been remitted. All that France has asked of us, with every tragic and dramatic adornment, had already been granted by the United States without so much as a gesture of generosity. It seems that we are compelled to mention it now only because of the abysmal misrepresentation of the United States which seems to be the stock in trade of some French politicians and professional patriots. It is greatly to be regretted that both the United States and Great Britain have been forced by France to entertain reflections concerning an ally for which the one has made great sacrifice of treasure and also a sacrifice of life, and for which the other sacrificed just short of a million lives and unlimited treasure. These experiences, passed through together, should have made unnecessary such statements as that which Secretary Mellon has been forced to make. To be forced to recite one's acts as evidence of one's generosity, does not promote friendship in either party. Nevertheless it may aid truth. And the truth seems to be that all the United States asks of France is *the repayment of loans made since the war*, and that not a dollar of war loans is in the present account.

## *A New Dictator*

DICTATORS in Europe are increasing in number. Poland has adopted one, and Belgium has made its king a financial dictator. Albert has the one dictatorship that promises results if it is really taken seriously. There must be somewhere in the world a financier who can put his finger on the point where the people's money becomes the plaything of international gamblers. It is known that national financial systems are manipulated. It is known that vast wealth is accumulated through the manipulation. It is known that, given sufficient power, one who knows the game and has the will to expose it could do so. All financial programs thus far made are proposed with reference to the profit of the financial world, whereas they should be based absolutely on the principle of bringing opportunity to the human world. Humanity and raw material are everywhere, yet money manipulation holds the one in idleness and the other in uselessness. Where is the financier, the mighty man of money affairs, the 'international financier' even, who will become the liberator of the nations in this matter? Let him draw up his Fourteen Points (if he should need so many) and show the world the way out. His fame would eclipse that of any warrior, ruler and philosopher of the last five hundred years, and rightly, for he would include in himself the best qualities of all these classes.

## *The Pullman Porter*

THE *Wall Street Journal* (which, by the way, in spite of its name, is not dominated by Wall Street, but is one of the most independent critics the Street has) draws an interesting parallel between Abraham Lincoln, who liberated the colored man in this country, and Robert T. Lincoln, of the Pullman Company, who has given the negro 'the only racial monopoly in the world,' namely, that of Pullman porter. The porter's wages have increased 141 per cent over the 1916 scale, and it is estimated that if each of last year's sleeping-car passengers tipped the porter a quarter and each chair passenger tipped him a dime (the tips are usually much larger) the result would represent an income of $55 per man each month. There are 10,400 porters employed, and 3,811 (or 700 in excess of those in the employ of the company for ten years) own their homes. Negro doctors, lawyers and other professional men are often found to have made the porter's position a stepping-stone to success in life. The long layovers permit the porter to study, if he is so inclined, and in many cases the spare time is used to conduct private businesses.

This is a pleasant report, and it is sincerely hoped to be as good as it sounds. A good porter is indispensable to the comfort of long journeys, and personal experience adduces the conclusion that the vast majority of them know how to express in action the spirit of service.

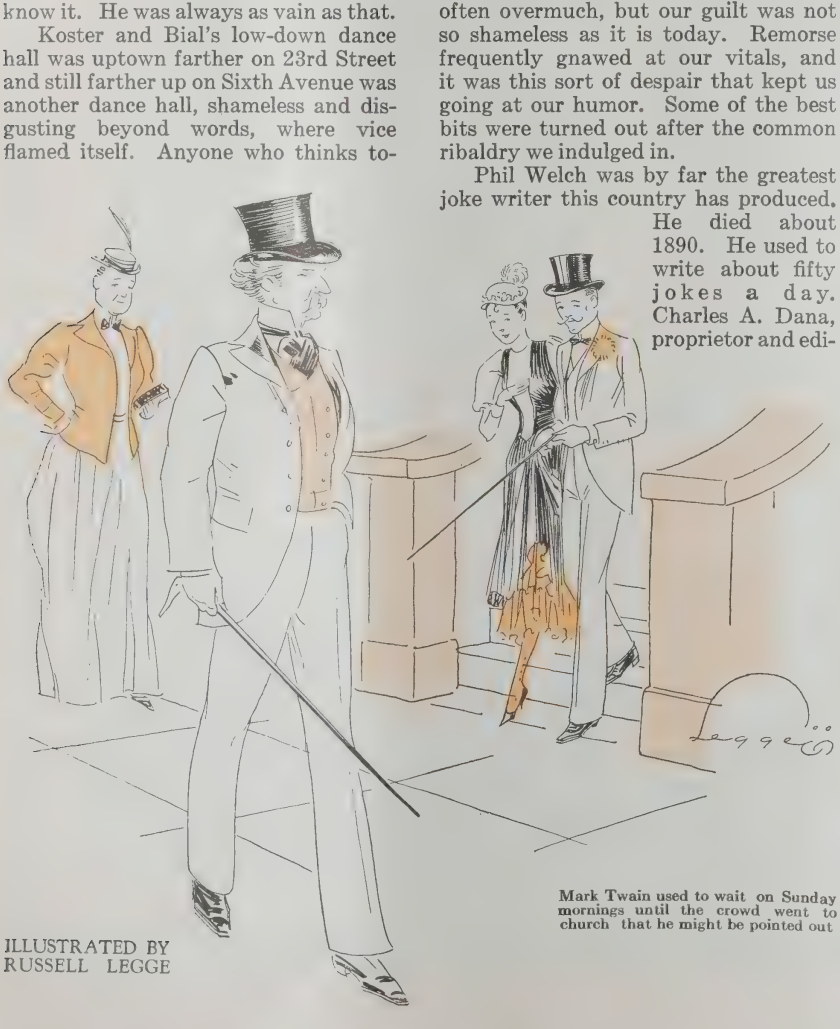
## *The Intellectual Steerage*

THERE were enough professors in the steerage—wrote one of them, Europe-bound—to start six colleges. And there were more Phi Betta Kappa keys than hairpins. Thus has come about one of the wonders of the day—the evolution of the steerage into the tourist cabin. No longer is the third class despised. It has, indeed, become 'stylish and intellectual—the high-brow end of the boat.' The demand for and the provision of cheap transportation is what brings about this seemingly impossible change. The same forces revolutionized travel on land that are now transforming it on the sea. The world is fair and pleasant; and people are determined to see some of it. And they can see it economically and enjoyably. The old conceit that high price denotes high quality has gone to join the dodo.

## *Thomas L. Masson Describes His Life Among*

# The Wild American Humorists

NEW YORK of 1880 was vastly different from the New York of today. Perry's drug store (still going, but a faint and decadent echo of its former self) was the mecca of the bohemian newspaper crowd, and real bohemians they were in those days. In the late afternoons we used to congregate in the cellar of a 'ratskeller' opposite to the present entrance to the Brooklyn Bridge, and drink large schooners of beer and display what wits we had. Greenwich Village was unknown except to the elect, and on its edges places like the Black Cat Restaurant flourished.



It was somewhat later than this, as I recall it, that Mark Twain came to live on lower Fifth Avenue, and used to wait on Sunday mornings until the crowd went to church and then walk up and down the avenue, that he might enjoy the pleasure of having himself pointed out and pretend that he didn't know it. He was always as vain as that.

Koster and Bial's low-down dance hall was uptown farther on 23rd Street and still farther up on Sixth Avenue was another dance hall, shameless and disgusting beyond words, where vice flamed itself. Anyone who thinks today that we have not improved should go back to those former vile spots in great cities. Personally, I think there is more realism today, more intellect, more sincerity and less actual corruption than existed in the nineties.

There was a small group of us incipient humorists, who hung onto the skirts of the newspapers and comic journals—especially *Puck* and *Harper's Bazar*—and we gained a sporadic existence by writing quatrains and other bits. Some of us lived in Brooklyn. I was guilty of that, and, when I was especially opulent after having disposed of ten or fifteen dollars' worth of witticisms, I would cross on the Wall Street ferry, and renew ties broken for a week or so, or maybe longer.

I cannot say that there was more real comradeship then than now, but it was vastly different. Our sins, which were common to all of us, were kept for our own private delectation. We drank, often overmuch, but our guilt was not so shameless as it is today. Remorse frequently gnawed at our vitals, and it was this sort of despair that kept us going at our humor. Some of the best bits were turned out after the common ribaldry we indulged in.

Phil Welch was by far the greatest joke writer this country has produced. He died about 1890. He used to write about fifty jokes a day. Charles A. Dana, proprietor and editor of the New York *Sun*, first became aware of Welch's genius, and paid him three dollars each for all the jokes he printed. Every day in the *Sun*, at the bottom of the editorial page, would appear several of Welch's jokes. After his manuscript had been returned by Mr. Dana, Welch would sell his jokes to *Harper's Bazar*, at that time edited by John Kendrick Bangs, *Life*, *Puck* and a paper called *The Epoch*, for which he wrote a weekly column of his dialogs. He had a set of characters and his dialog was invariably interesting. If he had lived today he would probably be a successful playwright. He finally succumbed to an operation and on the day he died Chester Lord, at that time managing editor of the *Sun*, received his last batch of fifty jokes, the manuscript odorous of the anesthetics.

Mark Twain used to wait on Sunday mornings until the crowd went to church that he might be pointed out

ILLUSTRATED BY RUSSELL LEGGE

### *Methods and Pay of a Joke Writer*

Welch was a very quiet, unassuming fellow. He generally got his ideas by walking up Broadway with a notebook. The signs stimulated him. He never wrote anything but dialogs, but these were extended to make miniature plays which occupied about half a page in *Puck*, or a full page with the illustration. He received fifty dollars for these plays which at that time was considered a high rate. He was a regular contributor to *Puck* and *Scribner's*. These plays, illustrated by C. J. Taylor, were afterward published in book form, but I think never sold widely.

I myself did not write any jokes until after Welch died, as I never believed I could approach his technique; but immediately thereafter I began writing for the *Sun*. I was paid at first, however, only at the rate of one dollar. *Life* had been started in 1883, and I recall quite vividly the delight with which I received from that paper the notice that 'thereafter' I would be paid at the rate of $2.50 for each joke accepted. I began to write them regularly, averaging about twenty a day, and at first my income from this source was only $18 a week, whereas Welch had made about $6,000 a year. In a few years' practice, however, I managed to raise my standard and averaged about $40 a week.

At that time there were perhaps less than half a dozen men who wrote jokes, and they were greatly in demand. Nowadays anyone who has the necessary talent for writing them uses his talent in wider directions, so that today the interminable mass of witticisms turned out by young college men are with some exceptions of a very low order, being

mostly that species of inanity termed a 'wise crack.'

Welch's technique was very characteristic and individual, and not at all in the manner of provoking a laugh. He managed in some indefinable manner always to create an atmosphere of character around each one of his dialogs, so that, although the point might not be the wittiest, they could almost invariably be read merely for the pleasure of the style. No one approached Welch in this respect, but there was a man who lived in some remote place in Vermont who, at this time, wrote a good many jokes for *Punch*. Du Maurier, who was doing illustrations for *Punch* at the time, used to illustrate a good many of this man's dialogs.

I secured my position with *Life* as literary editor in 1893 owing to the jokes I wrote for that paper. I originated a system of numbering them, so that I could tell instantly the ones which had been accepted. On one occasion I appeared in *Life* office with my book and showed them that they had omitted to return a certain joke. J. A. Mitchell, the owner and editor of the paper, was so much impressed with my businesslike method that he sent for me and asked me to take charge of the paper while he went away for the summer. My salary was to be $45 a week, but this did not include my writing, which was to be paid for at an extra rate.

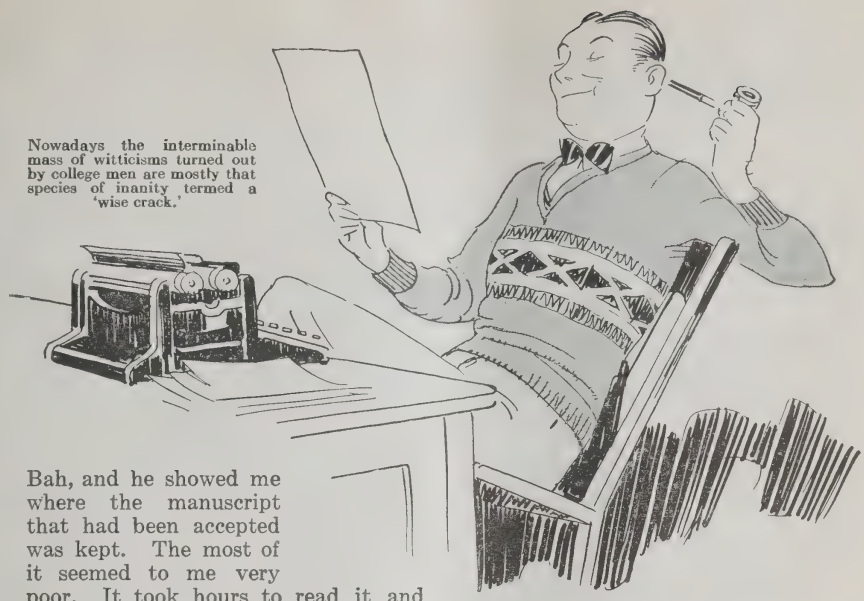
I arrived at the office the following morning, my interview with Mr. Mitchell on the previous day having been confined to the following conversation:

'Can you come? I will pay you $45 a week.'

'Yes sir. When do you want me?'

'You might drop in tomorrow morning.'

When I arrived in the office ready to take up my work, Mitchell was just about to depart for his country place at Petersham, Massachusetts. He had made up three 'dummies' of the coming numbers of *Life*, at that time sixteen pages, and handed them over to me. A 'dummy' consisted of an old copy of the paper, upon which had been pinned the proofs of the humorous pictures he had accepted. I was to fill in the spaces with text.



*Bids Farewell to His Carefree Days*

As he laid them down on the table in front of him, he remarked:

'Do you think you can run this paper while I am gone?'

'I'll do the best I can.'

He then got up, took his hat, shook hands with me, and walked out. I was so paralyzed with combined fright and astonishment that I couldn't think of a thing to say, before he was gone. I knew nothing about making up a paper of this sort, although I had edited other copy, notably the sermons of Thomas de Witt Talmage and the weekly letters of Bill Nye and Charles B. Lewis (M. Quad). I inquired of a young man named 'William,' who was a kind of Poo Bah, and he showed me where the manuscript that had been accepted was kept. The most of it seemed to me very poor. It took hours to read it and I then turned to the mail. In this I discovered only one thing, by a girl named Jessie Wood. I knew very well what the rate of payment was, and as Mr. Mitchell had taken the precaution to inform the cashier that my acceptances were to be honored, I had a check sent to her for a small amount, as I recall it, five dollars.

Nowadays the interminable mass of witticisms turned out by college men are mostly that species of inanity termed a 'wise crack.'

By this time it was late in the afternoon. I had been so busy with my reading that I had not thought about the practical details, until my reveries were rudely interrupted by the arrival of a messenger with a note from J. J. Little, the printer. The substance of it was short and sweet:

'Where is next week's dummy?'

'Tomorrow morning,' I replied, and spent the rest of the waning day and part of the evening completing my task. On top of this I made up the best dummy I could, putting Jessie Wood's verses in a prominent place. Early the next day I repaired to the office and plant of the printer which in those days was located just north of the Brooklyn Bridge, off Park Row. Mr. Little, who was undoubtedly one of the best printers this country has produced, looked me over carefully and briefly and I fancy dismissed me as being undersized and incompetent. However, he gave me a schedule of the hours that he expected his dummies and returned proofs, all of which I carefully noted.

The following day Jessie Wood appeared in the office. She was plainly excited at the acceptance of her manuscript. She was an English girl, a kind of feminine waif who had drifted to this country and had been knocked about fairly well. She handed me another piece of verse, which I promptly accepted. Thereafter she became a regular, but somewhat intermittent contributor, eventually going on to the *Evening World*, where she achieved a highly enviable local reputation.

A little later than her debut in *Life*, she wrote a play, and not having any money, arranged to take the principal part herself. She lived in miserable quarters near lower Broadway, but enlisted her friends for the various parts and actually produced this play under her own rented roof. As I recall it, it was a terrible performance. Jessie Wood was a very talented young woman, and had she lived, I have no doubt that today she would be a very prominent writer. As it was, she faded out with tuberculosis.

The first number of *Life* under my literary dispensation came out about a week later. An advance copy was sent to Mitchell in Petersham, and he was good enough to write me immediately that it was the best number he had seen, and to keep it up. Encouraged by this, I promptly scrapped most of the accumulated manuscript and scurried around town to get new copy. I was very freshly married at the time, and the advent of twins in my household kept me preoccupied, but in spite of this I managed to get together a small circle of would-be geniuses.

Mitchell, without any formality, which was foreign to him, had given me *carte blanche* to accept what manuscripts I wanted, but he kept a rigid hand over the contributing artists, and for several years after my advent always insisted on making up the pictorial part of the paper himself. He would wait until the paper was set up and then go over the page proofs with a microscopic eye. If anything did not please him, he would snort with rage and order it killed. This was only on very rare occasions.

One day I picked out of the mail a manuscript from a man named Gillilan, with the title *Off Agin On Agin*. I read it with a fine glow of delight. It was rather long for verse, but I had no doubt about taking it, although it did not quite fit into our atmosphere. I liked it so much that I had it set in a prominent place at the top of one of the first pages.

# Islam Aims at World Domination

## Consolidation of Moslemism Inspires Conference at Mecca

By THOMAS CHALMERS WHYTE

THE most important Mohammedan conference of many years assembles at Mecca in concern for the Holy Places of Islam and the welfare of the pilgrims to these.

The Holy Places and the pilgrims —two pictures flash to memory at the phrase. The first is of the deck of a tramp steamer out of Jeddah for Singapore. On that sizzling deck, under the blazing sun, are packed six hundred pilgrims. The deck might have accommodated four hundred 'comfortably.' They had paid their fares at the gangway as they embarked, those six hundred of the returning faithful who had been to Mecca. The ship supplied them with water only, for drinking, and a mere ration of that.

*Smallpox Hits Overcrowded Pilgrim Ship*

We had just cleared the well-named 'Hell's Gates' and laid a course for Colombo when it came . . . smallpox! The Chinese crew rigged little isolation pens for the patients, but their friends crawled in at night to visit them . . . The sharks that trailed and escorted the ship; the first bodies that were shot overside with old fire bars at the feet; the other bodies that were slipped overside when there were no more fire bars; the lunging twist of the sea monsters as they rose and seized and dived: these are not the most deeply drawn lines of the picture. Deepest of all is the memory of the strange, glowing endurance of the survivors, who, devoid of frenzy or of panic, called upon Allah and with amazing content awaited what might come.

The second picture is of a wild pagan town in remote West Central Africa, and a market place in which were gathered at least four thousand fetish-worshiping savages. Of all places in that region, that was one in which the life of an unarmed stranger possessed not the value of the proverbial straw.

*The Force of the Moslem Faith*

It was toward evening, and the pagans, their barter over, were about to depart and ready for any diversion. Suddenly, right in their midst, a tall young Mohammedan trader—one of those solitary pioneers from a thousand miles to northward, to whom no depth of the black equatorial region was too dark—placed his prayer-mat on the ground, laid aside his weapons with steady deliberation, and uplifted his voice to Allah in the routine prayers of the faithful. He was at very close quarters with death at that moment . . . but, it was the hour of prayer! The force of the Mohammedan faith!

Upon the conservation of this force the conference at Mecca is centered, and the field of consideration is wide. There is not a political nor geographic sore point in Asia Minor which is not touched when one considers the care of the Holy Places of Islam, and the welfare of the pilgrims involves consideration of all conditions affecting the entire sweep of the wide Islamic realms. In short, the most remarkable Mohammedan convention that Mecca has seen for a long time will review Islam's position as a whole, at an interesting stage, and with the most noteworthy Mohammedan figures of many years in the picture.

Kemal Pasha, in the forefront of progressive Mohammedanism and open-eyed to the demands of modern national consolidation, has sent two delegates to bear his views. To the wider world, he is the best-known figure in Islam; but at the conference in person will be one other notable Mohammedan, of whom it is believed in many quarters that no more forceful exponent of Islam has appeared since that Mohammed of the Senussi who founded the Mussulman Brotherhood about a century ago, the fighting chief of the Wahabi.

*Wahabi Leader Credited With Great Capacity*

Ibn Saud, this Wahabi leader, is difficult to know. Since he suddenly assembled his fighting men, not so long ago, and smashed his way to Mecca to assure himself that the shrine city should be in firm Mohammedan hands —his own—he has been a person of much interest to many inquisitive outsiders. Nevertheless, the little that is known of him is of hearsay character from his admiring friends, of whom he has hordes. They credit him with a fervid Mohammedanism and great capacity. He has been quoted as a keen and outspoken critic of the progressive urge in Turkey in so far as it might affect Mohammedanism: 'Without Mohammedanism, what is Turkey?

'Do the Powers consider Turkey and court her, even, because of her ten millions of people? The consideration she gets is won for her by the belief that she has all Islam behind her. The real defenders of Turkey are the Islamic peoples in distant possessions of the Powers. If Turkey retains her place in Mohammedanism, the defense remains.' They say of him, further, that in cold analysis of political affairs he carries a mighty conviction and counsels constructive patience: 'The bombing airplane holds Mesopotamia. The bombing airplane will hold the Riff. The superior weapon wins against the superior people lacking it. There is no merit in a superior people beating itself to atoms against the superior weapon. Preserve and build up your people and the Faith.' These are the most striking of the points made by his admirers. Islam has taken note of him, and Turkey is very much aware of him.

In reviewing recent developments in Islam, the conference will have a record of much success and some seeming defeats. Mohammedanism continues to make ground, everywhere. The numbers of the faithful are swelling. A quarter of a century ago, in Africa south of the equator, a million Moslems might have been found, but the figure would have been questioned as an overestimate.

*Numbers of Faithful Are Swelling*

Late last year, as the result of a careful survey carried out in behalf of a church body in South Africa, the statement was made that there were now *six millions of Moslems in South Africa*, and the figure may be regarded already as an understatement. There are nearly as many Moslems in Russia now as there are in Turkey proper. China has almost six millions. In the much disputed territories of the Sudan, the Nationalism born of distant Egyptian centers of political development may be making little progress, but essential Mohammedanism is filtering in and will raise crops which in time may fully justify to Islam the counsels of constructive patience and Mohammedanism first.

It is doubtful whether, in reviewing such defeats as have been inflicted upon Moslem peoples in recent wars, the conference at Mecca will find cause for despondency. In the ending of the Riff war, Mohammedanism as such has gained, inasmuch as a long-drawn, hopeless waste of Moslem life against 'the superior weapon' has stopped. It is no depreciation of French arms to state that three factors operated in ending the war in the Riff—French arms, Moslem counsels from out with the Riff in the interests of 'Sarikat Islam,' and Spanish arms. Modern fighting equipment could have reached Abd el Krim through other Mohammedan countries to whom it was offered for sale by agents of both Oriental and Occidental manufacturers; but the heart of Islam departed from the struggle, which had passed quite out of accord with the longer view and the wider policy which takes cognizance of the welfare of Islam as a whole.

*Heart of Islam Departed From Struggle*

Doubtless the French have heard,

over. How much of Africa north of the equator have the Powers actually *secured?* It is a wise power that makes no new martyrs!

A new slogan is being heard throughout Islam in these days. It is but a whispered phrase, and it is not so new, though its wider use is eloquent of the spreading consciousness of Islamic unity: 'Sarikat Islam.' It is heard from beyond the Burman frontier down to distant Java, and from Afghanistan to the Niger Delta. There has been much puzzling over its meaning and significance. It represents, meantime, nothing more than a gain to Islam in the acceptance of the idea of a Moslem interest greater than the personal, the local, the tribal and even the national. It means, literally, if I have not forgotten my Haussa tongue, 'Islam First!' or, equally literally, 'Islam Dominant!'

***Conference Is Step Forward***

To the wider Islamic view, the conference in itself represents one of the greatest of recent forward steps. Delegates from practically every quarter of the great regions of Islam are there, not merely as individual enthusiasts but as representatives duly appointed. In this conference, peoples long separated by local antagonisms, by fostered differences, or by self-will, and others parceled apart by more recent external force, *unite by mutual arrangement.*

Modernism, Nationalism—all the surface elements and developmental phases of the spreading lands of Islam—acknowledge here the higher platform and the greater interest: the conservation of a mighty religious force. The mutual arrangement is significant indeed. For many years it has been impossible of achievement, even if the need of it had been realized.

The revival of Islam and the policy animating it, described in THE DEARBORN INDEPENDENT two years ago, is following the lines forecast. No greater expression of the deepening of the consciousness of essential Mohammedan unity has been given in two decades. The fostering process is showing its value: 'Sarikat Islam!' With the tendency to organize on modern lines—to guide its affairs by a council of the peoples rather than through a figurehead—Mohammedanism in its concern for the care of its Holy Places and its pilgrims would seem to declare that the first regard of its millions must be —the faith.

Islam closes its ranks.

*'A group of enemy planes had been wreaking havoc on our planes. Guynemer and I were ordered to see what we could do. We decided to go up separately. The decision as to who should go up first was left to a cast of the dice . . . I won . . . I had not long to wait. The fight began at once.'*

*Thus starts the second story by Captain Alfred Heurtaux, the great French ace—a feature of next week's* DEARBORN INDEPENDENT.

# A Negro Views His Own Race

FROM A WASHINGTON CORRESPONDENT

THE other day Charles Plummer came into the office. Plummer is a full-blooded Negro and is proud of the fact. He has devoted his life to the problems of his people and has arrived at an exceptional understanding of them. He is striving for racial advancement, amity and good will.

In the first place, Plummer is the representative of The Lowery Institute and Industrial School, of Mayesville, South Carolina. He came into the office armed with letters from Congressmen and Senators, including some of those from his own and other Southern States—showing that he has the support of the leading whites of his state. He is a preacher, and one of the old-school type of Southern negro, with a personality that grasps a Southerner, like myself, immediately. He is trying to advance the interests of his school, where about 210 Southern negro children were enrolled during 1926. This school is undenominational, but Christian; it has bought a 200-acre tract of land, and is teaching these colored boys and girls of the South how to live, giving them an education along with their work. Their products help to pay their way as they go.

He did not have to 'sell' me the idea; that he is on the right track cannot be doubted: but I wanted him to discuss the problems of his people, as he saw them, and explain the remedies he would apply. He was not only willing, but ready to talk.

'This is my general outline of the conditions in the South,' he began, 'and what I believe would solve the negro problem. I have advised the negro to stay home on election day and dig potatoes. His vote doesn't count for anything. He only starts trouble. No negro can possibly come to Congress from South Carolina, so why start trouble?'

***Does Not Want a Negro in Congress***

'That is probably true,' agreed I, 'but enlarge a little.'

'Well, for instance, I was talking to some gentlemen a few days ago. They feel that the colored man is getting too far away from the Republican party. I told them he is not far enough away from it. In articles last year I advised the negro to drop it. I told them that I personally did not want to see a negro in Congress.'

'What was your reason for that advice?' I asked.

'For the reason that a negro Congressman can do us no good,' he declared. 'He certainly can do us a lot of harm. He will stand on the floor of Congress and try to demand something. What has he got to back up his demands? When they tried to send a negro to Congress in place of Mr. Madden, of Chicago, I told them they were wrong. Why, no negro can go to Congress and help his race like Mr. Madden can.'

'Do you propose to eliminate your race from politics?' I inquired.

'Yes, and no. I once told Senator Curtis that if the negro of the South has to come into politics, let him come in knowing what it means. He does not know now. When he goes to the polls now he doesn't know what he is voting. Someone will give him a couple of dollars or a bottle of corn liquor and tell him how to vote — perhaps, they will even mark his ballot for him. In preference to this, I would rather see my people stay away from the polls. I have a proposition I think would help, which I will explain briefly, but let me speak first of another phase or two in connection with our whole racial problem.'

***Negro's Vote Is Now Wasted***

'One of our greatest problems is the 3,500,000 mixed blood, or mulattoes, we have among us. The unfortunate thing about them is that they are not satisfied to be black men and women. They feel that they are a little bit better than the kinky-headed black—that they are a little nearer to the white. The social castes among the American negroes give us a great deal of trouble.

'Again, the colored people of the North cause us some concern. They feel that they are a little bit better than the colored people of the South—perhaps that is because they believe they have a little more freedom. They do not seem to realize that the Southern black has something they do not have. As much as some Southern people may declaim against the negro as a race, any colored man in the South who is worth while has a white friend. The Southern white and black have a much better understanding of each other than they do in the North. Oh, Northerners may make a lot of pretenses, some of them may declare that they are willing to associate with the black, but when the two get together both find that neither of them has what he thought. We have too many people trying to make our people believe they are what they are not. I have as little sympathy for the white man who will go to live with blacks as I have for the black who will go to live with whites. That is not the solution of *(Concluded on page 22)*

# The Voyage of the Victoria

## WRECK of the SANTIAGO

*Eighth of a Series*

They told of huge Patagonians swallowing arrows, dragon-like birds carrying off great animals, terrible sea-creatures, and what might be a species of mermaid.

BY CHARLES J. FINGER
WOODCUTS BY PAUL HONORÉ

THERE are strange things to be said of race memory. Tales have been handed down from generation to generation through hundreds of years, some of them with a basis of truth easily verifiable, some with a ring of truth for which we can find no foundation. I have heard men say that Patagonian Indians have been known to tell a misty story recounting how, 'before there were horses in the world,' white men touched Patagonia, killed their own people, gave gifts to the Indians, then, by treachery stole the Indians away. Whether there is any such tale extant I do not know, but the outline has resemblance to the story of what actually happened at St. Julian while the fleet wintered there.

For native Patagonians came down to the coast in curiosity. Pigafetta, in one of those freakish fits of wild inaccuracy to which he was subject, records that 'they were so tall that we only came up to their waistbands,' which would make them between eleven and twelve feet in height. The Genoese pilot is more observant, his description being true to this day: 'They have not got houses; they only go about from one place to another; they eat meat nearly raw; they are all archers and kill many animals with arrows, and with the skins they make clothes. Wherever night finds them, there they sleep; they carry their wives along with them with all the chattels they possess.' Pigafetta makes note that the natives were 'dressed in the skins of an animal cleverly sewn together,' evidently referring to *capas* made from the skins of the *huanaco*, stitched together with ostrich sinews, similar to those made to this day. But Pigafetta also describes what he calls '*luogho di purgarsi*,' telling of the habit of 'thrusting arrows down their throats as a purgative!' That may have been a mere trick, comparable to the trick of a sword swallower. Still, it was good enough as a wonder to please those at home seeking a new sensation, and de Bry afterward used it to great effect in his so-called *History of Oriental India* (1598), painting Magellan navigating a narrow strait, but sailing eastward instead of westward, huge Patagonians swallowing arrows, dragon-like birds carrying off great animals, terrible sea-creatures, and what may be a species of mermaid. It is needless to say that the imaginary thing found ready credence, and to this day the Patagonian giant notion persists. The truth is that the Patagonian does not average more than any other race of men. I rarely met a Tehuelchean more than six feet in height. Sometimes a slight twist or change of a word has been responsible for the sending of a long-lived lie into history. Thus there were historians who twisted a conquistadore's statement, '*desde lejos parecen Gigantes*,' which means 'from a distance they looked like giants,' into 'they were giants.'

What happened in connection with Magellan's dealings with the natives is this, in brief. Two of the natives, quite unsuspicious, went on board, and Magellan decided to capture them as prisoners. So their arms were piled with gifts; then, as they turned to leave, thus loaded, sailors leaped upon them, chained them hands and feet, and carried them away. That piece of treachery, it is said, has passed into Patagonian folklore, with the white men figuring as cannibals, though I have not heard the story at first hand.

'When they saw the trick which had been played upon them,' writes Pigafetta, 'they began to be enraged, and to foam like bulls, crying out very loud, *Setebos*, that is to say, the great devil, that he should help them.' How Pigafetta knew the meaning of the sounds the Indians used, and how he came at a mythology through them, is a mystery. Presently he tells us that in the Patagonian mythopoesy, the lesser devils under *Setebos* are called *Cheleule*. Then, 'this one who was in the ship with us, told us by signs that he had seen devils with two horns on their heads, and long hair down to their feet, who threw out fire from their mouths and rumps.' Comment is needless. Any intelligent man who will make the experiment of sitting down to convey all that 'by signs' to another of equal intelligence will find himself exhausted in the effort. However, from the passage quoted, Shakespeare gained an idea and so gave Caliban, in *The Tempest*, his god.

There was a later attempt on the part of the seamen to capture women, but a Patagonian arrow killed one of the *Trinidad's* men, Diego de Barrasa, and the natives suffered no further molestation. But the affair had its effect in the way of striking fear into the hearts of the seamen, for when Magellan sent out an exploring party, they went no farther than the nearest hill, which must have been one of the foothills of Mount Sholl, and there they erected a cross and so returned. Had they climbed the mountain, much later trouble would have been avoided.

Of the five ships beached for cleaning and repair, the little *Santiago* was first finished. Knowing, as a masterful executive, that the maintaining of interest is half the battle, he prepared the *Santiago* for an exploring expedition, Serrao in command. The cruise was to be to the south. Every opening in the coast was to be examined, and in the event of the strait being reached, it was not to be explored, but the *Santiago* was to return to report. At the end of April, the expedition started.

From St. Julian Bay the coast line falls away in a great curve to the estuary of the river Santa Cruz, then by a reverse curve to what is known as Coy Inlet. Roughly, it would be a sixty-mile sail from St. Julian to the Santa Cruz River. Arrived there on the third day, Serrao dropped anchor and it was nine days before they left. It is a swift-flowing, crystal-clear stream, abounding in fish, and must have been exceptionally pleasing to the men after all that irritation of incessant toil in

the cleaning and provisioning of the ships. Had Serrao continued his cruise, with fair winds he could hardly have missed the discovery of the sought-for strait. Following the course of Magellan, though without anchoring at night and without exploring any inlets, I made the sail from St. Julian to the strait in four days. But comparison is unfair, as I knew my route and objective point. Unfortunately, Serrao did not explore the river, for, had he done so, within less than a day's rowing from where he anchored he would have found an easy fording place, which knowledge might have been valuable a little later. Or, continuing the list of unfortunate circumstances, had Magellan's men ascended Mount Sholl they would have gained a knowledge of the lay of the land. However, it is easy to be wise in the light of hindsight, and idle to speculate with dogmatic severity upon what might have resulted had something occurred that did not occur. If Serrao was weak in one place, he showed plenty of noble zeal and self-sacrifice in another.

Sailing south again in time, when they were abreast of a promontory, which must have been Cape Redondo, the most likely place of banks and shoals extending far out, they met disaster. They were hugging the shore closely when a strong southeast breeze blew up. At a critical moment the rudder post gave way and the ship went ashore. All gained land except a negro. 'Saved by a miracle,' writes Pigafetta, 'for they were hardly wet at all,' though the miraculous nature of the affair diminishes when conditions are visualized. For when so small a ship as the *Santiago* runs bow on to a sandy spit, and when that spit is in the shelter of another cape, as Redondo is in the lee of Punta Norte, safe landing is not much more of a difficulty than many thousand New England or Norwegian fisher folk encounter in the ordinary day's work. But there was no getting the ship off, and when the wind shifted and the Atlantic rollers came roaring and bullying, the old and timber-strained craft broke up with the pounding. So all the next day the shipwrecked men were kept busy dragging the wreckage and jetsam high up the beach.

Romantic-minded writers have enlarged on the shipwreck of the *Santiago* and some have grown sentimental about the hardships endured. But what are the facts? The men were unhurt and in good physical condition. Moreover, they were within no more than 120 miles walking distance from the fleet and the base of supplies. Three or four days' tramping would have seen them in St. Julian, and the difficulties of the march would have been no greater than might be found in a walk along part of the shore of Lake Michigan. But instead of setting off at once, they stayed about the scene of the wreck for eight days; and when at last they did start, they burdened themselves with timbers with which to make a raft at Santa Cruz. As might be expected, much of that burden they threw away before they went very far. It took them four days to get to Santa Cruz River, a distance of about sixty miles, and there they camped, waiting for help. Two of the party were sent on to St. Julian. But they made a long journey of what should have been a short one, following the seashore instead of cutting across the semicircle, and so took eleven days to travel sixty miles, arriving 'in a state of terrible exhaustion.' Had Magellan's scouts, when sent to explore the territory adjacent to St. Julian Bay, climbed the inconsiderable mountain in sight of the ships, they would have seen the land outspread at their feet as on a map. Two days' march of thirty miles a day would have sufficed to put the party at Santa Cruz within hail of the fleet. There was ineptitude somewhere.

Magellan sent a rescue party back to Santa Cruz River, by land, carrying provisions and wine. That party, which numbered twenty-four men, also followed the beach line, and at least 'it speaks well for the courage and endurance of the Spanish that they eventually reached the fleet without the loss of a single man,' says one historian. Another construction might well be that the 'miracle' of the shipwreck, as Pigafetta put it, was a very ordinary affair tremendously exaggerated, and that all the difficulties and dangers were largely imaginary. And yet, while all of them were scared stiff, as we would say, full of fear lest 'cannibals' leap on them, or starvation stalk them, or fierce animals beset their path, not a word was raised in protest when, two weeks before the fleet started south, Juan de Cartagena and the priest were set ashore to face those perils, wholly imaginary, which took the heart out of the wrecked men, making spiritless cowards of them.

Of the five ships beached for cleaning, the *Santiago* was the first finished. Magellan prepared the *Santiago* for an exploring expedition, to be to the South.

On Saturday, August 24, 1520, the fleet left St. Julian. The men of the *Santiago* were distributed among the other ships. Serrao was given command of the *Concepcion*, Alvaro de Mesquita was captain of the *San Antonio*, and Duarte Barbosa was made master of the *Victoria*, Magellan commanding the *Trinidad*. So at last Magellan had matters his own way and there was no king's appointee to challenge him.

Two days' sail took them to Santa Cruz where the fleet again dropped anchor for two months, passing the

time in salvaging what was left of the *Santiago*, and in catching and curing fish.

(It has been said that the river Santa Cruz offered tremendous difficulties in the way of passage, and one writer has referred to it as a 'river with a terrible current, three or four miles wide.' I have crossed it in a canoe, and a day's ride upstream, by fording. The general width of the river is between three hundred and four hundred yards; its current runs at about six miles an hour. Magellan seems to have been quite incurious about the river, having ascertained that it was no strait. Following its course upstream for twelve days, my party sighted the Andes. We were then, I suppose, about sixty miles' distance from the nearest reach of the Pacific. Going south a few days' journey, three or four, we came to the great inland sea known as Ultima Esperanza, which joins with the Pacific. From there, five days' journey took us to a point from which we could survey the straits from the second narrows as far as Broad Reach.)

Until Magellan had freed himself from those appointed by the king, he was wicked, persecuting, despotic, bitter and suspicious. All that frightfulness at St. Julian was not formalized discipline, but individual resentment, and it is foolish to try to excuse it, as does one historian, by saying that 16th Century matters cannot be judged by present-day standards. The case of Drake shows that barbarism was not the only practice. Brutish violence did not mark the doings of many of the conquistadores. Vindictiveness was not the compelling force in the cases of Caesar, or Columbus, or Vasco Nunez, or Ptolemy Soter. To be sure Magellan possessed resolution and purpose, but we are not justified in ignoring the unlovely aspects of his character. He had a disease of character. It was an intense egotism which made him utterly regardless of the rights of others. He was devoid of chivalrous feeling. He was without that self-discipline, or high breeding. He was ethically defective just as Villon was, or as Frederick II was when he declared that he would die happy if he could inflict on his enemies more evils than he had suffered from them.

And yet, when the fleet sailed south leaving Juan de Cartagena and the priest to face those perils which had made spiritless cowards of the men, not one word was raised in protest.

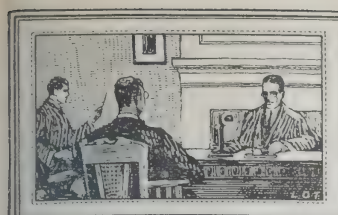
# Pulpit a Bulletin Board?

(*Concluded from page 5*)

organizations whose salaried officials distribute these documents and call for action. Ministers are persuaded or almost bullied into calling upon their members to write to their Representatives in Congress to pass this or that bill.

I say again and perhaps for the hundredth time that I think all this may have become necessary. We have had to make it safe for men in legislative bodies to vote for those bills which represented the moral sense of the community. We had to go further and make it dangerous to a legislator not to do what the better people in his district demanded by compelling him to face the prospect of defeat if he permitted the underworld to control his vote. At the same time we have very nearly forgotten how to uplift the community by teaching men to love righteousness and hate iniquity and be strong enough to resist temptation.

### *Jeremiah Found a Remedy*



The Prophet Jeremiah is one of the clearest thinkers as well as one of the most courageous heroes in the Old Testament. He lived in a time when law collapsed and government went to pieces. It became impossible to enforce laws and he saw the moral chaos which resulted. He was unterrified. He said that something better was coming. He declared that God would put his law into men's hearts and write his precepts in their inward parts and there should be no need for penalties or prohibitions, for all men would do right for the love of right.

Jeremiah was enunciating the only principle on which a democracy can ever be stable. Ultimately we must put the spirit of the law into men's hearts or all law must fail.

It is difficult to imagine Jesus going before a legislative committee and asking for better legislation. He did no tinkering with laws. His kingdom was not of this world, but of the inner spiritual life of men. He wrought no reforms by legislation; he sought to bring men into loving, willing conformity with the will of God, and to make them friendly and helpful to their fellow men.

The Gospel, as Jesus taught it, was not privative but constructive, it dealt with the inner life of men. Unlike the Ten Commandments which are necessarily negative and prohibitive, His beatitudes concerned themselves with the inherent blessedness of mercy and kindness and meekness and purity of heart.

I have done my full share of preaching in favor of righteousness and temperance and human welfare. I have actively supported most of the moral reforms that have seemed to me to have any legitimate claim upon the pulpit. I have no apology to offer for any of this activity. I could even say I am glad and proud of what I have done in this direction. Nevertheless, I have believed all the time and believe more than ever that *the pulpit must guard itself with very great earnestness against becoming the cat's-paw for propaganda in any form.* The preacher is a prophet of Almighty God and not the propagandist even of good causes. It is his duty to teach men to be honest and upright and generous and courteous and clean-minded and to love God and their fellow men. If he can induce them to do this, there will be less need of law and he will have less time to meddle with it.

# CHATS WITH OFFICE CALLERS

'What the Chicago diversion of water out of Lake Michigan means is better told after a trip to Quebec,' observed ***the Middle Westerner*** as he dropped into The Office on his way home from his vacation trip. 'You hear and see them blasting among the rocks of the bottoms around Quebec and you ask what they are doing. "Why, it is becoming so shallow here that ships can no longer pass—the Lakes are so low—so we are getting ready to be the great harbor." That means that instead of "inland seas," as we have been calling our Lakes, we shall see our ocean inlet cease at Quebec.

'I have looked into the matter from the Chicago end, and I have yet to find my first scintilla of civic spirit in it all. Chicago is graft-mad. In this whole question I have found no smallest evidence of a conception of what the Lakes mean to America's life; I have found no disposition to look at the question in a scientific way; I have found nothing but a madly intense determination to push through a plan which at its utmost promises only a big increase of political jobs in the vicinity of Chicago. Chicago commits a crime against civilization in ever attempting to send her sewage down past the cities of Illinois. If the full story of this barbarous method were published in American newspapers (of course, it is far too physically nasty for print; only the morally nasty is fit to print!) the indictment would be felt to be not against Chicago alone but against our common civilization. The stench in the streets of some Illinois cities south of Chicago is worse than anything experienced in China where they spread their filth openly on garden and field.

'This question has never yet been approached in its proper aspect. When it is, the present squabble of politicians will be swept to one side. The moral right of eminent domain and a national suppression of the anti-national, unneighborly and destructive spirit shown by certain Chicagoans, would fully justify any regulatory action on the part of a Government. You know Chicago puzzles all of us these days.'

ɤ ɤ ɤ

We were sitting at a little table on the green, ***Seven of Us in Committee,*** and, as usual in such gatherings when conversation insensibly slips off the business on hand to some off-side interest, so it was now.

The subject was real estate. There had been a good deal of very energetic subdividing and selling round about and, as some of us thought, no little misrepresentation. People had thought they were buying within four miles of the city hall, when indeed they were buying fifteen miles away, and the salesman was asked how he justified his statement. He airily replied that they weren't counting the big city hall any more, but the city hall that would some day be built in the city which should cover his own subdivision! So it came to pass that someone asked if there were no ways of warning the people against such things.

'I know how you feel about it,' said ***the Business Man,*** 'but it is always a question with me whether, with all our good intentions, warnings do any good. I don't mean that people will not heed them; I mean that they probably will heed them and lose. Now, take the case you just mentioned: who here would undertake to warn a man not to buy land fifteen miles from two million people? I wouldn't. When I think of the fortunes in real estate that I have turned down by being too careful, I don't feel competent to advise anybody—least of all against investment in land. Why, I remember'—and here ***the Business Man*** went on to describe in a very diverting manner some of his own experiences, and they were of such a nature that all seven of us knew how true they were.

'You see,' he went on, 'there are some sharks, some foreshortened maps, some printed plats that omit or distort important details, but as a rule the buying of one or two lots has a stabilizing effect on people. Real estate is becoming a high-type business, due to the character and insistence of the best men in it. And though in some cases a person may pay for land more than it is worth today, no one can tell how much it may be worth in five years. The marvelous extension of range permitted by the automobile has caused people to go a hundred miles or more for week-ends, with a consequent effect on real estate prices far out from our larger cities. That's the reason, brother, why I would not care to be party to any warning to folks—we may be warning them away from the best thing for them.'

ɤ ɤ ɤ

'I saw an unusual sight the other night,' said ***the Man From the Other Room.*** 'It was eight-and-twenty railroad presidents sitting in a row. Someone said that never before have so many presidents been on view, at one and the same time, before the public. They were old men and young men, tall men and short men, some famous and others—well, not so famous. You could not always go by appearance, either. Some of the most impressive looking men were presidents of the smaller lines. The least significant looking of them all—until you saw his eyes—was head of one of our greatest railway systems. He had come up from the ranks. And he ran his railroad without letting his banker owners run him. I hope I'm not a snob, or anything like that, but I confess I was glad to be able to see so many railroad presidents sitting in a row and eating their dinner. I ate the same dinner and it was, oh, just a trifle below ordinary, perhaps.

'They talked about rather practical things. They didn't boast much. They were under no constraint. I suppose they bore the same relation to each other as if they had been yardmasters of various roads. But they did seem to pride themselves on giving better service. They claimed that they did, and I think the claim is justified. They visualized what better service meant to American business in general. It gave to me, a layman, a rather different view of railway service. I thought it simply meant lots of trains and all of them on time. But being on time, or cutting down the time, means millions of dollars. If train service is slow and uncertain, merchants must carry heavier stocks, and consequently tie up more money uselessly on their shelves. Where railway service is speedy, merchants can carry less stock, order more frequently, do business on less capital, make quicker turnovers, and give the public the benefit of the resulting economies. Thus it comes that good railway service may be instrumental in cutting down the big interest load of the country.

'One thing, however, I was warned against. The presidents were congratulating themselves on the passage of some bill—I forget the name—which they said prevented railway strikes in the future. It sounded fine, put in just that way. A wise man at my elbow, not wishing an innocent outsider to be taken in, whispered to me that what the bill really meant was that the presidents and the railway union workers could get together and raise wages and charge it to the public without the public having a say one way or the other. The 'no strike' bill had another aspect, you see. But why drag in suspicion? The point is worth filing away until we see how the new bill operates.'

ɤ ɤ ɤ

'Here's something I read that I want you to print,' said the ***Man from Philadelphia*** as he came into The Office. 'It's by William Lyon Phelps, and *Scribner's* had the courage to print it. It deals with a situation that you have commented on editorially.'

He held forth a passage from Phelps' department, 'As I Like It.' Here it is:

'New York stage plays attacking Protestant ministers, missionaries, and evangelists are becoming more and more common. The reason Catholic priests are not attacked is not that these dramatists love the Catholics, but that they are afraid to attack them. It requires no courage to attempt to befoul any Protestant clergyman. A favorite line of assault is to pretend that religious excitement—like a "revival"—is sexual. Now the sex-excitement really exists not in the evangelist, but in the mind of the dramatist. Imagine the late D. L. Moody conducting a religious revival because he was what these playwrights would have us believe! The minds of this kind of playwright are so obsessed by sex-excitement that they are forever seeing it where it has no objective existence. When Tolstoi maintained that Beethoven's *Kreutzer Sonata* was full of sex-excitement, he merely revealed his own mind. He made no contribution to music criticism, because what he said had no connection with the facts. Beethoven's splendid sonata—an example of healthy, unclouded genius—remained after the publication of Tolstoi's novel exactly as it was before; but Tolstoi gave himself away, all the sex-excitement being not in Beethoven, but in the Russian's mind. I am becoming a little weary of those who cannot think of a church steeple, or religion, or Beethoven, without sex. I wish they would wash their linen in their own backyard.'

# Under the White Tops With 'Gil' PART IV

## Tales of the Time When People Traveled for Days to See the Circus, and Slave-Traders Followed the Show

By HARRY E. BARNET

THE performance of John Robinson's Circus was in full swing when Gil Robinson, the world's oldest living circus man, strolled into the big top. And at about the moment he seated himself, the band ceased playing. Mounted upon a white Arabian stallion, a girl, singing, rode into the arena. The animal pranced daintily around the hippodrome track. The girl paused before Gil, and curtseyed to him from the back of her mount. The horse also curtseyed, flexing his right foreleg and nodding his head several times. White pigeons fluttered from all parts of the big top, and alighted upon her head, shoulders, and arms, as well as upon the sleek neck and broad back of the stallion.

The song finished, the pair moved on. A crowd of clowns, grinning broadly at Gil, began their antics.

'They've resorted to the methods of the clowns of the old-time circus,' Gil said, half to himself. 'From about the time that my father founded this show more than a hundred years ago, to well up in the seventies, when circus canvas got so big that the clowns couldn't be very intimate with their audiences any more, and had to depend largely on pantomime, our principal clown was always a finished Shakespearean actor and a singer of funny songs.

'Dan Rice was with us off and on. And John Lowlow was with us for years. They were famous Shakespearean clowns. The principal clown in those days recited the soliloquy from Hamlet, for instance: "Alas! Poor Yorick! I knew him well." That was done very seriously. It was followed by something very ridiculous. Then the clown sang a funny song. We had only one principal clown at a time, of course, and he got up little song books, and sold them to the audiences. That was his privilege. He got a fixed amount as salary, and the privilege of making that extra money. Shakespearean clowns disappeared during the era when the American people wanted everything big—big ships, big circuses, big everything.

'Fifty and sixty and seventy years ago, when we took this show over the country by wagons,' Gil went on, 'there were few roads. We built most of them as we went along. And our wagons were always getting hopelessly stuck in the mud. Oftentimes, when we built roads through swamps in the South, the wagons slid off into the water and muck. To save them, we would throw out trunks and trapezes and whatever else was in the wagons, and abandon it. Sometimes half the show hadn't arrived in a place when it was time to start the performance, so we would go ahead and do the best we could under the circumstances. But we never could start a performance without the principal clown. Everything else could be missing, but he had to be ready to go into the ring. He was of more importance to the audiences of those days—and, of course, to the show, from the ticket-wagon standpoint—than the fanciest bareback rider. We put the name of the clown on our advertising, such as it was; featured him, you know, just like any other first-class performer. His salary was very big for those days.

'You see, we had just one ring. The clowns got personally acquainted with their audiences, because we went over the same territory time and again. All that was necessary to be assured of a big crowd was to advertise that a man like Lowlow was with us—everyone was his friend. In the South especially our audiences, except the negroes, knew and understood Shakespeare and the classics, and they appreciated a man who could properly recite parts of the Shakespearean plays.'

Gil paused and chuckled.

'I remember only one person who ever took offense at a song that a clown sang and then for a few minutes it looked as though the whole show was going to get into a fight,' he continued.

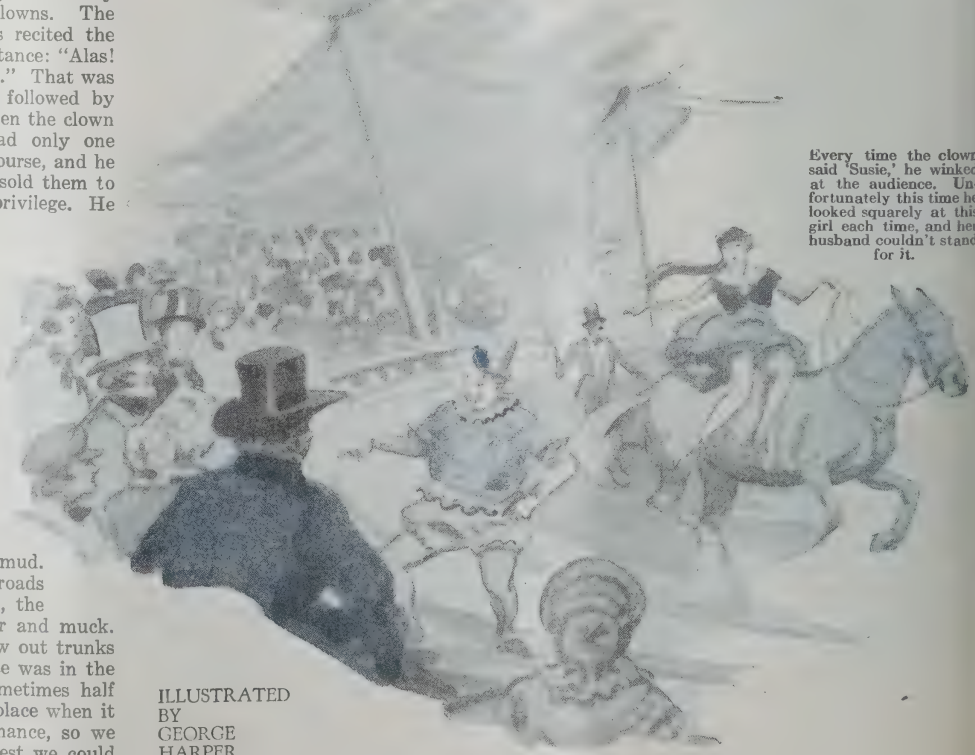
'I was standing at the front entrance one afternoon when a young fellow came out of the canvas with a pretty girl hanging onto his arm. I could see he was mighty mad and she was crying and begging him not to do something, but what it was I couldn't hear, even when they were right close to me.

'"Mister, I want to borry a gun," the young fellow said to me.

'"What do you want with a gun?" asked him. "And what kind of a gun do you want?"

'"Any kind."

'"Well, what's the trouble? What do you want to shoot?"



'"None of yore business. Gimme a gun."

'I couldn't get any satisfaction out of him. In a minute or two, some of his friends came out of the canvas, and took him off to one side. I slipped back to the dressing room to see what was the trouble.

'It seems this young fellow hadn't been married very long, and his wife's maiden name was Susie Brown. The principal clown sang a song that afternoon that went something like this:

Oh, Susie Brown, the prettiest girl for miles around.
Oh, Susie. Oh, you Susie.

'Every time the clown said "Susie' he winked at the audience. Unfortunately this afternoon when he winked he looked

Every time the clown said 'Susie,' he winked at the audience. Unfortunately this time he looked squarely at this girl each time, and her husband couldn't stand for it.

ILLUSTRATED BY GEORGE HARPER

The men and women came from long distances to see the show. Sometimes they would start a week ahead of time with their oxcarts and horses and dogs.

squarely at this girl each time, and her husband couldn't stand for it. He wanted to kill the clown right there, and then organize a mob of his friends to whip the whole show for carrying such a man with it. For the life of him he couldn't understand that the clown had never heard of nor seen his wife, and that the song was sung every day in every town. Finally, between his wife, and one or two of his cool-headed friends, we managed to get him quieted down. Nevertheless, many a big battle between town people and the show started from a circumstance just as trivial.

'In the old days we were always losing bird feathers out of the cages. They'd drop along the roads, and be lost—ostrich feathers, condor feathers, and the like, you know.

'One of our greatest exasperations with the old wagon show before the Civil War, and after it, too, was arguing with ferrymen about their charges. They ordinarily had a fair price for a team and wagon, but when the circus came along they boosted their prices away out of sight.

***Ferry Prices Jumped When Circus Arrived***

'One Sunday we were coming along a road in East Tennessee when we reached a ferry. The ferryman knew in advance that we were coming, and he had figured out his charges. They were enormous. While we were arguing about it, a farmer called me to one side and told of a ford, hardly knee deep, about two hundred yards below the ferry. I called to my brother, Jack, and headed the show wagons down there.

'But the ferryman wouldn't let Jack come along. He argued that we had no right to use the ford, inasmuch as he had the ferry privilege for that road, and everybody was bound to use his boat. He threatened to sue us for damages if we didn't pay him $200, even though we didn't use his ferry. Jack argued for a few minutes, and I went back. On the way, I picked up an ostrich feather. When I came up Jack took the feather out of my hand and changed the subject of talk. He commenced to tell this ferryman about the commercial prices of ostrich feathers in New York—that they were worth from $50 to $100 apiece there, and, of course, out in East Tennessee they ought to be worth twice that. He offered the feather to the ferryman for his bill. The ferryman looked at the plume for a minute, and then reached for it. He was satisfied. We saved broken-off bird feathers for a while after that, but a similar opportunity never presented itself.'

Robinson was born with the circus eighty-one years ago. His cradle was the till of a trunk in the dressing room. Except for trips around the world looking for freaks and rare animals, his entire life has been spent with the show.

'If you name a town or region in the United States,' he challenged, 'I'll tell you something that happened to me or that I saw happen there. Take New Orleans, for instance. The city had the greatest snowfall it had ever experienced one January when I was a very small boy. Snow lay on the ground to a depth of several inches.

'Pa took advantage of the snow to do some advertising. He built a sleigh from dry-goods boxes, and made runners from two-inch planks. Then he took the festoons of sleigh bells from the trappings of the ring horses and put them on the finest sets of harness he had; put the harness on his best span of horses, and hitched them to the sleigh. Then Dan Rice got into the sleigh and drove up and down St. Charles Street for several hours.

'St. Charles Street was packed with people. They came from everywhere in the city to see the sight—something they had never seen before, a real New England equipage.

'One of my earliest memories is of sticking tacks through small squares of leather. Our advertising then consisted only of small handbills, decorated with little woodcuts. These were tacked on trees in the small settlements and at the crossroads. We didn't even have a positive date line for the show. "On or about August 15," was the line, because we couldn't tell whether we'd get there on that date or not. We were traveling through sparsely settled country, you know, and no roads to speak of.

'We fixed the tacks in the leather so the agent would lose no time. Pa was economical. When the show came along, we hunted up these handbills and took out the tacks and leather; carefully tore down the handbills, too, if they were in fair shape, and sent them on to the advance agent to use over again.

'People in the South were isolated in those days and news of the coming of the show wouldn't travel very far if it was left to the few bills that the agent stuck up. So he hunted for someone who was going back into the swamps, and sent a few bills with them.

'The men and women came from long distances to see the show. Sometimes they would start a week ahead of time with their oxcarts and horses and dogs, and they camped in the little settlements, waiting for us to come. This gave them a chance to visit with other people while they waited.

***People Would Start Weeks Ahead of Time***

'And we were a strange sight when we arrived in those days. In addition to the show crowd, a lot of people who didn't belong to us followed the wagons. They were traders of all kinds, who worked among the crowds we drummed up. As a boy I preferred the buggy traders. We boys with the show had to ride on the baggage wagons, and didn't get very much sleep. We used to fill the traders' buggies—five or six of them in a string belonging to each trader—with fodder and straw and thus make nests in which we would curl up and sleep in the wintertime.

'Only the slave traders scared us. A lot of them followed us; and we always avoided them. We especially avoided their slaves, though we felt sorry for the

poor negroes. They walked along by twos, tied to a long chain that the trader had fastened to the back of his buggy.

'A harsh slave owner was the exception, but the slave traders were a heartless set.

Planters as a rule wouldn't sell a slave to the traders unless they were destitute, or the negro was treacherous. And some of the slaves were demented. They would kill a white person if they got the chance. When a planter got hold of a negro like that there was no way to get rid of him, except to sell him to a trader.

'Years later we began to use paper with bright pictures posted on billboards. We erected the billboards in the towns and communities and afterward sold them for lumber. For a long time, we limited the length of the billboards to 100 feet. We broke the rule in Goldsboro, North Carolina.

'The Great Eastern Shows wanted to get into that territory at the same time we were headed there. So we had a great advertising battle. The Great Eastern put up billboards 150 and 200 feet long. Ours were only 100 feet long. Therefore the darkies, and a good many of the white people, concluded that the other show would probably be the bigger and better.

'I went ahead of our show to supervise the advertising contest. As soon as I comprehended the situation, I rented a whole square in the heart of Goldsboro, fronting 300 feet on each street, and built 1,200 feet of billboards. Then I covered them with our gaudiest paper. That settled all arguments; the Great Eastern wasn't in it.

'I had a great deal of trouble with our billposters during that campaign. They played tricks on the other fellows. When I was leaving Goldsboro with our advertising men to go to the next town a young fellow came into our coach and sat down close to me. He was crying. I asked him what was the matter. He said he was the programmer for the Great Eastern and that one of our men had stolen most of his programs. He pointed the man out to me.

*Our Men Had Stolen His Posters*

'I thought that wasn't a very fair trick, and told the man to return them.

'"How can I?" he said. "I dumped them into an old well."

'As the train went along we threw a program out of the window whenever we passed a cabin and a lot of them in the tiny villages we passed through. When we threw one program, the Great Eastern man threw two. Therefore we often threw out programs where there was nothing but barren ground, and he doubled the number. In about twenty miles he was out of programs.

'The most laughable part of the whole campaign occurred while the billposting crews of both circuses were working in Goldsboro. Before breakfast one of our men dropped three pounds of lard into the boiling water the other fellows were using for their paste. When they started to put up their paper, the minute they let loose of it with their brushes, down it came. They worked on two or three sheets for half an hour before they realized the trick. During that time, they got the whole board and their brushes filled with grease. They had to wash the board down with hot water, and soak their brushes in it before they could get any paper to stick.

'On show day, we did the biggest business of the two circuses in Goldsboro. The billboard trick worked but to do it we put up twelve times as many feet of boards there as we had ever put up in any one place before.'

# A Negro Views His Own Race

(*Concluded from page 15*)

our problem. We need more faith in our own race.

'Faith is a great thing. The colored man does not believe sufficiently in his race. But that is where he must work. He must remember that he is only five hundred years from the jungle and that he is living among people who have a civilization thousands of years old. Of course there is a racial inferiority, but that should cause the black man no resentment. On the contrary, he should seize the wonderful opportunities he has to elevate his race. He must do this alongside the white man. He never amounted to anything until the white man took hold; even though the white man sold him into slavery, it has proved his salvation.

'Take the situation of the black man in Africa today. There is a white man's job there. The negro will never be able to do anything for his African brethren. It seems as if God could do nothing with the negro away from the white man. The American white man knows the negro by dealing with him here and he should go to Africa and take over the situation there. He can make that country what it should be.

'We have been dealing with negro leadership 103 years, and have got nowhere. The black man does not have to go to Harvard to understand that he is not of the Anglo-Saxon race and that he has not the background of Anglo-Saxon civilization. What has our 103 years of negro leadership brought us? For over a century we have been trying to do something for our African brethren. Bishop Claire, who has been there so long, says that there are only 15,000 natives over there on whom we can count as really having an idea of what we are trying to do. Only this after a labor of 103 years. It certainly is a white man's job.'

This was interesting. But I wanted to know what he thought of radicalism among the colored people. So I asked him if he thought it would help the negro to become radical or revolutionary.

'Our salvation is by evolution and not revolution,' he replied. 'The progress we are now making, the progress of the Southland in recent years—it is wonderful what has come about in the Southern people, white and colored, since the war. Down there we are developing racial coöperation and amity. The South is going to be the real base of this country, and the labor of the colored man will be needed in the South as never before. It is a great opportunity we have, and some of us are determined that the disturbers in our midst shall not spoil it for us. The negro must keep his head. We have these agitators, too many of them. I try to get my people to see the peaceful way.

Why should any colored man want to move out from his own people and into a white community? Once he does it he loses identity with his own people and obtains no influence in his new home, but only stirs up antagonism. But, our people are yet in their infancy, and both races must be patient in dealing with the problem.

*Negroes Must Use Care in Leadership*

'As for this radicalism, we must be careful as to the kind of leadership we have in our organizations. It is too easy to be led astray by glib talkers who appeal to the emotions rather than to common sense. Where we have negro leadership we must have men who will look at this thing judicially, and not from embittered hearts or ulterior motives; men who have a little race pride and who are interested in our race as a race, and are not seeking self-advancement.'

'You spoke of having a proposition that would help out on this political situation,' I reminded.

'Oh, yes.' As he spoke, he handed me a card. 'Now, this card is of the National Supreme Council of the Coat of Many Colors, of which I am the humble author. I believe the solution of the problem is to let the negroes elect an advisory council to Congress. What I mean is not to let the negroes have the right to the Floor or a vote in Congress, but in every Congressional District wherein there are a sufficient number of negroes let them elect one of their own race who will go into the matters that particularly affect them, and let that man be their adviser to their Congressman—this is simply a representative way of using the right to petition. Many Congressmen would do anything they could for the negro, personally. But, they are in a position where they cannot, officially. To do so would mean political suicide for many of them. All we need is a black man on the ticket as a counselor.'

*Offers Solution of the Problem*

'Is that practical?' I inquired. 'Would not every other element in the country, racial, religious, national and international, demand also the right of such counselors?'

'I do not think so,' he responded. 'All the people you mention have an old civilization behind them; they would not be willing to suspend their *right of franchise* for such, the lesser thing, I propose for the negro. My proposition would give the negroes a chance to coöperate with each other as well as with white friends. The negro who cannot coöperate with his own people cannot coöperate with anybody. We get along all right with our own churches and do not have to crowd the white churches. We have our own churches, and plenty of them. And, we are happy; we shout all we want.'

'What is the significance of that portion of the title of the National Supreme Council, "the Coat of Many Colors," what does that mean?' I asked.

'I use that as a motto,' he said. 'The evolution of the negro is a duplicate of the life of Joseph. All of Joseph's life is typical of the life of the negro. You know Joseph had a coat of many colors. There are in this country about as big a proportion of white men to the negro as there were brothers to Joseph. Joseph was a trustworthy fellow in spite of all he went up against. He went into Egypt and was sold unto Potiphar. Having great love and respect for his master, he did not betray his trust when temptation came. Neither did the negro in the South.'

'A beautiful conception,' I commented.

'Joseph went to jail and stayed there two years,' he continued. 'But he came out; the negro also came out of slavery. Later Potiphar elevated Joseph. Just so the white man will help the negro and will put him in his rightful place—not at the top, but in the place he deserves and where he belongs.'

When Plummer left the office he carried my friendly feelings with him. I reflected, 'Well, here is one viewpoint that is worth the consideration of the white man.'

# Farmers Should Utilize Waste Products

(*Concluded from page 7*)

lowing yields in by-products are obtained:

33 lbs. of (Methyl alcohol) metanol
44 lbs. of methyl-ethylketone
55 lbs. of acetone
55 lbs. of light oils
176 lbs. of heavy oils

The approximate value of these by-products is forty dollars, the absolute amount dependent, of course, on the somewhat fluctuating market quotations.

All the by-products are of importance in the arts. Metanol is used as a denaturing agent. Acetone finds an extensive use as a solvent, being specially in demand with the artificial leather industries. Methyl-ethylketone is also used as a solvent, while the oils that are obtained can, as has been said, well be used as fuel in internal combustion engines such as tractors and automobiles, as well as for other purposes in the arts.

To produce one ton of pulp from straw approximately one and one-half tons of straw is required. The value of the pulp thus obtained is sixty dollars, and adding to this the value of forty dollars for by-products produced during the manufacture, it is apparent that the farmer has a source of revenue well worth developing.

As to the cost of producing the pulp, it can safely be estimated it would not be greater than in the case of wood. When wood is used as raw material, the total cost of manufacture, including the by-products, is sixty dollars for each ton of woodpulp. From this can be deducted the estimated value of the by-products, leaving a net cost of twenty dollars for the manufacture of one ton of paper. With the sales price of paper pulp at sixty dollars, it would seem as if the farmer could expect some forty dollars additional profit on each ton and a half of straw, a source of revenue that has heretofore been virtually overlooked.

Fruit rotting on ground. Note props supporting heavily laden branches.

Then again, in chemistry there are often found substances that in the slang of the science are called 'chemical parsons,' since they, as the parson in daily life, have an important function to perform, but after this function is done are still 'unaffected by their acts.' One of these substances is the humble muriatic acid. The chaff of the wheat is a waste that today has slight if any value, but by calling in the assistance of a 'chemical parson'—muriatic acid even in very small amounts—the whole chaff can be transformed into a liquid containing a large percentage of soluble sugars almost identical with blackstrap molasses. This molasses can be produced at a cost of approximately five dollars a ton, and in view of the high price often asked for the blackstrap molasses, its use should constitute a great saving to the farmer in fattening stock on molasses, as so often is done.

Similar possibilities open out in the various agriculture fields. Take the apples of California for an example. There were 154,000 tons of apples marketed in this state in 1924, just a small fraction of the nation's crop, and it is estimated that this amount was less than half of the actual amount grown. The balance was left on the ground to rot. It is the same in regard to nearly all the fruit crops of the country. They contain most valuable products developed during the growing season, yet they are left to rot, thus losing completely the values which chemistry could and should save for the arts and other purposes.

The first step toward rehabilitating agriculture is to make it a real industry that utilizes everything it produces, turning all into values. The packing houses of Chicago indicate the way. They have become more than food factories; everything is turned into value, so that in addition to being food producers, the packing houses are recognized as medicinal and fertilizer industries.

It is indeed not too much to say that a day will come when next to the wheat elevator will eventually stand a paper mill turning out the nation's paper.

Equally certain is it that one day large chemical plants will raise themselves close to the large fruit warehouses, where all fruit not demanding the highest prices as human food will be converted into products of such a character as to command markets all over the face of the globe.

When agriculture has become modern and efficient in all respects, then it will be time enough to seek special remedies. But that time, it may safely be predicted, if modern methods are really pursued, will never come.

To quote from Mr. Burbank's letter again: 'Until the plant breeder can produce special fiber and cellulose plants, all these wastes should be utilized.'

# China's Use of Proverbs

## By L. M. CRAMER

CHINESE proverbs are literally in the mouths of everyone in China: the one-time royalty, the men in power in today's Republic, even the beggars in the streets. All classes are accustomed to use Chinese proverbs.

'A stitch in time saves nine,' we hear in America. Here in China the little Celestial hears, 'If a little hole is not repaired it will increase to a foot and a half.'

As a child I used to hear my playmates say, 'Two heads are better than one, if one is a sheep's head.' But in China they say in more dignified manner, 'The knowledge of one man is not equal to that of two.'

I have said 'Easier said than done' when referring to something difficult to accomplish, and so perhaps have you; but if you were born Chinese you would say, 'To behold a task is easier than to do it.'

An old Quaker grandmother, used to say to me—'What I say goes into one of thy ears, and out of the other.' The Chinese would say, 'Enter by the east ear, exit by the west.'

'What is everybody's business is nobody's business' is one of the most repeated proverbs I remember. In China: 'When one priest carries water there is some to drink, and when two priests together carry water there is some to drink; but when three priests carry water together there is none to drink.'

Another Celestial saying is: 'If you follow the good you will learn the good, if you follow the beggar you will beg for food.' Twenty words it takes to say it the Chinese way, while we use five words: 'Evil companions corrupt good manners.'

'All within the four seas are brothers' is one of the shortest of the Chinese proverbs, while we say, 'All men are brothers.'

We say 'Lock the stable door after the horse is stolen' and the Chinese says, 'When the guest comes we sweep the floor; when the thief goes we close the door.'

'Like teacher, like pupil' we say and in China they say, 'The illustrious teacher produces a good disciple.'

'Self-praise is no recommendation.' How often did I hear that proverb when I was a child, which some way shows that I must have been vain of my own abilities. The little Chinese girl is told:

'A quack doctor has no efficacious medicine,' which is a very strange saying in a land where native trained doctors too often use dried centipedes, dried tiger's eyes and dragon's teeth, all powdered up, for their medicines.

# The Stories the Windmills Tell

## Joy, Grief, Trouble, or Celebration All Are Indicated by the Huge Sails Which Serve As 'Town Criers' for the Countryside

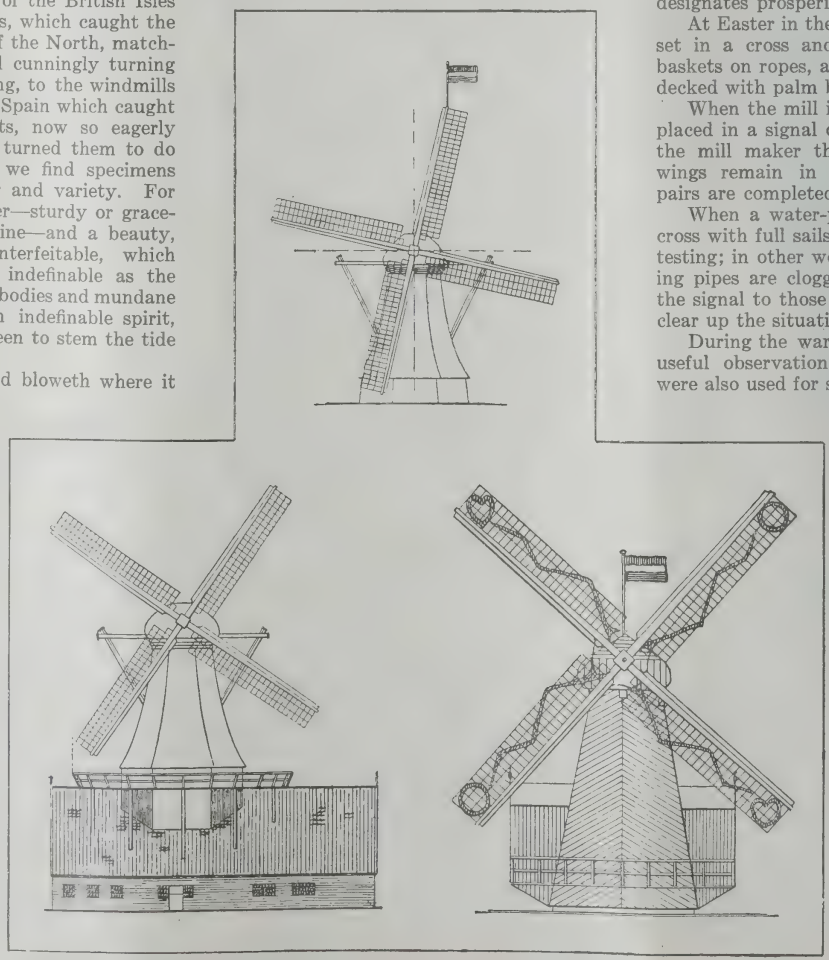
BY JANE HICKS

'Whoever goes tilting windmills must be prepared for surprises.—The old castles have their seneschals, the old forests their keepers, supported by moneys that are always forthcoming when any aristocratic hulk, left stranded by the sea of Time, is in danger of falling to pieces. But windmills are the old laboring men; and mankind in general is not very much interested in laborers who are too old to work, or whose labor is now a homely antiquity.'

SAILBOATS and windmills, companions of the wind, strike a responsive chord in the hearts of all who love the artistic, the picturesque.

This engine-driven world seems gradually to be crowding windmills out of the picture; but today, at time's crossroads, we still are heartened by splendid specimens of these centuries-old giants, and if we pause we may still learn their story.

From the windmills of the British Isles and the North Countries, which caught the cold, boisterous blasts of the North, matching wits with them and cunningly turning them to do man's bidding, to the windmills of Southern France and Spain which caught the warm, playful gusts, now so eagerly sought by society, and turned them to do serious work for man, we find specimens fascinating in character and variety. For windmills have character—sturdy or graceful, masculine or feminine—and a beauty, individual and uncounterfeitable, which constitute a charm as indefinable as the wind. For all their solid bodies and mundane purposes, they have an indefinable spirit, and they may still be seen to stem the tide with their frail fingers.



To be sure, the wind bloweth where it listeth, but our ingenious forefathers expressed themselves artistically by designing for utilitarian purposes these picturesque contrivances to harness the fitful and uncontrolled element for their use. Sails enormous and beautifully curved may be seen from a distance cutting the blue sky into fantastic mosaics.

A century or two old, most windmills are. So, as we peer back into the world of then, we find the indispensable mill in the heart of each community, providing its chief livelihood; and the miller a big man of the neighborhood.

But, as has so aptly been said, 'When a windmill falls into commercial hands there is little likelihood of its retaining anything of its pristine charm. It becomes a factory; it has fixed hours of work; and when the wind has a lazy fit and hides from the traps laid by man, an electric dynamo is brought into operation, and the work goes on.'

Not only in grinding the grain was the windmill used in its early days. Its dominating position for the surrounding country was most effectively put into use, and it became the town crier, the newspaper, the tale-bearer of those days. For in very deed there was worked out a definite code, a language of the windmill, as complete as the Morse code of today, and universally understood by the people of those days.

So it came to be the established custom of the miller, through the wings of his mill, to spread the news to his community.

Above—'Joy.' Left—'Crippled'—call for mill maker. Right—'Wedding' or 'National feast.'

In windmill countries it is still the custom for the miller to announce a birth in his family by placing the wings in the sign of Joy. This is done by stopping the wings just before the vertical position; usually a flag is placed on the highest wing. In mourning the wings are stopped just past the vertical.

To announce the wedding in the miller's family, the mill is set in 'Pretty.' For this signal, the wings are set in a cross facing the miller's house. The sails are rolled up and braided through the wings as decorations. Often garlands of ropes, flowers, leaves and colored ribbons are hung from the upper wings. National flags, tin shields, hearts and wooden statues of angels with trumpets were also used to decorate the wings. The news is heralded for three Sundays preceding the event.

It may be observed that some mills have brown and white sails on the wings. This designates prosperity.

At Easter in the old days the wings were set in a cross and adorned with hanging baskets on ropes, and the upper wings were decked with palm branches.

When the mill is crippled, the wings are placed in a signal of distress. This informs the mill maker that he is wanted. The wings remain in this position until repairs are completed.

When a water-pumping mill is set in a cross with full sails set, it is said to be protesting; in other words, the canal and feeding pipes are clogged with weeds. This is the signal to those in charge of drainage to clear up the situation.

During the war windmills proved most useful observation posts, and the wings were also used for signaling.

In Friesland most farmers own their own mills. When a calf is for sale, the wings are set in a cross by which the butcher understands he is to journey to that place for the animal.

In Zeeland the miller and game thief have been found to be in cahoots. The miller gives the signal with his mill wings when a policeman is near.

So it is that windmills, set in the midst of human events, came to be not only agents and playmates of the winds but chroniclers of the joys and sorrows of the men who made them and whom they so faithfully served.

# A Fighting Quaker of '76

## Joseph Hewes—Who Led the North Carolina Men in Declaring for Independence

By CARL SCHURZ LOWDEN

Copyright, 1926, by Carl Schurz Lowden.

## NORTH CAROLINA

NORTH CAROLINA was the first colony to come out flat-footedly for saying 'Goodby' to old Britain. Thomas Person, a fellow with an odd name and a member of the colonial legislature from Granville, which was the home of one of the signers from North Carolina, seems to have been the moving spirit in obtaining definite action. He was a member of a committee named on the eighth of April, 1776, to consider the 'usurpations and violences attempted and done by the King and by the Parliament of Britain against America, and the further measures to be taken for frustrating the same and for the better defense of the province.' When the committee gave its report the legislature adopted a resolution empowering its delegates, William Hooper, Joseph Hewes and John Penn, to 'concur with the delegates from the other colonies in declaring independence and forming foreign alliances.' By virtue of this authority these three men became the three signers for North Carolina at the Congress in Philadelphia.

Joseph Hewes was born in New Jersey in 1730—neither the day nor the month is known—and he died in November, 1779. John Penn, a Virginian by birth, lived from 1741 to 1788. The span of William Hooper, a Bostonian by birth, extended from 1742 to 1790. The North Carolina signers died comparatively young at an average age of forty-eight. Only one other state, the sister state of South Carolina, had a smaller average; it was forty-seven for its four signers.

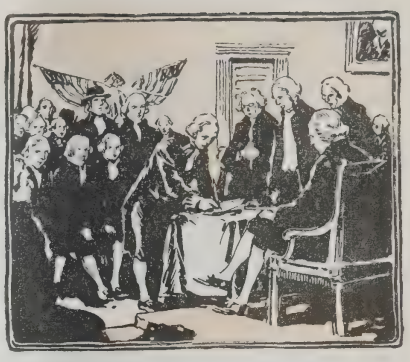
Hewes served not only as a member of the Provincial Congress but also of the Continental Congress; and, furthermore, he was the agent for North Carolina, supplying her with everything needed to prepare for the war and equipping her troops. These materials were brought from abroad on ships owned by Hewes.

When Washington's army nearly starved at Valley Forge in the winter of 1777, it was saved by Hewes' ships bringing provisions to South Quay on the Nansemond River where wagon trains took them northward. Hewes, as the chairman of the Marine Committee of Congress, proved himself a glutton for work and qualified as one of the chief builders of our Navy. Indeed, it appears that when officers were selected for the naval service it was Hewes who appointed John Paul Jones, who probably made the most brilliant record among all the naval commanders of the Revolution.

Hewes was a Quaker. In 1775 the Quakers held a meeting at which they denounced Congress and its proceedings. The sect did not believe in war; but Hewes thought there were worse things than war, and he promptly broke with the church. He became a promoter of war. He threw off his Quaker restraints, danced whenever he could and evinced a fondness for the ladies; he would not permit any slackening in his patriotism, however.

Even in February, 1776, Hewes and the other leaders were still hoping that the trouble with Great Britain might be smoothed out so that mother and child would be reunited. Great Britain was preparing to start a campaign somewhere in the South that spring. Hewes urged his fellow North Carolinians to fight for their rights. He wanted to fight too but, like other men needed in Congress, he was persuaded to serve where he could serve best.

### *Health Broke Under the Intense Strain*



Joseph Hewes was virtually the first Secretary of the Navy. He worked too hard in supplying a naval force for his country. One of his colleagues pictured Hewes' arduous labor as follows:

'From the large share of naval and mercantile business which has been allotted to his attention by Congress his health has been much impaired. From six in the morning till five and sometimes six in the afternoon, without drinking or eating, he would be at work.'

His health broke under the intense strain. Three years later he died, having given his life to his country as truly as the soldier expiring on the battlefield or the sailor dying in action at sea.

William Hooper, a compatriot of Hewes, suffered from ill health. He had been born and educated in Boston, which had too many lawyers; so Hooper had come South. The open country with few roads and fewer comforts, the hours he kept, and the otherwise too easy life of the South weakened his powers of resistance. However, he would not heed his father's advice to return to Boston. Instead he married a Miss Clark, of Wilmington, North Carolina, and settled down there. His health so greatly improved that in 1770 he took a leading part on behalf of the Government in preventing mob violence and a state of anarchy by the Regulators, about three thousand strong; in fact, there was a battle in which Hooper gloriously participated. Three years later he was chosen to represent Wilmington in the Provincial Congress.

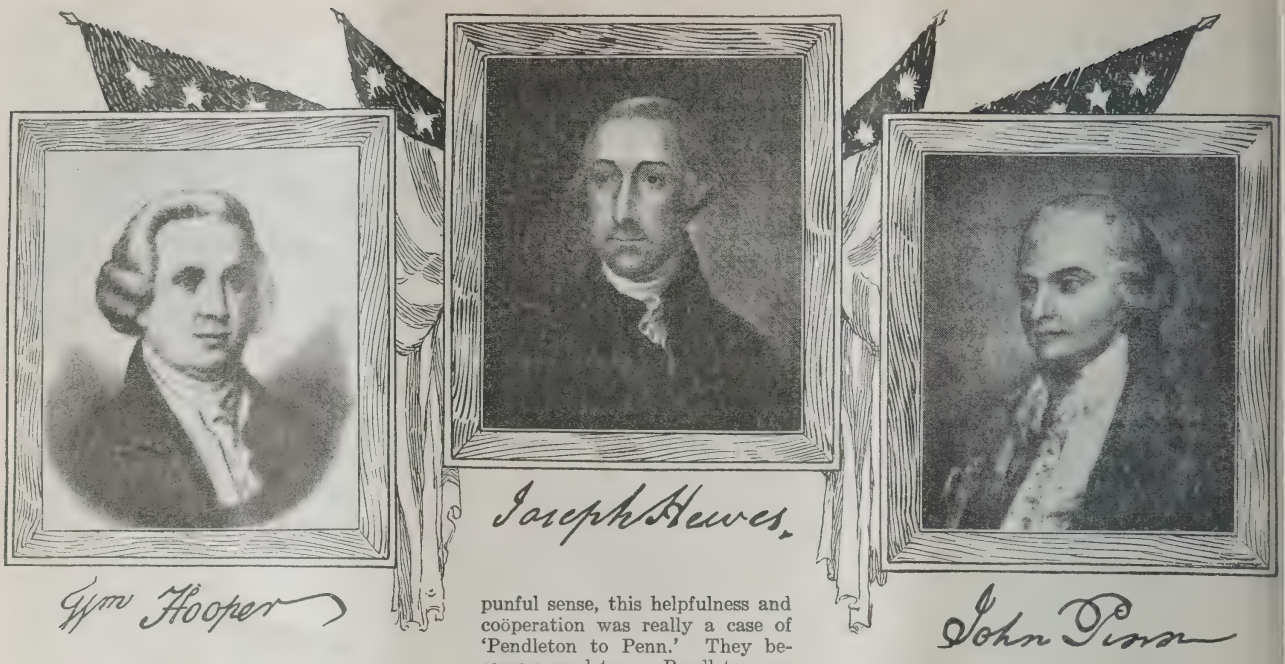
This man's rise to the Continental

Congress may be attributed to three or four factors: his record in opposing the ill-advised demands of the Regulators, his wide information linked with an admirable poise, and his utter unselfishness.

During Hooper's first year as a legislator he opposed a certain measure that the British wanted passed to change the methods of the courts. He objected to one clause because he thought the dearest rights of the people would be infringed thereby. He made speeches against the measure, besides writing a series of essays on the subject. Due to his protests, the colony was left with no court for approximately a year. Hooper, the lawyer, suffered the loss of his own income. He preferred to adhere to his conscience and high principles rather than selfishly consider his own welfare.

The honest conduct of this man made such an impression that in 1774 he was elected to Congress, and he took his seat in September of that year. At once he received appointments to two important committees. His first address attracted wide attention. 'The house,' a writer of that time commented, 'was astonished at the exhibition of so much eloquence by a delegate from North Carolina.' Evidently Congress did not expect a great deal from this southern state; if it had known then that Hooper was a Yankee by birth, it would not have been surprised at his oratorical ability.

### *Hooper Asked for Day of Fasting*



Hooper was devout. In June, 1775, less than a month before independence was declared, he introduced a resolution naming a day of public humiliation, fasting and prayer throughout the land.

After a short stay at his home, William Hooper returned to Congress. There at Philadelphia, on the fourth day of July, he gave his vote for independence. He soon resigned his seat, however, and returned to his home, from which his influence for the Revolution radiated throughout North Carolina.

The news of the disaster at Germantown dazed many of the patriots, but it seemingly made Hooper even more zealous than he had been. A party of his friends clustered around him when the news came to Wilmington.

'We have been disappointed,' he animatedly agreed with them, 'but no matter; now that we have become the assailants, there is no doubt of the issue.'

The British occupied Wilmington after Hooper and his family had fled to a small plantation. His active part in the Revolution led the enemy to pursue and harass him for several years. At last, in November, 1781, the enemy evacuated Wilmington; the Hoopers returned but later

they moved to Hillsborough, their country-seat eight miles away.

There is a handsome monument, twenty feet in height, at Guilford, North Carolina. It is crowned with the statue of an orator holding within one hand a scroll, the Declaration. The 'In Memoriam' inscription on a bronze tablet is as follows:

'William Hooper and John Penn, Delegates from North Carolina, 1776, to the Continental Congress, and Signers of the Declaration of Independence. Their remains were reinterred here in 1894. Hewes' grave is lost; he was the Third Signer.'

And this brings us to John Penn whose mother was a Taylor from a family which gave us two Presidents, James Madison and Zachary Taylor. Furthermore, Edmund Pendleton, whom Thomas Jefferson characterized as the 'ablest man in debate I have ever met,' probably contributed more than any other man to the shaping of young Penn's career. When Moses Penn died, Pendleton offered to his young kinsman the free use of his extensive library to overcome the defects of an early education; so, in a punful sense, this helpfulness and coöperation was really a case of 'Pendleton to Penn.' They became a good team. Pendleton was old when the North Carolina legislature, largely due to John Penn's initiative, instructed its delegates for independence. It is entirely possible that Penn's influence reached across the border and moved Pendleton, his Virginia cousin, to offer the resolution directing the Virginia delegates to propose the declaration in Congress.

Penn formed another team, as it were. He stood for the plain people while his fellow signers were of the aristocracy. 'Penn and Person' was the name of this team. Hewes and Hooper, the other signers, often criticized Person, whose outspokenness and radicalism displeased them; but they got along pretty well with their colleague, Penn, who worked splendidly with Thomas Person. Penn trusted the people, but notwithstanding he once wrote to Person:

'For God's sake, my good sir, encourage our people. Animate them to dare even to die for their own country.'

Penn and Person were residents of the same town, Granville. Person, as a member of the Carolina assembly, had been highly instrumental in having his fellow townsman named as a delegate to the Continental Congress to succeed Richard Caswell.

'My first wish,' Penn wrote to Person on St. Valentine's day, 1776, 'is that America be free; the second, that we may be restored to peace and harmony with Britain upon just and proper terms.'

Watson, in his annals of Philadelphia, tells the story of a near-duel between Penn and Henry Laurens. It reveals Penn's persuasiveness and reasonableness too.

'A singular case of duel occurred in Philadelphia in 1778 or '79 between Henry Laurens, president of Congress, and Mr. Penn,' Watson says. 'They were fellow boarders and breakfasted together the same morning. They were to fight on a vacant lot on Chestnut Street across from the Masonic Hall. In crossing at Fifth Street through a deep slough, Mr. Penn kindly offered his hand to aid Mr. Laurens, then much the older, who accepted it. He suggested to Mr. Laurens, who had challenged him, that it was a foolish affair, and made up on the spot.'

# Pageantry for All

By FRANCES L. GARSIDE

IT IS not an impossible thing to put on an imposing pageant in the smallest community,' declared Miss Era Betzner in the course of an interview. Miss Betzner has done this in almost every state in the Union. 'I find real histrionic talent where it is least suspected. In putting on a pageant, the trouble does not lie in finding the live tools, but the accessories.'

'What would be a new and amusing feature for a street fair?' 'Do you know of a snappy substitute for the worn-out fish pond as a means of making money?' 'Can you give us six weeks' time in the autumn for directing and rehearsing the children who will give a Children's Carnival?'

Many such requests have drawn Miss Betzner into a field of service which has taken her all over the country. Her first experience was in a schoolroom in Atlanta, Georgia. She saw that little feet did less shuffling, there was less twisting of nervous little bodies, and the children showed better results in their lessons when the room was made attractive. She relieved the tedium of bare walls with gay pictures; growing plants were put in the windows, and the pillars of the room were adorned with festoons in bright shades. She found the children so responsive that she went a step further, doing an unprecedented thing in those days—she put on a children's play. A pageant by her pupils followed and she was chosen as one of the directors for an imposing Shakespearean pageant.

Wherever Miss Betzner went after that, she saw the need of gayer colors, more music, more recreation and a better understanding of the pageant. It was a charming vehicle for bearing to one generation the story of the generation that preceded it and it brought folk together.

She is the apostle of community recreation.

Miss Betzner directed the pageant put on as a community feature to celebrate the 175th birthday of the city of Reading, Pennsylvania. Two thousand men, women and children took part, and some idea of its magnitude may be gathered by this item in the accessories: 'One-half mile of footlights.' Perhaps one of the most interesting phases of this event was that rivalry in politics and differences in creed were forgotten. The people were united in one ideal.

'Any group,' was a comment heard on that occasion, 'will work together, but the real test of democracy is to play together. We have played together.'

'We need more color,' concluded Miss Betzner, 'more music, more appreciation of play. We have journeyed a long way from the day when the hunger for community entertainment was gratified by the sight of a badly frightened child breaking down in the middle of the "piece" he had so well learned; we have journeyed a long way, but we have a long way to go.'

# Mental Tests Make Us Seem Foolish

(*Concluded from page 8*)

ng by the layman of what is written by the psychologist, since language common to everyone is used. But let this be emphasized. *It is not used with the same meaning.* The net result is that many appear learned in mental tests, lead discussions on this provoking topic, and write for the papers when the real meaning of a fourteen-year-old mental level is obscured to them by the very plainness of the terms.

Does your school have someone who gives psychological tests? Probably. Someone really qualified to do this crucial work? Probably not. This is another phase of the second menace. Anyone can secure a book on mental tests for a two-dollar bill, pay sixty cents additional for the testing material, follow the directions and *think* he is giving a mental test.

Cakes may be baked in this cookbook fashion and wonderful culinary products result. But not mental tests. Yet in almost any school system you will find someone who is 'doing' a few tests now and then. *Doing* is the correct word. I would wager that not one out of a hundred of those who do tests is qualified.

This is a vicious situation, since many school officers take the test results seriously. Anyone who gives courses in mental tests in a large university usually runs across this experience several times late in the course:

'Oh, Professor. I wanted so-o much to take your course in mental tests, but you see I could not. Do you care if I drop into some of the class sessions now? You see I am going to teach in the Blank High School and they want me to give mental tests to the students.'

The shame here lies on the secondary school system. The elementary schools sin in this respect just as much. And so do the colleges themselves. For example, take this letter:

———————, Ohio.
July 23, 1925.

Dear Professor Laird:

You will remember I was in your class at the University of Iowa two summers ago. I have taken another course in psychology since then.

———— College has just engaged me to teach psychology and I wish you would recommend some text books to me. Could you tell me, also, a good book for me to read on mental tests. The president wants to give mental tests to all the freshmen this fall and I am to do it. What mental tests do you use at Colgate? We might want to use these.

Sincerely yours,

———— — ————

They say that college professors are underpaid. This was one that was not going to be.

Perhaps he needed the job, but I am convinced that he secured it under false pretenses in posing as being able to teach psychology.

Opportunists in the graduate schools find it profitable to become 'psychologists' overnight and enter the faculty of some small college as official psychological examiner. They do almost irreparable damage to psychology and to those they examine.

Even established teachers in colleges find it intriguing to flirt with this practical application of psychology. Witness the following letter received last week by an industrial magazine on psychology:

———— College
March 29, 1926.

Gentlemen:

I have been teaching philosophy and education here for six years. I am interested in entering industrial work in psychological testing. Do you think advertising in your journal would bring me into touch with someone interested in my services? What are your advertising rates?

Cordially,

———— — ————, B. A.

He wrote down that B. A. in his own handwriting as though it gave him complete license to give psychological tests—after having been in other fields for six years at least. His advertising will never appear in the journal, and the editors fear their ears are burning as a result of what they wrote him.

It is astounding the number of theological students who want to become psychologists the last year of their ministerial course. Psychologists are *assumed* to receive higher remuneration. So with students who have been intending to enter medicine, but at the last moment fear the courses will be too difficult for them. And others almost without end who find themselves intrigued into this field since they don't know just what they want to enter. When they are firmly told that they must do at least three years' graduate study in this particular field before they should assume the responsibility of doing psychological examining their enthusiasm cools at a rapid rate.

This is probably the greatest menace of mental tests. How are you to know if the 'tester' in your schools is qualified? There are no state laws for certifying mental test experts. There are for plumbers, electricians, accountants, lawyers, and physicians—but not for psychologists.

It's a gamble—selecting a psychological examiner under present conditions. And the hazards are redoubled by the fact that your town is likely to be visited in a year or two by some itinerant 'psychologist' who will go through some hocus-pocus and give a 'mental analysis' of you for a modest fee. This tramp 'psychologist' is apt to be some quack that medical practice laws have driven from fleecing the public as a medicine man and who has, presto chango, become a 'psychologist.' It is a poor city with 100,000 population that this traveling humbug cannot fleece of $30,000 in two weeks.

One did it in Kansas City just last week! Another in Albany and another in Washington at the same time!

Your town is likely to be visited by some itinerant 'psychologist' who will go through some hocus-pocus

## Life Among the Wild American Humorists

(*Concluded from page 13*)

When Mitchell came to it in the proof he looked at it first without reading it and remarked:

'That's too long.'

'Suppose you read it.'

He read it very carefully and slowly and then laid the proof down deliberately.

'It isn't quite like us,' he said.

'I know it,' I replied, 'but isn't it good?'

'You like it very much?'

'Oh, yes.'

'Well, if you like it that much, run it, but put it back in the paper.'

I can see now that his editorial judgment was perfectly correct. Gillilan's poem has probably been copied more and been more widely read since then than any other humorous poem I could name, but it would have spoiled the effect of the paper to have been placed so prominently. It was an Irishman's poem, and suffered no loss by being placed in an inconspicuous position; indeed, it was a gain, as I have always thought. One of the best editorial rules in the world, making for permanence and stability, is to place the best thing in an out-of-the-way position. It creates in the reader a kind of confidence which is worth a great deal to any periodical.

To show that my own editorial judgment was not by any means a stable thing, it was about this time or somewhat later that I rejected the first fables George Ade wrote. I think it was after he had begun them in Chicago that this occurred. I recall very well receiving them, deliberating about them briefly and returning them. On the whole, I still believe I was right, as they would never have spread in a paper like *Life* as they did with a newspaper circulation.

(*To be concluded in an early issue.*)

# A Sailorman Poet—Spins Yarns of the Sea

(Continued from page 2)

I was at sea there was little leisure; a young friend of mine tells me that there is too much now.'

'Did you find it possible to read at sea? I never could do it.'

'Well, it's not easy. Anthony Trollope's the kind of writer I found fit for the sea; a nice, long, leisurely Trollope lasts several days. He's jolly good; one of the very best of the Victorians. I don't mean the Barchester stories so much, which I don't think are really his best. He covered an immense range, hunting, politics, all sorts of subjects. I like him.'

'He was very methodical; very matter of fact?'

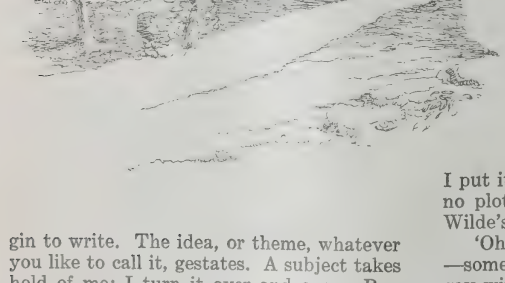
'Yes, very methodical; a steady worker; but why not? Am I? Ye-es; I do work steadily; of course, not when the mood is not on me; and not so many thousand words a day, like Trollope. Not exactly fixed hours for work; generally a couple of hours in the morning; the same, or much about, in the afternoon, and often from five to half-past six.'

He went on to tell me something of his methods, his habits, of working:

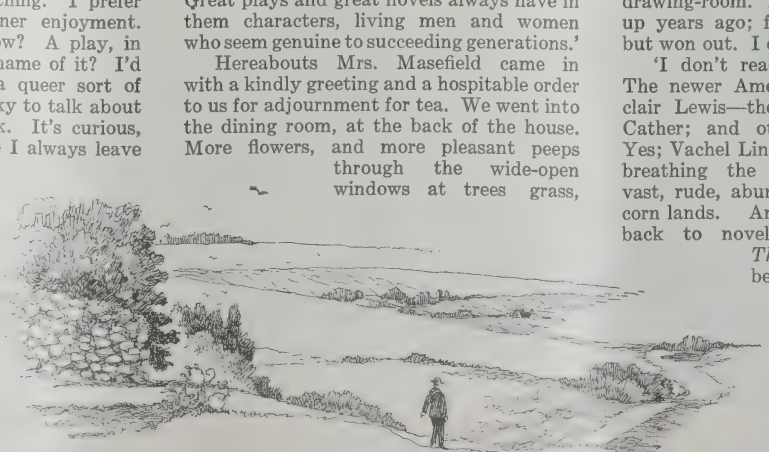
'A subject for a poem or a play—yes, or a story—simmers in my mind for a long while, sometimes for a year or two, before I begin to write. The idea, or theme, whatever you like to call it, gestates. A subject takes hold of me; I turn it over and over. Perhaps a character comes to me; grows to life, until I am ready to get to grips with it. I am always writing something. I prefer verse; it gives me a keener enjoyment. What am I at work on now? A play, in verse. The subject? The name of it? I'd rather not tell you; I've a queer sort of superstition that it is unlucky to talk about an unfinished piece of work. It's curious, but when I write an article I always leave the title to the last; sometimes never give it one at all. An editor friend used to complain that I left to him the most difficult part. To get an exactly right title is difficult. I always do my writing with a pen. I have only met one man who did his work straight onto a typewriter—J. M. Synge. He did his drafts, all of them, up-

on his typewriter. Yes, I agree with you; he was one of the most modest of men.'

All this in a quiet, gentle tone of voice, with just every now and then a flash of energetic emphasis.



'No,' in answer to a query of mine, 'No, I don't get to the theater now very much; chiefly when I have a chance to see a poetical piece. Shakespeare? Oh, yes. *What?* You don't think Shakespeare a supreme dramatist? Do you mean it? Hamlet a childish plot? *Is* it? See how it has survived, held the stage, fascinated thousands and thousands. You call it—as a plot—a rowdy melodrama? It *is* melodrama. Does that make it the worse? Aren't all good plays melodramas?'



I admitted that there was somewhat of the truth in what he said, could not, however entirely agree; and generously gave him, as an example of the stage value of Hamlet, this:

'Years ago I saw Sarah Bernhardt as Hamlet; she threw overboard all of the poetry and rushed it through as straight melodrama. It was really most exciting, and gripping. And—' I put it, '—some great plays have practically no plot at all, for instance, most of Oscar Wilde's.'

'Oh, yes; and he's held the stage—what—some thirty years. But what delicious, gay wit! Sheridan? Yes; there were characters, complete human portraits, in his comedies; that's where Wilde was weakest. Great plays and great novels always have in them characters, living men and women who seem genuine to succeeding generations.'

Hereabouts Mrs. Masefield came in with a kindly greeting and a hospitable order to us for adjournment for tea. We went into the dining room, at the back of the house. More flowers, and more pleasant peeps through the wide-open windows at trees grass, flowers, and sunshine. Delicious home made bread, and such a cake! I, being young at heart, got right onto that cake. Never eat bread-and-butter, however goodly, when you can have cake!

I let loose the confession, of which I am not at all ashamed, that I have never been able to read *Paradise Lost*.

'Oh, dear,' exclaimed Masefield, 'you don't mean that? I've read it again and again. Not many do? I don't agree; I'm certain that there are many who read it maybe, once a year at least. I do.'

And I was nearly pulverized by Mrs. Masefield supporting her husband with:

'And I love it too. Why, I know quite a lot of it by heart.'

But I do agree with Poe that long poems are never wholly great; that they are a series of short poems hung together on a usually dull string.

'Poetry?' said Masefield. 'Yes, I read quite a lot. There's Spenser; I don't read *him* as a whole, but casually, dipping into him; taking him up for a while now and then.'

And so on.

After tea, back for a short while to the drawing-room. He does not smoke; gave it up years ago; found it a wrench at first, but won out. I did smoke as we talked:

'I don't read very many novels now. The newer Americans? Yes; there's Sinclair Lewis—the *Babbitt* man—and Willa Cather; and others. American poetry? Yes; Vachel Lindsay; and Carl Sandburg—breathing the great Middle West—the vast, rude, abundant expanse of the great corn lands. And Ernest Poole—turning back to novelists—have you read his *The Harbor?* Do. You've been over there?'

'Yes, but many years ago.'

'New York? You'd scarcely recognize it! I agree with you; it is beautiful; amazingly beautiful. And they have, especially in their churches, a striking Gothic of their own. We build

Gothic churches, but the architecture seems to be dead, a dim shadow from the past. American Gothic is alive—they've got themselves into it somehow.'

We got talking about Joseph Conrad—

'Magnificent! Amazing that he, a foreigner, wrote such English; but it is not an Englishman's English; I feel the foreign mentality at the back of it.'

While we were looking at his model of the old merchant sailer, I asked him about sea chanteys, now so much the fashion.

'Oh, yes, but they don't know how to sing them; no one does, except a sailor. I have heard some of them on the wireless. Very doleful! A chantey is, at least should be, inspiriting; I have joined in many and many myself, at work. The hauling chanteys—these concert singers sing them too slowly. When you're pulling at a rope you must make a noise of some sort, but not a funeral march! The capstan chanteys they sing too fast, far too fast. You can't dance round a capstan! It's slow, hard pushing. It's striking how inspiriting a simple sound can be! I heard, or read, somewhere a story that struck me; during the war, during the retreat in 1914, General Tom Bridge's men were flagging, footsore, weary, dead-beaten; he heard music in a tavern, drumming on a toy drum and the playing of a fiddle. He fetched the musicians out, gave the drum to one of his men, and the tap-tap, tap-tap-tap and the tune on the fiddle saved the lot of them!'

## American Installment Buying

(*Concluded from page 6*)

may be faced with a novel and very interesting problem. Not only is every manufacturer producing at high pressure to meet the present demand, but in many trades, notably in the motor industry, he has 'scheduled' a great increase of production on which the whole policy of his business rests, and while he is planning this greater output for the future, he is still collecting from the consumer the payment for goods bought months ago and already partially consumed. The country, in fact, may come to its trade reaction with a great industrial program in full swing, relying on a body of consumers who not merely have not been saving, but are actually in debt to their manufacturers—consumers who are so far from having the accumulation of thrift to draw upon that they are still in pawn for their past luxuries.

This situation is so different from anything we have known in the past that it would be imprudent to dogmatize, and certainly presumptuous for anyone without an intimate recent experience of American conditions to start ringing the alarm bell. But observers in the United States are already sounding a note of caution, pointing out that this hire-purchase can be regarded as a kind of inflation, that the convincing motor salesman may prove to have nullified the careful anti-inflation policy of the banking authorities, and that once the system has become generally popular it is extremely difficult for the manufacturers either to abolish or to restrict it. Whether this is so or not, the position is full of interest, and it would appear to be beyond dispute that the effects of any sudden decline in trade must be aggravated and complicated by the new system of long-term retail credit.

GERMAN WAR GLASSES

$9.85
Postpaid

***For hunting, motoring, the races, ocean travel, bird and nature study, etc.***

We have been fortunate in making new and permanent connections with one of the best German optical manufacturers for an additional supply of these German War Glasses, which have proved so popular in this country.

Representing a conservative $20 value, they are the same efficient model all-purpose field glass built for war use, according to strict military specifications, for German Army Officers.

Day and night lenses — dust and moisture-proof — 40 m.m. objective, giving large field of vision—pupillary adjustment.

Built for service, crystal clearness, and accuracy. Equipped with leather neck straps and lens cover.

Each glass inspected, tested, and guaranteed in perfect condition.

Shipped promptly, postpaid, on receipt of check or money order for $9.85. Positive guarantee of full cash refund if not satisfied. *Order your field glasses today.*

## What Has Become of Our Parties?

(Concluded from page 4)

that in both countries the two-party system obtains. England for a time had three parties—Conservative, Liberal, and Labor. The idea of a Labor Party is unsound. There is nothing that a Labor Party as such can do—as was shown by the MacDonald Cabinet in England. Now Parliament is gradually getting back to two parties

> The plain truth is that there is today no way of distinguishing a Republican from a Democrat—in or out of Congress. A man has got to tell you what he is and you have to take his word for it.

—the Liberals will merge with Labor or the other way about. The Progressive Party of Roosevelt passed out while the Progressive Party of La Follette did not attempt to go into Congress.

Our natural division is into two parties, and now that we have finished the rougher work of shaping the nation, the two parties will be the Conservatives and the Liberals, although we shall continue to use the names Democrat and Republican. Mankind divides into those who want to go too fast and those who want to go too slow. In a truly representative government these two elements are present. The Conservatives keep the Liberals from jumping fences, and the Liberals stir the Conservatives enough to prevent them from going to sleep.

That is the ideal set-up, for then every good idea is certain of a hearing—and issues are avoided. For an issue is really an ill of the body politic which was not taken in time.

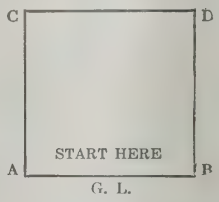
## Laws the Puritans Enacted

The following are items from the Code of 1650 of Connecticut:

Idleness. 'It is ordered that no person shall spend his time idlely under paine of punishment and for this end it is ordered that the constable shall use dilligence to take knowledge in this kinde, esepecially of common coasters, unprofitable fowlers and tobacko takers.'

Burglarly. 'If any person shall commit burglarly, such shall for the first offense bee branded on the forehead with the letter 'B.' If hee shall offend the second time hee shall bee branded and also severely whipped and the third time, be put to death. If any person shall commit burglarly on the Lord's Day, besides the former punishments, hee shall for the first offense have one of his ears cut off and for the second offense shall looss his other ear and the third time, shall be put to death.'

Gaming. 'Upon complainte of great disorder by the use of the game called shuffe board in howses of common interteinment, whereby such precious time is spent unfruitfully and much waste of wyne and beare. Therefore, no person shall henceforth use said game in any such howse, howse to forfeit for each offense 20 shillings and every person playing to forfeit for every offense five shillings.'



# A Dance A Week

## THE SEVENTEENTH CENTURY MINUET

The following is danced by two persons. However, any number may take part formed in columns, but each couple moves independently. In learning this dance, learn the steps then draw a diagram on the floor about eight feet square and designate each corner by letter or numeral. The introduction, consisting of eight measures, is called 'honors' and is the only part of the dance where the bow and curtsey are performed. The numerals used in the body of the description are beats in the music and not measures.

G. L.

Honors..... 8 bars

Salute partners, 1-2-3-4-5-6; join nearest hand, shoulder high; each starts with right foot.

Pas Marche 7-8-9; Assemble, 10-11-12; starting with right foot, return to place with Pas Marche step, nearest hand joined 13-14-15-16-17-18; Assembled 19-20-21; to assemble, face each other, join right hands shoulder high and raised upon the toes, then turn and face center of the square, ready for the next movement, 22-23-24.

**Pas Grave**—Join nearest hand, shoulder high, each starts with right foot forward, and **pas grave** 1-2-3-4-5-6; Pas Marche—7-8-9; Assemble—turn and face each other right foot forward 10-11-12; Pas Minuet. Each to the right, and looking at each other, gentleman toward 'A,' lady toward 'D' 13-14-15-16-17-18; Pirouette —19-20-21; Balance Backward 22-23-24.

**Second strain of music.**

Gentleman starting from A, Lady from D.

**Pas Grave**—Toward each other 1-2-3-4-5-6; Pas Marche forward 7-8-9; ASSEMBLE—10-11-12; Both now, Pas Minuet to the right away from each other, gentleman toward 'B' lady toward 'C' 13-14-15-16-17-18; return toward each other with **pas balance,** starting with left foot, and passing by each other, 19-20-21-22-23-24; both then **Pas Bourre** to the left then right, 25-26-27-28-29-30; **Pas Bourre** quick double time, lady toward 'B,' gentleman toward 'C,' and pirouette to face partner 31-32-33; **Balance** backward on left, right toe pointing in front 34-35-36; starting, gentleman from 'C,' lady from 'B,' moving forward toward each other with a **Pas Balance,** starting with right foot 37-38-39-40-41-42.

**Pas Marche**—Turn partner half around with right hand facing each other 43-44-45; each pirouette half around, finish back to back, 46-47-48; each take three **PAS MARCHE** forward, gentleman toward 'B,' lady toward 'C,' turn and face partner 49-50-51; **Balance** back on left 52-53-54. Repeat the first strain of the music.

**Pas Grave** toward each other 1-2-3-4-5-6; **Pas Marche toward** partner 7-8-9; **Assemble**—10-11-12; join nearest hand and **Pas Marche** to original place 13-14-15-16-17-18; each join left hands, and turn in place 19-20-21-22-23-24, so that the lady is returned to the right side of her partner. Repeat the HONORS eight bars.

*Good Morning*, a dance manual of the Old American Dances, compiled for Mr. and Mrs. Henry Ford, contains 169 pages of calls, descriptions and some music of the dances taught in the Ford School. Price 75 cents.

Also, there are 20 orchestrations of 11 parts each—25 cents each orchestration, or $4.00 for the lot. Book and music will be mailed upon receipt of price.

# The Seventeenth Century Minuet

Arranged by Humphrey

# I Read in the Papers

During the three longest days in the year, June 21, 22 and 23, more than 40,000 out-of-town persons attended the West Texas chamber of commerce meeting in Amarillo. Indicative, this, of the dynamic force which is upbuilding one of the few remaining frontier regions of America. San Antonio, more than 700 miles away, sent a trainload of delegates and dozens of other Texas communities, ranging from Dallas to smaller Lubbock and Abilene, did likewise. The area of the Lone Star State that is termed West Texas could accommodate Maryland, Virginia, North Carolina and Florida and have enough vacant space remaining to take in big segments of Kentucky and Tennessee. The former cattle kings of West Texas have seen their holdings become enormously valuable through the discovery of oil, one Fort Worth cattleman enjoying an enhancement of land values to the extent of fifty million dollars. The resources of West Texas are imperial—as the state suggests an empire in its scope. One-half of the mohair of the nation is produced there and the bulk of the domestic production of quicksilver comes from there. The public domain is owned by the state and not by the Federal Government and a great mountain park will probably be created in the Guadalupe Peak district near the New Mexico boundary.

The significant thing about this enormous meeting in Amarillo is that the United States was supplied with newspaper dispatches about crimes while 40,000 West Texans were engaged in energizing their two million fellows to upbuild their state in accordance with the finest American traditions. Most of us learned of it only through accident.

At a recent auction sale at Christie's where Sir William Orphen's portraits of the principal figures at the Versailles Peace Conference were sold, Woodrow Wilson's portrait brought a higher price than any of the other War and Peace Conference notables. It brought $13,000. The next highest price was paid for a portrait of General Smutts—$2,700. Following these came those of General Pershing at $2,500; David Lloyd George and General Botha, both at $2,400; Colonel House, $2,250; Georges Clemenceau, W. S. Hughes and Lord Sumner, $2,000; Lord Reading and Sir Henry Wilson, $1,900; Lord Derby, $1,600; Earl Beatty, $1,500; Lord Cecil, $1,400; Lord Balfour and ex-Premier Venizelos, $1,000.

A committee of the National Association of Manufacturers has been analyzing the facts about child labor. Arguments in favor of the federal child labor amendment were based upon the claim that southern mill operators were the outstanding offenders; that the children of the poor mountain whites were being worked to death in conditions approximating peonage. It now develops that Rhode Island with 11 per cent; Massachusetts with 6 per cent; Connecticut with 4.9 per cent and New Jersey with 4.6 per cent of the children aged ten to fifteen years, employed in manufacturing and mechanical industries, are the chief offenders. North Carolina's percentage is 2.1, South Carolina's 1.5 and Georgia 1 per cent.

The president of the National Association of Manufacturers (often denounced for his leadership of the opposition to the proposed constitutional amendment) operates a woolen mill in a southern state and has a chapel in the works where all the working people hold a prayer and praise service before commencing their day's work.

One of the charms of South Africa lies in its great diversity of climate—quite literally, you may pay your money and take your choice. At the Cape itself the weather is never excessively hot, and never cold enough for frost, and the rains fall in winter. In the Karoo and Transvaal the winters are crystal-clear; exhilarating cold under a radiant blue sky, and never a drop of rain, for the summer is the rainy season, as it is in Natal and the Orange Free State.

The newcomer to the land is not left alone to struggle with the puzzles of climate, soils, and prices. A society exists, called The 1820 Memorial Settlers' Association, which has helpers in every corner of South Africa, and an office in London at 199 Piccadilly. Intending settlers are advised before they start, and helped when they arrive, and guided in their choice of a province in which to settle by the avocation they intend to pursue. If it is orange farming, the settler may take his choice of certain areas in Natal, the Rustenberg district in the Transvaal, or Clanwilliam in the Cape Province. Cotton-growing will take him into warm districts, where there is a certain degree of moisture, as in Southern Zululand. Cattle-farms lie, for a great part, in the Karoo, and a number of settlers, many of them retired civil servants and officers from India, are thriving in the beautiful lands of Griqualand West. These last are mainly mixed farms, cattle, mealies, sheep, and dairy. The large fruit farms, where peaches, plums, apricots, and pears are grown, lie, many of them, in the neighborhood of Cape Town; apples thrive at higher altitudes. The vineyards and wine-farms are also near the Cape, and at the Paarl olives are flourishing. A happy settlement is at George, near the glorious primeval fore of yellow-wood. There is a lingering mance about the name, for it was call after George Rex, a son of Hannah Lig foot, an early settler. Every variety climate is at the command of the ne comers, whether they choose to drive 'mile-long furrow' through the corn lan of Caledon and Ceres, or to cultivate sug cane in the Natal coast belt. The conditio of life are, in most respects, far easier th in England, though they vary somewhat the four provinces of the Union, accordi to climatic influences and the distances fr towns and railways.—Dora Fairbridge *The English Review.*

The all-pervading spirit in Denmark cheerfulness. Although financially the Dan have been badly hit since the war and t pathetic tales of poverty and bankrupt nothing seems really to depress them. It strange to find this happy-go-lucky mosphere side by side with such practic hard-working common sense.

But that is Denmark. Whether it be the roadsteads of Copenhagen, where t ships of a world's fleet swing at anchor, out on the moors of Jutland that have be reclaimed from the sea—where the Dani farmer sets an example in industry and ef ciency that might well be followed elsewhe —there is the same healthy optimism a the same clear-headed judgment that ali seem the product of the crisp northern a —Marguerite Coote in *The English Revie*

Lawmaking is still rampant. Unit States lawmakers in 1925 considered 40,9 bills, ultimately putting 13,018 of them the statute books. In *Nation's Busine* Agnes C. Laut writes that 'these laws a solely state and federal, not municipal n county regulations; and if you doubt t figures, please write to the National I dustrial Council, Church Street, New Yor and get a condensed list of what the la mill grinds out each year, and who pays t bills, and what the enforcement costs a how many jobs are created, first to iss the laws and second to enforce the laws.

'Then you will have a dizzy idea wh taxes go up, and who pays the taxes, an who gets the taxes. It's all right if you li it. I'm not objecting. I'm just stating fact. If all the bills proposed in one ri middle-western state in 1925 had passe it would have added to the indebtedness that state a billion dollars. Put the rate interest at 4 per cent. Figure the tax f yourself. At least seventy-five per cent the surplus laws proposed are to extract an exact the dollar from thrift's pocket.

'I do not subscribe to the charge that w are "a nation of law-breakers." The never was an era in the human race whe the ten laws or the two laws were mo closely followed in private and public co duct and contract; but I do say there is n man, woman or child living in the Unite States, no corporation and no individu who knows even ten per cent of the law passed in 1925 alone, which each is expecte to obey.'

Price: 25 cents each; set $1. THE DEARBORN PUBLISHING COMPANY, DEARBORN, MICHIGAN.

# BRIEFLY TOLD

NEARLY ONE-FOURTH of the import trade of Australia is carried on with the United States.

FOR FIVE YEARS SINCE 1920, Canadian wheat crops have averaged 15.5 bushels per acre. The average for the same period for the United States was 13.3, Argentina 13.3 and Australia 11.7.

THE KANSAS STATE government cost $6.91 per capita in 1925, as compared with $22.17 in 1924, and $3.65 in 1918.

A FRENCH COURT HAS JUST settled a suit concerning ownership of 12,000 acres of land filed in the year 1372. It is estimated that lawyers' fees during this period were sufficient to have bought the property twenty-one times over.

LATIN AMERICA TOOK over $880,000,000 of imports from the United States in 1925. This was a gain of 14.25 per cent over 1924.

A LUMINOUS SPIDER, THE first ever discovered, was found recently by a scientific expedition in Central Burma.

THE STINGING JELLY FISH, known as 'Portuguese-man-o-War,' was given that name by Portuguese mariners seeking a new route to India in the 14th Century. Hostilities between European nations which had closed the regular trade routes had made it necessary that a new route be found.

AMERICANS LIVING IN London now number 6,700.

BELGIUM HAS RECENTLY passed a law providing for compulsory insurance of workers against old age and premature death.

THE TOTAL CHURCH WEALTH in the United States is about $3,300,000,000.

SEVERAL BLUE GEESE have been successfully raised in captivity by the United States National Zoölogical Park. This is the first time this has ever been done.

FRESH FRUITS AND vegetables used on the Presidential yacht, the *Mayflower*, are now being inspected for grade and condition by the Food Products Inspection Service of the Department of Agriculture.

A CAMERA HAS BEEN made for the Army Air Service which will take photographs at an altitude of 35,000 feet. The camera is 4 feet long and weighs 100 pounds.

TO POPULARIZE the potato in France, Louis XIV is said to have worn the flower in his buttonhole.

MILK CONSUMPTION IN THE United States last year reached the highest point in the nation's history, the quantity of milk, including cream, consumed in fluid form being 54,326,000,000 pounds, an increase of 1,554,000,000 pounds over 1924.

SUPERSTITIOUS CHINAMEN PLAY on many weird instruments while the sun is in eclipse to frighten away the evil spirits they believe are devouring it.

POISONED-BRAN BAIT, consisting of one pound of Paris green to twenty-five pounds of bran, when applied to tobacco plant beds will effectively control the grubs of green June beetles.

APPROXIMATELY 82,000 ACRES are planted in muskmelons or cantaloupes annually, and about 32,000 carloads of the melons are shipped to the markets.

AMERICAN HEADLIGHTS HAVE just been installed on a number of Australian locomotives. They formerly operated with no headlights at all. It is expected that crossing accidents will be lessened as a result.

TREASURY AUDIT FOR the fiscal year 1926 was completed within twenty-four hours after the books were closed. This is considered to be a remarkable achievement.

THE GRANARY WEEVIL, known for centuries as a pest of stored grain, may be killed when exposed for a few hours to a temperature of 155 degrees F.

THE COMBINED CIRCULATION of America's 13,400 newspapers is 45,000,000 copies.

EVERY SIXTH PERSON in France owns a bicycle, and there are ten times as many bicycles in that country as automobiles.

THE GOVERNMENT OF NEW SOUTH WALES, Australia, has built more than 1,000 homes at an average cost of $3,250, selling them to workmen on a low weekly-payment plan.

THREE RECRUITS AT AN air field stole a plane and, after flying a short distance, crashed outside a police station.

TAXES IN THE UNITED STATES today are $15 a year for each person, as compared with $75 in Great Britain, $35 in France and $26 in Germany.

A RICH OIL FIELD HAS been discovered in North Central Siberia, almost within the Arctic Circle.

THE TOTAL VALUE OF automobiles and trucks exported from the United States in 1925 was $222,599,132, a gain of 66.4 per cent over 1924.

FIRE DESTROYS AN AVERAGE of 360 homes, 96 farm buildings, 15 hotels, 6 department stores, 5 churches, 5 schoolhouses, 4 warehouses, and 1 hospital each day in this country.

COAL WAS USED FOR melting metal in Greece in 300 B. C.

HENS EXPOSED TO direct sunlight produce eggs rich in vitamine while those kept in glass inclosures do not, experiments conducted at Kansas State Agricultural College indicate.

EACH GROCER IN THE United States has an average of 449 customers.

WOMEN IN AINU, NORTHERN Japan, admire bearded faces so much that they tattoo their own to make them appear whiskered.

A SEATTLE POLICEMAN uses roller skates to patrol his beat in the outlying districts of the city. His mode of transportation has the approval of his superiors.

FRANCE HAS RAISED the salary of Marshal Foch to $3,000 a year.

THE TERM SIRLOIN (Sir-Loin), was originated by Henry VIII of England, who was so pleased at a dinner in which that cut formed the main item that he conferred the honor of knighthood upon the steak.

INMATES OF IOWA STATE Prison are allowed to keep and breed birds. There are now 500 canaries in the penitentiary.

A NEW STYLE OF typewriter has been invented by a Washington man who claims it is capable of being operated at an average of 150 words a minute. The machine has 1,160 keys.

IT IS NOW POSSIBLE to buy air tickets in London for fifty-two different European centers.

FURTHER EVIDENCE THAT the Maoris of New Zealand and the Indians of Alaska were connected is found in the almost exact duplication of the totem poles used by both races. The raven, which figures as the creator of mankind on the Maoris pole, bears the same name in Indian legend.

EMPLOY thy Time well if thou meanest to gain Leisure; and, since thou art not sure of a Minute, throw not away an Hour. Leisure is Time for doing something useful; this Leisure the diligent man will obtain, but the lazy man never; so that, as Poor Richard says, a Life of Leisure and a Life of Laziness are two Things. Many without Labour, would live by their wits only, but they break for want of stock. Whereas Industry gives Comfort, and Plenty and Respect: Fly Pleasures and they'll follow you. The diligent Spinner has a large Shift; and now I have a Sheep and a Cow, every Body bids me Good morrow, all which is well said by Poor Richard.

*—Benjamin Franklin*

CHRONICLER OF THE NEGLECTED TRUTH

# BRIEFLY TOLD

SERIOUS OBJECTION is being expressed in Western Australia to the influx of low-wage immigrants from Southern Europe who work for one-half the pay of native Australians.

MORE THAN $216,000,000 was paid to unemployed workers in the British dole in 1925.

A 30,000-WATT INCANDESCENT light bulb, the largest ever made, has been designed for taking colored motion pictures. The ordinary sized lamp is 115 watts.

THE RED SWASTIKA SOCIETY is an attempt to replace the Red Cross in China.

THOMAS CARLYLE was the originator of the term 'The Unspeakable Turk.' It occurred in an article written by him before he attained fame.

AMERICAN MARBLE FIRMS are complaining because the Government is considering awarding to foreign companies the contract for furnishing crosses for the graves of 30,000 American soldiers buried in France. The bids were $14.50 each for Italian marble and $35 for American marble.

BECAUSE OF THE HOUSING shortage in London, cells in an old prison are being rented as apartments.

THREE HUNDRED AND FIFTY years ago an English micrographist wrote within the circle of an English penny the Lord's Prayer, the Creed, the Decalogue, two short prayers in Latin, his own name, a motto, the year of the Lord, and year of the reign of the Queen (Elizabeth).

RICE HAS ALMOST DOUBLED in price recently in China. Chinese women, traditionally subdued, have created a new problem by raiding rice shops.

UNDER THE NEW NICARAGUAN immigration law every immigrant to that country will receive fifty acres of tillable land. Tools, materials, and other necessities will be entered duty free and farmers will receive a subsidy for raising alfalfa, coffee, chocolate, and pineapples.

AMERICAN MOTION PICTURE producers in 1925 exported 225,000,000 feet of positive photographic film, exceeding by 55,000,000 feet the 1924 record

ONLY ONE PERSON in four in Mexico is able to read or write

TWO HORSES, a prize bull, and a tomcat licked three circus lions recently in a battle royal in the public square of Cremona, Italy. The lions, which escaped from their cages, were driven back into them by the other animals.

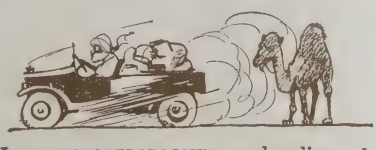
THE FOLLOWING DECLARATION will take the place of the oath formerlly sworn before notaries public: 'This is a true statement, made under the penalties of perjury.'

A PLEA OF SELF-DEFENSE made in behalf of a bull which engaged in combat with a man was upheld by a jury in a Kentucky court. The defense was that the bull was merely protecting itself when it knocked the plaintiff down loosening his teeth and breaking four ribs.

SELF-SUPPORTING STUDENTS won forty-five per cent of all honors at Yale University last year. One-third of the Yale students are either partially or wholly self-supporting.

THE AVERAGE FARMER gets value of about $440 in living expenses from his farm, according to data compiled by the Nebraska Agricultural College.

A FOREMAN IN A LUMBER camp in the Cascade Mountains, Washington, stepped into a hole and found that he was standing on a bear enjoying its winter sleep.



A WOMAN'S ATHLETIC ability is rated at 67 per cent of that of a man of the same weight.

A CHICAGO THEATER requires as much electricity for its outdoor display signs as would be used by an average city of 8,000 residents.

ENGLAND HAS A MILE of railroad to every 3.63 square miles of territory. In this country the record is a mile to each 12 square miles, in Canada a mile to each 71.5 square miles.

TRAINED PSYCHOLOGISTS will hereafter examine undergraduates at Brown University as to their worries, doubts, despairs, loves, and hates.

MAPS WHICH PICTURE the interior of Australia as a desert are incorrect, according to Michael Terry, who has just completed a survey of that country. The interior, he says, is a black soil plateau from 700 to 1,600 feet above sea level, containing many hundred square miles of well-grassed downs.

IN TRANSPORTING LIGHT merchandise and passengers from Arabia, India and Persia to Mecca, the time-honored camel can no longer compete with the automobile.

IMPERIAL RUSSIAN GOVERNMENT war bonds have been declared a dead loss to American holders, under a ruling of the Board of Tax Appeals.

AUSTRALIAN ABORIGINES bob their wives' hair, using sharp stones as knives.

PICTURESQUENESS IS TO be sacrificed to efficiency in Italy by a new order banishing donkeys and dog- and oxen-drawn vehicles from the streets.

WORMS THE SIZE OF hairs threaten five hundred acres of hemlock in Sturgeon Bay, Wisconsin. Six million feet of lumber have already been destroyed, and airplanes are combating the pests by scattering calcium arsenate powder.

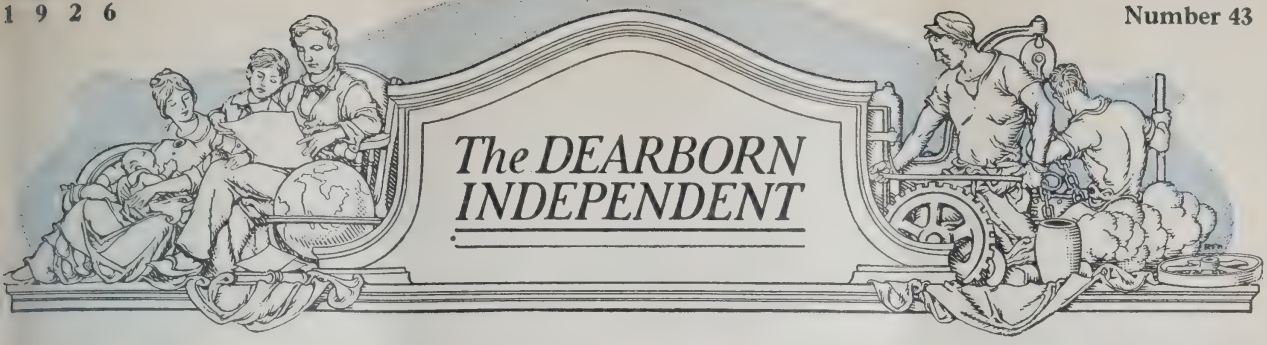
REFRIGERATION EXPERTS predict that within the near future the same pipes that heat homes in winter will be used to cool them in summer.

THE AUTOMOBILE IN which Archduke Ferdinand and his wife were murdered in 1914 has been offered for sale for the twenty-fifth time since the tragedy, but there are no buyers. Superstitious persons believe that the car, blood red in color, is bedeviled, inasmuch as four of its owners have died in it and it has killed and injured several others.

TEACHING THE ARTISTIC use of rouge, instead of forbidding cosmetics among high school pupils, was advocated before the Illinois State Teacher's Association.

SCHOOL CHILDREN OF the United States have more than $30,000,000 on deposit in savings banks throughout the country, the boys and girls of New England leading those of other sections.

THREAD THREE TIMES as strong as ordinary cotton is made from the bark of the magui tree in Mexico.



THE FIRST THEATRICAL press-agent stunt took place a century ago when an actor drove a tub drawn by a flock of geese for three miles along the banks of the Thames. The act was successful in filling the theater for the subsequent performance.

THE LAST HERD of the wild white cattle that roamed over Britain in the days of Caesar live in a park in the North of England. Their cry is more of a roar than the familiar 'moo' of domestic cows. They stampede on the slightest provocation.

THE EARLY TOOTHBRUSH was the chewstick, a twig the size of a carpenter's pencil with one end beaten to a soft, fibrous condition.

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week iscusses some aspects of pessiism.

---

Three decades ago a stocky little an from Ohio devised a scheme for bolishing both debt and interest. Ie carried his scheme to Washingon. Thousands of unemployed men ccompanied him. The man—acob S. Coxey—was branded an narchist, a dangerous fanatic. He as finally arrested—*for walking n the grass.* Coxey's march is istoric. It was a footnote to a age of history, but the idea behind is almost forgotten. (p. 2)

---

Why did 'Coxey's Army' march? ecause Coxey knew that during the ix weeks it would take to reach Vashington, the whole nation would e mulling over his idea. Here's his dea. It is the same that he carried o Washington thirty-two years ago. 'he scheme may be considered ineenious or ingenuous, according to iewpoint. It is at least important a calling the nation's attention to he growing interest evil. THE )EARBORN INDEPENDENT prints it, ot to endorse it, but as the honest xpression of a man who must be anked as one of the country's inor prophets. (p. 24)

---

Some term it instinct. Others call it a *inch.* Whatever the name, says Dr. Laird, oted psychologist, this indefinable someing is more powerful than we realize. A inch that flashes into the mind is often ore dependable than slow, careful reasong. He tells why. (p. 5)

---

The pilot sailed into the sky, a human rget for five enemy planes. Back and forth e weaved, like a crazed butterfly, while ey emptied their machine guns at him. he wings of his plane were perforated. reams of lead whizzed past his face. A ousand rounds of ammunition to each in—5,000 bullets. Finally, their last rtridge fired, *he* began to shoot! (p. 13)

---

Captain Heurtaux' story is unique. It is tale of the great fliers of the war, written r one of them. It is a tale that can now be ld by no one else. All the others who were i aviation at the beginning of the war are ne. Here Heurtaux tells of his last thrilling battles, and of the gallant, tragic death of Guynemer, the Ace of Aces. (p. 13)

---

Two men stand out from the political scrimmage line. Staunch prohibitionist, World Court foe, keen-minded debater, Senator Borah, of Idaho, and anti-prohibitionist, popular governor, smiling hand shaker, Alfred E. Smith, of New York. (p. 21)

---

The prestige of President Coolidge is seriously worrying some people. It seems to have suffered a change. Many reasons are advanced for this, some sound, some palpably wrong. What they are, we have tried to discover, and we believe that this article justifies us in saying that you will be better informed after reading it. We wish the President himself might read it. (p. 21)

---

The clergyman calls this the age of the pagan. Old-time ideals are being lost sight of. Things once sacred are held in contempt. Cheap cynicism is replacing deep reverence. The word Puritan, which meant so much in the days of the country's founding, is now one of reproach. Dr. William E. Barton is no alarmist. He is an exceptionally clear thinker, an able writer. When he declares that we must return to Puritanism, he sounds a warning that should be heeded. (p. 7)

---

This nation has a crime bill of $10,000,000,000 a year! You pay it—in theft losses, insurance rates, taxes for police protection and for prosecution. New York, where a large percentage of crime is committed, has adopted a drastic new penal code—to the distinct disadvantage of the criminal—in an attempt to reduce the bill. You will want to read about it. (p. 3)

---

A life sentence in New York, hereafter, will mean a *life* sentence. It won't mean a mere five or ten years in prison. Nor will it mean just another little joke between the convict and a benevolent parole board. The functions of the parole board have been sharply curtailed. Compensation is done away with; commutation privileges are abridged. (p. 3)

---

Bond laws have been tightened. Heretofore an habitual criminal released on bail would promptly commit further crimes to raise money for his defense. An end has been put to this. The time allotted for appeal has been shortened. Stalling on the part of defense attorneys will no longer be tolerated. Criminals perpetrating felonies *while armed* will be dealt with harshly—life sentences awaiting some of them! *In short, the laws now favor the criminal less and society more.* (p. 3)

---

Remember Stockton's famous riddle-story, 'The Lady or the Tiger'? Here's a yarn about a man and a tiger. It's the last of 'Gil' Robinson's delightful circus reminiscences, and one of the best . . . Thomas L. Masson concludes his tale about the wild American humorists, who furnished wit and gaiety for the gay and garish nineties . . . And there's an article on how Britons (a certain group, at least) take the dole. That's one bit of socialism we certainly don't want in this country.

Thirty-Two Years Have Passed Since the 'General' Made His Famous March, But He Is Still

# Coxey the Crusader

'General' Coxey.

DRAWINGS BY PAUL HONORE

By CHARLES J. FINGER

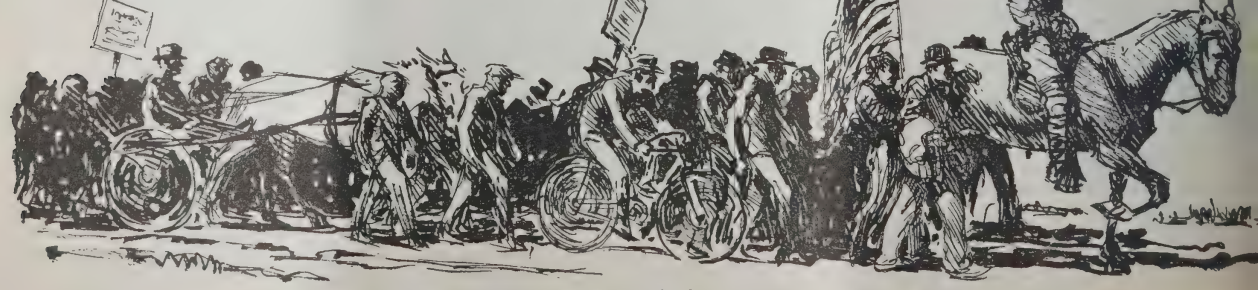
THIS is how I first came to hear of the man.

One day, down in the south of South America and in a town in which were neither policemen, electric lights, telegraphs nor telephones, a schooner dropped anchor and fluttered the Stars and Stripes. Making out the name, *Lively*, of Boston, we went aboard to be sociable and to hear the news, and the captain called all hands for a sociable time. The mate did most of the talking, for he talked well and about the things we wanted to hear, to do which is the essence of good fellowship. In the course of his discourse he said:

'By the way, when we left Boston there was trouble a-brewing. A fellow out West, in Ohio maybe, was a-gatherin' up all the bums an' crooks in the country to march on Washington, to loot it. I heard it said that he wanted to make hisself President.'

Then the captain spoke, saying, 'Them kind of fellows is anarchists, and ain't got never a soul to save,' and relapsed into silence, for he was a moody man.

We did our trading when the talk was ended, exchanging gold dust and seal skins and ostrich feathers for what we considered necessities, and as we were dropping aft at nightfall, the mate leaned over and said:



'About that fellow out West. I remember his name now. 'Twas Coxey.'

In a day or two, being up in our place in the Andes again, we gained a sort of distorted notion of the state of affairs in the civilized world in 1893-4. By the aid of the newspapers the mate gave us we made our picture, and a strange, jumbled, disordered, torn and distracted world it seemed when viewed through the eyes of sensational journalists, and cartoonists, and editors whose words failed to enlighten.

For we saw a United States nervous and panicky after a tremendous heat wave, followed by a severe drought. That made for a crop shortage and high prices, for the closing down of factories, for strikes and conflicts and for railroads operating under military protection. We read, wide-eyed, of a little war in Tracy City, Tennessee, with miners fighting against convicts—we read that Jay Gould had died worth $72,000,000, and found editors predicting universal disaster because of all that accumulated wealth—we noted that people were disagreeing about immigration laws, and Chinese exclusion acts, and the tariff—we wondered at the trouble in France with anarchists throwing bombs and sometimes blowing themselves up. We learned that there was trouble in the coal mining industry with strikes in Pennsylvania, in Maryland, in Illinois, in parts of the British Isles. And there was Ireland nervous about Home Rule, Canada excited about reciprocity, Paris annoyed about its Latin Quarter where there had been rioting.

So the general impression we had, especially when we hit upon a few Populist papers, was of a world full of disorder and discontent, with financial fraud everywhere; with the capitalistic system tottering to an early fa and humanity generally leaping swift destruction with eyes blin folded. As for the United State judging from the lurid headlines the half-year-old papers we had, was hopelessly diseased and visibl disorganized, and Withington, one our outfit, said: 'I give the countr three months before a revolution spli it from top to bottom.'

Now Hardie, the long-headed, o posed that view. He held that black it looked back home, there were glean of light. There were men of genius ar loftiness of aim at work, he said. H held that the capitalistic system, i stead of being on its last legs, was your and vigorous, 'afflicted for a mome with growing pains' was how he put i He also held it as a hopeful sign tha there were minor prophets, earnest an articulate men, calling (Continued on page 2

They started—on foot, in wagons, buggies, surreys, bicycles, on horseback . . . sullenly determined.

AFTER a three years' survey of the crime situation, the New York legislature put into effect, July 1, drastic laws for the elimination of crime. That criminals fear the new regulations was shown by the eagerness with which they pleaded guilty and sought admission to prison before the new program became effective. Under the new system a prisoner must serve the entire term to which he is sentenced. Heretofore a life sentence has meant little to an habitual criminal. He knew he would probably be released in ten years at the most. Hereafter, however, a life sentence will be a ***life*** sentence. The new laws favor society, not the criminal.

# New York Wages Bitter War on Crime

## Drastic New Laws Are Put in Force in the Struggle to Restore Law and Order

By BURT M. McCONNELL

MOST of us have been aware at some period or other within the last five years of a crime wave, particularly in our large enters of population. We have more riminal courts and less results to show or them than any other nation. Crime no longer merely an occupation; it is n industry, highly organized and irected with extraordinary cunning. herefore no function of organized overnment is of greater importance to ie people than the protection of life id property and the preservation of w and order.

The honest citizen will be glad to arn that the state in which much of ie crime of the past five years has oc-urred—New York—has some new ws which went into effect July 1. hey tighten the screws on some of our ost desperate criminals. Their effect, ready noted, will be to expedite, rengthen, and simplify the adminis-ation of criminal justice; increase the rms of imprisonment in state prisons; strict the indiscriminate release of cond offenders on bail; and permit ie state-wide collection and dissemina-on of criminal records and informa-on. An appropriation of $50,000 has en made for the latter purpose.

The first result was a great stam-ede of criminals to get into prison be-re the longer sentences may be im-osed.

New York has set an example for ie rest of the states to follow. With ie evidence of the existence of organ-ed gangs of gunmen, bandits, and urderers all over the East, the New ork legislature forgot for the moment is political squabbles and adopted the ost drastic program for the elimina-on of crime in the history of the coun-y.

Of course, there were objections to ie proposed changes in criminal pro-edure on the part of some lawyers no specialize in criminal practice, th in and out of the legislature. espite this opposition, however, sev-al important amendments were ap-oved by Governor Smith. These may summarized as follows:

The new laws provide for a state-de collection of criminal records, ch as finger prints, Bertillon measure-ents, et cetera, by police officers and prison wardens, and the interchange of such information with the federal authorities and police officers of other states and countries.

The absence or existence of a criminal record must be established before a person charged with a felony or any one of seven specified misdemeanors can be admitted to bail. The court may also use its discretion in refusing bail to a person charged with any one of these misdemeanors.

District attorneys, except in New York County, are required to proceed against the surety on criminal bail bonds within sixty days after the adjournment of the court directing the forfeiture of the bonds, instead of 'at any time,' as heretofore.

Persons jointly accused may hereafter be tried separately or jointly at the discretion of the court.

A defendant in a criminal case must now appeal within thirty days, instead of within one year, as formerly, and appeals must be argued within ninety days, unless the time is extended by the court. And except in instances where the Appellate Court is overruled, there can be but one appeal.

The sentences of judges will hereafter be carried out as imposed. This amendment, by abolishing compensation and reducing the time granted for commutation, through the substitution of a new form of commutation limited to five days a month, will have the effect of increasing definite sentences from sixteen to sixty per cent. Commutation and compensation in the case of life sentences will hereafter be abolished.

The actual term of imprisonment in a state prison will in future be not less than one year, and this term may not be reduced.

The statutory sentence for felony shall be increased, when committed by an armed person, from five years, in the case of a first offender, to twenty-five years or even life in the case of a fourth offender. And such armed persons, even when first offenders, may not be released on probation or otherwise have their sentences shortened.

The penalty for burglary in the first degree shall be not less than fifteen years; for robbery in the first degree, from fifteen to twenty years. A life sentence, in future, will not mean a minimum of ten years or an indeterminate sentence; it will mean a *life* sentence.

Persons convicted for the fourth time of felony must hereafter serve a life sentence. Persons originally sentenced as first offenders may be resentenced on the discovery of previous conviction.

The receiving of stolen property in any amount is now a felony, with the maximum penalty increased to twenty years' imprisonment.

These new measures resulted from a year's survey of the crime situation by the New York legislature. Other states have undertaken crime surveys, but most of the commissions have merely piled up reams of evidence and volumes of testimony. In the majority of states, under existing laws, a criminal sent to prison for a long sentence rarely serves more than one-third of his time; hundreds of criminals are freed on bail every week, and many of these undoubtedly commit new crimes to pay their bondsmen, and then 'jump' their bail. 'Fences,' who form the backbone of much of the crime industry, are virtually immune from effective punishment in most of our states. A large number of old offenders escape charges against them because of the lack of adequate means of identifying them. Their plunder enables them to engage shrewd lawyers.

It is these handicaps that the New York legislature, despite the protests of lawyers with criminal practice, both in and out of the legislature, has overcome.

There is no doubt that a large percentage of the crimes committed in New York City during the past five years were planned and carried out by criminals who were out on bail. Here is one of the large loopholes in our administration of justice. With the old offender, crime is a business. He does not worry about being arrested and held for the grand jury if he can be released immediately on bail. Given his liberty, he can at once begin planning another crime. The system that permits this condition is a scandal. There can be no appreciable lessening of crime until this practice of freeing criminals on easily

procured bail is ended. New York State has taken the first step. Under the new law, second offenders are not entitled to bail as a constitutional right.

In New York City alone there are said to be over five hundred bonding agents ready to put up bail that will free the criminal. The bandit always has a bondsman. Many bonding companies are willing to take a risk when the crook can pay the premium. Once he regains his freedom on bail, the criminal often commits another robbery to get money to pay his bondsman.

According to a New York City magistrate, some bonding houses hire agents who are in close touch with the criminal world, if they are not criminals themselves, and who know when a crime is to be committed. The bonding agent, in many instances, is looked upon by crooks as a friend, and he often is, ready to go the bail of the arrested criminal up to any amount before the ink is dry on the commitment papers. Many bonding houses accept stolen property as collateral. In some cases they take no collateral against their bonds, but accept the promise of other crooks that the criminal will be produced upon request.

Under the new law, district attorneys, except in New York County, are required to proceed against the bondsman in the case of forfeited bail within two months. Heretofore no time limit has been fixed. Under another provision, the bondsman who accepts stolen collateral may be sent to prison for perjury.

One of the reasons for the prevalence of crime in the United States is the long delay between the crime and the punishment, due to the opportunities to appeal from one court to another. It will be impossible hereafter in New York State to postpone indefinitely the trial of a defendant by one appeal after another at intervals of ten months or a year. Furthermore, in cases where the Appellate Court is overruled, but one appeal will be granted.

The habitual criminal regards a prison sentence with comparative indifference. He knows that if he conducts himself in strict accordance with the rules of the institution, he will get the benefit of 'good behavior' allowances—and be able to return to his chosen profession in a few months. Heretofore, the phrase 'life sentence' has meant little to the inmates of a New York State prison, but in future the sentences of judges will be carried out as imposed. There will be no commutation in the case of a 'lifer.'

Dangerous criminals are often paroled after serving part of their sentence. There are many cases on record in the larger cities of hardened gangsters committing murder. In future, prisoners sentenced to a New York State prison must serve at least one full year. There will be no parole, nor will the actual time served be reduced through 'good behavior.'

Additional punishment will hereafter be inflicted on the person convicted of a felony committed while armed with a pistol or other dangerous weapon. Nor will the prisoner be released on probation, or otherwise have his sentence shortened.

Under the old New York State law, a life sentence could be converted into an indeterminate sentence, with a maximum of life and a minimum of ten years. Under the new law, effective September first, a life sentence becomes exactly that. And it may be imposed even for first-degree robbery.

There are no figures available to show England's actual money losses from crime, but the direct property loss in this country amounts to approximately $4,000,000,000 a year, and statistics place the indirect cost of prevention, detection, prosecution, and punishment, and the cost of prisons, reformatories, and asylums at $6,000,000,000 annually. A total of $10,000,000,000—enough to pay the cost of running the United States Government for three years! In fact, it is estimated that the cost of housing, feeding, and attending the criminal charges of the various states now amounts to *one-fifth of the states' total income*. Penologists tell us that at all times about 200,000 persons in the United States are under lock and key. But these 200,000 are said to represent less than one-fifth of the actual criminal population. Not only does this great army of criminal offenders steal $4,000,000,000 annually; not only does it require $6,000,000,000 for policing, imprisonment, feeding, and attention; but it is an unproductive force, a great economic waste. If the annual productiveness of the individual is estimated at the conservative sum of $1,500, it will be seen that $1,500,000,000 must be added as industrial wastage.

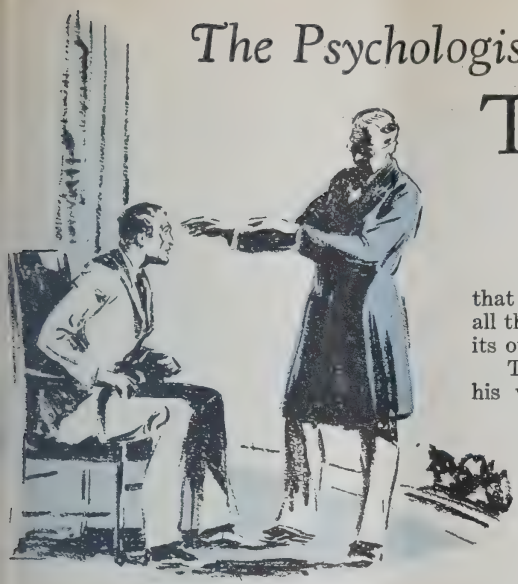
Formerly the New York State law provided that to sentence a criminal as an old offender it was necessary to indict him as such, and to prove him to be an old offender at the trial. Under one of the new amendments, it is not necessary to indict a person and convict him as a previous offender in order that he shall receive the increased punishment provided. And persons convicted for the fourth time of felony must serve a life sentence.

No longer may an arbitrary distinction be made between receiving stolen property of a value of less or more than $50. Under the new law, the receiver of stolen property, no matter what the amount, is a felon. Moreover, the maximum penalty has been increased from five years to twenty years, although the court still retains the right to impose a fine in lieu of, o in addition to, a prison sentence.

There has been too much twaddl about the criminal. As a result, our is the most lawless of civilized countries Murder, banditry, robbery, and vio lence of every description are mor common here than anywhere else i the world. What are the causes of th astounding prevalence of crime among people enjoying the widest benefits o liberty, education, and self-government Unemployment might have been ad vanced as a reason for the crime wav in 1922, but it would not be a soun explanation today. Some say that on of the contributing causes is the loos laws in various states permitting th sale and distribution of firearms.

By some the crime wave has bee blamed upon the war, but this diagnosis has broken down. Others, with considerable justification blame the crime wave on the thousands of criminal aliens in the United States, most o whom are in the great cities where they roam at will. Experts in social diagnosis attribute the prevailing lawlessness to such varying causes as lack of religion and Puritanism; economic wrongs and motion pictures; excessive luxury and widespread poverty; too much liquor and not enough; heredity and environment; physical defects and the newspapers; the temptations of leisure and the evils of overwork; and lack of recreation and abnormal indulgence. The most competent observers now agree, however, that there is one cause which outweighs all others—the fact that the American system of administering justice has become so weakened that it has lost most of its deterrent effect. Court machinery has not been functioning as it should.

The more the English judicial system is studied, the more indefensible does our own look by comparison. England has made punishment for crime swift and certain. That country has revised its criminal and court procedure to meet modern conditions—*to favor the criminal less* and society more.



The easy granting of bail is unknown in England. The large bonding companies which exist in the United States for the purpose of furnishing bail do not exist there. In fact, the man who goes bail for the defendant cannot be reimbursed if the bail is forfeited, for that in itself is a crime. In England, moreover, the criminal is entitled to but one appeal, whereas in the United States, except in New York, he may have as many as three. The English criminal is therefore unable to delay final decision in his case for two or three years. And the appellate bodies (Concluded on page 26)

*The Psychologist Says:*

# Trust Your Hunches

By DONALD A. LAIRD

ILLUSTRATED BY J. C. GRAHAM

ur eye sees much more than you are aware it sees. Should you hypnotized you would be able to tell in great detail of all the window displays you passed today.

WHEN fishermen of Nova Scotia are in a fog and suddenly hear the siren of a steamer, do they take time to reason om which direction the warning mes?

They do not. They act upon their st hunch regarding the direction, and e almost always right. They have und that those who take time to ason are almost always wrong.

It is astonishing how trustworthy nches usually are. It is still more remarkable whence they come. Some of e most fascinating chapters of modern ychology are written around this pic.

In telling my students about these apters I have to preface my lectures th these remarks: 'World explorers ing back reports which amaze us d which we are at first loath to beve. Within each of us can be found nexplored mental lands from which st as amazing reports can be brought ck. The reports may be so unexpected as to arouse disbelief until personal experience has verified them to our tisfaction.'

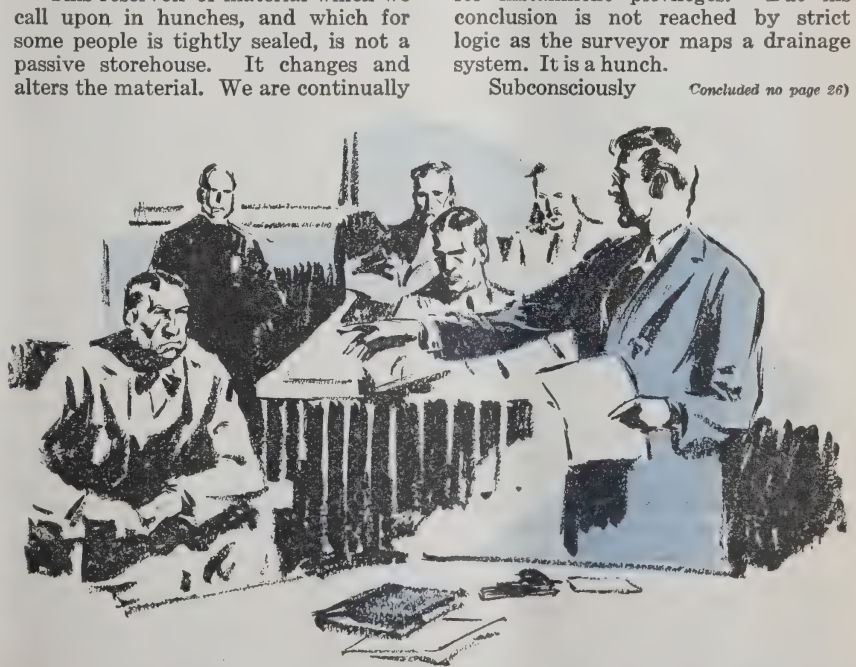
Your eye, for instance, sees much ore than you are aware it sees. Should u be hypnotized you would be able to ll in great detail of all the window splays you passed today and, apparently, had given no notice. While dinarily we are not aware of these impressions which are being made upon r nervous system and mental life, ey undeniably furnish a great reservoir of experience. For some people is reservoir is hidden and unproductive. For others it is the source of nches, and even inspiration.

The French conjurer, Robert oudin, developed the use of this eat natural resource. While you and have to be hypnotized to recall the ntents of the show window we have ssed, Houdin had so trained himself that he could *consciously* remember all that had fallen on the eye, even its outermost regions.

This facility was very useful in his work: for instance, when he was performing in the outlying provinces and suspected the honesty of the local manager. Since he could estimate the number in the audience, with this same facility he could always check on the report the manager gave him.

Agassiz, the famous biologist of Harvard, affords another illustration. For several days he had been trying to make out the details of a fossil fish which was only partly uncovered. His unconscious eye, however, had seen details his conscious eye had overlooked, and in a dream revealed them to him on three successive nights. On the third night the dream was so vivid that he dressed and went to his laboratory to chip away the bits of stone as revealed in the dream. This hunch, which was successful, came in a dream. For some reason it did not flash into his head the way the fisherman notes the direction of the siren. The reason will be evident in a moment.

This reservoir of material which we call upon in hunches, and which for some people is tightly sealed, is not a passive storehouse. It changes and alters the material. We are continually thinking with this hidden material without knowing that we are!



A young man had been hypnotized by the late Dr. Boris Sidis. The hypnotist tried this experiment: 'Ten minutes after I awaken you from this hypnotic sleep,' he said, 'you will give the answer to this problem—7,569 times 3,796.'

The young man was immediately awakened and engaged in lively conversation. In precisely ten minutes he called out the correct solution to the problem. Consciously he had not had a chance to solve the problem, and it was a problem which would have required considerable figuring. Yet underneath all his conversation his mind had been busily engaged in solving this difficult multiplication.

That is how hunches are developed. Inspiration for poetry has the same sources. So have some forms of mental disorder. Thus it becomes at once a bane and a blessing, as is true of many things that we do not fully understand. Perhaps sometime psychologists will develop a mental serum that can be used to develop hunches as serum is used to further health.

Can hunches be trusted? Modern credit systems are built largely upon hunches. The credit manager has information gleaned about the applicant for installment privileges. But his conclusion is not reached by strict logic as the surveyor maps a drainage system. It is a hunch.

Subconsciously *Concluded on page 26*

Lawyers' mental eyes miss the thousand and one things that impress the uncritical juryman. The juryman who is used to running his life largely by hunches notices unconsciously the slightest tremor of the witness when evidence is introduced.

## The Federal Board of Tax Appeals, Created to Be the

# Taxpayer's Final Arbiter of Facts

## *Falls into the Grip of Bureaucracy*

By JOHN D. ERWIN

THE extent to which bureaucracy is entrenched at Washington is well illustrated in the method pursued in the selection of members of the Federal Board of Tax Appeals. With the extension of the federal income tax so that nearly every citizen has tax dealings with the Government at Washington, the importance of this body to citizens can hardly be overestimated. The small taxpayer is affected no less than the wealthy.

Until 1924, or for the first ten years of the operation of the federal income tax law, the taxpayer had no method of making an appeal (unless he wanted to go into endless and expensive litigation in the federal courts) from the decisions of the Internal Revenue Bureau.

It is true there was a Board of Appeals and Review within the Treasury Department to which the appellant could go, but this body worked in such close harmony and understanding with the particular official of the department who made the decision against which protest was being made, that it oftentimes appeared a futile undertaking to bring about real judicial determination of the question. The board was made up merely of department clerks.

To remedy this recognized evil, Congress created in the Revenue Act of 1924 a Board of Tax Appeals with the avowed purpose of creating a tribunal to which the taxpayer could appeal for redress and present his case to an unbiased court, in a judicial atmosphere. The appointments to this tribunal were authorized for specified terms of six, eight, ten and twelve years, with salaries of $10,000 per annum, each. A maximum of twenty-eight 'judges' were authorized, to be appointed by the President, by and with the advice and consent of the Senate. Fifteen were appointed.

The debate which preceded the incorporation of this provision in the statutes shows clearly the intent of Congress to keep separate from the Treasury Department and its Bureau of Internal Revenue, this new tribunal which hhlds such broad powers over the property of taxpaying citizens.

The whole protest against the arbitrary operations of the so-called Board of Appeals and Review (the forerunner of the new 'court') was aimed at its unfairness from the standpoint of the taxpayer, in that the decisions from which appellants took their appeal were virtually reviewed by the same bureau where the original action was taken. Citizens protested loud and long over this phase of the Income Tax Bureau at Washington, and eventually Congress took heed of the justice of the protest.

### Personnel of the New Board

For a term of twelve years: Jules G. Korner, of North Carolina; Charles R. Arundell, of Oregon; John J. Marquette, of Montana; Logan Morris, of Utah.

For a term of ten years: Benjamin H. Littleton, of Tennessee; William R. Green, Jr., of Iowa; Percy W. Phillips, of New York; Charles M. Trammell, of Florida.

For a term of eight years: William C. Lansdon, of Kansas; Charles P. Smith, of Massachusetts; Sumner L. Trussell, of Minnesota; John M. Sternhagen, of Illinois.

For a term of six years: J. Edgar Murdock, of Pennsylvania; William D. Love, of Texas; John B. Milliken, of Arizona; Ernest H. Van Fossan, of Ohio.

To emphasize the independence of the new tax court created by the law approved June 2, 1924, there was written into the law this declaration: 'The Board (Tax Appeals Board) shall be an INDEPENDENT AGENCY in the executive branch of the Government.'

The fifteen members of the board were named and there was grumbling and dissatisfaction when a perusal of its personnel disclosed that a great majority of its membership had been selected from subordinates of Commissioner of Internal Revenue David H. Blair and Secretary of the Treasury Andrew Mellon. It was obvious, from the large number of assistants to Mr. Blair who were on the new 'court,' that the President had largely taken the names handed to him by the head of the Internal Revenue Bureau or Treasury Department and made them his nominees for this 'independent agency'—a board that was expected by Congress and taxpayers to be free from the domination of the Internal Revenue Bureau and Treasury officials.

There can be no question about this intent on the part of Congress, since it was the main consideration in bringin about the abolishment of the so-calle Board of Appeals and Review in th Treasury Department and substitutin a board whose members were to b named for statutory terms, and b Presidential appointment.

The Senate may have been derelic in confirming without question th original board without carefull inquiring into the connection and qualifications of all the ap pointees individually, but ther was apparently a feeling that t do so would inject an element o politics into the appointment that would mar the establishmen of the new procedure.

Recently the Senate was agai faced with the duty of passin on the confirmation of the Ta Appeals Board, the new Revenu Act, approved February 26, last having provided that the term of members of the board servin prior to June 2, 1926, shoul expire on June 1, 1926. Thi latter proviso gave Presiden Coolidge (or, more accurately Secretary Mellon and Com missioner Blair) an opportunit to name an entirely new board, i desired, but it developed tha there was no desire to get rid o anyone except two members wh had shown independence in thei consideration of the vastly importan cases submitted to the board.

The two members dropped when th board was reappointed were Judg Albert E. James, of New Jersey, an Adolphus E. Graupner, of California

The fact that they were let ou when the whole board, except them selves, was reappointed caused a sti when the facts became known in Wash ington. There was a threatened revol in the Senate, but in the rush to clos the pending business and get away the Senate finally acquiesced in the nominations on June 8, after several red-hot executive sessions had been taken up in discussing the matter.

These two men were not dropped because they were inefficient, but by reason of their independence. This is so well established by the record that when the charge was made in the executive sessions of the Senate, it was not denied. While James and Graupner constituted only 2/15 of the board, the record shows that they did more than twenty-five per cent of the *original* work of the board. That is, they prepared more than one-fourth of the original decisions that

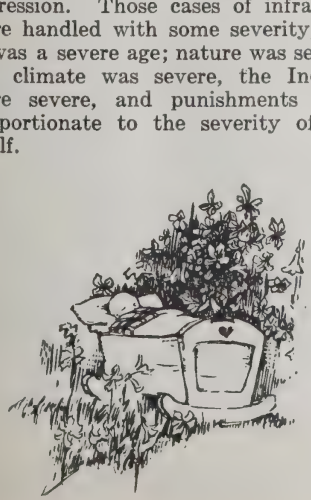
A Clergyman Compares Our Era With a Hardier Age—and Declares

# We Need More Puritans!

By WILLIAM E. BARTON

DECORATIVE SKETCHES BY GERALD VAN DER HEYDEN

THE word Puritan has become one of cheap contempt. A man figuratively takes his life in his hands when he openly advocates Puritanism. Words are very potent things, and few people seek to define them or to know their real significance. To call a man a Puritan or in a particular measure Puritanical is enough to damn him to the deepest depth in the mind of the shallow and the unthinking. A recrudescent paganism is walking naked through the land, flaunting its lewdness and glorying in its shame. To those whose god is their belly and who hate all decency, no satisfaction comes cheaper or goes farther than to sneer at Puritanism.



I am not asking for a restoration of the old Puritanism any more than I am asking for a return to the old log cabin, but each was good in its day, and each is entitled to something more than flippant contempt. In this day, when the center of the home is no longer the hearth, and the glory of architecture lies in the number and magnificence of its bathrooms, there are still standards by which society may be graded.

The old Puritanism had its marked and obvious limitations, but it served its day and generation faithfully. It built men and women of marked intelligence and strong character and conscience. It sometimes erred on the side of too little gentleness and charity. It was too stern to be as tolerant as it might have been. But the worst thing it did was to father a race which, with little character of its own, can hold a sterner and a nobler age in contempt. If the old Puritans, looking down from whatever height they have attained in the Elysian fields, could see some of their descendants, they would robe themselves in celestial sackcloth and cry out, 'May Almighty God forgive us for having begotten fools.'

We probably have erred in our estimate of the joylessness of Puritan life. Such glimpses as we get into the daily doings of Puritan times in the diary of Judge Samuel Sewell and other such men, exhibit to us a kindly humor and a pleasing appreciation of simple joys that went along with their stern religion. But take them at their worst and think of them as painfully serious and oppressed by a forbidding theology; still there is much to be said in their defense.

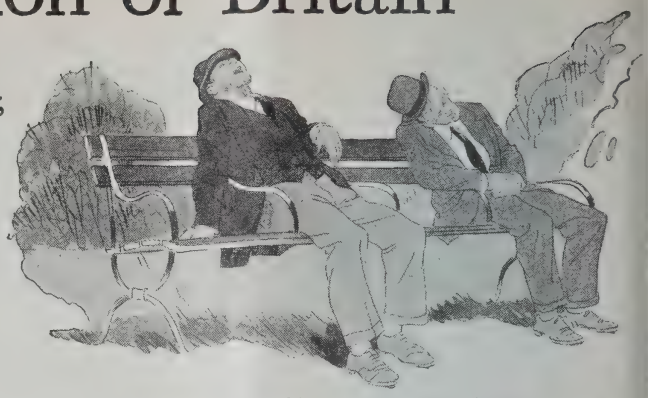
Their youth was not destitute of cheerful sports. Courtship, love and marriage belonged to their normal life, and were definitely encouraged. They looked with little favor on the celibate life, believing it to be a scheme of Satan against which the human flesh was likely to rebel. They married young. Theirs was a normal sex relationship within the limits of the marriage bond.

All cases of church discipline which are of record concerning infractions of the moral law tell their own story of a life that was something else than sheer repression. Those cases of infraction were handled with some severity, but it was a severe age; nature was severe, the climate was severe, the Indians were severe, and punishments were proportionate to the severity of life itself.

I am not asking that those days should come back again. They went none too soon. Indeed, I think they did not go quite soon enough. There is too much a tendency in human affairs to permit good things to outlive their usefulness. Puritanism, I think, was one of those things. It would have been better if the rigidity of the older types of Puritan life had moderated a little more rapidly than it did.

But that is not saying that we should now go to the other extreme and laud the pagan at the expense of the Puritan. The present protest against Puritanism is not a sign of virility, but of degeneracy. It is not a robust protest against repression; it is in itself a repression of much that is finest and most virile in our heritage.

We have need to recover the Puritan faith in individual responsibility. We are too cheaply content with the tyranny of mediocrity. Far too easily do we go with the multitude to do evil. Our fear of intolerance has made us tolerant of everything but the good. We need courage which shall justify us in being ourselves and expressing our own individualism as the Puritans insisted on doing.



If anyone replies that that is exactly what we have, my answer is that he is mistaken. We are in an age of pagan shams. We have a sham admiration for things we do not normally admire. The herd mind was never

# The Pauperization of Britain

## Dole Collectors Lose Desire for Work; Characteristics of Sturdy Industry and Independence Are Vanishing

There are thousands of 'new poor' in Britain. While many have lost all desire to work there are also those who prefer to suffer than take the dole.

By PAUL TYNER

THERE is something picturesque about the poverty of the *lazzaroni*—the sturdy beggars of Naples basking in the sun and appealing for alms in poetic and pious accents. But the poverty of London is simply soul-sickening in the tragedy of its silence. Pathetic beyond words is the air of humilation surrounding its victims, for Anglo-Saxon poverty reflects a breaking down of soul-fiber that is too sad ever to be picturesque.

There is more and worse poverty in Britain today than I have ever observed before—and I have known London before the war, during the war and since the war. There are thousands of 'new poor' here, people who until lately have known at least comfort and decency and to whom the normal life of the 'poor devils' of the slums, who have never known anything better, means all the more intense suffering because of their greater sensitiveness.

Stung by the sufferings of homeless people, the vicar of one of the principal churches, that of St. Martin's-in-the-Fields in Trafalgar Square, a year ago threw open that edifice as a shelter, and nightly from 100 to 200 men gladly avail themselves of the privilege to get such sleep as they can while sitting in the pews or huddled on the floor. Others of the churches furnish free breakfasts of tea with bread and margarine. So far, the local authorities have avoided the familiar 'hard-times' measures of soup-kitchens and 'wood-yard' relief. It seems to be recognized that most of the present sufferers are not of the chronic tramp and beggar class.

I have talked with several of the men who sleep in St. Martin's, when they are unable to get hold of a sixpence to defray the price of a bed in a cheap lodging house. Among them I found men of the various professions, men who had served as officers in the Great War, graduates of the great public schools and of the universities, trained engineers and mechanics, and men who had held important business positions.

There is much cheap sarcasm current as to the readiness of the unemployed to 'lie back' on the 'dole.' While it is unhappily true that there are thousands who have become so demoralized and lacking in backbone that they have lost all desire to work and are content to eke out an existence on the weekly allowance of from twenty to fifty shillings a week (equivalent to five to twelve dollars), the latter where the allowance is for wife and three or four children. There are also many victims of present conditions who bravely prefer to suffer semi-starvation rather than take the dole. These struggle on from day to day, eagerly striving to obtain employment. They seem to feel it a disgrace—an actual beginning to pauperdom—to take 'something for nothing' in this shape.

The night clubs are scenes of mirth. The spenders are doing their best to keep up the notion Old England has money to burn.

It is true that weekly reports during the last few months show a steady decline in the number of unemployed, although they are still some 50,000 above the figures for the corresponding date a year ago. But to gauge the true position it must be taken into account that the Ministry of Labor, in its strenuous endeavors to keep as many workless off the registers as possible, have driven many of them to the local Poor Law authorities, so that the figures of those now in receipt of Poor Law relief show an alarming increase. This relief comes out of local rates which are consequently forced up, increasing the burden of taxation that is already strangling trade and industry.

Whatever may be the deplorable facts as to the number of men whom enforced idleness has deprived of inclination to work, there is no question as to the very large number glad and eager to exchange the dole for a job.

The other day one of the chief business streets of Bath—ordinarily a comfortable and prosperous town—was crowded with men and traffic was hampered. A shopkeeper had advertised a thirty-shillings-a week job for delivery work and the rush was the sequel. He interviewed one hundred and then gave up the task after appointing two men.

Another illustrative instance occurred a short time ago when an advertisement for 'handy men' led to wild scenes outside a big factory at Trafford Park, Manchester. The vacancies were advertised in the evening papers of the previous day, and a crowd of 3,000 unemployed, many of whom had walked miles, began to assemble before six in the

(Concluded on page 23)

# MR. FORD'S PAGE

THERE is perhaps nothing so wholly false as the view of affairs which condemns them as irremediable. Optimism may be only a half-truth, but pessimism is always a lie. It is known to be such by those who harbor it, because it bites and stings.

We may, for example, say that today there is little of that solidarity of opinion that once marked the people of the United States. 'Public opinion' in this country was once a distinct existent force; one could go out and find it; one could weigh and measure it; it was undoubtedly there. Doubtless the same thing exists today, but it is not so evident; it is not observable in so many connections. People, perhaps, have comparatively fewer opinions than they formerly had, because now there is a greater number of matters about which to have opinions. And besides, it is not mere opinions that make 'Public Opinion'; there must be a large core of *conviction* to make that.

Now, it is possible to view such a condition in various ways. It may be mourned as the end of the American mentality. It may be interpreted as the last destructive scene of universal frivolity. False prophets may arise and say that the doom of dumb-mindedness has descended upon us for our shortcomings. There is no reason to deny that even these views may bring with them a certain degree of benefit. Whatever one may say of pessimism, there is certainly something to be said for the serious-mindedness which seems to accompany it. The error of thoughtless minds is to assume that there can be no serious-mindedness in optimism. To be serious, they think, one must be pessimistic. Yet, it is probably nearer the truth that optimism without serious-mindedness is as false as pessimism. It certainly approaches fallacy to hold that serious and sober thinking belongs to dull and gloomy minds. Quite the contrary, seriousness is an element of soundness, and soundness is the very heart of sprightliness.

But it is not the reaction of the observing few to the change which has taken place in the multitude that constitutes the ground for a possibly hopeful view of the change. That ground must be found in the fact of the change itself. If good exists, it must exist in the thing which the analytical few hold to be bad; otherwise the mere fact of their recognizing the bad is not always a sufficient counterbalance for the defection of the many.

*THE pessimist has this to commend him, that he has attained something similar to serious-mindedness. But it is a mistake to assume, as is widely done, that sober and serious thinking belongs only to gloomy minds. To be serious is necessary to being sound, and being sound is essential to being free, and freedom is the soul of sprightliness. That which passes for optimism is so seldom serious or sound that the whole idea of optimism, as popularly conceived, makes for contempt of it. The facts, as facts, are neither good nor bad, which gives the first jolt to pessimism. Life is more than 99 per cent of the basis of a sane optimism. What is living is changing, and Life is constantly casting out the unsound thing.*

Perhaps it is well for us that at times a clearing season arrives when our intenser interests are suddenly loosened, or transferred to something else, or a mood arrives in which it seems unnecessary to have opinions about anything at all, or a deeper change of attitude arrives when we determine that we shall issue new challenges to all that we took for granted before.

If there are certain matters to which the national attention is really important, and national attention toward them had become stale by its very strainedness, it is perhaps well for the really important matters that we do grow indifferent or even forgetful of them for a time, that we may return with freshened eyes and keener minds and an altogether stronger attitude.

It is probably true that the people are losing interest in politics. It is probably true that the politicians, using the old methods, will fail to create any renewal of interest. And the reasons for this oncoming of public indifference are not difficult to understand. If, under cover of it, the sleepless interests do not steal the country, the mental vacation may be the best thing that can happen to politics. When the people come back, politics may get the surprise of its life from the strength and firmness with which the people take hold again. It has now become the fashion of politicians to complain of the indifference of the people, but the return of interest will make an effectual end of the politician.

What we must not lose in any view of conditions is the power of looking all around them and beyond them, and the ability to estimate their probable results. The autumn is very beautiful even if it is the departure of much that pleased us, but more than all that it is the removal of the old and outworn to make way for the new. Thus it often is in human affairs. The march is ordered; we may elect to believe that it is a retreat, but every light we have upon the matter constrains us to regard it as an advance. Yet advances are often harder than retreats, and it is no criterion of an advance that it is unpleasant. Some of the most unpleasant aspects of present-day changes may mark the very places where the beginning of advance is being made.

New beginnings, or the sloughing off of old and outworn things, always have their harsher aspects. Until the old is positively painful, humanity does not willingly let it go.

## *This to YOU*

THE press states that House of Commons criticism of the United States will cease, on the orders of international bankers. Outbreaks against Americans in Paris will be discontinued by the same orders as soon as the diversion created thereby has served the political purpose. That, plainly, is where we have arrived through the handling of our public affairs—we are under the protection, if not in the custody, of the international bankers.

No, patient reader, we are not going to discuss the international debt. We prefer today to discuss *you*. *You* are a somewhat greater mystery than the debt. If we could only understand *you!* If, after reading this, you would write to us and tell us just what *you* are thinking about it.

And here is part of the mystery of you. For ever so many years now you have been told by President, Cabinet and Press that the policy of the United States was not to cancel war debts, but to determine the amounts due us, and make the best arrangements for payment that we could. That is what *you* have been told; that is what *you* believed. When you heard that the 'U. S.' was being interpreted as 'Uncle Shylock' throughout Europe, you understood the reason to be that our Government insisted on collecting the debt. It is true that *you* had no greed for that money; you might even have been willing to forgive the debts if you had been convinced that the benefit of such action would have flowed past the bankers down to the pitiful people of Europe. Undoubtedly you would have said: 'Just the principal; not those mountains of interest too.' And if you had chanced to think of the difference between the purchasing power of the dollar which Europe borrowed from us, and that of the dollar we are demanding, doubtless you would say, 'No more value than we lent, not a penny.'

However, you were not consulted, and Mr. Andrew Mellon does not do business that way—at least, so you were told. The Republican party told you the debts would be collected. President Coolidge told you that cancellation was contrary to his policy. As long as you understood this, you understood why Europe howled.

BUT—just the other day Mr. Mellon told you in letter and statement that this Government was not collecting any war debts at all, except from Great Britain. The war debts of France, Italy and the others have been cancelled. We are collecting only the loans made since the Armistice.

Just as coolly as that, Mr. Mellon informed you that everything which you had been told about the loans was not true. And there is not a ripple from the country.

The bludgeoning of the good name of the American people goes on overseas. It is the international bankers, the Press says, who are intervening on our behalf.

Yet not a ripple of astonishment, not a word of protest, not a sound of inquiry from *you*—from the American people. Misled, hoaxed, misrepresented—then publicly told about it—and yet dumb. This is not to say whether Mr. Mellon did right or wrong; it is to say that all the while *you* were being told that one thing was being done, it was really the opposite thing that was being done. And you swallow the fact without even faint protest.

There is a reason for your being so placid—what is it?

But is it any wonder that our public officials think that they can play with you as they do?

Or maybe you are wiser than they, having the deep instinct of the common people that what officialdom may do today means nothing to tomorrow. It may be that Mr. Mellon and Mr. Churchill do not matter after all.

But feelings of nation for nation do matter. There are FACTS which all the nations ought to have. These FACTS as they regard the United States have patently been distorted. And there is not an authoritative voice in the country to declare or even to inquire the extent to which the policy of the United States has been pawned into financial control.

Why is it that you, John Citizen, have been silent about it? There is a reason. What is it?

---

## *'Come Home'*

SOMEONE long ago remarked the difference between 'go' and 'come.' We have been telling our discontented aliens that if they do not like America, they should go back to their own country. It is not an entirely amiable frame of mind that engenders such a saying, nor is it an amiable frame of mind that is in turn engendered by it. But if one were to stand on the home shores and say to the discontented aliens, 'If you don't like America, come home,' how different the sound and effect!

Thus Archbishop Matulevicius, of Lithuania, preaching in Detroit, said to his countrymen dwelling in America. He told them to love the United States, the country of their adoption, to study its language, uphold its Constitution, adopt its manners and obey its laws. Then he added:

> 'But if for any reason you feel that you cannot become acclimatized here, come back to the country of your birth. Do not attempt to change the country to suit your individual taste. Do not join disloyal anti-American organizations or movements.'

This is sound advice and given in palatable form.

---

### *Whence Progress Comes*

RESEARCH should be placed in many small shops or centers. Centralization of effort makes waste in research.

Success in invention comes from individual ingenuity, not from business acumen.

He sometimes best succeeds who does not know enough about the problem to know it can't be done.

One organization can express only one line of thought.

Soviet engineering produces only compromises; groups of experts never yet created anything.

America's future in creative engineering depends more on the 'nut' than the scientist. The 'nut' creates; the scientist develops. The poor inventor brings the child into the world; the scientist kidnaps it with the help of finance, and brings it up to a manhood of lucrative activity.

Inventions come from small shops.

It takes intelligence to create; big research centers only accumulate knowledge. The unit mind thinks in fundamentals, the organization in detail.

---

### *An Anomaly in Constitutional Government*

THE Constitution of the United States of America is looked upon by most statesmen as the greatest bulwark of individual freedom in the history of the world. We are taught that only by divine inspiration could so perfect a document have been agreed upon by any body of men, and Americans are supposed to honor the Fathers of the Republic by venerating their handiwork. Through some failure to safeguard the amendment provision by insisting that changes be made by popular vote, a point insisted upon in the adoption of the Constitution itself, or by delegate convention organized with the issue in view, ratification of amendments was left to the legislatures incumbent at the time of submission, and no limit was set to the pendency of an amendment not fully ratified.

As a consequence, there are now before the legislatures five distinct propositions, the last the as yet unratified Child Labor Amendment, submitted in 1924.

The others are probably dead from inaction, but the fact that the last is still being agitated points to the necessity of limiting the time allowed for action or reconsideration. If any action of the American people should be deliberate, and not slipped through by hocus-pocus after the point at issue has passed from the public mind, it should be the matter of amending the Constitution.

An equally necessary change is that an amendment may be approved only by popular vote or by a delegate convention chosen with the issue in full view.

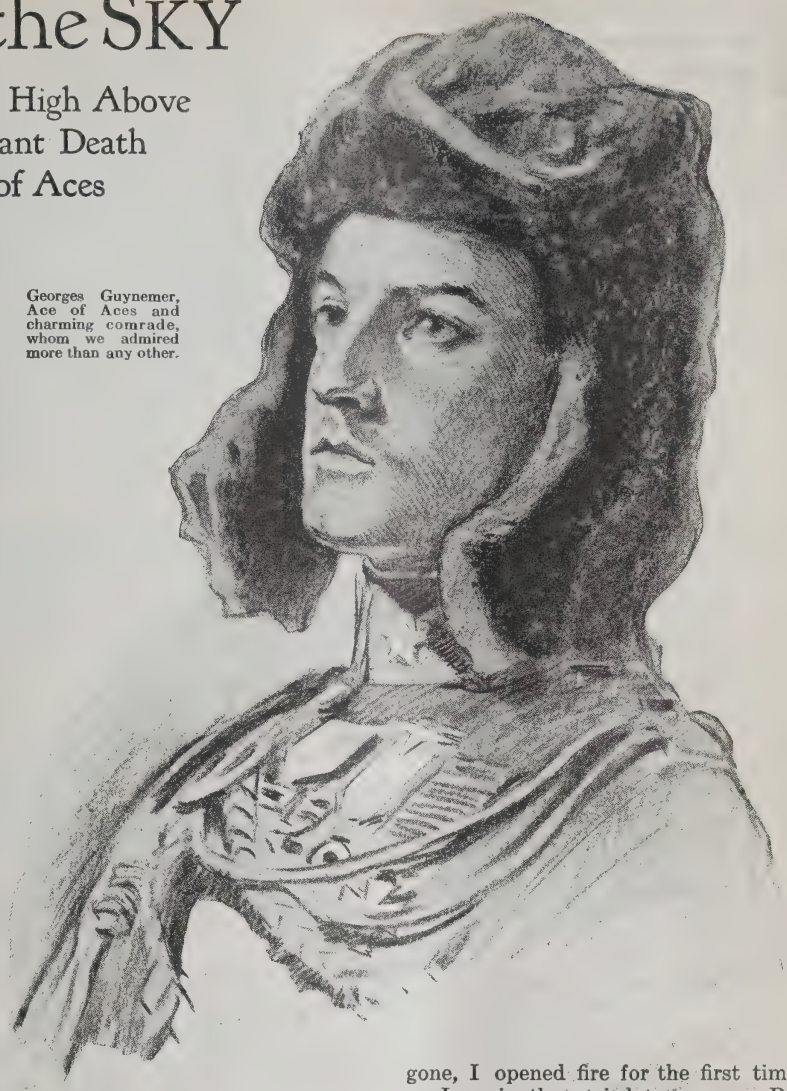
Some of those who earned these decorations with their blood are dead. Others bear scars they will carry all their lives, in lieu of the medals they have pawned for a few pennies. Others, maimed or blind or dying, are eking out existence as best they can. A fanfare of glory accompanied the presentation of each of the medals. Troops were drawn up, bugles blown. A general read a citation of honor and pinned a bit of metal and ribbon on a proud breast. And before the presentation—each represented some outstanding act of heroism, of gallantry, of sacrifice. Perhaps a life saved, or a life given.

But the fanfare and the glory are gone. The heroism is forgotten. In dark little corners of pawnshops the world over these symbols of sacrifice are lying, haplessly awaiting the day when they may be bought by a collector, or by some charlatan eager to pose as a hero. One wonders what grimacing, mocking fate caused their once proud owners to dispose of them.

Some of the grimmest pictures of war are painted in the peace that comes after!



Diving for 6,000 feet, I passed in the middle of the enemy and before any of them understood what was happening I was behind the leading machine.

# DUELISTS of the SKY

## A Story of Thrilling Battles High Above the Clouds and of the Gallant Death of Guynemer, the Ace of Aces

By
CAPTAIN ALFRED HEURTAUX

*PART II*

Georges Guynemer, Ace of Aces and charming comrade, whom we admired more than any other.

A GROUP of enemy planes had been wreaking havoc on our bombing, reconnaissance and spotting planes. They had almost paralyzed our aërial work in that sector and it was essential that something be done. It was near the end of September, 1916. There were five of the enemy planes, single-seaters, but their attack was so effective that our fliers seemed helpless against them. Guynemer and I were ordered there to see what we could do.

On our first flight we saw the enemy. Their planes were painted an orange shade; we knew the squadron, and that we had a stiff problem on our hands. Nor were they long in learning who we were. Our machines also bore characteristic marks: a red stork painted on both sides of the body and big numbers on the upper wings—No. 2 for Guynemer; No. 11 for myself.

For several days we met together south of Bapaume, but there was no opportunity for us to begin the engagement. As soon as they sighted us, our adversaries would retire farther behind their lines, hoping that we would pursue them. We were not tempted, however, to invite a battle under such unfavorable conditions. Finally Guynemer and I decided to go up separately. The decision as to who should go first was left to a cast of the dice. I won.

The next morning at our accustomed hour, four-thirty, I arrived at the rendezvous. I had not long to wait. The fight began at once. My gun jammed; I was unable to fire a cartridge. In a few minutes I was partially disabled, and it was with great difficulty that I managed to land on a field not far from our trenches especially prepared for such an emergency. My engine was riddled with bullets, and the wings and body were not in much better shape. I abandoned the plane and returned to my headquarters.

Guynemer received me with jocular pity, and indeed I was not very proud. But before the day was over he had his turn, and he esteemed himself highly lucky to drop into our trenches. The débuts were not encouraging. In the days that followed our fortunes were no better and more than once we were shot down. This only increased our rage, and we decided to put an end to the intolerable situation.

So finally one evening I climbed very high and let the group attack me, maneuvering only to give it a difficult target. I was flying in a circle; so short was the radius that my adversaries were obliged to shoot at me while diving—one of the worst positions possible. The speed was so great that it was hard for them to take good aim or keep good control of their machines. As I turned to the left I could see many bullets piercing my right wings, and as I turned again they would shoot through the left. Fortunately for me, the pilots did not think of correcting this situation, made by my maneuver.

But I did not feel any too comfortable, for there was always the danger of one lucky shot from the *chasseurs*. I remained a target until my adversaries' ammunition was exhausted—and this took time enough, for each of the planes carried about a thousand cartridges. Finally, their last bullet shot, I suddenly became master of the situation. Too late they realized their fatal mistake. Their ammunition gone, I opened fire for the first time.

In vain they tried to escape. Before the engagement was over two of their planes were falling in flames, and the rest were fleeing for safety. After I landed we counted 197 bullet holes in my speed scout, and yet no vital part had been struck!

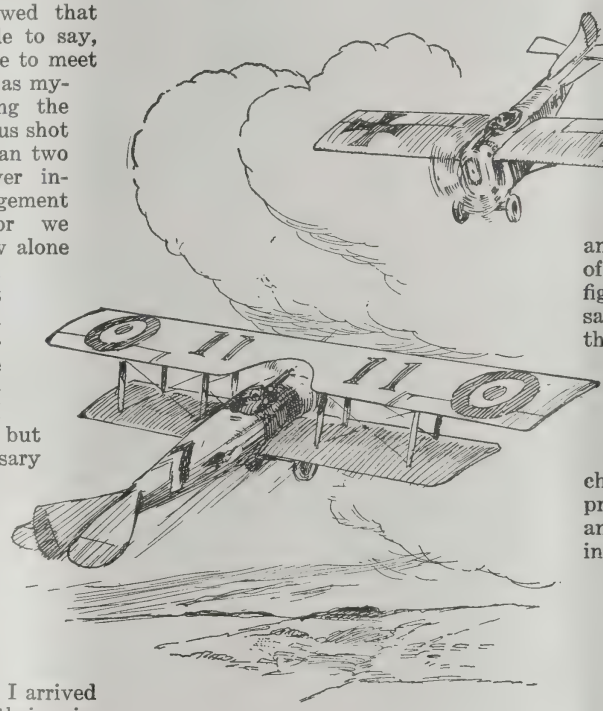
Soon after Guynemer also took his revenge and brought down two more planes. We did not have an opportunity to meet the fifth; but the sector was given the tranquillity for which it had begged.

Never shall I forget my first attempt at aërial warfare. It took place in the month of June, 1915. Having done reconnaissance work in the morning, I departed in the afternoon in search of a duel. At that time I was operating a two-seater. My observer, newly arrived with the squadron, had not had much experience, but I hoped that, with the advice I gave him, he might be of some use to me.

We were not long waiting for an opportunity. North of Rheims I sighted a machine I thought might be one of the enemy; we flew there, and soon we could see the large black crosses. The plane was a two-seater.

Nearer and nearer we came until I could perceive every detail of the enemy. They were not yet aware of our presence. I glanced at my passenger. Carefully he took aim at the target. He pulled the trigger. Nothing happened. In vain he tried again and again; his machine gun remained silent.

Suddenly the Germans discovered us. So threatening was our appearance that they dove hurriedly and escaped. My ire had no bounds. I went back to my field. There I learned from my passenger that in his excitement he had forgotten to cock the gun! Such was his shame and sorrow and I had not the heart to reproach him further.



Of the fights that followed that initial attempt, there is little to say, save that it was lucky for me to meet with adversaries as unskilled as myself. In July, 1916, during the Battle of the Somme, five of us shot down seven planes in less than two hours in an expedition over invaded territory. This engagement was unusual, however, for we customarily at that time flew alone and engaged in single combat.

Early in September I shot down my twelfth plane. I had learned that an enemy observation plane crossed the front each morning for reconnaissance near Amiens. I started out before daybreak, but in spite of my haste my adversary had preceded me. I was at 13,000 feet when I saw him entering our zone far higher than I was. The reconnaissance plane was accompanied by a speed scout. I had only one course: to start to the chase. For more than an hour I was forced to climb and follow them before I arrived at the same height. Then, their mission accomplished, they started home. Our journey began in the region of Peronne and did not end until we were above Roye, a small town which at that time was a few miles behind the enemy's lines.

The situation was not wholly unfavorable for me. A violent wind, blowing from the east, might prove of aid in case I needed to retreat to my own field. It was the chaser which began the action; the observation plane left us to fight it out and returned home. For a time we maneuvered high in the air, each unsuccessfully attempting to attack the other from the rear. These efforts failing, we rushed at each other face to face. This was not so dangerous as it sounds; our speed was so great that we must needs pay more attention to our planes than to our guns to avoid collision.

After several passes of this kind, I at last resolved on a desperate maneuver. Before arriving near him I made half a loop which I concluded by a turn over, followed by a side slip. At the end of the maneuver I was directly behind the other plane and headed in the same direction. At once I knew my plan had succeeded. I could see my opponent looking over his fuselage trying to see where I was falling. He seemed sure that he had shot me down and apparently had no feeling of anxiety. A dozen bullets and, pushed by the wind, his plane crashed down among the French trenches.

A few days later I had the good fortune to count another victory. Cruising at 18,000 feet, I sighted a group of seven enemy planes coming in my direction. They were flying on a far lower level, and as I was between

These efforts failing, we rushed at each other, face to face.

them and the sun it was difficult for them to know of my presence. I had only to await a favorable moment when, coming over our lines, I should attack them.

They had taken the flight formation, V-shape, as wild geese fly. Seeing this I decided to assail the first pilot; he would be the least on his guard, as he would depend on his comrades taking care of anything behind him. Moreover, being placed between the two arms of the V, I would be nearly safe; the pilots could not shoot without risk to themselves, or before making a turn which would carry them away from me.

Diving for 6,000 feet, I passed in the middle of the enemy and before any of them understood what was happening I was behind the leading machine. Five bullets were enough. I dropped my Spad in a tail spin, surrounded by the wreckage of the unfortunate plane. I was not pursued. Later I learned that my unlucky adversary was Lieutenant Wintgens, a German ace, who had a number of victories to his credit.

The last months of the Battle of the Somme were marked by a great number of our successes. It befell Guynemer and myself each to shoot down three planes in the same flight, the best exploits of our careers. Once while we were both returning to our field we met an enemy observation plane which had entered about six miles into our lines. We had no cartridges left, but so tempting was the occasion that we decided to attempt the method of descent by persuasion. This consisted of fluttering around the adversary so near that he would be obliged to dive to escape collision.

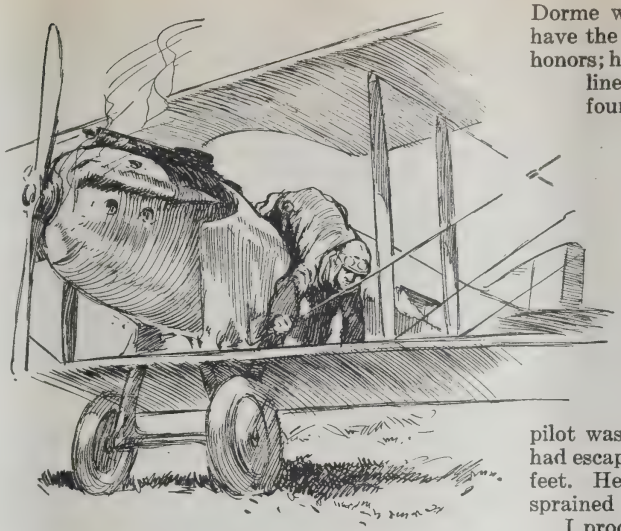
At first everything went well. The pilot stopped his engine and dropped. He came very near the ground and our hopes were great, but he soon grasped the situation. In vain, to frighten him, we flew nearer and nearer; his observer began to operate his machine gun and before long I was in the necessity of landing. Guynemer pursued the fight for a time, only to arrive at the same conclusion. We met together in the same cornfield and rejoined on foot on the road, looking for a car which would carry us back to our squadron.

These misadventures had their good side: to get new machines we must go to Paris, and the prospect of a few hours with our friends and families was very alluring. I might insert here a few words about these trips to Paris. Many people during the war wondered at the large number of aviators who paced the boulevards. They were really not so numerous as many thought, but their gift of ubiquity gave the impression of vast numbers. If their presence there was aviation's moral evil, it had as its offset the advantage of saving much equipment.

Most of the boulevard-aviators were highly unskilled, and the veteran pilots were as lief to have them on the pavements of Paris as to have them wrecking machines at the front. As for the members of the Stork Escadrille, we never used our regular turns of *permission.** Instead we awaited bad weather when flying over the front was impossible; and then we would use our planes to fly to and from our homes. Hence the first good day we would be back at the front, ready and eager for combat. Our privileges were great, and we did nothing to abuse them. Of the more than 200 pilots I have had under my command, not one drew down upon himself the slightest reproach in this connection.

The Battle of the Somme ended, we were sent to the neighborhood of Nancy. There the situation on the ground was very quiet, but not so in the air. The proximity of Metz, where was located

* Leaves of absence.



an important aviation center, resulted in Nancy being bombarded without respite day after day. The unfortunate inhabitants had pleaded for protection, and we were dispatched there to see what we could do. After the months of intense activity we had just passed, this seemed like a vacation.

The installation of our camps took place near the end of January. The first days we flew without seeing a trace of the enemy. The cold was intense, and these fruitless cruises did not add to our enthusiasm. Fortunately for me, my first engagement here was auspicious. I was in my Spad ready to start; my engine was running; I wanted to get it warm; a necessary precaution, for the temperature was seven degrees below zero. A familiar sound caused me to look up. In the midst of white snowflakes a German two-seater appeared.

I took off immediately. Soon I had reached the needed altitude. This time there was no element of surprise; my presence was known. But I made my approach with what sun there was at my back. The enemy observer's eyes were dazzled as I approached, and I succeeded in taking the preferred position. At my first bullets the plane reared up. This maneuver uncovered me. The observer was quick to take advantage; we were so near each other that each shot took effect.

My carburetor was split, my spark plugs were broken, the controls of the engine were cut in my left hand, the sides of my seat were driven away. Bullets whizzed on all sides, but only a few splinters entered my body; they inflicted slight scratches. I was blinded by the oil and water and afraid I would not be able to continue the pursuit, when I saw my opponent diving vertically. This told me that he was in bad shape. Once again I took up the fight. My last shots must have dealt harm, for the passenger gave no further signs of activity. A black smoke came out of the fuselage.

There was nothing more for me to do but land. It was high time; our battle had taken place above the center of the town and I must keep a sufficient height to reach an open space. With the help of a strong wind I managed to land without accident in a field recently plowed on the side of a hill. My adversaries had done the same thing not far from there.

Fearing fire, I let myself fall from the fuselage to the ground.

Their machine was afire but they had escaped the flames. Both of them were wounded. The pilot had been severely shot by the first bullets and this was why he had made such a strange early maneuver, of which the observer had taken prompt advantage. The observer had three bullets in the right forearm, received during the last period of the fight.

Our sojourn in the East was successful. In fifteen days our squadron added fifteen victories to its list. The bombardment of the city was at an end and this situation remained until the end of March. We were sent to the Aisne to take part of the offensive of the Chemin des Dames.

Our arrival was attended by the accustomed successes, but the good fortune which until then had attended us soon was gone. Prior to this, without doubt, we had sustained great losses, but the aces of the squadron had always escaped with slight injuries. Now things were different. Four of our young pilots did not come back in the last week of April. And finally Dorme was killed. We did not even have the consolation of giving him last honors; he had fallen within the German lines and his body was never found.

We determined to avenge his death and our efforts cost the enemy dearly—ten machines put down in fire within their own lines. The fourth of May, I met an observation plane on a reconnaissance tour above Fismes. A few bullets, and the plane fell in a spinning nose dive that lasted to the ground. Soon after my landing I learned that the pilot was killed, but that the observer had escaped, in spite of his fall of 12,000 feet. He had received, in fact, only a sprained foot and a scratched nose.

I proceeded to headquarters, where this observer was a prisoner. As I arrived, the general emerged from a room where he had been interrogating him.

'It is no use to question him,' the general said. 'Either he does not speak, or when he does it is not complimentary.'

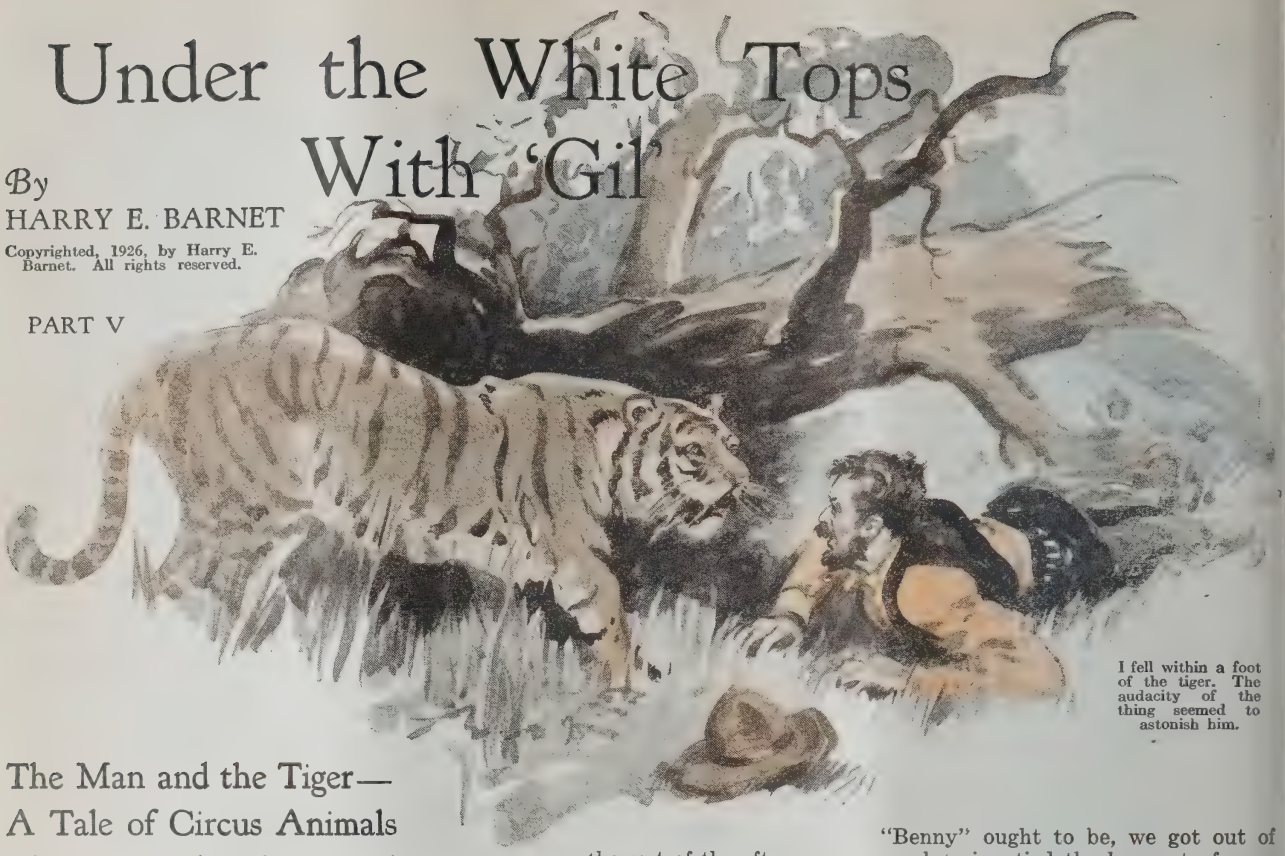
Nevertheless I insisted and he let me go in. The German captain had indolently sat down, his face in his hands. As soon as he learned who I was he stood up, saluted, and took off his cap.

'Did we fight well?' he asked. I assured him that they had.

'I thank you, Captain,' he replied. 'It is an honor to have been shot down by you.'

He then readily answered any questions I wanted to ask. (Following the war he flew one of the dirigibles provided for in the Versailles Treaty from Germany to France.) His politeness to me was equaled only by his contempt for the general and his staff, greatly, of course, to the ire of the latter.

The next day, going to the attack, I had the misfortune to emerge from a cloud directly in front of two enemy planes. They had only to shoot. My right arm was pierced, and I was not able to retain control of my machine. My fall saved my life, for I was not pursued. I dove for *(Concluded on page 19)*



Two German pilots were sent to see if this pilot was not the great Ace of Aces. They were too late. Shells had buried the remains.

# Under the White Tops With "Gil"

PART V

I fell within a foot of the tiger. The audacity of the thing seemed to astonish him.

## The Man and the Tiger—A Tale of Circus Animals That Escaped and Roamed the Startled Countryside

THAT interval between supper and the opening of the night performance is usually a comfortable time around any big tent show. And it was during such a respite that Gil Robinson, the world's oldest circus man, wandered into the menagerie of the John Robinson circus.

Immediately the dogs in their corral started a welcoming clamor. Gil talked to them. Walking the length of the canvas, he passed in succession twelve solemn elephants. At the far end of the menagerie top, Gil stooped to pet a baby camel. She laid her head upon his shoulder, and bawled out some sort of weanling woe. 'Kitty,' the tiger who rides a horse in the arena, aroused from a nap. Rolling onto her back, she waved her paws in the air, openly inviting Gil to tickle her under her chin. Gil didn't.

'There was a time when I'd do it,' he said, 'but I've never tickled a tiger since I tickled "Benny," right after the Civil War. And I don't intend to tickle another of the same breed.'

Gil sat down upon a bale of hay. The story was not long in starting.

'Shortly after the Civil War, when we were still traveling by wagons,' he said, 'Pa shipped some animals to the show, among them, a royal Bengal tiger. We received them at Dalton, Georgia. The animals filled several cages, and after the matinée we spent the rest of the afternoon shifting them into the the proper traveling cages. Somebody forgot to lock the door of the tiger's cage—(we'd already named him "Benny").

'Going from town to town, the baggage wagons came first, then the cages, and behind them the "led horses," who worked in the ring and were never hitched to a buggy or a wagon. Such menagerie animals as we could lead across the country—camels, and so forth—followed the horses. The cavalcade wound up with the buggies and carriages of the performers and our family, and old Mary, the family elephant, at the end.

'Two or three o'clock in the morning was our regular time for leaving a town, and we left Dalton on time. About daylight, the negro leading the advance drove of ring horses saw "Benny" crouched in the road a short distance ahead, just about to spring at him and the horses. The negro yelled and turned his horses back toward Dalton. The other darkies followed. A couple of miles down the road I managed to stop them.

'The darkey who saw "Benny" told me what was the matter. I got him into the buggy, and told him to show me as nearly as he could the spot where he encountered the tiger. But the man was so scared he had forgotten the place, so there we were, trying to locate a tiger that was some place in the vicinity, and we didn't know where.

'My brother Jack and a lot of the men performers hurried along after me. When we got to where we thought "Benny" ought to be, we got out of our buggies, tied the horses to fences, and formed a skirmishing line from the road up into the bushes. This was at the place known as "Buzzard's Roost," familiar to Civil War veterans as the scene of some pretty stiff fighting. We went ahead in skirmish formation, and about thirty feet from the starting point, my brother Jack picked up a fence rail for protection. But if the tiger had attacked him, the rail would have been of no value. I had nothing, not even a rock.

'A big tree had blown down not far from the road, and when I got close to it, I ran to get momentum, and jumped up on the log. At that moment I saw the tiger on the other side, lying on his stomach, ready to spring. I wanted to stop on that log, but I couldn't. When I landed on top I went right on over, and fell within a foot or two of "Benny."

'The audacity of the thing seemed to astonish the tiger,' Gil continued, 'at the same time he appeared to be glad to have someone there to see him. He rolled over and unconsciously I commenced to pat him on the head. The tiger relaxed himself upon his back, and seemed to want me to scratch him on his belly. I did it, although I was shaking like a leaf.

'The minute I commenced to scratch "Benny" he commenced to whine in a friendly sort of way, like a pleased house cat, and to draw his claws up and down. His claws were so sharp that every time he moved them he ripped my clothes as though with a knife.

'I knew it was certain death if

I quit tickling "Benny," and attempted to walk away, and the only thing I could do was to keep it up. All the time I kept shouting to the rest of them, who were back a little ways, "For Heaven's sake do something." Apparently, they were paralyzed with fear.

'Jack yelled at the darkies, who were away up the road with the horses, to get some ropes, and if they couldn't get them, to take the reins off the horses. It was but a matter of a few minutes until "Benny's" claws would dig into my flesh, and that would be the end of me. I shook so badly with fright that I couldn't help but tickle the tiger; all I had to do was to hold my hand close to him, and my trembling did the rest. But I was afraid that with my shaking I'd bear down too hard, and there the trouble would start. Nevertheless, I had to keep "Benny" amused and quiet.

'After a while the darkies came up with some reins. Jack got down on his stomach, crawled behind the log, put a rein that had a loop on the end of it on a long sapling with a couple of limbs cut off to make prongs, and shoved that through the grass and rocks to me. I got hold of it with my free hand. In a minute Jack shoved a second rein with a loop in it to me. I tickled "Benny" with one hand and worked the loops over the tiger's head with the other.

*Man's Strategy Pitted Against a Tiger's*

'About this time along came the driver with "Benny's" cage. The baggage wagon and cage teams had stopped for water a few miles ahead and someone had discovered the cage door open and the tiger gone. He reported it to the train master and he sent the cage back along the road, knowing that we would need it more than anything else.

'They backed the cage as close to the tiger and me as they could. They hadn't pulled the other ends of the reins tight around "Benny's" neck as yet. Nobody wanted to get him provoked. There were no guns or other defense weapons.

'At a signal I gave the tiger a shove, and jumped to one side. "Benny" saw his cage, and apparently he wanted to get back into it, for he jumped and ran to the door. Unfortunately, one end of a rein caught in a sapling or something so he couldn't get all the way in. The rein jerked him back onto his haunches. That did settle it. "Benny" did exactly what was expected; he started to chew at the rein. As quickly as he could, Jack got the other rein through the bars on one side of the cage and out on the other side, so the tiger was chewing on a rein that was free. Then somebody put two or three sticks into "Benny's" mouth for him to chew on. With two or three pulls on the rein already through the cage bars they yanked the tiger into the cage, shut the doors, and everybody offered thanks.'

Gil paused and glanced at a den of trained lions in the menagerie.

'We had a good many animals escape, and some we never captured, or even heard of,' he said. 'The last I ever saw of a magnificent lion, for instance, he was streaking across a Texas prairie, and an ostrich was streaking right after him. We never heard of the ostrich either.

'Of course, we never said very much about it when ferocious animals escaped, because somebody would have been sure to sue us for damages. The greatest mystery we ever had was the escape of two very fine black leopards. We were traveling by rail then, and one night while we were on our way to Portsmouth, Virginia, the leopards evidently got out of their cage through the ventilator in the roof, though how they did it nobody ever knew, because the ventilator was smaller than their bodies.

'When they got out, they ran along the floor of the flat car under the wagons and cages until they came to a goat that was tied under a cage. They killed and ate it. Then they ran over three or four workingmen who were sleeping under cages. The animals stopped with a workingman between them. The fellow was awake, but he had sense enough to keep still. The leopards sniffed at him, then went on.

'No one knows where or how they got off the train. We were afraid to go back and hunt for them, although they were worth a big sum of money. Leopards are the most cruel and ferocious beasts there are, and we didn't know what damage they had done. About six months later we got a letter from a fellow down in that country who said he had the hides of two black leopards, and wanted to know what we would give him for them. We never replied, for fear he might take the letter to be an admission of ownership.

'But funny things often happened during escapes and they took the edge off the tragedy. There was the time my brother Jack and Dan Dale got themselves into an awful fix in a convent yard. Jack and Dan were trying to get away from "Chief," one of our elephants, who was probably the biggest rogue any show ever attempted to carry over the country. He went on a rampage every now and then, and caused a lot of damage. Old "Mary," our pet family elephant, was always boss of the herd. If we turned "Mary" loose when "Chief" broke away, she would chase him and when she caught him would beat him with her trunk until he would whimper for mercy. Apparently, he didn't have the nerve to resist her.

'One afternoon after the performance when the crowd was off the lot "Mary" lost control of "Chief." He charged and knocked her down, but he could

'Chief' picked Jack and Dan as victims. They were alongside a smooth convent wall about eight feet high. The first thing we knew, the men had climbed the wall.

ILLUSTRATED BY GEORGE HARPER

We had a good many animals escape. The last I ever saw of a magnificent lion, for instance, he was streaking across a Texas prairie, an ostrich right after him.

not gore her with his long tusks because of the load of chains with which we kept him fastened to stakes.

'The pony of the chief elephant man was standing near. "Chief" ran his tusks underneath the pony, and threw it to the top of the sloping canvas. The pony landed on the ground with a thud. The exertion broke "Chief's" chains. "Mary" was paralyzed at such treatment, something she had never before had, and for a moment she made no sound. Then she began to trumpet and raise an awful fuss. But the assault broke her spirit—she never tackled "Chief" after that.

'"Chief" ran to the back end of the tent and out. I was in the ticket wagon at the time and when I heard the confusion—all the menagerie animals went crazy—I ran in just in time to see the pony strike the the ground. I raced through the menagerie, but "Chief" was already four or five squares away. Everybody ran after him, Jack and Dan in the lead.

'Then "Chief" turned. He stood still for a minute. Finally, he picked Jack and Dan as victims, and started in their direction. They stood still until "Chief" was within 400 feet and then they started to run.

'They were alongside a brick wall, surrounding a convent. The wall was smooth, and about eight feet high. They ran along by the wall for some distance. They could hear "Chief's" chains rattling, but they had no time to look around. "Chief" was gaining. It was an awful race, with almost sure death at the end, for Jack and Dan were heavy men.

'The first thing we knew the men had climbed the wall. Neither they nor anyone else ever knew how they did it. They landed in the center of a number of girls and Sisters. Some of the girls screamed for help; others fainted; some ran to hunt janitors and gardeners and watchmen.

'Jack and Dan were too winded to apologize or explain; besides, they wanted to get out to see what became of "Chief." So they began to run around the inside of that wall, hunting for an exit. In a minute or two along came several gardeners with rakes and hoes. They joined in the footrace on the inside of the wall. After a while Jack and Dan found a gate that would open and they ran out.

'"Chief" had started toward the center of town after Jack and Dan disappeared from his sight. A performer and his wife were coming down the street, and as soon as they saw "Chief" they started to run ahead of him. But he gained so fast they jumped over a high barbed wire fence—and afterward they never knew how they did it. "Chief" charged them, and when he hit the fence it was so stout that it rebounded and threw him back about twenty-five feet on his haunches. The elephant didn't get a scratch. But when he landed he sat up like a dog, with his front legs out. He had had the wind knocked out of him.

'By this time the pony had gotten over its fall, and the head elephant keeper had ridden after "Chief." He soon got the elephant under control, and "Chief" walked back to the lot as calmly as though he had just been eating peanuts.

'Then my job came along. I had to go to the convent and smooth matters over. I explained the case to the Mother Superior. She had a good laugh, and said she hoped Jack and Dan were no worse for the wear. They were laid up a bit for a few days, but that was all in the circus business of those days.

# Building the First Continental

By D. M. LE BOURDAIS

AT A PUBLIC meeting held in Halifax in 1851 a remark was made: 'Many in this room will live to hear the whistle of the steam engine in the passes of the Rocky Mountains, and to make the journey from Halifax to the Pacific in five or six days.'

By 1875 no less than 13 separate reconnaissance lines had been run across the continent.

In the meantime the great project was passing through many interesting vicissitudes in the political field.

The whole continent was in a state of business stagnation induced by one of the worst financial depressions ever experienced in North America.

The Canadian Pacific Syndicate, as it was called, agreed to build and operate an all-Canadian line from Montreal to the Pacific within 10 years for $25,000,000 in cash; 25,000,000 acres of land in the Northwest, exclusive of right-of-way and grounds for stations and similar necessities; all materials necessary for construction to be free of duty; all taxation to be remitted forever on the company's property, excepting lands which were exempt for a period of 20 years from date of patent; and a number of other considerations. In addition, the portions already constructed by the Government or under contract, comprising in all some 713 miles, were to be turned over to the syndicate free of charge.

There was much opposition to these terms on the part of the Government's political opponents and also by others, who believed that the terms were over-generous. But generous enough as the terms eventually proved to be, there were many persons at that time who believed the building of a transcontinental railway on any terms to be a hopeless undertaking. One statesman predicted that the road would never earn enough to pay for axle grease!

Presently a syndicate was formed, composed of Donald Smith, chief commissioner of the Hudson's Bay Company, his wealthy cousin, George Stephen, James J. Hill, Richard Angus, of the Bank of Montreal, Kittson (an associate of Hill's) and John S. Kennedy, a New York banker. The partners subscribed sufficient funds to get the bankrupt St. Paul and Pacific Railway into operation. A few years later it made history as the Great Northern. These, then, were the men who proposed to build the future Canadian Pacific railway. A company was incorporated with a capital stock of $100,000,000. The most difficult section was, of course, the 600 miles of mountains in British Columbia. The line was actually constructed to Calgary, less than 100 miles from the mountains, before an available route through the ranges was discovered.

Behind the pathfinders came the pathmakers. The men who overcame the multitudinous engineering problems of those 600 miles of mountain construction have erected a monument to themselves for all time. 'Every foot of the mountain division of the road was contested and probably every mile of tunnel and track was sealed with the blood of men.'

# Duelists of the Sky

(*Concluded from page 15*)

4,000 feet. I was able, however, to regain control of my plane before it crashed and to land on our field. A few weeks in the hospital, and I was back in service. But in the meantime many familiar faces were gone. Many of our experienced pilots had been killed, and we painfully felt their absence. The young pilots were full of courage but their inexperience counted against them. In one month forty-seven men were disabled. I, too, was soon to be shot down for the last time.

The third of September, 1917, I started for a trial flight with my new Spad, equipped with the 200 horsepower Hispano-Suiza engine. I had no intention of fighting; nevertheless, spotting an enemy plane within our lines I could not resist the temptation. I approached it easily; but neither of my two machine guns would work. Without attracting my adversary's attention I proceeded to fix the guns. One emitted a few bullets and I thought it was functioning again.

I returned to the attack, but with no more success. After the first two cartridges, the gun jammed again. The noise was enough to warn the enemy of my presence, and the observer grabbed his gun. Making a turn, I felt a violent blow in my left thigh. Just at that instant one of my guns started again. I determined to give the adversary blow for blow. This time I was more lucky. Surrounded by flames, the enemy plane began to fall.

The last efforts had exhausted me, and the pain was so great that I had not the strength to retain control of the plane. The battle ended at an altitude of about 20,000 feet. For a time I lost consciousness. It was only when I was about 1,500 feet above the ground that I was again able to maneuver the machine. The landing was made successfully. Fearing fire, I let myself fall from the fuselage to the ground and await aid. Soon ten English soldiers arrived, and two hours later I was on the operating table.

My luck had held with me to the last. I had been shot with two incendiary bullets, and the phosphorus, while it had provoked almost unbearable pain, had cauterized the wound. Both the femoral artery and the saphenous vein had been severed, and had it not been for this cauterizing, I would have been dead from hemorrhage before I reached the ground. I passed long, weary months in the hospitals and was not able to fly again during the war. My nomination as officer of the Legion of Honor and the numerous decorations sent me by the Allied Nations were a consolation that did not permit me to forget the adventures I was missing.

Seven days afterward it was Guynemer's turn and he, less fortunate than I, never came back.

I heard of his disappearance from the Prince of Wales who, as long as I was in the English hospital, did me the honor to visit me nearly every day. For days we waited anxiously for news from Guynemer. The German papers were silent and we could not understand this. We hoped he was only a prisoner, and dared not speak of him, fearing he might not want his identity known. It was not until October that we learned the sad truth.

Guynemer, accompanied by a new pilot, had gone to attack a group of German planes. Fate had decreed that the plane he chose to engage was occupied by an observer flying for the first time. For his first attempt, he made a master shot. Two bullets pierced Guynemer's head and a third cut away two of his fingers, entering his chest. His death was instantaneous. His Spad crashed in front of the German trenches near Poelcapelle. Two German soldiers crept to the wrecked machine and brought back his personal papers which, as usual, were sent to the General Staff. There they learned the pilot's name. Two German pilots were sent to see if this pilot was not the great Ace of Aces. They were too late. Shells had buried the remains; no trace of the plane was visible.

The Germans feared that we might have two pilots of the same name, and they hesitated to publish the news. It was only when the French papers told of Guynemer's disappearance that they revealed their victory.

We had lost our greatest fighter. Never again were we to see this charming comrade, whom we admired more than any other. He had a presentiment of his fate. After I had been shot down he told my wife that he would be next. 'When I take off,' he said to her, 'I always make a sign of "Goodby"; and my comrades answer me smilingly. They don't realize that I make it because I know I shall never come back.'

And so he died as he had lived, his face to the enemy, the open sky showing all the way to follow.

# Once a Bustling City—Now a Ghost of the Desert

RHYOLITE, Nevada, once a humming mining town of substantial buildings, with a population of ten thousand, is now abandoned—another ghost town of the desert. Coyotes howl and chase jackrabbits through the streets and building shells of the once prosperous city. The pitiless sun shines down on a vast expanse of silence and solitude. A schoolhouse, a modern railway station and other buildings stand out as bleak monuments to the faith of the builders.

On August 9, 1904, Frank (Shorty) Harris and E. L. Cross were prospecting in a blowout of quartz and quartzite in Southern Nevada. Shorty struck a boulder with his pick and revealed the genuine green 'bullfrog' rock. The blow caused a gold stampede to the region. In less than two years a railway passed within a stone's throw of the spot.

When news of Shorty's find filtered to the outside world the rush began. The gold-eager crowd came from all directions. Down from the north they streamed. Men on foot, burros, freights, light rigs, mule teams, and straggling horsemen, all coming down from Tonopah and the other fields in that vicinity. Concord stages brought passengers, express and mail from Las Vegas, one hundred and twenty-five miles south. Some came on foot with their beds, canteens and grubboxes strapped upon their shoulders. Many never reached their destination; others pushed on to fortune and fame. The automobile at that time was coming into its own, and the fortunate owners of cars blazed trails across the hot sands over which even wagons had not passed. Hundreds of white canvas tents dotted the desert and the city grew as if by magic.

(c) *Ralph Hamlin, Los Angeles.*
Railroad station at Rhyolite.

The men were herded into canvas lodging houses, partitioned with burlap and cloth. They were fed at lunch counters and many stood in line for hours awaiting their turn. Water cost from $2 to $5 a barrel and was poor stuff at that price. Property values soared. Lumber and other building material were in such demand that three companies could not freight it in fast enough to keep up with the building. In 1906 the town appeared to be so well established that two railroads entered Rhyolite, one the Las Vegas and Tonopah, covering the 115 miles to Las Vegas on the southeast, the other the Goldfield-Bullfrog from the north. With the advent of the railroads Rhyolite took on a more substantial aspect. Two large three-story buildings of reinforced concrete were built and later a fine eight-room school building with metal tile roof. The Las Vegas and Tonopah built a substantial passenger station. Later its rails were taken up.

The city had good railroad service; three water systems, supplied from springs; electric lights and power; two banks; a telephone exchange with long-distance service; Western Union and Postal Telegraph; three newspapers; two churches; a modern public school building, an opera house, and fifty-seven saloons.

But the Bullfrog mining district did not fulfill expectations. Not one mine in the Rhyolite district was successful and most of them were almost total losses. The rich lead which Harris uncovered was badly faulted and could not be picked up again.

The exodus became general. Then, early in 1923, J. D. Lorraine, 92 years old, died. He was the town's last inhabitant.

# CHATS WITH OFFICE CALLERS

And who should come into The Office but ***Ezra Meeker***, bearing his ninety-six years on a torrid day with apparent ease. Of course you know who Ezra Meeker is; everybody does, from Presidents to garage men. He is the lone adult survivor of the great trek to Oregon in 1852. We say 'lone adult' because some of the babies who went along are still alive. Ezra himself carried his first child along in the covered wagon, a boy less than a year old. That baby is now 74 years old and still farming in the West. Ezra looks like a prophet from out of the Old Testament, and truly those pioneers were prophets—they saw the land that was to be. We talked along, and he told us how he had always loved work—work was an enjoyment to him. He said that his work and his wife accounted for his long years. When he mentioned his wife, his old eyes filled with tears, his lips trembled beneath his patriarchal beard. They lived together 58 years—think of that! She was a Quaker girl from Indiana, and he spoke of her good qualities, not forgetting spinning and such things. They lived in one cabin for twenty-five years. Ezra is a man of sound conversation. He says that looking at it one way, his life seems long, and then looking at it another way, it all shortens up like a closed accordion. He smoked until he was fifty; he learned to smoke by lighting his mother's pipe. She was a corpulent woman and did not like to lean over the fireplace to search with the tongs for a small coal to light her pipe, so she had Ezra do it. And he would take the first few puffs to assure a good light, so that by-and-by he acquired a taste for tobacco. But when he was fifty his wife said to him one day, 'Ezra, it seems so strange that a man makes a chimney out of his mouth.' The remark struck Ezra so forcibly that he flung his pipe away then and there, just because it was his wife who had said it. They must have been a rarely happily mated pair. All that Ezra lives for now is to mark with monuments the trail he traveled in '52. He says that if the graves of the pioneers who died en route were spread out, there would be four to a mile all the way across the country. He has now taken the trail by oxcart, horse, airplane, and he is doing it this time in a Ford car. He was due in Oregon a month from the day he dropped in to see us. He has a covered automobile now instead of a covered wagon. He writes a fairly steady hand and has published three books, his latest being *Kate Mulhall, A Romance of the Oregon Trail*. But best of all is his personality; he gives one the rare feeling of having met a real man.

* * *

'Some people call our country desolate,' said ***the Kansas wheat farmer.*** 'That's because it's so large. But it's the greatest wheat country in the world.'

'Don't let anyone tell you that the Kansas wheat farmer is hard up. Men who started on little more than a shoe string are today independent in a small way and they made it all in wheat. There's my neighbor south of me. I argued with him day and night to buy that section. Tried to convince him it was good wheat land and that this would be a good year. Reluctantly he bought it and today he has seventeen thousand bushels of wheat in two great piles. He was afraid of dry weather, insects, rust and what not. But the seventeen thousand bushels will clear him at least $12,000 above the cost of producing the crop. And that's much more than he paid for the entire 640 acres. Of course you might strike an off year or prices might drop a bit but take it as it comes and put away a bit for a rainy day and you can stand that.'

* * *

'Service is in danger of becoming a word of cant,' said ***the Young Minister***. 'But I have just been told something that makes me realize that those who go into life for service must be content, usually, with service as its own reward.

'My aunt goes to the movies, and chiefly for the scenes which show events of the day. She told me the other day of two pictures which I should have seen.

'First, she said, there came a picture of a group of returned missionaries from Africa, arriving in New York. Old, broken, tired, spectacled men they were. They stood alone, with their homely clothes and their grips. One of them had been forty-seven years in the Congo. They had lived for service. Their lives were gone. There they were. But no one about the pier noticed them until the motion-picture man photographed them.

'The next picture my aunt saw was of a young man, with actual garlands of roses hung around his neck, with men and women bearing flowers thronging around him, with a band in attendance, and an automobile fit to carry a king awaiting him. His reception was one to be remembered, and some in the audience applauded. They say he is very wonderful in his line. He is a pugilist.'

* * *

'I question whether our publicists really know what the people are thinking about,' said ***the Western Writer*** during the course of an Office Chat. 'They know what things they want the people to think about, and most of our printed stuff indicates what they want the people to think about them, but all that is quite a different thing from what the people, of their own taste and volition, are actually thinking.

'Out in our state we draw up our programs in the feeling that we are pretty close to the people, but when we get a-going we often find that we haven't hit their interest or their thought by a long shot.

'I have been traveling a good many thousand miles in the United States and Canada trying to find out what engages the people's mind more than anything else; I mean more than the compulsory interest they must show in the work of getting a living. I have talked with all sorts of people, and have had editors in various places help me through their staffs. I am almost afraid to tell you what the result is. But whether you like it or not, here goes: the two subjects uppermost in the minds of the plain people of the United States today are Fundamentalism and Prohibition.

'No—don't get me wrong on that. I am not saying that they have any definite thoughts on these things: I am not saying that they are either Fundamentalist or Prohibitionist; I am only saying that according to my investigation these are the two most prevalent subjects of thought.

'It surprised me greatly, because they are not my subjects of thought at all. I would say that when my mind swings to its own interests, they are not Fundamentalism and Prohibition. I am not greatly concerned about them at all. I don't know enough about the merits of Fundamentalism to settle the questions involved, and I think Prohibition will settle itself; so I don't think much about either.

'But it seems that multitudes of men in the street are thinking about them. And that is strange, when you think of it. Yet, translate these interests and they resolve themselves into universals—one means religion, the other means a problem of living. Both of them, at their roots, are very profound. People seem to be going to the movies, they seem to be wrapped up in baseball, they seem addicted to frivolities, but the surprising thing is that when I surprised them in their *thinking*, they weren't thinking about these things at all.'

* * *

***The gentleman from Arlington County,*** Virginia, was in The Office. Like most good Americans, he was full of enthusiasm for his home county. He links Arlington County up with the nation's capital; therefore his view may interest you.

'You know, Arlington County was formerly a part of the District of Columbia,' he began. 'L'Enfant and Washington had Arlington County in mind when they were selecting the nation's capital, and their idea was to beautify both sides of the Potomac River when the City of Washington should become the headquarters for a great empire. Now, we have become that great empire and the farming land of the District of Columbia has been turned into homes for the thousands who make Washington their home. They are spreading out into nearby Maryland and Virginia. In the meantime, Congress ceded back to the State of Virginia what is now Arlington County. Arlington County is being built up into modern homes for capital workers. I am greatly in hopes that, before it is too late, we can interest the Fine Arts Commission to the point where they will go over into Arlington County, lay it off properly into streets and avenues, according to the plans for the City of Washington, designate the future parks and beauty spots, so that it may become the most beautiful suburb in all the nation. After it is cut up into the varied schemes of the real estate operators it will be too late for anything that will be a real credit to the nation.

'Appreciating the importance of beautifying the suburbs of the nation's capital, Congress recently enlarged the powers of the National Capital Park and Planning Commission, authorizing the commission to employ the services of landscape architects and city-planning experts in developing Washington's metropolitan area.

In this corner,
Mr. Borah

# The PRINCIPAL PRESIDENTIAL POSSIBILITIES of 1928

—in this corner,
Mr. Smith

By ALLAN L. BENSON

WASHINGTON takes it for granted that Mr. Coolidge is serving his second and last term in the White House. It is not that the Coolidges have not enjoyed the life and would not like to remain four years more. Mrs. Coolidge recently told a friend that, to this day, she gets a little thrill every time she goes out of or comes into the historic old mansion, which is very pleasant to Americans and highly creditable to the First Lady. And the President enjoys being President. No one doubts that he is doing what he can to succeed himself. But the President knows, as does every other politician, that there is and throughout all our national life has been, on the part of the general public, a deep-seated opposition to third terms. Grant tried to come back and was told to stay out. Roosevelt changed his mind about third terms only to discover that the public hadn't.

Of course public opinion may sometime change. It may change during Coolidge's present term. He knows this. Opinion in Washington is that, without much hope of success, he is trying so to play his cards that if a change should come he may be the beneficiary of it.

It is usually within the power of the President to renominate himself if he be determined to do so. Mr. Taft did it—and carried two states. Mr. Coolidge probably could do it. But the President knows, as does every other politician, that as matters now stand if he were to attempt such a thing he would split his party every which way and probably elect a Democrat. The Republican party is well salted with estimable gentlemen, each of whom feels that he is big enough to be President and that the time for him to begin is next Inauguration Day. In the face of an overwhelming demand upon the part of the public for the continuance in office of Mr. Coolidge, these gentlemen would remain under cover. But if there be no such demand, they will come out and fight for his place. They are awaiting word from the country while permitting their friends to push necessary preliminary work that can be repudiated if the country shall call for Mr. Coolidge.

*Many Would Like to Be President*

Is the country calling for him or likely to call for him? It is the belief in Washington that there neither is nor will be a public demand for his reëlection. It is not that he is unpopular, though there can be no doubt that the farmers in the Middle West are disaffected toward him, but it is believed that people elsewhere feel that he has had his chance, has done what he could, and should, at the end of his term, retire. Or, to put it in another way, the feeling is that while Mr. Coolidge has done some things well, he has done nothing so well that the tradition of more than one hundred years should be broken. After eight years George Washington felt that the country's interests would be best served by his retirement. Gentlemen in the national capital feel that if the country could spare Washington then it can and will with equanimity witness the retirement of Mr. Coolidge at the close of his present term.

If Mr. Coolidge were an unusually able politician there would be more likelihood than there is of his overturning all precedents and succeeding himself. Washington correspondents say that Mr. Coolidge is a very adroit politician. But he isn't. Mr. Taft was the only President for more than a generation whom the newspaper correspondents did not declare to be almost uncanny in the exercise of political wisdom—and Taft was such a blunderer in politics that nobody could mistake him. It is a habit the Washington writers have.

Each President, in his turn, is branded as a whiz at politics. Coolidge is not even a whirr. He was blessed at birth with an astounding amount of luck which he has combined with a fair degree of common sense. It was luck that caused an Oregon delegate to propose him for Vice-President on the Harding ticket, at two o'clock in the morning, when the delegates were hot, tired and eager to nominate almost any suitable man whom the slate-makers did not want—this as a slap at the gentlemen who had steam-rollered Harding over on them. It was luck that thus caused Coolidge to be in place to succeed him, instead of Hiram Johnson, who had refused to consider the nomination. And at a time when the country was staggering under a hold-over load of war burdens, what could have been luckier than to have inherited the Vermont idea about the value of money? Al Smith, in poking fun at Coolidge, once said, 'A dollar and a half is an awful lot of money up in Vermont.'

The occasion required a tightwad in the White House and Coolidge needed no training to play the part. If a ready spender had been needed, Coolidge would have had to go hard against his nature to fill the bill. Coolidge was lucky that he came upon the stage at a time when his Vermont inheritance fitted admirably into the national necessities. Except as a tax-reducer he has not shined at all. This shows the extent of his luck. What was most needed at the moment he was able to do. But no moment lasts forever, and the moment that contributed most toward making Mr. Coolidge valuable is passing.

A good politician would have prevented the mess that has been made of our relations with Mexico. Mr. Coolidge permitted Mr. Kellogg to say a great many harsh things about our Southern neighbor, the slight basis of which may be judged from the fact that Mexico stuck to her course and the Administration did nothing. It did nothing because there was nothing to do. Mexico was within her rights. Kellogg went off half-cocked. A good politician would not have antagonized the Middle-Western farmers; or blown alternately hot and cold about Prohibition enforcement until neither side had any confidence in him. After announcing that city, county and state officials would be permitted to act as national enforcement officers, a better politician would at least have waited a few days to see what would be the reaction of the drys. But not Mr. Coolidge. The roar the wets put up apparently unnerved him and he hastened to let it be understood that his first announcement did not mean anything. By the time he had finished his explanation, letters from the country began to come in—began to pour in—commending him for what the writers supposed was his determination to fulfill his constitutional oath to 'take care that the laws shall be faithfully executed,' including the Volstead Law. But the writers might better have saved their postage. The President lacked the courage to stay put.

*Drys Have No Confidence in Coolidge*

If Prohibition enforcement should happen to come to the front as the chief issue of the next Presidential campaign, as many men in Washington believe it will, this act upon the part of Mr. Coolidge may well cost him whatever chance he might otherwise have had of succeeding himself. The drys have no confidence in him. They prefer Borah. There was a time when a man from a small state had no chance at the Presidency, but that time is past. Since California, in 1916, gave the Presidency to Wilson after Hughes had carried New York and pretty much all of the East, it has become apparent that a candidate need not be a resident of New York, Ohio, or some other state having a large number of electoral votes in order to have a chance to win. Any man who can command the attention of the country is eligible, regardless of the state from which he may come. So Borah, if he so desires, will be in the running for the next Republican Presidential nomination unless the people demand Coolidge. Borah is a Prohibitionist in

practice and believes that the law should be enforced so long as it is the law, and that if it is to be set aside it should be repealed in the way provided by the Constitution. This pleases not only Prohibitionists, but all who believe in doing things in an orderly way.

The late Colonel Roosevelt's daughter, once dear to us all as 'Princess Alice' and now a voter in the state of Ohio, is understood to have committed herself to the candidacy of Nicholas Longworth, Speaker of the House of Representatives. According to Washington gossip, she is conducting quite a vigorous campaign to put her husband where her father once was. She has a ready and sometimes a biting wit with which to switch those who stand in Mr. Longworth's political way and Washington often laughs at the use she makes of it. Perhaps the remark attributed to her that has caused most laughter is the declaration that 'Mr. Coolidge looks as if he had been weaned upon a pickle,' referring, of course, to the wry, shy smile that bedecks the Presidential countenance when he is about to throw the first baseball of the season into the field or do something else that may strike him as a little foolish.

At any rate, Longworth is one of those who may be expected to try for the Republican nomination when the time comes, and for whom much work is now being quietly done. What he stands for politically we shall perhaps know later. He has been in Congress for years, but his name is associated with no important legislation. But he is always dependably regular. Whatever the Republican party stands for is good enough for him.

Friends of Secretary Hoover are also understood to be doing what they can to put him at the head of the next Republican ticket. Hoover has some powerful friends, but he also has many powerful enemies,

*Hoover Not Taken Seriously*

and at the last count it appeared that the enemies were more numerous. As a candidate for the next Republican nomination, he is not taken very seriously by anybody. Nor is Senator 'Jim' Watson, of Indiana, who has also appraised himself as Presidential timber; nor Vice-President Dawes, another aspirant. In the Republican woods there is a candidate behind every tree because the belief is general that what has happened to so many of Mr. Coolidge's senatorial friends is what is going to happen to his third-term aspirations.

On the Democratic side events are steadily shaping to insure a furious fight in the convention. The friends of Governor Smith, of New York, are determined to nominate him for President on a beer and light wine platform, whatever that may mean. But the Southern democracy is as dry as Volstead himself and will do its best to prevent Smith or anyone else from bringing back booze. Of course, Smith, as President, could not bring back booze, but the rank and file think he could. So the Democrats of the South may be depended upon to oppose Smith, and as Smith cannot be nominated except by a two-thirds vote of the convention, the difficulties of his situation are apparent. Of course he may be nominated at that. The support he will receive from the wet Democracy of the great cities is sure to be impressive and may prove conclusive. But if Smith wins the nomination it will be only after McAdoo and all the rest of his opponents have done all they can to defeat him. It is not understood that McAdoo will enter the contest with much if any hope that he can win. Smith's following is too great for that. But McAdoo has a memory and it is said that he intends to do what he can to avenge the wrong that he believes Smith did him in 1924.

The difficulty of preventing Smith's nomination lies chiefly in the fact that no strong man is at hand upon whom the opposition can concentrate. Two years ago John W. Davis was available. Davis was not a strong man before the people, as events subsequently proved but the nitwit delegates permitted themselves to become convinced that he would be able to make a great race. The best that the opposition has yet been able to conjure up is Meredith. Who is Meredith? you may ask—most persons do not know. Meredith was Secretary of Agriculture for a few minutes under Wilson and is known to the farmers of the Middle West. How able he may be is not generally known. Of course the chance that he will be nominated is as good as was the chance that Harding, in 1918, would be the Republican candidate in 1920. Harding seemed to have no chance at all, which is exactly the way the Meredith boom looks at the present moment.

*Republicans Will Meet First*

According to political custom, the Republican convention will be held first, the party in power always being required to lead off. If it shall seem, in the early spring of 1928, that Smith is likely to be the Democratic candidate on a booze platform great impetus will be added to the Borah boom for first place on the Republican ticket. If the Democrats shall see fit to challenge the 18th Amendment, the Republican party, unless it be controlled by quitters, will have to meet the challenge. This will mean Borah to the front. A campaign between Borah and Smith would be something to which to look forward. Smith has a wonderfully ingratiating personality—one cannot help liking him personally—and he can make a speech that goes with the crowd. He is witty, homely in his phrases, and pepped up to a high point in his appeal.

Borah is not so conspicuously friendly in his mannerisms and he makes no attempt to appeal to the crowd. But he has a method of reasoning that is irresistible. He builds up his case slowly and with care, always taking pains to be perfectly fair in his treatment of the other side. As he talks, audiences soon begin to find themselves in great sympathy with him, both because of his fairness and his logic. Borah would say to Smith, for instance, 'I do not believe in opening the door to what you call light wine and beer, but if you and others disagree with me, the Constitution itself provides ways in which the 18th Amendment may be repealed.

*Borah Is Far More Able Than Smith*

If you want to change the Constitution, change it in the ways provided by the Constitution itself, instead of resorting to subterfuge.'

In a race between Borah and Smith, the latter would pick up speed more rapidly at the start, but Borah would pass him before they had gone far and beat him soundly. Borah would beat him because Smith has not a leg of logic to stand upon in his fight against Prohibition.

Smooth as Smith is, Borah is far the abler man of the two. And of course Smith would be fought, not only by the drys in his own party, but by those who differ from him in religion. One may talk as much as one pleases about the wrong of bringing a religious test to bear upon the Presidency, but the woods are full of men and women who, if Smith be nominated, will do just this thing.

# We Need More Puritans!

(*Concluded from page 7*)

more manifest than it is just now, when thousands of persons, taking their admirations secondhand, affect an appreciation of things they know and care nothing about, but which they think are popular, or artistic. The Puritan, whatever other faults he had, was an honest individualist. He dared to do his own thinking and express his own opinion. He lacked something of capacity for good teamwork, but his soul was his own. He was the keeper of his own conscience. It would do us no harm to have a revival of that type of Puritanism. The Puritan had faith in a God who was higher and holier than himself. Let it be granted that he might have believed in a kindlier God; that was not a part of the temper of his age. Kindliness had no great place in the original aspects of his life. The sea was stern, and the soil was stern, and all the visible aspects of life were stern. A gentler life than that of the Puritan would not have set its teeth grimly against so many untoward conditions and have mastered them. It took a stern faith in a stern God to conquer such stern conditions. We have no call now to believe in a God so uncompromising, stern, and unrelieved by the kindlier aspects. On the other hand, the nation was far better off with the Puritan God, sternly just, but with uncovenanted mercies, than with the grinning image of negation which the modern paganism offers us as an object of abject devotion.

*New Standard of Decency Badly Needed*

We need a new standard of decency, as good for our day as Puritanism was for the day of the Puritan. We do not ask that his standard shall be ours. We do ask for some surcease from impotent nastiness. We have lived long enough in the stench of indecent literature and filthy art. It is not repression we want, but a wholesome moral sense.

A quarter of a century ago, I visited Pompeii for the first time, and went with a crowd into one of the locked rooms there on whose walls are displayed the indecencies of ancient Roman fresco. The room was packed with my fellow tourists and the atmosphere close and suffocating. The pictures were what they were and are. As I elbowed in through the door, a big American business man was elbowing his way out. He had seen what was inside and had breathed the fetid air, and he was making a break for fresh atmosphere and sunshine and decency. Just as he got outside of the door, he swore a big round American oath. I had a good deal of respect for him. I would not have expressed my own feeling in precisely his terms, but my feeling was essentially the same as his. Not merely in the name of piety and religion, but in the name of such healthy masculine decency as that man had, it is time both for men who pray and men who can swear on occasion to elbow a path out of this fetid atmosphere of indecency.

We need something akin to the Puritan standard of downright honesty. Shrewdness and cleverness and success are not enough. We want a success that is based upon honor and probity, whose foundation is integrity.

We need the grim courage to go forth and make the world better and cleaner and safer. The Puritan in his day did that. We have no more occasion to do it in the way he did it than we have to fight with his flintlock, but the things he cared for are the things permanently worth while. The world needs more of them.

# The Pauperization of Britain

(*Concluded from page 8*)

morning, waiting for the factory to open. When it became known that the six jobs had been filled overnight, pandemonium broke loose and there were cries of 'Let's storm the offices!' Eventually, after fifty names had been taken by the manager in view of possible future vacancies, a force of police arrived in motor cars and the crowd was dispersed.

Another interesting aspect of the unemployment situation appears in a recent statement in the House of Commons by the Secretary for War. He declared that quite 60 per cent of the army recruits enlisted from the London area last year were unemployed at the time of enlistment.

According to a statement made by the Minister of Labor in reply to a question in the House, the total amount paid out in doles, or as euphemistically phrased in official language, 'under the Unemployment Insurance Acts'—for 1925 alone was no less than £45,800,000—approximately $229,000,000. Of this total, £20,030,000 came out of the pockets of employers; insured and employed persons paid £17,760,000 and the Government gave £13,250,000. In the last analysis, of course, the whole $229,000,000 came from the producers of the country and was, by that amount, a reduction of the wage fund. This reduced wage fund resulted in a lessened purchasing power with consequent decrease of demand for commodities, and so of demand for the labor of those who ordinarily produce them.

In face of these facts, it should be obvious that the 'dole' is no remedy for unemployment. Its adoption under the leadership of that arch-politician, Lloyd George, is plainly a demonstration of poverty of brains among British political and industrial leaders. One party is as futile as the other. The Government muddles things and the Opposition simply 'kicks up a row.' Neither side gets anything done and, for the most part, the only remedy the 'captains of industry' seem to be able to suggest is a reduction of wages or a longer working day.

To American mechanics visiting this country, a prime cause of its low wages and declining trade is evident enough. One with whom I talked recently made it a point to put in much of his time visiting the works of leading engine and steel firms and other shops in London and in the Manchester and Birmingham and Sheffield districts.

'Why,' he declared, 'I was astonished to find that even in the big Government plants at Woolwich and Enfield they are still using machinery that we scrapped in America twenty years ago. Throughout the plants that I was allowed to inspect, I found production handicapped by machinery and methods so effete that any intelligent manager in the United States would regard bankruptcy as inevitable if he were obliged to operate under them.'

***Losing on Coal***

I have said that the dole is plainly *not* a remedy for unemployment. That is putting it mildly. Experience has proved that the dole has made the situation immeasurably worse. It has caused, and is continuing to cause, a serious decline in the vigor, vitality and morale of the nation as a whole. And the situation is daily growing worse. It is pauperizing the mentality of Britain. More than that, it has set the example for subsidies and grants and Government aids of all sorts to private individuals and companies, usually in aid of enterprises unable to stand on their own feet. The subsidy granted to the coal-mine owners and which a few months ago had cost the taxpayers $115,000,000, was not at all revolutionary. For several years now, the Government has been paying subsidies to the chemical-dye industries, the beet-sugar industry, and shipping. Under the Trade Facilities Act, the credit of the Government has been placed behind bond issues of private companies to a total amount of £63,000,000 ($315,000,000) and these include not only money borrowed for railway, ship building and other construction, but also for the financing of foreign trade, a late instance being the pledging of the exchequer to the tune of $10,000,000 to the multi-millionaire Lord Cowdray's company for the development of the Kent coal fields. This in face of the fact that in the last quarter of 1925, if we exclude the subsidy, *73 per cent of Britain's coal production was produced at a loss.*

What the whole subsidy system amounts to is a deliberate encouragement of mendicancy and speculation. Government help to one industry is invariably a hindrance to another.

How large a proportion of the national expenditure for the financial year 1925-6 goes for what might be called pauperization is shown by the following figures summarized from a recent statement by the Chancellor of the Exchequer, Winston Churchill:

| | |
|---|---|
| Pensions—war, army, police, civil, old age and widows | £121,000,000 |
| Grant-in-aid services (mainly to local authorities such as educational and poor law) | 90,000,000 |
| Government's share of money expended under Unemployment Insurance Acts ('Doles') | 13,250,000 |
| Coal subsidy | 23,000,000 |
| Total | £247,250,000 |

Subsidies other than that to the coal-mine owners are not included, and the pledges of the national credit to the tune of £63,000,000 are not regarded as 'expenditure.' Of the 'grants in aid,' the sum of £8,440,000 goes to help the builders of new houses, an increase of £616,000 over the amount paid out for this item in the previous year. The amount above given for pensions includes about £30,000,000 voted for old-age pensions; and the new widows, orphans and old-age contributory pensions bulk at £4,000,000.

Finding that the Health Insurance Fund has accumulated a surplus of £30,000,000, the Government proposes to cut off in the coming fiscal year, the 2/9 of the cost of sick and death benefits it has been paying hitherto. There is a great outcry in consequence from the Socialists and from the doctors and the friendly societies, or as we call them in the United States, fraternal insurance orders. When Mr. Churchill introduced what he called an 'Economy Bill' a few days ago to enable him to make these reductions, his Socialist predecessor, as Chancellor of the Exchequer, Philip Snowden, bitterly dubbed it 'a bill to rob the sick, the disabled, the unemployed and the children.' The occasion for this bill was the need for a supplementary $13,000,000 to the sum of £825,000,000 voted to the Government on the last budget.

It is also beginning to be seen that protective tariff policy (camouflaged as the 'Act for the Safeguarding of Industries'), at the end of its first eight months' operation, is proving a national liability instead of an asset. It may well be included with the various direct subsidies as pauperizing. In so far as it has reduced the nation's imports, it reduces its exports also and increases in prices have burdened the consumer. Its inevitable discriminations also cause much discontent. Speaking recently at the annual meeting of the National Union of Manufacturers in London, George Terrell, the successor of Sir Eric Geddes as president of that large and representative organization, declared the act to be 'a complete failure,' only one industry having received any benefit from it.

***Do Not Want a Job***

The report of a committee appointed by the Secretary for the Dominions to consider the effect of schemes of social insurance on migration, and of which Sir Donald Maclean is chairman, has just been published. It declares that 'Unemployment insurance (the dole) and the comparatively recent extension of outdoor poor law relief to able-bodied persons *discourage migration to an appreciable extent at precisely the ages when the opportunities of over-sea life would prove attractive.*' The report goes on to explain that young persons approaching and in the years immediately following the age of eighteen show a diminished interest in migration. This is attributed to the fact that at this age *adult* rates of *unemployment benefit* become payable. Payment of the adult rate of unemployment benefit involves an increase from 7s 6d to 18s. for men, and from 6s. to 15s. for women. *Boys and girls over fourteen were made eligible for the dole by the last Parliament.*

More than a million persons received outdoor relief in one month last winter and, according to the report, 'the scales in operation in some districts place the recipient of poor law relief in nearly as favorable a position as if he were actually working in his own trade, and it is evident that in those areas there exists a definite *inducement to refrain from seeking employment*—overseas.'

The decline of the nation's virility under present conditions is confirmed by the official report of vital statistics for 1925. It shows that, while the marriage rate is practically the same as that before the war, the birth rate of England and Wales as a whole is the lowest on record, except during the war years 1917 and 1918, while the death rate is equal to that for 1924. The birth rate has steadily fallen from 25.5 in 1920 to 18.3 in 1925. This is lower than the rate for any other country in Europe. In France the rate was 18.7. Figures as to infant mortality are equally alarming. Deaths of children under one year in England and Wales totaled 75 in every thousand births.

A prominent physician and health expert declares that England is suffering from lack of fertility due to insufficient nutrition and wrong living conditions. 'Lack of fertility fully accounts for this decrease in the birth rate,' he reported.

# What Coxey Marched For

## Statement of the Philosophy Which Jacob S. Coxey, Sr., Has Expounded for 32 Years

'IN MASSILLON, OHIO, where I live—a city of 30,000 population—we have six banks,' said Mr. Coxey. 'That means six bank buildings (they are the most elaborate and most imposing structures we have), six bank presidents whose incomes must be among the highest in town, six sets of cashiers, six sets of clerks, six sets of stockholders. All of these have families; all must be supported by the people of the town. There is just as much sense in having six post offices in a city of 30,000 as six banks!

'The same situation exists in virtually every village, town and city in the country. Banks subsist on one thing alone—*interest*. They exact interest not only on actual money loaned but on paper credit! At present it is estimated that the banks have outstanding approximately $31,000,000,000 in loans. Of this only $1,500,000,000 is in actual money and $29,500,000,000 is in bank credits. *Yet the banks are receiving interest on the entire $31,000,000,000.*

'The accompanying table, compiled from official sources, shows that the American people are carrying the tremendous burden of $7,300,000,000 a year on interest charges! And the debt is increasing by leaps and bounds (state, county and city debts alone are being pyramided at the rate of $20,000,000 a month). The interest system is enslaving the American people. It must be destroyed or it will destroy the nation.

'People are asking how we can abolish interest. They realize that something must be done—and done soon. And the solution is so simple that the wonder is it was not thought of and adopted years ago. All that is needed is an act of Congress. The ground work has all been laid by the Constitution of the United States.

*Money Not a Measure of Value*

'Go back to fundamentals. What is money? Money is an idea of Congress enacted into law. It is a national medium of exchange. It simply represents values which are created by labor, and is a legal tender for goods purchased. This is all that money is or should be. It has no purchasing power. It should not get into circulation without a service being rendered or a value created. It is a representative and not a measure of value. The only power that money has is that which is given to it by an act of Congress.

'Prior to the ratification of the Constitution nearly a century and a half ago the sole right to coin money, so as to develop resources and help the people, was vested in the states or colonies. When the Federal Government was formed this power was delegated *to Congress*. The Fifth Clause, Section 8, Article I, of the Constitution provides: "The Congress shall have power to coin money, regulate the value thereof and of foreign coin." This is specific. The First Clause of Section 10, Article I, provides further: "No state shall coin money, emit bills of credit, make anything but gold and silver coin a tender in payment of debt." Bear in mind that it was *the people* through the states who thus delegated this sole power of coining money *to Congress*.

'But the people, in surrendering their personal and property rights, in allowing the Government to put a lien on their property prior to anything they themselves could exercise, were receive to certain privileges in return. Collectively the Government could accomplish things that the people individually could not. But the Government—being formed by the people and being responsible to the people—was to do these things *for the benefit of the people as a whole*. It was not to exercise its power for the benefit of a few.

'Under the laxness of Congress, the interest system has grown up—a system so intricate and so extensive in its ramifications that not one person in a hundred understands it or realizes the evil it causes.

'Take our banking laws as an example of the manner in which the interest system operates. Through an act of Congress granting franchises to banks, the Secretary of the Treasury is authorized to issue National, Federal Reserve, and Federal Reserve Bank notes to the banks. Before the Government turns over these notes to the banks it must first issue to them interest-bearing bonds. The bank purchases these bonds and deposits them with the Government, thereupon receiving the notes. In other words, the Government not only gives the banks its right to issue money but pays them for doing so. The banks benefit two ways—they receive interest on the Government bonds reposing in the vaults of the Treasury and interest on the loans they make to the people.

*Two Profits Received by Banks*

'Now here is a sound and possible solution of the whole problem: Coin the money for the states and their various subdivisions rather than for the banks. Let the money be issued against actual land values. A state or city desiring to obtain Treasury notes shall deposit with the Treasury Department a non-interest-bearing 25-year bond in any amount up to but not exceeding one-half the assessed valuation of its real property. This bond shall guarantee return of the principal at the rate of four per cent a year, this amount to be raised by general taxation. Upon receipt of the bond the Government shall have printed Treasury notes of varying denominations; and shall retain one per cent of such notes to cover the cost of engraving and turn over ninety-nine per cent to the community. With the debt cleared at the end of twenty-five years, the money will be canceled.

'Community banks would be established. This, however, would be a state function, not a federal. Each community would have at least one bank and as many branches as are necessary; just as we now have branch post offices. Private banks pay one cent for each bank note issued, whether it is a one-dollar or a ten-dollar note. If the community banks should obtain money from the Government without interest, paying only this one cent coinage charge, they could in turn loan it out without interest, merely assessing a charge of one-half of one per cent for cost of service.

'Through these community banks industry, farming, public improvements—everything—could be financed. The scheme could be carried to almost indefinite lengths. Suppose a young couple want to build a $5,000 home. Under the present system they have to pay at least six per cent interest, oftener eight or ten, not to mention the carrying charges or the amounts they have to pay on the principal. This makes it difficult for young people to own their homes. On the other hand, the community bank would furnish them the money without interest, taking a first lien on the home. They would pay one-half of one per cent service charge—once. Then they would pay back the principal at the rate of four per cent—$200 a year. The manufacturer, the merchant, the farmer, all could be financed the same way.

*Plan Avoids Raising of Revenue*

'The provisions of this plan do not require and actually avoid the raising of any revenue by the Federal Government to be paid out upon these community bonds. The bonds themselves would be representative of real value. The money issued would be thoroughly "safe" because it would be redeemable by taxation. The charge may be raised that this would result in inflation, but that charge can easily be refuted. Where could we find greater inflation than under the present system, where the banks charge us interest not only on actual money but on their so-called credit?

'The interest burden could also be removed from the railroads under this plan. The roads could issue non-interest-bearing 20-year bonds as security for the issuance of money—this money to be expended in equipment betterments and in purchasing outstanding bonds. The money could then be paid back to the Government at the rate of five per cent a year until these new bonds should be canceled. The issuance of further stock should be prohibited and dividends limited to six (Concluded on page 26)

---

The present national debt of the United States is estimated at about $20,000,000,000. State, county and municipal debts total about $13,500,000,000.

Farms are mortgaged to the extent of $8,000,000,000.

Railroad indebtedness is estimated at more than $11,000,000,000.

Corporation indebtedness other than the railroads is estimated at $40,000,000,000.

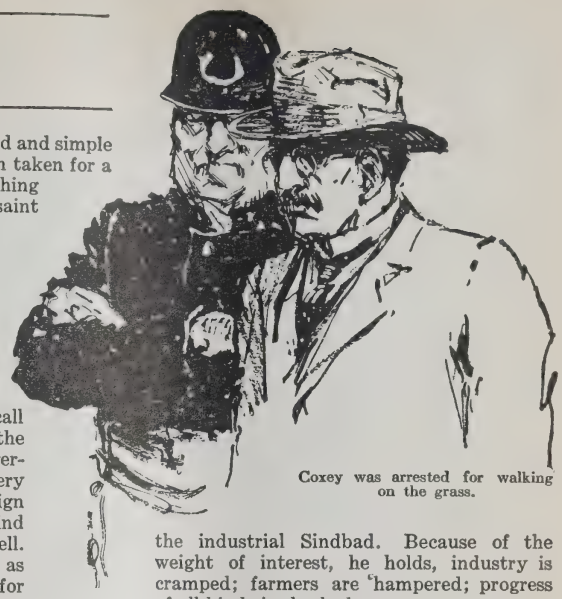
Persons making income tax returns report debts totaling nearly $18,000,000,000.

The total debt owed by the American people and the American Government is estimated at $122,000,000,000 to $150,000,000,000.

This is approximately 35 per cent of the estimated wealth of the nation, $353,000,000,000. On this tremendous debt, the American people are paying $20,000,000 in interest charges each day of the year including Sundays or $7,300,000,000 a year.

# Coxey the Crusader

(*Continued from page 2*)



others, making frantic appeals to them to enter into social and political heavens by all sorts of gates, narrow and wide. He checked off the names of some of them—'Sockless' Jerry Simpson, Mary Ellen Lease, Dennis Kearney, Samuel Gompers, Senator Peffer, W. H. Harvey, Jacob Sechler Coxey. There were others he named.

All that, you understand, was a sort of camp-fire argument growing out of the reading of the papers, and we supposed that we should have to wait an indefinite time before we knew anything more. But, as it happened, the next morning there came to our camp a man on foot, one of the crew of the *Lively*, who, bitten with a desire for shore life, had deserted, and, lo and behold! he was a Cleveland man who had sailed on the lakes, and was chock-full of news no more than three months old. From him we learned much about many things. We heard that the 'fellow with never a soul to save,' who led the army of unemployed, was a man from Massillon, Ohio; that he owned a stock farm and bred fancy trotting horses; that he dealt in sawed stone and silica sand and gravel and rock; that he had a half-dozen children; that he was not a black-browed disturber gathering together all the loose fish, the bad men, the black sheep, the rogues, the outcasts and rapscallions to leave waste in their wake like some new Genghis Khan, as the cartoonists had led us to believe. But for all the sailor's assurances, none of us quite lost our idea of Coxey as a kind of 'hard-case.'

I first saw 'General' Coxey about a week ago. The title given in a sort of derision has stuck to him, though there is nothing martial in his appearance. Indeed, if you want a true picture of him you must conjure up the vision of a man with mild and earnest eyes, full of emotional fervor. How such a one, so entirely kind and simple by nature, could ever have been taken for a stirrer-up of violence is a something to wonder at. Like that old saint who thinks himself an atheist, but who, I warrant, never goes to sleep without falling on his knees and saying his prayers—William Montgomery Brown, I mean—like him, Coxey is a simple, uncomplicated, uncalculating creature who would lose his appetite at a tale of woe. I recall well enough that some of the papers branded him as a 'dangerous tongue,' spoke of his 'fiery eloquence,' denounced his 'malign persuasiveness,' and all that kind of thing. Well, the man talks well. Of that there's no doubt. But as for any pestiferous shouting for the consummation of a holocaust, that's all nonsense. If you will listen awhile, letting him get rid of some superfluous steam in the shape of stern denunciation of things as they are and are likely to be, in his opinion, testing, as I suppose, the strength of his emotions—if you do that, you will find him presently falling into rich discourse, painting the life ideal, evoking a vision of rich and magnificent glories with a world free from intruding and jarring elements. For he is a poet, or at least a dreamer of poetic dreams. In fact, they are all much that way, these men of imaginative sympathy.

Looking at Coxey as he sat before me, a quiet man, very wrinkled, his hair silvering, his fingers interlaced, I saw in him a something reminiscent of Prince Kropotkine, the nihilist. There was the same far-away look in his eyes, as of one who sees over and beyond narrow and petty things to behold some impossible world of perfection, as in a map outspread. Such men see the world, not as it is, but as some glowing and shining realm unvexed with modern problems and modern ideals.

I asked Coxey what he would do if, of a sudden, he became a benevolent despot with his word an all-embracing law. He sat up straight with a jerk. His eyes twinkled. He flung out a hand, in the manner of a prince sweeping aside trivialities, and said: 'I would immediately abolish interest on money. I would issue non-interest-bearing bonds.' Interest, in his view, is the terrible Old Man of the Sea sitting tight on the shoulders of the industrial Sindbad. Because of the weight of interest, he holds, industry is cramped; farmers are hampered; progress of all kinds is checked.

Coxey was arrested for walking on the grass.

As there seemed to be a ring of John Ruskin in what he said, I was curious to know what he had read. Did he derive from Ruskin? From Adam Smith? From Henry George? From Tucker of the anti-government money school? No. He cared nothing for them or their theories. He had come to his conclusion alone and unaided. In 1893-4, he had seen a growing nation with execrable roads and labor idle. Counties and commissioners had no money for road building, nor could they afford to borrow because of the high rate of interest in a time of panic. So he conceived the idea of free money to be used for public improvements. Road building meant a call for stone—that meant the opening of quarries—that in turn meant a demand for machinery, a call for foodstuffs, for textiles, for housing facilities—and all that meant more eager human happiness, the tightening of domestic ties, civic rectitude, people interested in the beauty and complex charm and joy of life.

While his first broad plan was simple as the multiplication table, there came ramifications, and as they came, his theories expanded, which is important to remember because, economically speaking, William Jennings Bryan was sired by Coxey. To specify: it is all very well to talk about the abolition of interest, but there are men of scientific and financial skill in the banking business, and they, in what seemed to Coxey a narrow and selfish spirit, held fast to their mechanism. Whereupon Coxey added a plank to his platform and declared himself to be in favor of the immediate abolition of the banking system. That industry, he held, should be managed as was the postal system: one town, one bank; for in multiplicity and competition there is economic waste. Again, with interest declared illegal, there could be no war profiteers growing rich out of the misfortunes of others. So his platform, and that accepted by the party which grew, denounced as treason the issuance of interest-bearing bonds either in peace or war.

Coxey was the one prophet accepted in his own home. In Massillon he was known as a business man of broad views and sound public spirit. He had the reputation of a man who paid his bills promptly, who did what he could to nourish the life of his community, who was interested in local institutions—a good citizen, in a word. So, when he propounded his theories, holding

Leaderless, the army dispersed—vanishing like a dissolving cloud.

aloft his fragment of truth, there were ears to hear. And this is what came to pass.

He preached a crusade. He would, he said, lead the unemployed to Washington, D. C., starting from his home town. It would be an army of peripatetic philosophers, seeing for themselves the needs of the country, thinking and preaching a crusade as they went, pondering over economic ills for six long weeks, and, because of the attention awakened, making a nation think. And they started—on foot, in wagons, buggies, surreys, bicycles, on horseback. Eastward they went, sometimes sullenly determined, sometimes, as when they passed some town hard hit by the depression, a loose and dust-covered crowd.

Soon the popular mind grew nervous as detachments formed in the State of Washington, in Montana, Wyoming, California—there were two thousand moving, three thousand, four thousand: lumbermen, miners, cowboys, sheep herders, hoboes. The number of them leaped to six thousand, to seven thousand, to eight thousand. Out in the West trains were seized by detachments several hundreds strong. At Omaha railway men had a pitched battle with the crusaders. In Montana there were military operations and a train carrying more than three hundred Coxeyites was captured.

*The First to Arrive*

It was on April 21, 1894, that the first detachment arrived in the neighborhood of the Capitol city, the main body reaching there a week later, though far-away battalions still moved eastward. And then, with dramatic suddenness and in extraordinary contrast to all that excitement, came the grotesque and swift end. For 'General' Coxey and his spectacular grand marshal, Carl Browne, and Christopher Jones, of Philadelphia, marched down Pennsylvania Avenue with a few by way of advance guard. Spectators were more numerous than crusaders, and officialdom was cold.

It would seem that the three leaders were somewhat indistinct, as it were, for they had asked permission to address the world from the Capitol steps, but their request had been disregarded or ignored. But authority, in the shape of a body of police, was there. Yet, instead of activity there was haziness. After a little vague waiting, Browne made a dash for the steps, forced the issue, and was arrested and marched off to jail. Coxey also gained the Capitol steps but was stopped from speaking. Three days later he was arrested. It was nothing but a technical arrest and imprisonment—a charge of disturbing the peace by walking on the grass—and a small fine was imposed. Then, leaderless, the army dispersed—vanished like a cloud; so the end was easy for the authorities.

Of course the spectacular part gave opportunity for cheap witticisms; consequently was unwise. There were loud shouts over the downfall of the army. But what I see is this: the splendor of a man sitting down to think over problems at first hand, unafraid of his thoughts and his conclusions, hoping for a transformation from disorder to order, daring greatly regardless of the criticisms of others.

'Look,' said Coxey, 'at all the road building we are doing today. Don't you see that many of the roads are worn out before they are paid for? It's significant. It's significant.'

And so it is when you come to think of it. It is also significant that for the payment of war loans we are hampering future generations who are in no way responsible for the war, some of whom, indeed, will be paying interest for a war debt incurred before they were born.

## New York Wages Bitter War on Crime

(*Concluded from page 4*)

in England do not, as we do in this country, reverse lower court decisions on technical grounds. They do not even consider applications for appeals on such grounds; they throw them out.

Apparently, we as a nation are going to have plenty of crime until we overhaul our antiquated machinery for the administration of justice.

When the other states follow New York's example, and alter their criminal codes to eliminate the abuse of the bail system, to increase the punishment for criminals found with weapons in their possession, to give judges greater latitude in imposing sentences in robbery cases, to require the judges and district attorneys to submit recommendations in cases where clemency is asked, to reduce the evil of the indeterminate sentence as it now prevails, and to enable the courts to order a common trial for two or more individuals indicted for the same offense, we shall need less coddling in the prisons.

If the average bandit knew that his punishment was going to be a rock-pile, we would have fewer bandits.

*There should be more sympathy for victims* and less for their cold-blooded robbers and murderers.

## Trust Your Hunches

(*Concluded from page 5*)

he can decide much better than he could logically.

The poorest auto driver I know is one who has specialized in the mathematics of projectiles. Whenever he is caught in a traffic jam he tries to figure out by his mathematical methods just how far he should turn, how much gas to use, just when to turn. The result is that his fenders are battered almost beyond recognition.

His wife, in contrast, is a very safe driver.

'How do you figure out when and how much to turn?' he asks her.

'Figure?' she replies. 'I don't. I just *know!*'

She trusts to hunches. Needless to conclude, trust yourself with a hunchy rather than a logical driver.

The marvelous skill with which savages guide a canoe in the rapids is due largely to hunches.

The immense value of the jury system rests upon these facts. Lawyers are notoriously unfit for jury service. They're too logical. Their mental eyes, so to speak, miss the thousand and one things that impress the uncritical juryman. The juryman who is used to running his life largely by hunches notices unconsciously the fidgeting of the witness, the slight tremor of the defendant when evidence is introduced. Jury verdicts are sometimes contrary to what a jurist's review of the printed evidence would be, and are possibly more just and correct for the hunches upon which their verdicts are based.

Montaigne, more than 300 years ago, commented that 'good memories accompany weak judgments.' Our best judgments are hunches, and they are subconsciously formed, based upon material stored in the reservoir of our experiences. The act of forgetting is the prelude of a hunch.

Business men and scientists recognize this. When a decision has to be made that is based upon old experiences they act upon their first hunch. But when recent impressions are to be used, such as the reports just given at a directors' meeting, the best decisions are reached at an adjourned meeting which allows time for the material given into the reservoir to be forgotten.

An important conference in the forenoon, followed by an afternoon of golf in which all thoughts of the conference are banned, is good practical psychology, since a sound hunch depends upon the 'forgotten' material being worked over subconsciously.

This is why I sometimes feel sorry for the memory genius who can call off the amount of exports without a moment of hesitation. He would be nice to have around the office to take the place of an encyclopedia, but I'd be somewhat suspicious of his hunches.

The proverbially poor business judgment of college professors may be due to the fact that their occupation calls for a close fidelity in memory which almost automatically invalidates their hunches. If they would sleep over rather than think over their business ventures, greater success might crown less effort.

Education and a wide and varying experience are needed to keep the reservoir supplied with material out of which useful hunches can be formed. So keep on filling your reservoir—and trusting your hunches.

## What Coxey Marched For

(*Concluded from page 24*)

per cent. Labor rates could then be raised, freight and passenger rates reduced.

'Pay the national debt through accepting foreign debtors' legal tender money for what they owe the United States and Congress, making it legal tender, and coining our legal tender to pay the balance.

'We cannot abolish interest overnight; we will still have to stand for many obligations which still have years to run. But we can get a start. The important thing is to get the new system established. If we can cut the interest from our national and community debts, taxes will cease to be the burden they now are. If we can cut the interest from our railroads and industrial enterprises, transportation charges will be low, industry will hum and the farmer will no longer be borne down under the weight which now oppresses him. Interest is the greatest wastage of our age. Hydraulic pressure must be applied to squeeze out every drop of extravagance and waste.'

*Do You Know that the building of the national highways in the United States is being financed by a system that virtually amounts to a tolls collection? If you own an automobile you've had to pay your share of the total which will amount to approximately $1,500,000,000 this year. Read the facts in* THE DEARBORN INDEPENDENT *next week.*

$7000 a Year

DePries made it. You can too, selling a wonderful new fire-fighting device. A vital necessity for every auto, home, store, factory, farm, etc. Millions want it. Amazing new low price. Sells fast. Biggest, steadiest money-maker of the age. Hundreds make $2 to $6 an hour. Send post-card today for full plan.

# 'Let's Go to Coney!'

CONEY ISLAND is an historic old place. Henry Hudson's *Half Moon* lay to, off Coney Island, in 1609. The original island was called by the Indians Narrioch, and according to one version Hudson named it Coney, a corruption of Colman, the name of a petty officer on the *Half Moon*, killed by the Indians and buried in the sands nearby. According to another version, Coney is a distortion of Conejn, Dutch for rabbit, because the island was supposed to be infested with rabbits. Hubbarde's map, dated 1666, shows a sitting rabbit. But neither Hudson nor Hubbarde would recognize the Coney of today.

All Coney Island asks is that one fork over a dime for a ticket here, a tenth of a dollar for admission elsewhere, and two nickels for the privilege of turning a stile to something else. Its aim is to make visitors forget their identity for a few hours and become boys and girls once more.

Coney intends that you shall laugh, whether you will or no. We all know of the critic and cynic who go to the theater to witness a farce and sit through without batting an eyelid except in weariness; but at Coney the method is reversed.

About every other place in Coney Island is a place to eat. The alternate places are fun shops, tintype galleries, pink orangeade stands, souvenir bazaars, and miscellaneous alcoves.

Coney now is less circusy than it used to be. It lacks the spielers of the older school, but this is due to the fact that it is improving mechanically. Advertisements are electrified almost everywhere. But one misses the blatant,crude, wildly colored festoons, drops and canvases, which depicted the fattest man in the world—or the smallest white mouse.

Coney is really a town on the beach, and its boardwalk equals Atlantic City's. Coney has its churches, its schools, its banks, its public utilities, its chamber of commerce and its board of trade, all of which hope to maintain it as a plain resort for the fun-making of plain people.

Coney has names that mystify, draw, tempt and amuse. In one section, known as the Pit, there are forty-two amusements. When one has done the Leap Chutes, Spring Mat, Slip-the-Slip, Skidoo Sheet, Air Rollers, Shaker Bridge, Slip Slap Floor, Twirler, Trip Step, Incline Whirl, Broncho Bridge, Wave Slide, Roulette Wheel, Horizontal Thrust, Drop Floor, Steel Wave Runaway, Giant Steel Dip, Double Barrel, Cascade, Tower Chute, Electric Hot Treads, Curved Steps, Double Moving Stairs, Barrels-of-Fun, Tipsy World, Overhead Wheel, Sugar Bowl Chute, Air Seats, Drop Seats, Switch Back Belt and several others, a complete cycle of jolts has been experienced, but all harmless.

Luna Park and Steeplechase Park are the two largest amusement units. The former includes more than forty acres of amusements; the latter is half as large but in turn extends out onto the Atlantic Ocean some 1,500 feet. At least half of the amusements there are intended for young couples. What with mellow darkness and a chummy seat for two, there is no doubt that Coney Island has done a great deal toward speeding the fateful day for many a New York couple.

The great event of the Coney season is the baby parade. Coney is one of the few places which still features babies. One of the educational features of this resort is the exhibition of baby incubators, real infants living in incubators, some weighing two pounds, kept alive by scientific methods and special nursing until they are sufficiently built up to be returned to their parents.

Coney, with its all-year-round population of more than 75,000, really suffers from a very unaristocratic name—too late to change now. Yet, if it had a less ambiguous name it might attract those who do their choosing solely by name.

# Taxpayer's Final Arbiter of Facts

—(*Concluded from page 6*)—

were written by members of the board. Some members of the board have never written a single original decision since they were appointed.

The board has a legal unit which prepares a majority of the opinions and some of its members know nothing of the real merits of the cases until the decisions are prepared and submitted for their signatures.

James and Graupner took their duties seriously and delved into the intricate details of the cases, studied the record and brought before the board in written form their findings. Often they presented their opinions so forcibly that they won over a majority of the board, even when Chairman Korner, of North Carolina, a personal appointee of Commissioner Blair, was on the other side.

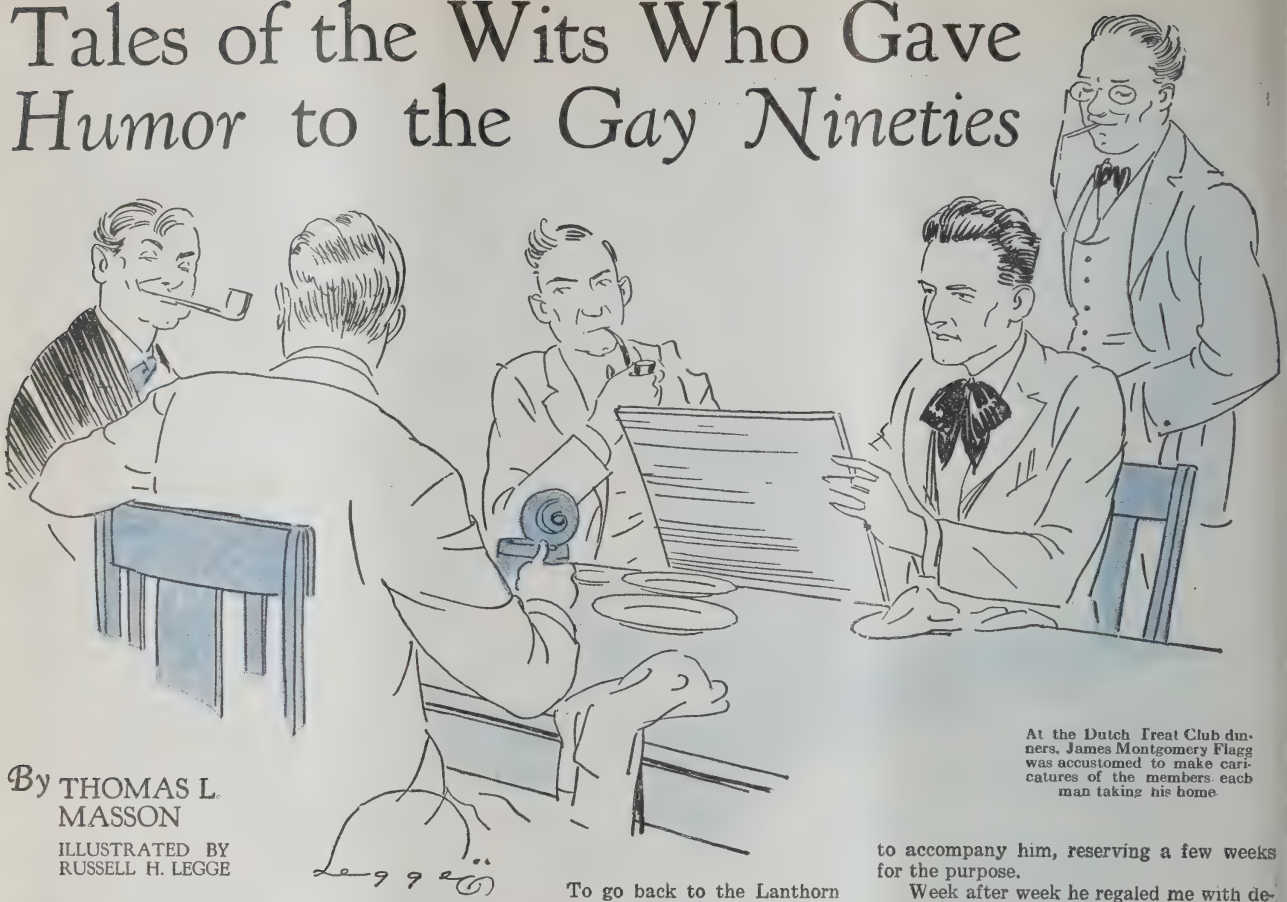
The chairman of the board, backed up by the Commissioner of Internal Revenue, did not like to be left in a minority. He regarded the departmental attitude differently from the two hard-headed lawyers who believed in trying every case on its merits, and who cared little that the bureau was placed 'in a hole' when its inconsistent rulings were shown up.

In naming the new board, President Coolidge exercised the discretionary power given him to increase the membership from fifteen to sixteen.

***About the Personnel***

It is true that the Board of Tax Appeals is not a court of law but a fact-finding body. Appeal from its findings can be taken to the District of Columbia Supreme Court, but the appeal must be on *law* and not on facts. The board is the final arbiter of facts. This latter statement alone shows the tremendous importance to the taxpayer of the tribunal being unbiased and unfettered by any bureau influences.

How 'free of bureau influences' the board is may be judged from the circumstances of the various appointments. Seven of the sixteen members of the board were employes of the Internal Revenue Bureau at the time they were selected. It is fair to assume that none of them would have been named without a positive recommendation from Commissioner Blair and Secretary Mellon.



In addition to the seven members of the board named directly from the service, the circumstances and previous affiliations of the other members shed additional light on the make-up of this important tribunal and indicate how far from the intent of the framers of the law the appointing power have been led.

No fewer than twelve of the sixteen members of the board which constitutes the only court the taxpayers have short of the Supreme Court of the District of Columbia are linked directly and indirectly with the tax bureau.

Senator Hiram Johnson, of California, one of the Senators who opposed confirmation of the board, sums the matter up as follows:

'To have one of the parties to litigation select the judges makes a mockery of the court. This is said without criticism of the character of any of the individuals, but in opposition to the mode of selection. This board was designated as a court, but it has lost every judicial attribute.'

# Tales of the Wits Who Gave *Humor* to the *Gay Nineties*

At the Dutch Treat Club dinners, James Montgomery Flagg was accustomed to make caricatures of the members each man taking his home

By THOMAS L. MASSON

ILLUSTRATED BY RUSSELL H. LEGGE

IT WAS in 1894 that we started the Lanthorn Club, of which Thomas Beer writes in his interesting biography of Stephen Crane.

'He (Crane) was made welcome at the new Lantern Club of journalists and editors in a crazy added story on the roof of an old building near Brooklyn Bridge. Irving Bacheller, Thomas Masson, Edward Marshall, Willis Hawkins, Richard Gilder, John Langdon Heaton—whose wife was "the most sensible woman in New York" to Crane—and some others lunched there almost daily.'

As a matter of fact, we went there, as I remember, once a week, and the daily luncheon was not a success. Also, there was Ned Townsend ('Jimmie Fadden') who had come on from San Francisco and as a member of the famous Bohemian Club there, I believe that it was he who originated the idea of the Lanthorn Club. At any rate, he took a lively part in the proceedings.

This recalls a story, which, however, occurred much later on, at a dinner given by the Dutch Treat Club at the Brevoort. At these early Dutch Treat dinners, James Montgomery Flagg was accustomed to make caricatures of the members. He did them on large sheets and after the applause they were distributed to the members in turn, each man taking his home. On this occasion, however, Flagg erred in making a drawing of Townsend as 'Jimmie Fadden.' For some reason, Townsend took offense at it and with doubtful taste, when the caricature was presented to him. he tore it up and scattered the pieces on the floor. Peter Dunne had the same aversion to the linking of his own personality with Mr. Dooley, and was likely to beat up anyone who suggested it

To go back to the Lanthorn Club, not only was it near the Brooklyn Bridge, but it was superimposed—a kind of shack—on the oldest building then in New York, known as Monkey Hill. The object of the club was to 'improve' the work of members by criticism. One man would read something he had written and then the others would criticize or commend it.

Irving Bacheller, who had a fine, resonant, melodramatic voice, read several of his pieces, some of which afterward had a wide vogue. He also was the one who introduced Kipling's work into this country. He used to get the manuscripts from Kipling and read them aloud to us. I remember one of the first was 'The Liner She's a Lady.' We didn't think much of it.

Stephen Crane attended many of the meetings but rarely said anything. I was also severely taken to task for silence by John Swinton, who was on the editorial staff of the *Sun* at the time, a radical and one of Mr. Dana's favorites. After one convivial evening in which I had, rather abashed, remained silent, he grabbed me and said:

'Young man you never will amount to anything unless you learn how to talk.'

Edward Marshall who was the Sunday editor of the *Press* and a very bright, versatile writer, had an imagination which I think has never been equaled. It completely ran away with him, and he would regale me with stories, as if they were actually happening, which covered weeks in the recital. For example, he came to me one spring and said that he was negotiating for a steamer on which to take a trip during the summer through the Great Lakes. He had a chance of getting it very cheap and in glowing terms he pictured the great adventure we would have. I made my plans to accompany him, reserving a few weeks for the purpose.

Week after week he regaled me with details of the negotiations, keeping me and a few others who were to accompany us in a fine glow of excitement. At the last moment, when we were about to start, he came to me with tears in his eyes and said he had just received a telegram stating that by a strange mishap the steamer had just blown up and was a total loss. Marshall's reputation as a weaver of adventures in which he actually took part grew until it became known everywhere.

One evening we gave a dinner at the Lanthorn Club and Richard Watson Gilder presided. He was a delicately admirable toastmaster, and called on one after another. When at last he came to Marshall he said quietly:

'Gentlemen, most of us here write fiction Ed Marshall lives it.'

Marshall was at first inclined to resent the comparison, but amid a chorus of howls got up and defended himself. It did him no good as a corrective, however A few weeks later he started in on another yarn, according to which he had rescued the daughter of an uptown millionaire from a tough on the elevated; her father had invited him to the house and so on through a rapt romance Afterward he went to the Spanish War where he lost both legs and distinguished himself greatly for sublime bravery.

The Lanthorn Club was doomed to a brief existence, as it was too impractical to succeed permanently. It was, however, followed by the Cloister Club, much more permanent and with a larger membership.

This club was by far the most successful and real bohemian club ever formed in New York, the later Greenwich Village varieties being but weak imitations of Parisian affairs.

The Cloister Club was located in a few rooms on the ground floor on the south side of Eighth Street. You went up a short flight

of steps flanked by a rickety iron railing and entered directly the main room. In the rear was some sort of kitchen where the meals were concocted. And what meals they were!

Some of the members of this club were William J. Glackens, the painter (since become so famous); Harry Leon Wilson, without doubt our best humorist; 'Pop' Wilson, then of *Puck* (art editor); George Barry Mallon, city editor of the *Sun*—about twenty or twenty-five in all.

The first thing done with the dining room was to decorate it with the work of the artist members. These decorations were of a mural nature and great works of art, the Cloister idea being prevalent.

It would be impossible to describe the spirit of genuine comradeship in this club. After we had been there some time we were forced out and obliged to move uptown but it was never the same.

I recall very well the morning after my twins were born I drifted into the Cloister Club to spread the news. There was present Theodore Wores, an artist of distinction and one of the best judges of Chinese art in this country. When I told him that one of the twins was a boy and the other a girl he stared at me incredulously for a moment and then exclaimed·

'Impossible!'

It was a singular fact, however, that two of the greatest bohemians in New York at that time (although totally dissimilar), Ernest Jerrold and Billy Fales, never joined the Cloister, or if they did they never came. Ernest Jerrold was a thin, wizened-up little Irishman, with the soul of a poet. He carried a drooping set of mustaches that fell away to an irregular set of points and his thin nose sloped down to a point, like a Celtic rat. He was a great humorist and if he could ever have been induced to work, would have been a national one. Gilder tried for some time to get him to write pieces for the *Century*, but he never would do it. He never had any money but never seemed to need any. Billy Fales, on the other hand, was a rather corpulent man, with a round face, never quite clean, and his clothes were a sight. He taught me how to eat a chop; he would gnaw it down to the last shred. He had received a legal education and might have been a prominent lawyer, but his roving disposition led him astray. He married a Chinese wife and lived with her in Chinatown.

I chanced to meet him one day, quite by accident, and by good luck quoted something from *The Ingoldsby Legends*. He was so impressed with my great show of learning that he 'took me up' and thereafter we became good friends.

There was the rathskeller saloon in the basement of a building just or nearly opposite the old *Sun* Building already referred to, and it was here, I believe, that in the old days Walt Whitman used to consort with his fellows. At any rate, Fales and Jerrold and myself consumed many a schooner of beer The talk then was, I think, better than it is today, because less artificial. It was duller and therefore better.

Fales married again, and I went to the wedding. It was a thoroughly bohemian affair. A week later I dropped in on him. His wife suggested that we walk to the Brooklyn Bridge (Fales' rooms were not so far away) so she changed her clothes while we sat and smoked. It was all informal enough but not as it is today, where certain fake bohemians make a fetish of indecent activities. Then it was without any self-consciousness.

Afterward Billy Fales faded from my activities until one day I heard—quite by accident—that he was ill in the hospital. I sent a messenger up with a five-dollar bill and had completely forgotten the incident when, nearly a year later, I began to receive through the mail copies of English papers published in various places in China. Each one of these papers contained a short piece of humor signed with my name, 'Tom Masson.' Later Billy Fales came in and said that he been out to China and in order to testify his gratitude for my fiver he had done his part to make me known throughout the Orient. I know of no finer method of displaying one's genuine friendship. It would have been utterly spoiled if he had offered to return the fiver.

There was at this time a small group of members of the Cloister who used to consort together. Among these was Dick Munkitterick, who wrote eccentric rhymes for *Puck* and never seemed to have any money. He would cash in on a poem when

I met 'Munk' in the bank where he was proudly depositing a check for a thousand dollars.

his needs pressed on him, but in his later days he was more prosperous, especially when Hearst came to New York and hired everybody in sight. I met 'Munk' one day in the Second National Bank where he was depositing a check for a thousand dollars, which he proudly showed me. 'Why, even the cockroaches in the Hearst newspapers get seventy-five dollars a month,' he remarked.

After Bunner, of *Puck*, died, Harry Leon Wilson succeeded him as the literary editor and 'Pop' Gibson as the art editor. Guy Wetmore Carryl, one of the best writers of light verse America has produced, used to foregather with us in *Puck* office. They paid two dollars for what were called 'comics' (that is, jokes susceptible of illustration), and one dollar for ordinary jokes. I don't think they ever paid more than ten dollars for poetry.

At this time, or in 1893, *Life* celebrated its tenth anniversary by a dinner at Delmonico's. This dinner was largely attended by the literati, many of them quite eminent. Among them was James Jeffrey Roche (father of the present Arthur Somers Roche), who was editor of the *Pilot*, a Boston Catholic paper, and whose verses, 'The V-a-s-e,' published in one of the early issues of the then struggling paper, has helped largely to turn the tide in its favor.

Apropos of this fact, Mitchell told me an amusing story of how he continued *Life*. He had, in the beginning, put into it about $50,000, which was all he had, much to the disgust of his family and many of his friends, who could not conceive of his making a success of a humorous paper. After a while it was literally true that each week, for a time, they got back more copies than they printed, because the paper was returnable and the newsdealers would wait to accumulate them and then they would all come back in a few weeks.

One day Mitchell, completely discouraged, went out to a lonely luncheon. At the next table was a man with bold whiskers who talked to his table companion about papers. This man was none

He threw his gold pieces on the table, exclaiming, 'That's what I earned today.'

other than the redoubtable Josh Billings, who, by the way, died shortly afterward. (This w s early in 1884.) Mitchell listened in a desultory way to the talk at the next table until suddenly Josh Billings, bringing down his fist, remarked:

'If you are going to make a paper successful, you have got to pour money into it like a drunken sailor, and not care.'

Mitchell went back to the office refreshed in mind and courage and borrowed enough more money to get out the next issue. In a few weeks more the tide turned and from then on the paper was very profitable. When Mitchell died thirty-five years ago he left nearly two millions.

Bangs, Munkitterick and I, together with a number of others, used to contribute to *Puck* regularly, while at the same time we also contributed to *Harper's Bazar*.

In those days Harper and Brothers were located in an ancient building on Pearl Street flanking the elevated railroad which had not then been built so long.

Someone told me the story of how W. D. Howells first came to Harper's. He smoked and as this was objected to, quietly put on his hat and walked out. Afterward he went back and was associated with the magazine for many years. Howells, during this period or a little later, used to take his breakfast at the Vienna Cafe on Broadway next to Grace Church. They had the best coffee in town and a few of us used to go there regularly.

The first time I met Bangs I brought a manuscript in and after some discussion with the office boy, he reluctantly went back with my name. Later I was shown into Bang's room, a mere cubbyhole. He was very cordial and I timidly took out my manuscript and asked him if he would look it over.

He began reading it, but when he had got about halfway through, suddenly looked up and said:

'For heaven's sake don't look at me that way. I can't stand it to have you sitting there.'

We then made an arrangement, which was kept up for a long time, that when calling I was to sit in desperate suspense at the other end of an outer room, after I had sent in my manuscript to him, and await his decision. There was never to be any personal communication between us, but the boy was to bring back the result. This worked very well. Later on Bangs became editor of *Puck*, which was still later bought by Mr. Straus for his son, then by W. R. Hearst, and so vanished from sight.

It was at this period that E. W. Kemble, originator of the Gold Dust Twins, who even now is illustrating Peter Dunne's resurrected Mr. Dooley, began his artist's career. He was employed by the Western Union Telegraph Company as clerk, but in idle moments made pictures on his blotter or any sheets of paper that were on his desk. One day he gathered up some of these pictures and left them at Harper's in Pearl Street.

A week later he dropped in again to ask about the fate of his contributions, and was paralyzed to have the cashier hand him several gold pieces (they often paid in gold in those days). He was so excited that he forgot to take an uptown bus, and told me he actually ran all the way home (several miles) arriving there nearly an hour late for dinner. His father started to remonstrate with him, when he threw his gold pieces down on the table exclaiming, 'That's what I earned today.' He never went back to the Western Union.

# A Dance A Week

## OLD DAN TUCKER

Metronome 112

Form a circle, any number of couples. In the center place a dancer without a partner. This lone person is 'Dan Tucker.' The fun of the dance is promoted by giving 'Dan Tucker' leave to secure a partner from the circle whenever possible. This is properly done during 'the grand right and left' when partners are separated, but may be done at any period of the dance. The gentleman without a partner becomes Tucker. In parties where there are more gentlemen than ladies, several persons may be placed in the center. The old music of 'Dan Tucker' should be played.

All balance to Tucker and swing..... 8 bars

All join hands, facing Tucker in the center, balance and swing partners.

Allemande left..... 8 bars

Each gentleman turns lady at his left with right hand, then turns his own partner with his left hand.

Grand right and left..... 8 bars

Dan Tucker will join in this movement, and steal a partner. Continue until the call

Promenade all.....16 bars

Gentleman promenades with the lady directly in front. The gentleman who fails to secure a partner becomes Dan Tucker.

Forward and back..... 4 bars

All join hands, walk four steps forward and backward.

All circle to the left..... 4 bars

All chasse to the left side.

Repeat all from the beginning.

## SOLDIER'S JOY

Metronome 112

Form as for Sicilian Circle. Call the first change before the music begins.

All forward and back..... 4 bars

Couples join nearest hands and walk four steps, forward and back.

Turn the opposite..... 4 bars

Take waltz position with the opposite lady. Each place right foot forward, and turn, with the toe of the left foot.

All balance..... 4 bars

Face partners and execute a step swing. (Step on left, and swing right up in front, step on right and swing left up in front.)

All swing partners..... 4 bars

Take waltz position and swing.

Ladies chain..... 8 bars

Lady gives right hand across to opposite lady, and walks half around; give left hand to opposite gentleman and turn; give right hand back to same lady, walk four steps to place, give left hand to partner, and turn to place.

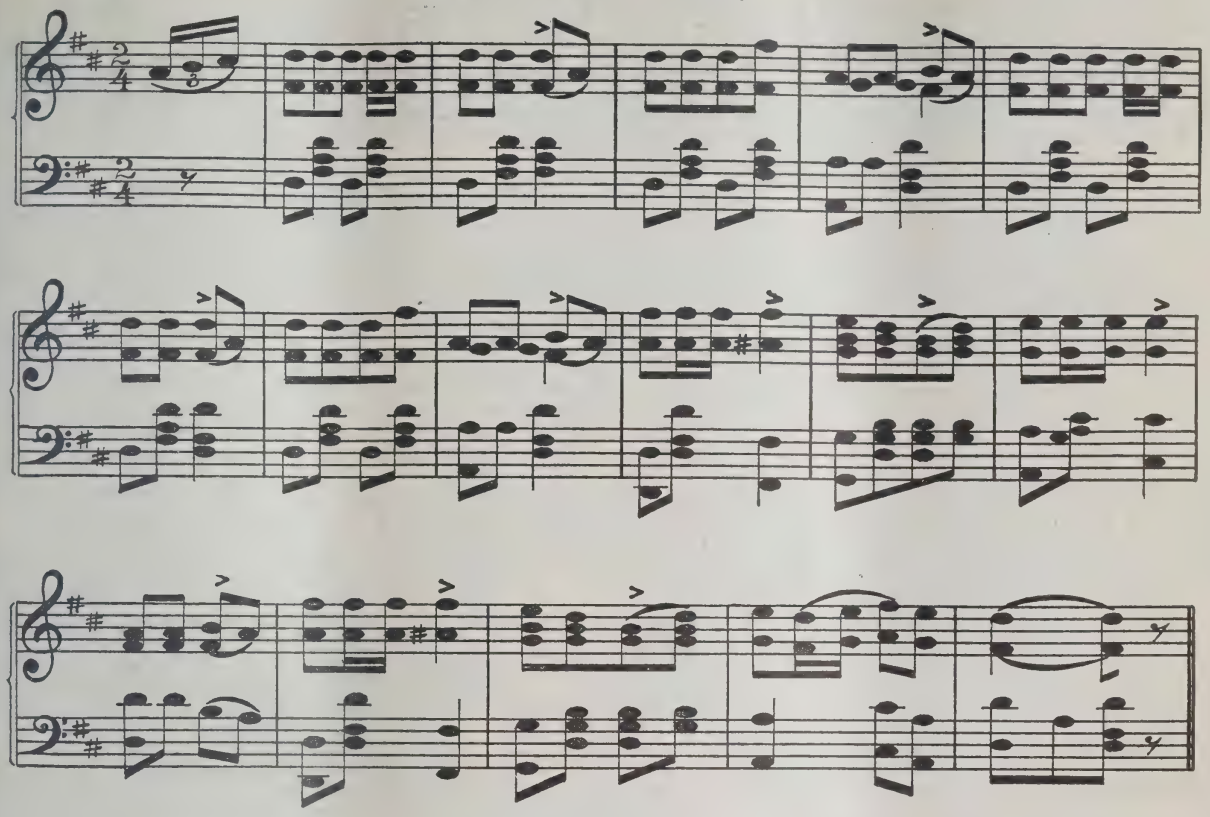
Forward and back..... 4 bars

Join nearest hands with partner, walk forward, drop hands, pass through that couple and meet a new one. Repeat as long as desired.

To end the dance call—Forward and back, balance partners, promenade to seats.

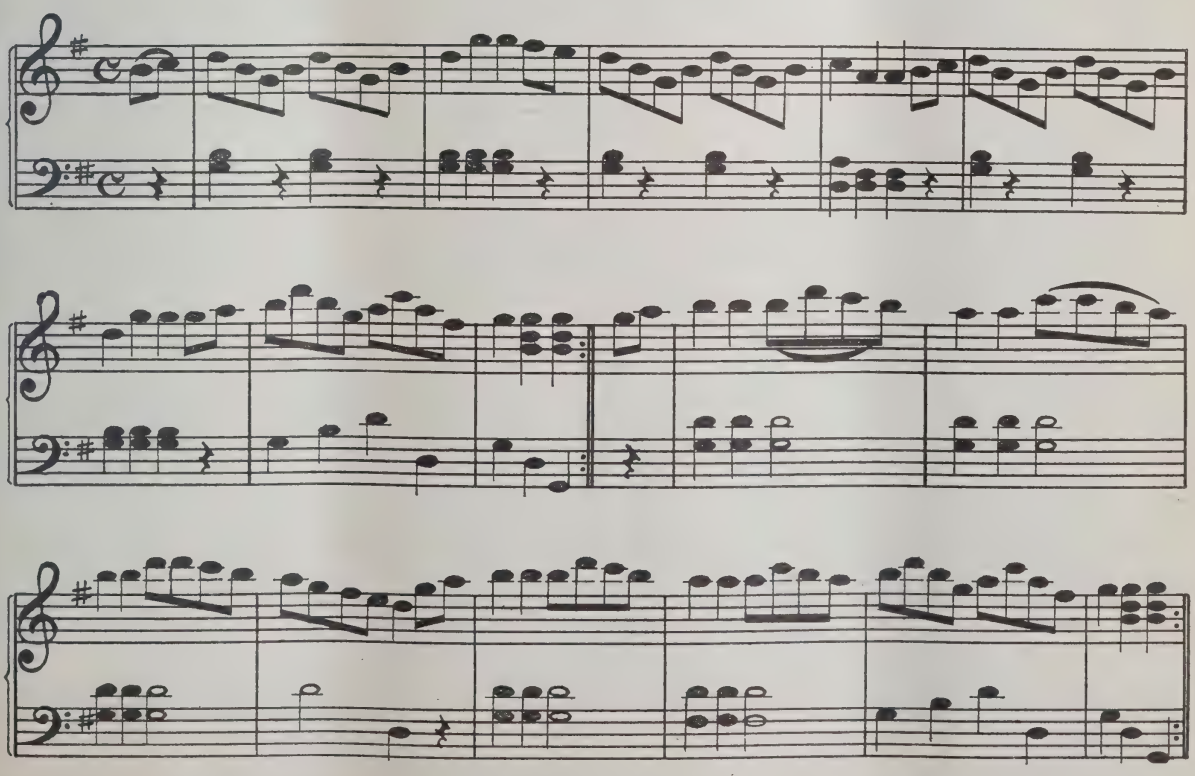
---

*Good Morning*, a dance manual of the Old American Dances, compiled for Mr. and Mrs. Henry Ford, contains 169 pages of calls, descriptions and some music of the dances taught in the Ford School. Price 75 cents.



Also, there are 20 orchestrations of 11 parts each—25 cents each orchestration, or $4.00 for the lot. Book and music will be mailed upon receipt of price.

Dearborn Publishing Company, Dearborn, Michigan.



Please order by number.

1. Grand Pa's Favorite
2. Sicilian Circle

# I Read in the Papers

The matter of invisible government was briefly and succinctly taken up by Gilbert K. Chesterton in his entertaining publication, *G. K.'s Weekly*. Under the heading, 'The Secret,' he declares:

### *British Secret Is Revealed by Chesterton*

'The secret of the Prime Minister is that there is no such person. He is a myth; or rather, to speak more precisely, he is a legend. He is a legend of the past; just as the full power of the King, which remains in official form, is a legend of the past. There is no Prime Minister; there are no Ministers; there is no Cabinet; in that docile traditional conventional sense in which simple Socialists and others still accept it. There is an exceptionally reasonable and good-natured gentleman named Baldwin, who is the bearer of this official name, as many other decent English gentlemen consent to be called grotesque names like Red Dragon and Blue Mantle. But the leadership once implied in such titles has stiffened like heraldry. The thing that rules England today is the banker who is at the back of the Industrial Group; and even that rules only so long as the Banker is at the back of it.'

ɤ ɤ ɤ

Can it be that Senator Hiram Johnson intends to retire from public life? That he no longer desires the toga or other insignia of office? That he has wearied of the inseverable hold he has on California, his native state? Hearken to these words, quoted as being uttered by him upon his recent arrival in Boston:

### *Maybe It Is a Touch of Native Son*

*'We came here today through Connecticut and were delighted with the beauty of the countryside, which is such a contrast to the scenery in California at this time of the year. We have little or no rain in the summer months and consequently the green of the trees and grass becomes bleached by the sun, losing that colorful charm which New England retains throughout the hot weather.'*

Coming from an ordinary citizen of California this would be held rank heresy. Coming from a native son—we might almost say *the* native son—on whom the sunkist state has heaped honor after honor, it borders on the treasonable! Is the man trying to imply to New England that *she* has climate? This kind of thing must be stopped! If he isn't restrained. Mr. Johnson soon may be telling the world that California has—but there, perhaps we had as well leave the word unwritten, for after all, was it not the Fire?

ɤ ɤ ɤ

One of the clearest views on the hullabaloo raised when a New York woman tried to prevent the singing of 'The Star-Spangled Banner' at a public gathering, on the grounds that one of its verses is offensive to England, comes from England itself, where the *Manchester Guardian* has this to say:

'Manners and tones of national anthems appears to be a subject which is receiving an increased amount of attention nowadays. One of the rarely sung verses of "God Save the King" has recently been criticized as not particularly appropriate for use in schools, and in America some comment has just been roused by a suggestion that "The Star-Spangled Banner" ought to be avoided because some of its references are "unfriendly to Britain." This shows a certain amount of delicacy, but the withers of most Britons would remain unwrung if the whole of the four stanzas were rendered with enthusiasm in their presence. The offending one is presumably

### *Our Anthem Does Not Irk England*

And where is that band that so vauntingly swore
That the havoc of war and the battle's confusion
A home and a country should leave us no more?

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set $1. THE DEARBORN PUBLISHING COMPANY, DEARBORN, MICHIGAN.

Their blood has washed out their foul footsteps' pollution
No refuge could save the hireling and slave
From the terror of death and the gloom of the grave.

'To an English hearer it would all sound very fierce but rather generalized. It is only the history of the poem and not its contents which fixes (if it does fix) the reproach of "hire'ing and slave" on the amiable and virtuous inhabitants of this island. Francis Scott Key wrote the verses in 1814, when the British forces were attacking Baltimore from the sea and when Key himself was detained on one of the attacking vessels. But it is all rather a long time ago now, and most of us in this country would rather hear all of "The Star-Spangled Banner" sung loud, long, and repeatedly, than sit for any close examination in the details of the Anglo-American history which produced it.'

ɤ ɤ ɤ

This protest against buildings commercial to replace buildings beautiful or buildings historic, which appeared in the *Graphic* (June 10), expresses admirably the attitude of many, British and American, who love the beautiful and the old:

'Almost every week brings its evidence that the desire to keep towns beautiful is being roused. We have had evidence of it in the anxiety over the Foundling Estate, and now the position of Edinburgh is creating interest. Professor Patrick Abercrombie asks pointedly: "Is Scotland tamely going to watch the wrecking of its capital, or is it going to harness its new growth so that commercial prosperity does not mean monumental ruin?"

### *The Destruction of Beauty by Commerce*

'Edinburgh, of course, does not stand alone. The same destruction is going on at a rapid rate in many old places, where beautiful houses are spoiled by the erection of vulgar shop fronts. I have in mind one very stately street, built in granite on the most classic lines, with beautiful rounded windows. Every one of these but two has been replaced by modern windows, so that the houses seem to stand on glass. Another factor in the destruction of individuality is the fact that most of these shops are occupied by multiple traders. It will be well for enthusiasts like Professor Abercrombie to consider the problem of multiple shops on street architecture, for all that they care about is the selling of goods. They have little or no sense of local tradition, yet some attention to this would be a real business asset.'

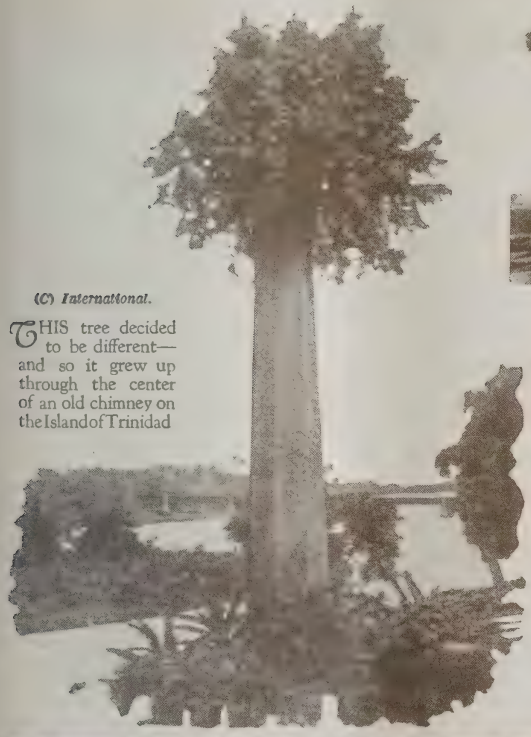
ɤ ɤ ɤ

The report of the National Crime Commission, headed by former Governor Hadley, of Missouri, and made up of Judson Harmon, former Attorney-General of the U. S.; Roscoe Pound, Dean of the Harvard Law School; Edwin R. Keedy, a former Judge Advocate of the U. S. Army, recommend:

### *Revision of Criminal Code Urged*

'In order to eliminate forced confessions and third-degree methods, persons charged with felony should be informed as to their rights, then allowed to answer publicly the charges preferred against them.

'Defendants charged with conspiracy should be tried jointly.



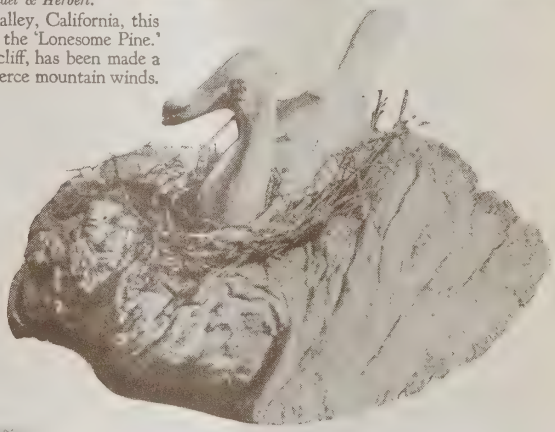
'If a defendant fails to testify, the Court and Counsel should have the right to comment upon the fact.

'Judges should be permitted to instruct as to the law, and to comment upon the evidence and upon the testimony and character of witnesses.

'In felonies, excepting capital offenses, five-sixths of the jury should be allowed to return a verdict.

'Criminal procedure, now framed about the archaic conception of the protection of individual rights, should aim rather at prompt determination of the accused person's guilt or innocence. Felons should not be permitted to escape by grace of a technical legal error.'

# Freaks of Nature



(C) International.

THIS tree decided to be different—and so it grew up through the center of an old chimney on the Island of Trinidad

(C) Kadel & Herbert.

IN Yosemite Valley, California, this is known as the 'Lonesome Pine.' The tree, on a cliff, has been made a hunchback by fierce mountain winds.

(C) Wide World Photo.

AT first glance the casual reader might think this is a Fatu-Liva bird such as Dr. Traprock found on his exploration of the South Seas. But it is really a piece of root found in Rainier National Park, and so curiously resembled a duck that a nest was made for it.

(C) Ewing Galloway.

THE two pictures directly above should be considered together, as they are both of a great banyan tree in Calcutta, India. One view presents the amazing proportions of this tree as seen from a distance, and the other shows the aerial roots which cause this tree to appear so immense.

(C) Ewing Galloway.

FOR many years this was the home of a pioneer woodsman in Sequoia Park, California. It is called the Chamber Tree. Note the comparative size of the woman standing at the entrance.

# BRIEFLY TOLD

SLOW-MOVING VEHICLES must speed up or get out of line on crowded highways of Pennsylvania, under orders issued by the State Highway Motor Patrol. Many accidents have been attributed to the blocking of traffic by slow motorists.

THE EX-KAISER OF GERMANY is referred to in the new Berlin telephone directory as 'His Majesty.'

AN AVERAGE-SIZE TREE with a spread of fifty feet of foliage under normal conditions throws off five barrels of water a day in the form of vapor. This is attracted to the clouds and returns to the earth as rain

A COMPILATION OF CONFEDERATE records has been started by the War Department, in compliance with an act of Congress appropriating $70,000 for this purpose. The records will be of great historical value to the Southern states.

IN 1899 THE SOCIETY weeklies listed 124 persons in New York City who had taken up golf. The game is now almost universally played.

A YARD WHERE LIONS, tigers and other animals and serpents are bought and sold is a feature of the East End of London.

THE CASH VALUE of a college education has been estimated at $70,000 by a statistician who based his calculations on the earning capacities of a number of university graduates.

'THE ENGLISH LANGUAGE, English literature, and English character have probably been more molded, shaped and inspired by the English Bible than by any other influence, literary or educational. Once this fact is grasped, the absurdity of leaving it out of the national system of education for people of English blood and English tradition becomes obvious.' —*Sir Harry R. Reichel,* President of the University of North Wales.

THE GOLD OUTPUT of the United States decreased slightly last year, while the silver output increased.

THE ARRIVAL OF THE first automobile recently in a little village in the highlands of Donegal County, Ireland, was celebrated as a public event. A holiday was declared and the streets decorated with flags and bunting.

THE JORDAN VALLEY, more than a thousand feet below sea level, is one of the lowest spots on the earth's surface. The fish and vegetation there are characteristic not of Asia but of Africa.

A STRANGE MALADY has attacked oyster beds in Japan, resulting in the death of millions of oysters. The disease is attributed to a change in the ocean currents affecting the temperature of the oyster beds.

WHEN FLOOD-WATERS OVERFLOWED an Ohio golf course, caddies armed themselves with clubs and hunted carp.

RADIO TELEPHONES HAVE been installed on the huge airships of European air lines, in addition to movies and phonographs. Passengers are thus enabled to hold conversation with different cities while en route.

NINE PERSONS WERE lynched in this country during the first six months of 1926, an increase of four over the same period last year. Six of the victims were negroes, two were whites and one an Indian.

THAT HUMANS CAN HEAR with their skins, and possibly see, is the contention of a university professor whose work with deaf mutes along these lines is amazing those who have witnessed the tests.

ONE MINUTE IN JAIL was the sentence imposed by an Arkansas judge on a man charged with embezzling five dollars from a neighbor.

THE PAWNBROKERS' SYMBOL of three golden balls comes from the noted de Medici family, money lenders and bankers of the Middle Ages. Tradition has it that one of the earliest of the de Medicis, fighting under Charlemagne, slew a giant whose mace was decorated with three golden balls. He adopted the mark as the family insignia.

MOTOR BUSES PLYING between Los Angeles and San Francisco carry stewards and serve hot meals, prepared in tiny kitchenettes.

FIRST-CLASS SADDLE ponies were recently sold at Helena, Montana, for twenty-five cents each to Boy Scouts who did not want them sent to the slaughterhouse.

TWENTY-NINE MOSLEM seamen on a British steamer, learning that their cook was a Buddhist, left the ship at New York and cooked their own food on the dock. Food cooked by anyone not of their faith, they believe, is contaminated.

YELLOWSTONE, LARGEST of the national parks, has an area of 3,348 square miles.

AMONG THE FISHERFOLK of Brittany, maidens, wives and widows each have their own distinctive colors for their shawls.

PUSHCART MARKETS in New York City sell produce valued at $45,000,000 annually.

CARL MAGEE, FIGHTING editor of a New Mexico paper, has been acquitted of homicide charges in connection with the death of a young man who was accidentally shot while Magee was defending himself from the attack of a judge whom he had defeated for re-election. Magee, in a newspaper purchased from Albert Fall, started the investigation which resulted in the Teapot Dome scandal and Fall's resignation from the Cabinet.

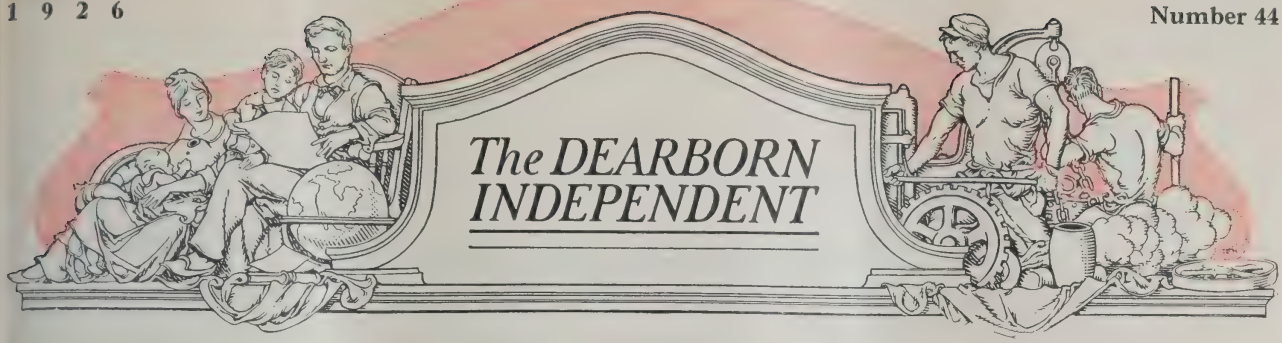
A BOY WHO found an old high-wheeler bicycle in a barn mounted it and rode out onto a busy street, only to find himself unable to dismount. He had to be rescued by police after seriously disrupting traffic.

A WOODEN IDOL, believed to have belonged to a race that existed 2,000 years ago, has been excavated in Florida. The idol is thirty-five feet tall.

OWNERS OF RADIO receiving sets in Germany must pay fifty cents a month for the privilege. The government uses the money to encourage broadcasting.

THE KING OF ENGLAND never dies. The moment a sovereign passes away, his title, dignity and powers automatically are transferred to the heir apparent, who thereupon becomes 'of age' even though he may not have reached his majority.

A 450-POUND INMATE of a Florida county farm had to be temporarily left behind when the quarters were moved. The man had been confined to the house for years because he was unable to squeeze through either door or window.



GAS CARTRIDGES, TO BE fired at thieves through keyholes, are now part of the Cleveland police equipment. The gas has a temporary blinding effect but does not result in permanent injury.

A SLAB OF MARBLE, under great pressure, will bend like stiff tar or wax.

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses indifference as a transfer instead of a dearth of interest.

Frank A. Munsey came to New York with forty dollars which in less than fifty years became $40,000,000, and when he died he had cast his burden of bullion into the dumping ground of public bequests—a museum got it. Munsey was called a success, but in the things that matter, in the acquiring of that happiness which on earth is the front garden of heaven, he was a failure. A solitary figure in a desert of dollars, a Midas who commanded millions but could not use them. (p. 2)

Kipling says that Judy O'Grady and the colonel's lady are sisters under the skin. Freud says so also. Dr. Joseph Collins has analyzed the psychoanalyst and finds in the test tube only a few scattered grains of pure fact among a messy mass of fantastic Freudism. (p. 3)

Many people think that good roads are made *for* motor traffic; but in reality good roads are made *by* motor traffic. This is true in a number of ways. Here is one of them: this year the total toll collection from the use of motor cars will be near $1,500,000,000 and this is to be applied to the building of national highways. For this year the gasoline tax will go to near $250,000,000. Stepping on the gas means the making of more good roads. (p. 4)

That mercurial Frenchman, Max O'Rell, once wrote a book called *John Bull and His Island*. Now it is Uncle Sam and His Islands. This does not sound right; nevertheless there are hundreds of islands over which the United States flag flies. They are scattered over the two great oceans, mostly in the Pacific. Dr. William Barton, globe-trotter *par excellence*, has been taking stock of them and in doing so has almost lost count. Some are in big groups like the Hawaiians and the Philippines, others are lone specks on an azure sea. There is Yap, for example. Where is the Island of Yap? Where, oh where is Pago Pago? Almost every race in the world sits under his own vine and fig tree protected by the American flag. (p. 6)

Henry Ford, President; E. G. Liebold, Vice-President and Treasurer; C. B. Longley, Secretary; W. J. Cameron, Editor.

Among other things inherited from our forefathers is bad English. It seems that what we call bad English was once pretty good English. Bad English is good English if it is old enough. Shakespeare threw tradition in the ditch and started an English of his own; the making of English is still going on. We in this country call it *American*. Language may be one thing today and another tomorrow. Its glory is that it is alive and growing. Expression is its purpose, and the greater its power of expression the better English it is. (p. 8)

'He would go on and on in spite of all though men were reduced to eating the leather on the rigging.' Thus spoke Magellan. And the passage from the Atlantic to the Pacific through the straits named after him was made a reality. This is the supreme hour in the Voyage of the *Victoria*. Charles Finger spins the true yarn in true sailor style. He knows the straits, has graphically visualized the adventures and final triumph of the great navigator. (p. 12)

What about women's rights in Mexico? With the exception of a very few, they never had any rights until recently. Living under worse than Oriental conditions, their story of patient acquiescence in degrading conditions is an amazing one. Helen Bowyer says the women of Mexico are now waking up. (p. 15)

Why should we pity the baseball scout? Paul MacDonald, who knows what he is talking about when it comes to baseball, gives us entertaining reasons for such an appeal to our sympathies.

The baseball scout is the man who wanders about the sports jungle in search of 'human ivory.' Sometimes the ivory proves a dangerous commodity, uncertain in quality and texture, and potential with blighted expectations. If the scout spots the right material, however, he may indulge in a little self-laudation—for no one else will do it for him—but if the recommended recruit proves a failure he hears about it unless he again takes to the woods. (p. 16)

How the use of telephones strung on trees annually saved millions of dollars' worth of valuable timber is told by S. Omar Barker (page 19). J. Olin Howe gives us the story of how delightfully the rarest of rare Americana has been preserved for all time in a setting that is historically and artistically perfect. In this number there are also some good yarns told by J. T. Faris in connection with some vanished towns in Kansas.

For example there is the story of that bitter fight between the towns of Leoti and Coronado. The cause of the trouble was that both Leoti and Coronado wished to be named the county seat. Finally the state governor appointed a commission to take a vote. Rifles, shotguns and imported bulldozers figured in the contest, and $50 a vote was the price named in the case of one of the towns. Bands of cowboys appeared on the scene and shot up first one place and then another. Several were killed and the jails were full. Finally Leoti won and became the county seat and Coronado was moved bodily thither. (p. 29)

# The Loneliest Man in New York

## An Intimate Study of Frank A. Munsey by a Man Who Was Once One of His Newspaper Executives

By ALLAN L. BENSON

PORTRAIT BY W. O. FITZGERALD

MR. MUNSEY has been dead since last December, and this spring his body was taken back to Maine, where he was born, and placed beside the ashes of his father and mother. As provided in his last will and testament, a fund set aside will forever keep green his grave and all the other graves in the cemetery.

'Mr. Munsey,' in this case, means Frank A. Munsey, magazine publisher, newspaper owner, chain grocery store proprietor, real estate investor and, for a brief, hectic, gold-productive period, stock speculator who, in his lifetime, would permit no newspaper of his to refer to him more specifically than as 'Mr. Munsey.' In this delicate, indirect way he intimated that, though the woods might be full of Munseys, there was but one that counted and he was that one.

Mr. Munsey is dead, but the story of his life has never been told because nobody ever lived who could have told it. If it could be told *and understood* no young man might ever again quit the country and face fate at short range in New York to decide whether he should remain poor or become rich. No country boy might ever again come to the city at all, if Mr. Munsey's story were known, because he might be overcome with fear lest he should become another Munsey. But the story can never be told with the fullness, the detail and the horror that it so well merits because nobody could tell it without all the facts. Nobody but Munsey ever knew all the facts and if he had tried he could have not portrayed himself as he was. Perhaps his deficiency, in this respect, was not unusual. At any rate, it would have been more difficult for Munsey to do so because he was a most unusual man.

Mr. Munsey came to New York with forty dollars, ran it up in a little less than half a century to $40,000,000, in the last year of his life gave $100,000 toward the completion of the Cathedral of St. John the Divine, and was honored by having his funeral sermon preached in that cathedral in the presence of 1,700 persons by Bishop Manning. If there had been 1,700 persons at his funeral who really mourned—persons whose lives could never again be quite the same because of what death had done—this article would have had to take quite a different turn. Such a funeral could have marked the passing of none but a great soul. But the attendants at the Munsey obsequies were not of this class. He had never cared enough about any woman to marry one, so he left no widow nor children. He had never cared enough about many men to be much of a friend to them—so very, very few friends were present, perhaps two or three.

If Munsey had gone broke ten years ago his funeral could have been held in the living room of a small flat without crowding anyone, because the only magnet that drew men to Munsey was his money. Seventeen hundred bankers, millionaires and prominent citizens can forget a man in a hurry when no bank holds a dollar to his credit and no property stands on the records in his name.

Whoever has been in the Munsey offices in New York will recall a famous wise crack, evolved by Munsey himself, framed and hanging on the walls of most of the offices, usually near the picture of 'the chief,' as his employes always called him. This bit of Munsey wisdom was to this effect: 'You cannot get out of a man what God Almighty never put into him. You must fit the man to the job, not the job to the man.'

It would be easy to account for Munsey on the theory that he came to this earth to get something or to do something, and then forgot what it was and spent a lifetime furiously accumulating things that he did not really want and doing things that he did not want to do. The way he dumped his fortune by the side of the road when he was through with it as the driver of a street cleaning wagon might dump a load of snow into the river, would seem to fortify this conclusion; but nevertheless, such was not the fact. Munsey's life was a tremendous tragedy because he himself was a tremendous tragedy.

Munsey made money out of magazines, not because he had vision but because he had mediocrity, highly energized. At a time when magazines were made to appeal to the intelligent Munsey began to make them to appeal to the half-wits, and at less than a third of the usual price. What suited him was what he printed and what suited him was sure to suit those who had his own degree of taste or understanding; and there were many of them.

Munsey blundered into this virgin field that more intelligent men have since consciously entered to cultivate. He did not know he was putting print down to anybody's level. He was only printing what he

Through the colored glasses of Freudism

# *The Doctor Looks at* Judy O'Grady and the Colonel's Lady

## —and decides that Freud should be repudiated

> THE medical profession by and large, the world over, repudiates Freud, his theory of the neuroses, and his system of therapy. Psychologists have always denied him, and now artists, litterateurs and critics are beginning to line up with them. To leave this statement unqualified would do Freud an injustice and the public an unfairness . . . Were they asked whether they subscribed to some of his doctrines it is likely that more than half of them would reply, 'I do' . . . Freud has taken a few sick souls and after studying them he has reconstructed a sick world, a horrible world in which no one save a few mystics and monsters want to live.

By JOSEPH COLLINS

ARE Judy O'Grady and the colonel's lady sisters under the skin? Does Lady Oxford have the same kind of thoughts, when her mind is in a state of purposelessness and reverie, as Marion Bloom, of James Joyce's imagination or experience? If the output of an intricate mechanism made up of assembled parts, each one of which is cast from the same model, is not uniform, but varies in quantity and quality, is not the variation likely to be greater if the material used is different?

The thought that must come to everyone who concerns himself with the theories and doctrines of Freud, whether as student, general reader or practitioner of psychoanalysis, is, first, 'Is the author sincere, credible, trustworthy?' second, 'Is his hypothesis assumable, his theory plausible, his logic sound?' and third, 'Is his psychology applicable to all persons?'

There can be no question about his sincerity; he believes in himself and in his contentions with the same strength and tenacity that a paranoiac displays for his delusions. Much of his hypothesis is assumable and some of his theory is quite plausible. Were he to abandon what his followers maintain is the keystone of the arch that he has raised to perpetuate his name, namely, the so-called Oedipus complex, many of his contentions would be acceptable to academic psychology and doubtless would be incorporated in its teachings. Some of his assumptions are wholly unwarranted. Ninety-nine persons out of a hundred are unable to accept his contention that the sense of guilt which is engendered by incestuous desires is the cornerstone of the edifice known as morals, the foundation upon which all religions have been erected.

That his logic is not always sound has already been stressed, but here I call attention to one particular instance which testifies its unsoundness. If the Oedipus complex is applicable to the male, it must be applicable to the female also, and the same process of development must take place in the one as in the other; but he has never been able to state how it develops in the female. He contents himself with saying: 'On the whole, our insight into these processes of development in the girl is unsatisfying, shadowy and incomplete,' words which are strangely applicable to many of the processes that his psychology describes.

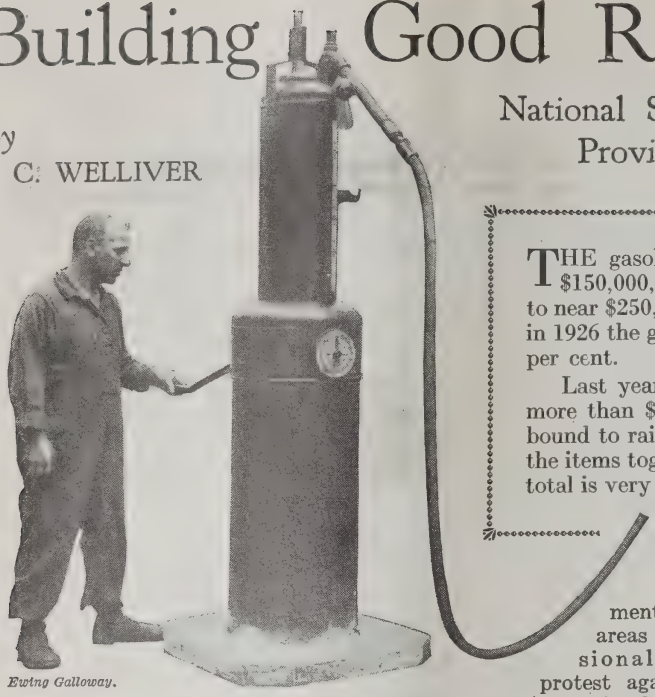
The fundamental principles of psychology or the science of human behavior have not been established with the accuracy of those of physics, and they are not immutable in their application like the principles of physics. There are certain fundamental truths, such as: the mind is built up from instincts which seek expression, or materialization, and these instincts or innate dispositions are the sources of energy, bodily and mental. There is only one fountain of such energy for Freud, the sex instinct, and there is only one way in which this fountain plays: in stages. And the reservoir spouts may get blocked up any time they are in play, and unless a psychoanalyst garbed as a magician-mechanic is at hand to adjust them the fountain may never gush geyser-like again.

The history of mankind is against Freud arrogant, dominant and unyielding, but it is not against Freud humble, conciliatory and coöperative. I wish particularly to emphasize that though we cannot accept the Freudian psychology, neither can we reject it *en masse*. We are in the position of the man who needs a suit of clothes. He has found one but he cannot wear it without looking ludicrous and contemptible. But he can have it made over. In fact, he can make it over himself.

Whether Freud has borrowed from the Roman Catholic Church or pilfered from Pierre Janet, whether he obtained his philosophy from Hartmann and his psychology from James or Lange, really does not make any difference. The question is, will his teaching stand the acid test, will his doctrine wash, has he been on the right track or has it not let him into a jungle in which he has lost his way and become lost to the world? Is the unconscious the real individual, the conscious the artificial?

Are we motivated solely by our sex urge and does it, on its way to its goal, undergo any such transformation as he describes? Are the disorders of the mind and nervous system which have no basis in material alterations of structures due invariably to repressions of sex-cravings, from the conscious to the unconscious, and are the displays of such disorders not only the indication of such repression but the proofs of it? Are civilization, religion, convention, morality conditioned by the Oedipus complex?

It must be admitted that Freud got on the right track but it led him promptly into a jungle: sexual fixation on the parent of the opposite sex present invariably in all human beings from infancy. From some of his later writings one is encouraged to believe that he is getting out of it but his followers urge him to stay in and do the job that was not imposed on Hercules.



It seems incredible that the medical profession of the world should be so hostile to psychoanalysis as it has been were the teachings of Freud the illuminators of man and his infirmities that they profess to be. It is only in Austria and in this country that it has been practised to any considerable extent. Aside from the followers of two Swiss psychiatrists, Dr. Jung and Dr. Bleuler, it has few adherents in Germany or in Switzerland and practically none in France, Italy or Spain.

Owing to the ardent advocacy of Dr. Ernest Jones, and its early incorporation into English fiction by J. D. Beresford, J. Middleton Murry, Rebecca West, and many others, it seems to have gained a great following in Great Britain, but the gain is more apparent than real. Recent attempts to make it appear (*Concluded on page 31*)

# Building Good Roads by Gasoline

## National System of Highway Toll Collection Providing America's Modern Roads

By
J. C. WELLIVER

(C) Ewing Galloway.

THE gasoline tax of the country in 1925 ran a little under $150,000,000. If you are surprised at my guess that it will go to near $250,000,000 for 1926, it is to be remembered that thus far in 1926 the gasoline consumption has shown an increase of twenty per cent.

Last year licenses and automobile number plates brought in more than $260,000,000. The increase in the number of cars is bound to raise this figure well above $300,000,000. Taking all of the items together, I think we will find that at the end of 1926 the total is very near $1,500,000,000.—Judson C. Welliver.

THOMAS H. MACDONALD, chief of the United States Bureau of Public Roads, recently declared that the equipment of the North American continent with modern highways in recent years 'had been the most amazing provision of a public utility that any community ever accomplished in a similar period.'

Mr. MacDonald is probably right. If any exception were to be taken to his statement, it would doubtless be on the ground that the construction of this country's railroad system could be regarded as an equally astonishing achievement.

But Mr. MacDonald takes note of this possible exception by observing that it took just about a century to get a $20,000,000,000 railroad system built, whereas at the present rate of highway construction it will take only about twenty years to build $20,000,000,000 worth of modern roads.

The country is putting about $1,000,000,000 a year into improved country roads; that is, is investing in roads at five times the rate at which it built railroads. Moreover, there is every indication that the coming decades will see road building greatly speeded up rather than diminished.

Most of the modern highways have been constructed in the last twenty years. Great stretches of them have cost two or three times as much a mile as did the early railroads. With every year road engineering is better, and construction constantly improved.

There are nearly 3,000,000 miles of country road in the United States, and less than 200,000 miles have yet been given strictly modern improvements. In some areas there are occasional murmurs of protest against the cost of this huge development. But on the other hand, even the most backward states are committing themselves to great programs of road development on modern lines, and no end is even remotely in sight.

In his interesting and informative presentation of the highway situation, Mr. MacDonald remarked that the Roman Empire knitted its provinces together by a system of roads radiating from Rome. It took centuries to create that system; whereas the American people in a few years have converted a continent into a neighborhood by a like construction of highways.

One of the most impressive things about a well-built road is that it can be pretty surely counted upon to last forever. No other public improvement is so well insured against wearing out or abandonment. Julius Caesar built a great road into Belgium that he might march his legions there and conquer the country. Eight hundred years afterward the armies of Charlemagne used that same road; and more than a thousand years after Charlemagne, Belgians and Germans and Franks were again struggling for its possession.

***Better Than the Romans***

Long after the architectural monuments of Rome had decayed or been buried; centuries after the Coliseum had become a ruin and the great aqueducts had fallen into hopeless disrepair; long after the empire of the Caesars had passed away, the Roman roads of France and Britain and Italy were in use precisely where the emperors had built them. For a great arterial highway, once built into the life and habits of a community, is almost certain to be preserved from generation to generation.

So it will doubtless be with the road system that America is now constructing. This generation is truly laying the ground plan of America for all the future.

The ancient Roman roads were built mainly by slaves and captives. Modern American roads are constructed under a system of special highway taxation that really amounts to a system of tolls.

In this year, 1926, something like $1,500,000,000 will be collected in the United States for the privilege of using these roads. Of course, the toll is not collected in quite so direct a form as this statement suggests; but the man who pays a tax of two, three, four or five cents a gallon on his gasoline, or buys a license plate, or pays for a driver's license, is just as truly paying tolls as if there were a tollgate and a collector at each end of the road.

The aggregate of these special taxes for the use of the roads reaches an amazing figure. Taxes on gasoline amounted to nearly $150,000,000 for 1925, and will go to nearer $250,000,000 for 1926. Then there was an item of $263,000,000 for licenses and motor car plates last year, which will be considerably increased this year.

State and local property taxes on automobiles were $150,000,000 last year, and will be much more this year. The Federal Government last year collected $143,000,000 in internal revenue taxes on motor cars and their accessories, which will not be much reduced this year. Finally, there are local taxes on buses, trucks, and various privileges, which will probably amount to $75,000,000 this year.

All these items will total about $1,000,000,000 for 1926, as against $750,000,000 for 1925. But this is not the final total. It is still necessary to add the corporation, income and property taxes derived from the oil and motor car industries; and when these are included the grand total of

$1,500,000,000 is seen to be a modest one. For 1925 the sum of all these items was $1,094,930,709.

Such is the enormous fund which people pay for the privilege of using our modern highways. It is more than the entire cost of the Federal Government before the World War; in fact, the 1926 figure will be nearly twice as much.

It is a curious fact that most people imagine the Federal Government, through its annual appropriation to assist in building roads, is largely bearing the burden of road construction. Last year the federal appropriation was approximately $100,000,000, or about nine per cent of the road bill. This current year the national contribution will be a much smaller proportion of the total.

The appropriation for the fiscal year 1927, which was signed by the President a short time ago, is $75,000,000; that is, about five per cent of the total that will be paid by the manufacturers, owners and drivers of motor cars, and the makers and users of gasoline, in special taxes.

Taking the period of ten years, 1918-1927, the federal appropriations for road building aggregate just about $600,000,000; but the special taxes in the last year of that period will easily amount to $1,500,000,000! The conclusion is that the federal contribution to road building is decidedly small as compared to that of the people who make and buy cars and gasoline.

Yet it is not to be assumed that the federal participation in highway building is unimportant. In the beginnings of federal aid, the National Government specified that a national system of rural roads be mapped out, and that the federal contribution to any given state must be matched, dollar for dollar, by the state's own contribution. Thus two things were accomplished. The states were required to be liberal toward roads, if they wanted the benefit of the National Government's liberality; and, perhaps even more important, a real national system, rather than a heterogeneity of state systems, was assured.

As the price of its contribution, the Government at Washington required that the road systems of the states should hook up together. Further, Uncle Sam assumed general authority over engineering and construction programs, assuring good results for the money spent.

There is still another important result of federal participation. It has brought about the construction of many bridges at strategic points. Some of these have been needed for many years, yet local authorities have been unable to provide them, partly because of the cost, partly because of competition between routes. Thus when a stream separates counties or states, it has frequently been impossible for them to agree where to build a bridge, or how to divide its cost. In such cases the Federal Bureau of Public Roads has many times mediated, settled the differences, and brought about construction.

On this latter point, the state of Missouri furnishes illustration. The Missouri River divides it east and west and because the counties on opposite sides of that vagarious stream have been constitutionally unable to agree about bridge construction, the two sections of the state have suffered much from limited communication. When the federal highway program was framed, it contemplated four bridges across the river within that state. Because of the federal leadership and contribution, it was finally made possible to construct them. Two are finished, the others soon will be, the national contribution being nearly half the cost.

(C) Ewing Galloway.

Typical of an unimproved road which becomes almost impassable after a rainstorm.

There is another case of the same sort at Memphis, Tennessee, where for generations better bridge facilities across the Mississippi have been needed. Tennessee and Arkansas were only brought to agreement, when the federal authorities intervened, and the bridge was assured.

The Federal Highway Act was passed only in 1921. Under its provisions, a nation-reaching system of about 200,000 miles was laid out, in the construction of which it was agreed that the Federal Government should participate. Making the map for that system was a terrific task, for everybody wanted his particular country road to be a part of it. But it was finally accomplished, and by the end of this year nearly all of these 200,000 miles will have been improved.

The system of special taxes on motor cars, gasoline, licenses for drivers, and the like, has grown up within a very few years. The gasoline tax was first imposed in 1919 in Oregon. As late as 1921 only a few states had it. Since then it has been adopted by all the states except Illinois, Massachusetts, New Jersey and New York.

(C) Ewing Galloway.

Typical of the modern improved road through a scenic wonderland (New York).

# America's Scattered Children

## More Than Halfway Across the Pacific Stretches Alaska, and Beyond That Are Thousands of Islands Where Its Flag Is Flying

By WILLIAM E. BARTON

JULIAN STREET, in a series of clever newspaper articles assembled about two years ago into a very readable volume entitled *Mysterious Japan*, tells how, having sailed from Vancouver as long on the Pacific as would have set him across the Atlantic, and with Yokohama still a week away, he was surprised when his Japanese steward invited him to look out of his porthole and see land.

Land was undeniably in sight on the starboard side, and Mr. Street remarked that the steward must be glad thus to get his first returning glimpse of his home land. But the steward said that this land, a week away and more from the coast of the United States, belonged not to Japan, but to the United States. It was, he said, a part of Araska, which was 'American land.'

'Araska' was, of course, Alaska, and the incident was a reminder that the United States stretches more than halfway across the north end of the Pacific in a long peninsula which spatters out into islands.

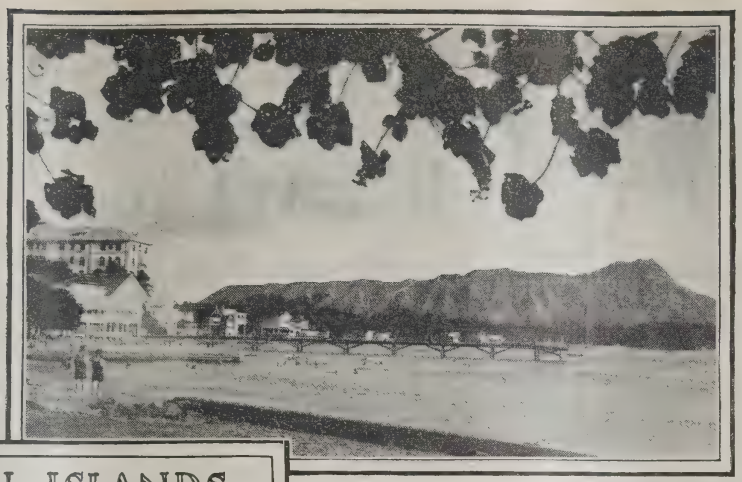
I did not sail by the northern route, yet I had more or less experience of islands. The United States owns 7,083 islands belonging to the Philippine archipelago alone. How many islands belong to Alaska I do not know, but the maps show them stretching from 163° West to 172° East longitude, and it is a long, long way to Wrangel Island from any point on the continent where most of the United States is to be found, and the map is well flyspecked with little islands, besides a good many large and medium-sized ones extending beyond the Alaskan peninsula.

In the Atlantic, besides such islands as lie in close proximity to the mainland, and which have been from the beginning a part of our nation, all the way from Maine to the Florida Keys and along the Gulf Coast, we own Porto Rico, and with it a group of islands which includes Vieques, which has 100 square miles; Culebra, 30 square miles; Mona, 20 square miles, and several islets.

In the Atlantic, also, we own the Virgin Islands, purchased in 1917 from Denmark. They lie about fifty miles from Porto Rico, and are three in number, St. Croix, St. Thomas and St. John. They have a total area of 142 square miles and a population of 32,000. They are said not to be doing very well financially since the coming of prohibition for the reason that ships from the United States now prefer to stop at other ports in the West Indies.

To return to the Pacific, the Stars and Stripes float over a number of other islands. There is the island of Yap, of which some readers will have a dim recollection, our sole territorial inheritance from the World War, and important to us on account of certain cable connections. Find it on the map if you can. And while you are discovering it, look for Wake Island, which we have owned since 1899, together with Johnston, Palmyra and Medway. Then, there is our part of the Samoan group, with a magnificent harbor at Pago Pago which we acquired in 1900; and there is Guam, largest of the Ladrone Islands in the North Pacific, an island of 210 square miles, lying 1,500 miles east of Manila. Uncle Sam has been doing quite a business in islands since the war with Spain.

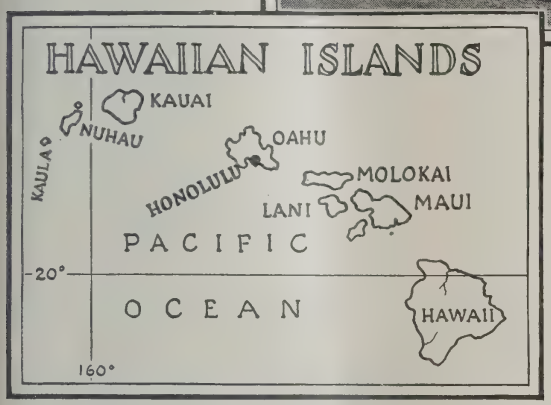
President Grant wanted to purchase San Domingo and the country would not accept his suggestion; we did not want any more islands than the Lord gave us when we acquired the United States. But now see what we have: islands, islands, islands, in oceans to the east and the west.



(C) *Ewing Galloway*

Havana, Cuba, showing its principal thoroughfare and Morro Castle in the distance.

We do not exactly have Cuba. She has her independence, and I wish I felt sure that she knew what to do with it. In 1848, President James Polk wanted to buy Cuba for $1,000,000, but the American people would not permit it. Cuba would have been slave territory, and we had enough of that, or thought we had, with what the Mexican War had just brought to us. So we let our opportunity g



past to buy Cuba, and later she cost us much more than that, and still we do not own her.

In the brief period during which we held Cuba after the war with Spain, the United States spent more than ten millions in schoolhouses and their equipment, and at one time sent one thousand Cuban teachers to the Harvard summer school, besides sending hundreds of others to other schools in the United States. We hauled down our flag as we said we would, and set Cuba free.

(C) *Ewing Galloway*

Waikiki Beach, Moana Hotel and Diamond Head, Honolulu, Hawaii.

The Platt Amendment to the article by which we withdrew from Cuba provided that the United States might at any time intervene to provide a stable government or to protect American lives and property, but established no protectorate over Cuba.

Cuba is prohibited from making any treaty with any foreign power that might endanger her own independence, and the United States has the right to use Cuba's naval stations. Cuba was finely loyal to the United States during the World War, using her small fleet to police the Gulf of Mexico, drafting soldiers for the army, and assisting in the sale of Liberty bonds.

But Cuba is a problem. Graft is rife there, and it is profitable in high places. The Government lottery is a source of revenue to high officials, and a new lottery law was passed on August 1, 1923.

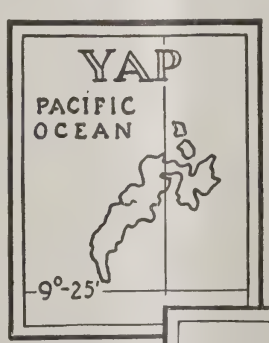
There are good docks in Havana Harbor, but our ships did not go to dock. There is a clique of lightermen who are said to have a profitable arrangement with Government officials making it unprofitable for ships to dock. Freight is mostly landed in lighters at additional cost to shipper and consumer, and passengers take small steamboats at a point about where the *Maine* went down and waste a half-hour at each end of their trip.

The first people to welcome an American ship in the harbor at Havana, other than the pilot and the port doctor, are the rum boats, which come alongside with liquor for sale, a wholly needless courtesy, considering that our ship flies the British flag and has plenty of liquor on board for all the passengers who care for it, and that there is liquor also on shore where open house is kept.

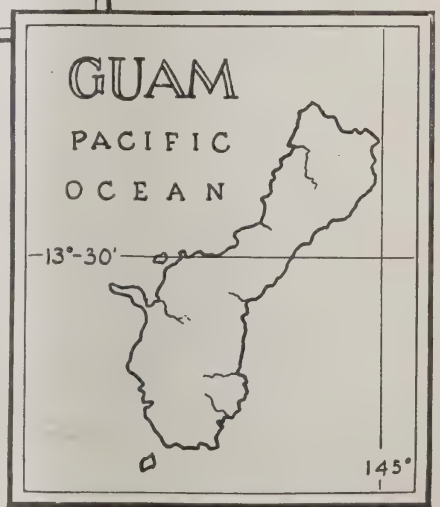
But these enterprising boatmen, who are said to pay to the harbor commissioners or other officials a good high price for the privilege, welcome the coming and cling to the parting guest with insistent solicitude for his thirst present and prospective.

I wish I could say that they were not patronized by the passengers. Their sales so far as I noticed were not large, but they did more business than was good for some of our passengers, and there were members of the crew who did not get ashore, and who did a porthole-business to their subsequent sorrow; for some of them were drunk on the vile stuff, and had to go to the chain gang where the ship's hard and dirty work is done and credits for good conduct are lost.

Cuba is so near us, and was so recently under direct government of the United States, and is still so nearly under our control, that she is not likely to go far beyond bounds, but one hears sighs for the days of General Wood, and some part of this lamentation may be judged to be sincere.



Havana is growing and is becoming an American city. The growth is not simply in size but in real beauty. While some of our American towns in Florida and California are affecting the Spanish type of architecture, Havana is doing the other sort of thing, and trying to be like America. Thus far there is less of bad taste evident in Havana than in the towns in the United States, and there is good hope that they will not overdo the work of Americanization in their building.



Politically Cuba is independent, but geographically and in her sympathies, to say nothing of her commercial hopes, she is bound to us by strong bonds which we shall do well to strengthen. The more free Cuba is, the more is she ours. We do not want to own her, but we greatly want to retain her affection, gratitude and confidence. We have it now. May we hold it ever.

The Canal Zone is to all intents and purposes another island. It is bounded on two sides by oceans and on the other two by foreign territory. Though only a strip of paint in the middle of a street separates the United States from the Republic of Panama, that strip is to be crossed with a degree of respect.

What one sees at Panama gives one great pride in the possibility of American control of detached portions of territory. If there is graft or inefficiency at Panama, the fact does not stare one in the face, and I neither saw it nor heard any credible rumor of it. The people are clean, well fed, healthy and well gov-

# 'Bad English' Is a Heritage From Olden Times

## Much of the Grammar Now Classed as Incorrect Has Come Down to Us by Word of Mouth From the Time of Chaucer and Before

By CHARLES D. CAMERON

A CLASS of tired children was writhing under its daily torture of 'grammar drill.' The now happily abandoned method of Lindley Murray was in use. This was an attempt to teach correct English by showing examples of incorrect English for the children to amend. They did not know that the ponderous Murray had declared, 'proper selection of faulty composition is more instructive to the young grammarian, than any rules and examples of propriety that can be given'—but they knew the results of this and other Murrayisms by enduring them.

The fretfulness and weariness of the class could not remain unseen by the teacher. She did not abjure Murrayism, but made a new application of it. She directed that each child in the first row might give orally an 'incorrect' sentence, which would be corrected by the child opposite, in the second row. Then the third row children were to correct ungrammatical sentences devised by the tots in the second row.

The children in the first row proceeded to utter their inmost falsities of syntax, blithely, with unholy zest! In the spirit of a game or of the United States Senate, the sentence uttered by the first-row child was 'paired' by correction of the child in the second row—until Seth Thompson was called upon.

'I ain't got no pencil,' dutifully said the first-row boy, smiling at the teacher and then at Seth Thompson. And Seth, halting for a moment as if among many opinions, offered the substitute:

'I HAIN'T got no pencil!'

This memory of school days is revived by almost every mention of questions of English usage, or the past, the present and the future of the incomparable language.

Defense of grammarians and their authority is offered by Dr. Ralcy Husted Bell in his book, *The Changing Values of English Speech.* He declares, in the course of his reply, that when Shakespeare said, 'Silence is the perfectest herald of joy,' he 'meant and virtually said "the herald of joy *nearest* perfect."'

In the name of Lindley Murray, Seth Thompson and all other corrective grammarians, let it be remarked that what Dr. Bell meant and virtually said was 'the herald of joy *most nearly* perfect.' He did what Seth Thompson might have done. He broke grammar while discussing grammar—he used an adjective for an adverb.

We users of English belong to the Germanic family of languages, and in most of these the adverb and the adjective have the same form. Old English or 'Anglo-Saxon' had this sameness of form. The living speech of English, outside the ordinary influence of written English, retains this antique Saxonism. It seems almost normal for a child to say with spirit, 'I went to school quick and got my lessons good.' This indeed is 'incorrect'—it is 'bad English'—but it is English indeed, ancient as the race—a living link of surviving form between the readers of Alfred the Great and those of Alfred Tennyson.

The secret of the continuance of what we call 'bad English' is that it has life in it, the souls of ancient warriors, the high emotion of men and women, the blood of people whose flesh and spirit were both real.

Much of the 'bad grammar' of today is a vestige of the good grammar of a former age, like certain crude superstitions which abide as remnants of a former religion. A professor lost in the woods might be a savage for a day, might kill a bird with a club and eat the flesh raw, and try to shelter himself under two or three head logs piled up into the worst-made of wigwams. So the professor, lapsing from purism in carelessness or by emotion, may drop back to Chaucer with double negatives or back to King Alfred by using an adjective for an adverb.

The time has surely come, in the advancing study of English, for those who love this language to learn more of the almost indestructible elements of bad English which accompany good English into all parts of the world.

Here we are not referring to real slang, though this name is often given to words and expressions which are not slang at all. Real slang is low speech, vicious dialect, usually of base or criminal origin, as short-lived and insignificant as the career of a burglar. Slang is like profanity, not so much language as a substitute for language.

At the other extreme of speech is purism or grammatical preciousness, which is language that once lived and is frozen. But between the low wallows of slang and the sterile peaks of purism there are the middle uplands of living English, and here two tongues, good English or received English and bad English or incorrect grammar, strangely coexist, and at times intermingle in classrooms or in the works of learned men.

Everything that belongs to English in either of these forms is worthy of study; the speech of characters like the best of Dickens and of Ring W. Lardner, as well as the actual written language of Henry James.

Bad English as incorrect English is not to be defended. We owe it to others to make ourselves understood, and we can do this only by observance of the customs of speech.

Seth Thompson's double negative and Professor Ralcy Husted Bell's use of an adjective for an adverb are correct English of (Concluded on page 28)

# MR. FORD'S PAGE

THE rise of public interest and its decline into indifference offers a problem to those who desire to know by what methods the public mind works. At one time, indeed in some things at all times, there is complaint that the public interest has been engaged by the wrong things, and at other times there is equal complaint that the public has grown indifferent to matters that ought to command its deepest attention.

One may study the conditions without any theory at all and simply observe the facts; one may begin with a theory that the public instinct is right; or one may entertain the opposite theory that the public is helpless until a few wise men lead it around. The theory most inclined to here is that the public instinct may be trusted, and that no temporary turn should ever be interpreted as the final position which the public will occupy.

Public interest, we may say, always exists; it is only with reference to certain objects that we may say that public indifference exists. When wells run dry, the public deserts them. The instincts of the people warn them away from exhausted sources. It may seem rather hard on those whose interest it is to keep the public coming to those wells, but private interest is one thing and public benefit another and more important matter.

Sometimes the wells from which the public turns away are not dry, but the mechanism which lifts the water has broken down or proved insufficient, or the barriers placed in the way of people wishing to get the water have proved too burdensome to surmount. In this connection, one thinks of religion as an example.

There is no generation of our people accessible to us by their contemporary literature that has not lamented the religious indifference of the people. This indifference has had many manifestations. In our own day it has a manifestation all its own. But it has always had its periods when it existed. These were not the worst times, either. It seems that the interest and energy withdrawn from one channel of activity usually finds its way into other channels. Thus a financial authority states that the United States has never had any total hard times; he says that even in the worst times some lines of business enjoy prosperity, or some parts of the country are getting along nicely; the stoppage is never total or nearly so. It is true in the economic world as in the natural world, the sun is shining somewhere.

Now, the analogy seems to run throughout life—the sun is always shining somewhere. If the people seem for the time indifferent to theology, they are certainly not indifferent to sociology or those things which make for justice among men. The seesaw of human experience is very evident in this. Times of theological interest have not been notable for advances in economic justice; times of economic interest have not been notable for theological advance. According to temperament there is a temptation in theological times to decry the economic, and in times of economic interest to decry theology. Because we do not see life as a whole, because we do not know how natural the divine law is, because we do not know that human relations are an inseparable part of religious truth, we simply fall into pessimism on one side or the other.

*PUBLIC indifference does not exist; there is only a transfer of public interest. When the wells of use or inspiration run dry, they are deserted, but that does not mean that the need for water is less keenly felt. The people decline to be interested in what does not meet their need, and their indifference is as significant as their interest. Human experience is a seesaw, now negative, now positive; now rest, now action; now material interest, now ideal interest; in this way all the elements of life are drawn into the act of living. The pendulum swings, but comes back. Vital interest of the mind remains; its objects are found and deserted and found again, in turn.*

But Truth remains and it is for us to discover it. When certain formulas into which the truth is cast become trite and non-nourishing to life, they are deserted like dried-up wells. But such desertion does not mean that thereby the resort to water has ceased, or the need for water has ceased, or the cleansing and thirst-quenching properties of water have changed. One drinks and goes on with work. It is the work that counts after all. The worth of water is in the work it makes possible.

Following this apparent rule of life a little further, it must be evident that we are not through with religion or theology. Whatever it has of life-giving quality, or of correction of vision, or stimulus of inspiration, will be needed when the inspiration now in use begins to slacken. The seesaw will still be in operation. We are never through with any great source of enlightenment. Those who represent the religious faculty have work in the interim. They should be making the fountains more accessible. That is, they should be making their special truth more easily interpretable.

Men go from refreshment to labor, from labor to refreshment; from contemplation to action, from action to contemplation; from theology to sociology, and back again and return. It is the ceaseless swinging of the pendulum of vital human interest. Yet people bemoan themselves when the pendulum leaves their special quarter and talk dolefully about the increase in public indifference. But the force of vital interest always remains the same; it focuses on one matter at one time, on another at another, according to the needs of human nature.

## *Another Way*

DISILLUSIONMENT is profitable when it arrives in the course of honest search. There is no question about our nation desiring peace, not only for herself but for the world. We have gone to greater lengths than any people in the world to prove that desire. Our attitude toward the League of Nations is one of the strongest evidences of our determination to have peace if it is at all possible. We have remitted more debts, sunk more armament, reduced to greater extremity of weakness our army, than any other nation on the globe. If the extent of our destruction of costly naval material were known to our people—if they could visualize it—a convulsion of public feeling would ensue. We have promoted disarmament conferences and have been the first to put into practice, by way of example, the kind of thing which we suggested to others.

The world now frankly tells us that it does not want to disarm. It tells that to the only nation that is practically disarmed today. The world now tells us that the promises made at the Washington Reduction of Armament Conference are somewhat too impractical to keep. (Yet we have kept our promises made there!) At Geneva, the nations assembled to continue the work begun at Washington preferred to talk about everything else than the business in hand.

That is the disillusionment. It may be treated in either of two ways. You may ridicule American negotiators as babes in the woods for being deceived by the methods of the more experienced diplomats of Europe. You may stigmatize them as traitors for destroying the defenses of the United States at the suggestion of its potential enemies. Or, you may take the position that, after all, it was right that we should strive for peace; it was right that we should show by example that we had the moral courage to practice our own preaching. But, however you regard it, the total effect on this nation must be one of disillusionment. Peace is desirable; peace may be possible; but this one thing we have learned: we have been going the wrong way to obtain it.

Never in the history of the world has the talk of peace been so rife, yet there has never been so imminent a possibility of war. Even in the days previous to 1914, when the talk was predominantly of war, war was not so really possible as it is now. People in America especially are greatly deceived as to the present state of the world. Perhaps it is just as well. But the greater duty devolves upon statesmen who know, to guard the welfare of this country. Our first line of defense is to prevent our own entanglement in quarrels. Our resistance to the weight of the whole world organized to draw us in, gives hope that we are wise enough and strong enough to stay out. America, another termagant among the haggling fishwives of the world, would not be America. Good fortune, if not always good sense, has kept us out; the people themselves are now consciously and rationally for staying out. Our second line of defense is that measure of the physical appurtenances of self-respect which will give the irrational enemy pause in his thought against us. That is, we determine to keep ourselves out of trouble with others, and we determine to keep others out of trouble with us—discouraging these latter by every means that they can understand. That is the quality of our pacifism.

But we have been trying another way, and, rudely jolted, we are discovering it is the wrong way. The world deals in weasel words, war as a trade is not yet obsolete. The nations agreed with us while we were disarming; they agreed with us until it came their time to disarm; then they said they had reconsidered it. And while we were in this condition, they began the greatest organized attack of world opinion against us that any American generation has seen. These are the things we have learned from Geneva, and London, and Paris.

Not that we desire peace less than formerly; not that we believe less that peace is possible. We shall have peace; but we shall learn the way by which it is obtained. Peace is a strong man; we have been seeking Peace among the weakly and sentimental. No wonder we missed it.

---

## *Women and the Ballot*

TO INTERPRET the defeat of Mrs. Ferguson as a slap at women in politics would be both unfair and ungallant. It was not, indeed, a slap at women at all, but at a man. Jim Ferguson was the real target of the voters of Texas, and that his wife suffered the flip of the blow was of her own choosing. She was a candidate for reëlection, not on her own record, but on her husband's. She sought to vindicate *his* acts, not her own. Jim Ferguson was the person repudiated.

The charge that women are a complete failure in politics is, to say the very least, pre-

mature. Good judgment would not venture such an opinion. It is true that woman suffrage has not brought about all the reforms its enthused proponents promised. That was to be expected. Where it served only to increase the percentage of foreign-born voters (as in the large cities), immediate beneficial results could not be looked for. But out through the country where the population is American, the effect has been marked. Those states in which women have had the ballot longest are generally credited as having the cleanest governments.

The machinery of the ballot is still new to women. They do not fully understand its uses. Where men have had the vote for years, women have had it for months. The general apathy of American citizens toward the ballot affects them as well as it does men. The hope inspired when the ballot was given to women should not be relinquished too soon. The common sense of the American woman may be expected to surmount all obstacles to a registry of her will for the nation.

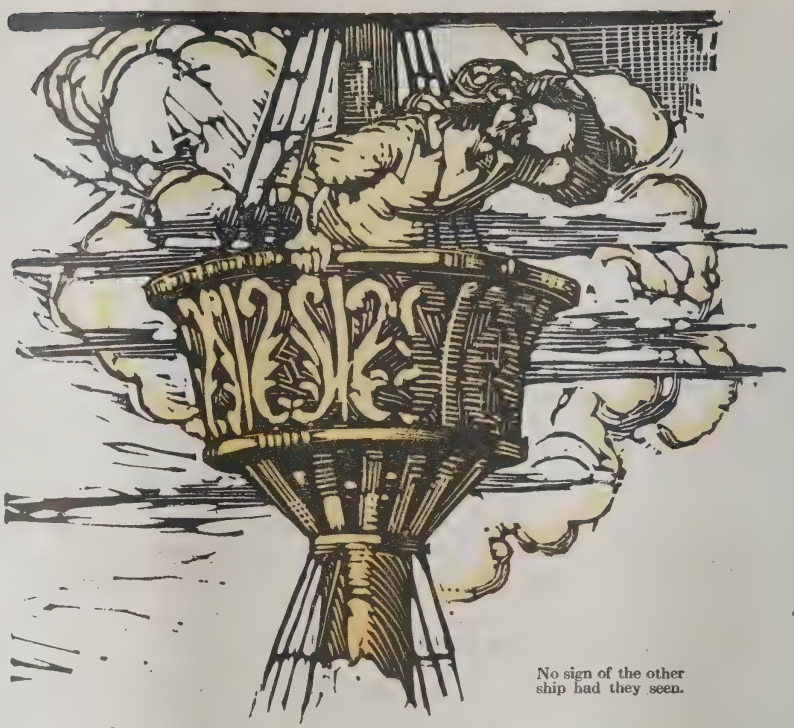
## *The Passing of the Poorhouse*

THE poorhouse, uneconomic, degrading, is doomed to go. It has outlived its era. The Bureau of Labor recommends centralized homes for the aged and the unfortunate, but even this is but a modification of the poorhouse, and probably will give place to another suggestion. The poorhouse, in all its phases, must go. It was degrading; there is no doubt of that. Too many scenes of desolate tragedy were enacted within its barren walls.

For generations the poorhouse was a symbol. The road to the poorhouse! How often the phrase appeared in the speech, thoughts, and writings of our forbears. Hard work—that was supposed to be the antidote; and it was dinned constantly into the minds of youth.

But we are living in an easier age. A different blood has come into the land, a blood which thinks it no disgrace to live off one's townsmen. Perhaps the Puritans and their first descendants took life too seriously, too grimly, put too high a value on independence, maintained too high a degree of self-respect. Perhaps it is better to have this shadow of 'Puritanism' removed. To have the race know that, however life may be wasted, a comfortable, easy home is provided by the 'State,' which means 'the Taxes taken from Citizens' who did not desire that either a poorhouse or a county home should be their goal. And yet—passing by the 'poorhouse' palaces with their fine gardens, wide lawns, herds of registered dairy cattle, and all the luxury of situation that only great public wealth can command, one wonders whether, after all, poverty has not become a rather profitable profession among us.

## *Corn!*



COMMON corn goes into a total of 146 commodities, such as axle grease, shaving soap, shoehorns, varnish, chair cushions, gunpowder, face powder and incense. Aside from these there is a market which if developed could take care of one hundred million bushels, or possibly more, of each crop of this yellow product, which is now taking the place of wheat as the staff of life: namely, the manufacture of sugar from corn. More than eight billion pounds of sugar are imported into the United States each year, and our total native production of cane and beet sugar is only a little more than two billion pounds—so that the market is undoubted. The American people are the greatest of all sugar eaters. In 1924 more than sixteen billion pounds, or 148 pounds per capita, were consumed here.

A bushel of corn can be made to yield twenty-five pounds of sugar. On that basis, if eight billion pounds of corn sugar were to be manufactured, which is the figure for our annual imports of the commodity, 320,000,000 bushels of corn would find a new market. Should only 100,000,000 bushels be converted into sugar, far more than the annual corn surplus would be taken care of and American products would be grown, sold, and consumed under American conditions.

But this is only one angle of the possibilities that await the farm—it is only one part of the food angle, and farming is destined to have more than the food angle before many years.

## *On the Way*

THE Distillers' Company of Great Britain complains dolefully that high taxes are destroying the whisky-making industry, and points to 12 million odd gallons in 1925 as against 28 million in 1916. The power to tax is the power to destroy is an axiom, and this power inheres in the lawmaking prerogative of the people. Thus it would seem that the Government of Great Britain has started along the same road which has led the American people to prohibition. It would appear that taxation is itself a partial prohibition, and that more taxation means a greater degree of prohibition, and that the same power to place a prohibitive tax may also draft a prohibitive law. The tax is for revenue, which is a necessity of the state. But there are other state necessities besides revenue; there is, for instance, the necessity of doing away with commodities that harm health and destroy public tranquillity and corrupt political processes and waste the public funds. No amount of revenue from these things can equalize the harm they do. In the meantime the distillers complain that prohibition in Britain has increased 60 per cent in ten years.

No sign of the other ship had they seen.

# The Voyage of the Victoria

## THE PASSAGE OF THE STRAIT

*Ninth of a Series*

BY CHARLES J. FINGER

WOODCUTS BY PAUL HONORÉ

THE fleet left Santa Cruz on October 18, 1520, and three days later they rounded a long, low bluff; 'and there we saw an opening like a bay,' writes the pilot Alba.

Following Magellan's course, I saw the guardian cape of the straits, that long, low bluff called Cape Virgins, but through a veil of mist, and the land behind it looked unsubstantial. When the mist cleared, it was gray and forbidding, a plain destitute of trees. There were three of us in the little cutter, and seeing the unpromising look of the weather, a sullen sunset with low, solid clouds, we slid across 'the opening like a bay' on a southwest course, and presently dropped anchor in shallow water in the lee of Catherine's Point. We did exactly what Magellan had done in similar weather conditions.

From where we lay, the Patagonian shore was almost indistinguishable from horizon cloud. Southward was the low-lying land of Tierra del Fuego, a drab picture with its long line of cliffs looking as if they were mud-plastered; the stretch of yellow-white sand fringed with a jetson of crooked tree trunks tangled with seaweed as though a careless giant had strewn things; the leaden slow sea with its long lines of snaky, slimy brown kelp. All about us was a brooding, threatening tranquillity, though beyond the shelter of the point we could see uneasy water and the heavy, heaving rollers.

At sundown the wind rose, and all night we heard the moan and buffet of the rising sea. When tide and wind fought, there was a turmoil of water in the bay. Taken altogether it seemed to be as unpromising a place as could be imagined, and it came upon me that the first sight of the strait could have inspired very little enthusiasm in Magellan's sailors, whatever ecstasy filled the heart of the captain-general.

Magellan's first act was to send Serrao in the *Concepcion*, and Mesquita in the *San Antonio*, to explore, limiting them to a five-day voyage, at the end of which they were to report. Meanwhile, the *Trinidad* and the *Victoria* stayed at anchor in Lomas Bay as affording the best shelter from the southeast wind.

The two scouting ships would have passed the first narrows, or Angostura de la Esperanza, as they named it, going easily enough on the drift of the tide, for it is a gut about ten miles long and less than three miles wide, and at ebb and flow the tide runs swiftly, making eight knots or so an hour. Between tides the water is easy enough. Indeed, I knew a case in which an outlaw, a Scot, being pursued in Tierra del Fuego, and hard pressed, paddled across in a packing case, using a little board by way of oar. I mention that by way of getting a true conception of things as they are, because the danger of navigation in the straits has been sadly exaggerated.

The drift of the tide swept the two ships into Santiago Bay where is a good enough anchorage, and there they rode out a half gale. They were then just west of the point where, in 1580, Sarmiento proposed to build a fort and perhaps stretch a chain to prevent the passage of the rascally English pirates, as they called Drake and his seamen. Meanwhile, the two ships in Lomas Bay lifted anchor and rode out the storm.

The next day broke fair, and the two scouting ships continued the cruise, dropping down the second narrows, rounding Cape St. Vincent, as Sarmiento afterward named it, and sailing south until they came to Dawson Island whence they could see the sweeping opening into Tierra del Fuego which is now known as Useless Bay. Due south appeared the gray head of Mount Sarmiento. They had then sailed the straits for more than a hundred miles, shaping a course that was almost a quarter of a circle, and were headed due south.

Though there were no signs of an open sea, yet the ebb and flow of the tide, the sighting of a whale, and the depth of the soundings taught them that they were in no *cul de sac*, so wind and tide serving, they retraced their course and safely joined the two ships in Lomas Bay. 'We united our shouts to theirs,' writes Pigafetta, 'and thanking God and the Blessed Virgin Mary, resumed our journey' after agreeing upon El Canal de Todas los Santos (The Channel of all the Saints) as a proper name for the straits.

The four ships then entered the straits. By Alba's diary, they anchored on October 28, at an island. That must have been Elizabeth Island, southwest of the second narrows, a pear-shaped island about eight miles long and three broad at its widest, with an excellent anchorage at Cape Silvestre, sandy bottom and seven fathoms of water. It was there I built myself a little cabin and stayed for eight months.

Much has been said about the slowness of Magellan's passage through

the strait. But it has always seemed to me that it was due to the meticulous care with which he examined the land for possible openings. For instance, suppose that he expected to find an opening westward from where he lay at anchor, he would not have overlooked the bay Santa de Gracia. A boat entering that would find a good harbor, but opening into it a channel, and beyond that again a considerable gulf that actually comes within a few miles of touching a great inland bay opening by a narrow channel into the Pacific.

Or he might have looked eastward from his anchorage to see another opening, half hidden by an island, that Gente Grande Bay which Sarmiento afterward explored. For we must bear in mind that so far as the explorers knew, Tierra del Fuego, the land on the south, stretched away indefinitely.

There were one or two little land expeditions, but of no importance. The suspicion constantly intrudes that the mariners were terribly afraid of what the land might hold. On one such expedition the men returned and told a wonderful tale of having seen a building 'containing more than two hundred graves of giants.' It is idle to speculate upon that. It may have been sheer brute lying, or else the historian Herrera was possessed of a romancing imagination, and had an eye on popularity.

We have a hint in the Journal of Columbus that stay-at-homes looked for tales of wonder from adventurers, and he bluntly refused to please those agog for a new excitement, saying that in his travels he had 'not observed any great diversity in the appearance of the inhabitants' in foreign countries, nor had he 'found any people of monstrous appearance.' What the boat's crew possibly saw was the death place of a *guanaco* herd, for San Gregorio range, where the crew landed, has been a grazing place for ages.

The record of the passage of the straits is sketchy, and descriptions are vague. Neither Magellan nor any with him had any idea that they were sailing among the islands of an archipelago and that there were at least four separate passages by which the Pacific could be gained. So Magellan stayed at Elizabeth Island and sent two ships forward, the *Concepcion* and the *San Antonio*. But before the parting, a council was held on the island. I chose to flatter myself that my shanty stood where that meeting took place, for I found the hilt of an old Spanish sword there. Still both Drake and Sarmiento were there afterward.

At that conference Magellan consulted with his officers as to the advisability of pushing on through the straits or of returning to Spain and reporting the discovery. Estevan Gomez, formerly of the *Trinidad* as pilot, but at that time pilot on board the *San Antonio*, a Portuguese, was the one outspoken man who objected. The strait had been discovered, he held, therefore

Estevan Gomez was the one outspoken man who objected to pushing on through the straits.

it was their duty to sail home and report, returning with a newly equipped fleet to continue the search if the king so decided. But Magellan's consultation was more of an opportunity to declare himself than it was a conference. He would stand for no opposition. In fact, he would make malevolent effort against it. So he issued an order to the effect that it would mean death to any who as much as discussed the difficulty of the voyage. He would go on and on, in spite of all, though men were reduced by starvation to eating the leather on the rigging. After that, whatever denunciations or objections Estevan Gomez had, he kept to himself.*

The four ships sailed south, down Broad Reach, then parted, the *Concepcion* and the *San Antonio* taking the passage east of Dawson Island, the *Trinidad* and the *Victoria* following the channel that ran in a northwesterly direction, skirting Brunswick Peninsula, until they came to what they named the River of Sardines, an unidentified place which was probably Rio Honda. From there they might have sent a boat almost directly south and so come into the Pacific by the channel between Santa Inez Island and Clarence Island. The route, though possible, is not direct.

The channel ahead ran narrow because of islands, so Magellan anchored and sent out boats. The scouting party found that the channel split, one running up into the inland sea, now known as Otway water, the other passage heading northwest. Up that the scouting party went for fifty miles and so came to the wide water between Desolation Island and Archipelago del Cabo Deseado. It was enough. The way to the ocean had been found. Another fifty miles would have taken them to Cape Pillar, the western extremity of the strait, but the boat's crew could not have gone so far as that and returned in three days, as they did. Anyway, they had indubitable evidence of open sea after they had passed the strait leading to Xaultegua gulf, so they returned and reported, and salvos were fired and 'men wept for joy.'

Despair died then, and men were full of hopes and fancies. Freshness and courage was within them. Life was full and free once more, and the world very beautiful, for ahead were hopes and possibilities. They found themselves, Herrera tells us, 'in the most beautiful country in the world,' and, I would add, one of the healthiest; for the year was well advanced into the *(Concluded on page 23)*

*Gomez was the first to try to find a northwest passage, and in 1525, examined the North American coast from Florida to Cape Breton, conducting his expedition exceedingly well.

# *No Longer Like the Turks,* Women of Mexico Awake

## and Claim That Freedom Which Their American Sisters Enjoy

*By*
HELEN BOWYER

BEFORE the Revolution brought the potential freedom which they are now beginning to exploit, the position of women in Mexico was Oriental. There, as in China, in India, in old Turkey, there were a few women who had liberated themselves, who had done things, who had lived their own lives—some with the glamour of romance and success, more with the tragedy of loneliness and even social ostracism. But for the overwhelming majority of the girl babies born in the Republic, there was only one career ahead—that of sex-slave.

In the upper and middle classes, this slavery was dignified by marriage. That is to say, regularly it was, for of course the *casa chica*, the 'little house,' might be the fate of the *senorita* of *familia distinguida* as well as of the girl of humbler rank. But for the women of the masses, for the daughters of the twelve million Indians and Indian-mestizos, there was nothing to dignify the abyss of animalism into which adolescence plunged them—there was neither law nor Church nor honor nor faithfulness nor protection for the children to be born.

Until about seventy years ago 'the Law of the Reform' struck the first great blow at its temporal power, the Church controlled marriage in Mexico, and it made the price of it so prohibitive that the masses simply put it out of their heads.

In its awakening, in its new bid to be the savior of the *patria*, the Church is urging marriage on the people, is offering it gratis, is commanding them to come and receive its sanction to their *de facto* unions. It will have a serious time deciding which are the *de facto* ones—which women in each little isolated village or each city parish belong to which men. The claims of the children will help little for the two or three living to each mother as well as the three or four dead may each have had a different father. But if the Church will persist, if it will go into the thing intelligently and energetically, it may make of the marriage rite a means of immeasurable uplift to the 'low people.' It may make of it a means for their education in conjugal honor, in a man's responsibility for the children he fathers and the right of the children to a clean heredity.

It will be slow work. It will be the work of creating conceptions which have been utterly lost. And it will succeed only to the extent that the upper-class women throw themselves into it.

For the Indian woman is even more impassive than her man. On her horizon there looms nothing more than has always loomed, poverty, illness, slavery to conditions and slavery to him—these and the brief crude joys of youth and passion and the compensation of her motherhood. She knows there are other things in life. She has seen them in the 'big house' of the *hacienda*, she has heard of them in the cities.

But these other things are only for the *gente decente*, the 'nice people'—it has not dawned on her imagination that they might be for her, too. The new Constitution expressly recognizes on paper, her rôle of motherhood and surrounds it with many safeguards. But she does not even know that this Constitution exists. She squats beside a smoldering fire built among a clutter of stones on the dirt floor of her hut, patting tortillas for the man who is hers for the moment and for the baby swinging in his dirty hammock. She will not look forward till someone takes the inert depths of her animal maternity and transforms it into human motherhood.

Those on whom the task devolves, the women of the upper classes, have had, in the main, a background which but poorly prepares them for the undertaking. But those who can come out of that background as leaders will come with the power of those who have already overcome much.

The girl of the 'low people,' though born to sex slavery, is reasonably free till her first lover claims her. There is no possibility of harem care of her childhood. She grows up in a home and

Above—Mexican children of the *gente decente* as their fine clothes would indicate.—*International Newsreel.*

Left—Half-starved children of a poverty-stricken Indian family of Mexico. These boys and girls revere their mothers even more, perhaps, than in the upper classes.—*Keystone View.*

a community in which not the most elementary privacy is observed; she goes to all the dances, bullfights and other *fiestas*—all the range of life there is, is open to her eyes. But the little daughter of the 'decent people' is the victim from the cradle of a conspiracy to keep her innocent of all knowledge of and all contact with the world except that which will make her pleasing in the eyes of the man to whom, in due course, her parents will marry her.

The first thing, naturally, that he will demand is that she come to him pure. But in Mexico purity cannot be taken for granted. It is not supposed to exist except in the upper classes, and it is not supposed to exist there unless a girl has been rigidly segregated from men and boys and vigilantly chaperoned every minute of her life. It is not that the prospective suitor will so much distrust the frailty of women as he will be quite sure of the propensities of man. He knows what his own attitude would be toward a girl whom no one was guarding—and why should he suppose her safer with any other male?

So the little girl goes to a convent school, escorted there and back by one or the other of her parents or by some very highly trusted servant. Here she learns religion and manners and morals, music, embroidery and French. Here she meets other girls of her own social circle and she goes to their 'saint's days' and other festivities and they come to hers. Except under the most formal circumstances, she meets no boys but her own brothers and no men but those of her own family.

These, however, her father, her grandfather, her brothers, she learns to revere, to idolize, to serve as she will the husband to whom she is looking forward. She learns also to cajole and deceive and otherwise manage them to the limited extent to which she may hope to manage him. She learns every little endearing grace that is supposed to charm a man in his lighter and more amorous moments, for this is the utmost she can expect to do. Companionship of the mind her future lord will not ask—will not desire—of her. These he will get from other men and a few other women. Partnership, even, of the kind that French women give their husbands, he will not wish—the less interest she shows in his business and in his finances, the better he will be pleased. But all these things she learns early, or rather she grows up in them, not dreaming that conditions might be different.

She enters marriage, therefore, without any vain expectations. She does not, for one thing, expect her husband to be faithful to his marriage vows. Already, in her little girlhood, the *casa chica* has cast its shadow over her life. Already she knows that her idolized father has a mistress and a son and daughter in a 'little house' of which, in public, her mother keeps up a brave show of being unaware. Nobody else makes any such show. The servants know of it—they do errands to the other house. Her brothers speak of it. Why not?—they are in line for *casas chicas* of their own. And she does not dream of criticizing her father. It is the way men are—it will be the way of the man she marries. There will be a *casa chica* in her life, too.

It is easier, of course, when the other woman comes of a humbler class. Especially is it easier financially. For, unlike the peon, the upper-class Mexican assumes the support of his natural children and if his mistress is of decent family, as not infrequently she is, he is under social obligation to rear the offspring accordingly. In that case he takes them about with him quite openly and his wife may come across him in shop or boulevard with a charming boy or girl hanging on his arm and talking eagerly and adoringly to *papa*.

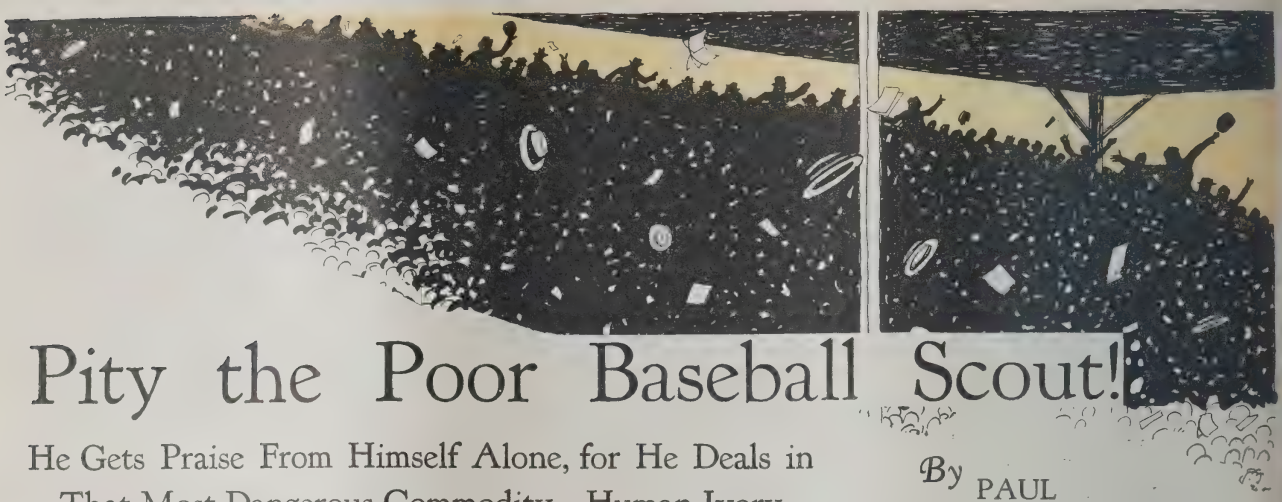
Courtship brings the girl a good deal of traditional romance, songs beneath her window, stolen interviews between its bars, both winked at by parents or *duenna* watching not far away. But it brings nothing approaching the intimacy, the chance for growing acquaintance, of the American wooing. Even after formal engagement the young people are never left alone.

Marriage may bring the bride a home of her own but often it does not. The upper-class family is patriarchal and whether she gets a separate house or goes to live with her husband's people, the wife comes under his parent's control. Affectionate control, but very watchful. But this also she has been trained to expect. It causes her little conscious unhappiness. But it does retard the development of a grown-up personality.

Babies now become her chief business in life and the business of all others for which she is most tragically unprepared. The most adoring mother in the world, she is the world's high-water mark in maternal incompetency, losing her children at a rate which has no parallel in Christendom. And more than the women of most other lands she needs all the fighting strength that special knowledge of her job can give a mother. For the social difficulties in the way of keeping her babies alive are very great.

Indian tortilla maker, typical of the girls of the Mexican 'low people.' She is reasonably free until her first lover claims her.

For the children who survive their first infancy, the upper-class woman is quite as unprepared. The national cooking, bad enough for the adult, is homicidal for the child. And alike, the great cold palaces of the wealthy and the mean apartments of the hard-pressed middle classes violate all principles of child hygiene—with their sunless rooms, hermetically sealed at night to every breath of air, sewerage and garbage problems still in their genesis and bacterial cleanliness undreamed of. The education of sons must in the nature of things pass early from the mother's hands and she can give her daughters only what she herself has learned.



Nevertheless her children adore her, the sons as well as the daughters.

She has set herself to learn what to counsel her children —at least a vanguard of her—and then she will teach it to the Indian mothers. For their children also love and revere them. They revere them even more, perhaps, than in the upper classes. For there the oriental love of parents is divided between father and mother, whereas, among the 'low people' it must often, in the nature of things, be concentrated on the mother alone.

But not all the women who are introducing the 20th Century into Mexico are *senoras* of the upper classes. They, indeed, have been galvanized into action by a group of women very different from them, a group of whom the more conservative cannot at all approve and yet with whom, if they are to achieve anything of their own, they must either coöperate or compete.

First of all there are the rebel pioneers, the women who, in the feudal days of Diaz, began to struggle for their personal emancipation. As in the United States, they stormed the schools of higher learning and a few of them won their degrees as doctors and lawyers. At the first 'Congress of Women' held in Mexico City in the spring of 1923, the first woman physician received an ovation that may have gone far to heal the scars of the lonely fight behind her. But the leaders of that Congress were young women of a still different type, representing the three strongest stimulants to feminism in Mexico at this moment—the Revolution, Protestantism and the influence of the United States

# Pity the Poor Baseball Scout!

## He Gets Praise From Himself Alone, for He Deals in That Most Dangerous Commodity—Human Ivory

By PAUL MACDONALD

DRAWINGS BY W. O. FITZGERALD

THE Sport Oracle of the Elite Cigar Store sauntered in with a sporting extra. He leaned against the counter and scanned the first page.

There were seven or eight other men in the Elite Cigar Store. It was the downtown meeting place of what is commonly known as the sporting element of the town. Another name is fans. They were enthusiasts of sporting affairs and they dropped in nightly at the Elite to talk things over. With them the Oracle's opinion held first and final place, always. The Oracle was a man looked up to by the fans. He had been a promoter. But this makes a different story and the Oracle is only incidental to this article.

On the particular evening we mention the Oracle received a tribute of silence as he scanned the first page of the sporting extra. He always did that when he entered the Elite Cigar Store of an evening. And then, after considering the late sporting news, he would begin voicing his opinions on all matters pertaining to sport, beginning with the most recent happenings.

The Sport Oracle did not consider the first page long before he remarked:

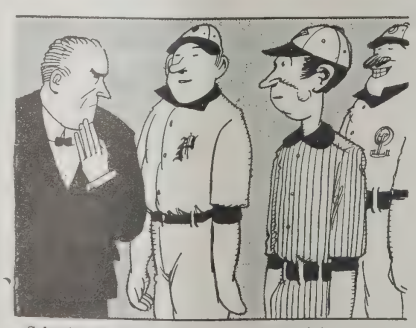
'Well, I see where this Vance wins another. Some pitcher, I'll tell the world.'

Several in his audience nodded assent. The Oracle paused a moment, but before he could resume conversation an elderly man, a stranger, standing at the counter near the Oracle, observed:

'Mister, he's the greatest pitcher since Johnson broke in an' I oughta know.'

The Oracle was taken aback. Here was someone presumptuous, someone treading upon the sacred territory of the Oracle. Always in the Elite Cigar Store the final word belonged to the Oracle. He was the court of last resort. The elderly stranger presumed to be that in the matter of the pitcher Vance.

It was the Oracle who broke the silence that ensued. He said with a solid tone of doubt:



'And how should you know, Mister?'

The look that the stranger focused on the Oracle was one in which contempt and tolerance were strangely mingled. His glance traveled from the Oracle's freshly shined tan shoes to his freshly cleaned straw top piece before he replied:

'I oughta know because I'm the man that discovered Vance. I'm a baseball scout. I'm in town here to look over some of the home boys.'

Having explained his position and his visit, the stranger turned his back on the Oracle and his audience and sauntered out into the night.

He was another one of baseball's scouts, one of an army of observers that are paid by the major-league clubs, on the college diamonds and on the amateur and semi-professional lots. Their job is, according to the profession, 'to beat the bush for ivory,' and writers of baseball generally refer to them as 'ivory hunters.'

Selecting playing material for baseball is one of the longest gambles known to sport.

Each club employs a number of scouts and from early April until late in September they travel about the country in search of new material.

These scouts, engaged in an occupation unique in the field of sport, are unusual characters. Many of them are former ball players or one-time managers of major or minor league clubs. Some of them never played ball. Hundreds of men have at one time or another been engaged in scouting for major league clubs.

A scout is jealous of his record and many of them are somewhat imaginative. Consider the case of 'Dazzy' Vance, for two years the star pitcher of the National League. When Vance became the leading pitcher of his league in 1924 he was no rookie just breaking in. Vance had drifted about for a number of years, had been a member of several ball clubs but at no time did he give any indication of being a world beater among pitchers until the season of 1924 was well launched.

We have heard at least three baseball scouts claim to have discovered Vance. There may be four times that number. It may be true that a dozen scouts recommended him to big league clubs. Vance was certainly around long enough before he delivered strikingly to have been recommended by all the scouts in America.

A few years ago there was a scout among our acquaintances who had discovered three-fourths of the stars of baseball. If he made any exceptions it was a matter of forgetfulness. He just could not remember the names at the moment. If you would engage him in conversation for a few hours you could rest assured that before he left you he would mention practically everybody in baseball.

There are many like him. And that is the trouble with the average scout. Few are really efficient and the major league clubs today probably do not employ one dozen first-class scouts. The ordinary scout will do a great deal of recommending. He will recommend hordes of ball players. If a few make good he claims credit for discovering them but he forgets about the regiments of recruits recommended by him and that absolutely fail.

Scouts work under orders of the

Infielder Brown was the hero. More than 30,000 witnessed his feat. A great city proclaimed him its sports idol.

owners and managers of clubs. If a ball player is highly touted to a club through the usual sources of paid information, the scout is sent out to look him over and give his opinion. Sometimes an owner or manager will send three or four scouts to look over a single prospect and then check and cross-check their reports. If the club signs the player and he makes good the scout takes all the credit for discovering him; if the player fails the scout blames the club for discovering him. This is a safe system; under it the scout never makes a wrong guess.

Selecting playing material for baseball is one of the longest gambles known to sport, amusement or business and baseball as conducted today is a combination of the three. The scout deals only in human material and that is always fallible. The scout has nothing to do with a player making good.

Consider two typical incidents to prove the point:

Scout A is sent out to look over Infielder Brown of a team in a Class B league. He recommends him highly and after further investigations the club employing Scout A buys Infielder Brown.

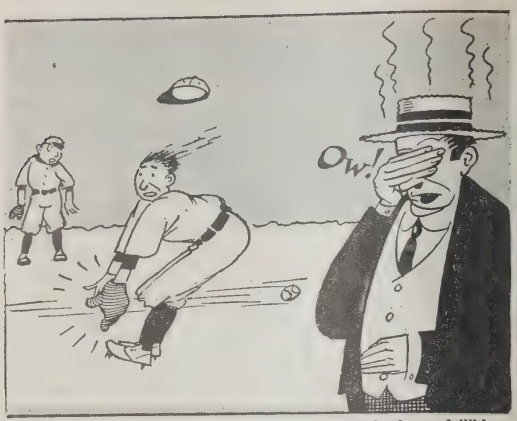
Scout B, employed by a rival club, is sent out to look over Pitcher White of a team also in a Class B league. He recommends him highly and after further investigations prove satisfactory his club buys Pitcher White.

Infielder Brown and Pitcher White are used on the opening day of the major league season. Infielder Brown comes to bat in the ninth inning with bases loaded, two out and two runs needed to win for his team. He hits a two-bagger, sends in three runs and wins the game. Pitcher White, working in hard luck, is beaten by a close score. Two months later Infielder Brown is released while Pitcher White becomes a regular.

On the day after the opening game it seemed that Scout A, who recommended Infielder Brown, had made an excellent choice. Infielder Brown was the hero of the inaugural game of the season and apparently cinched his job with a two-base hit that meant victory for his team.

Pitcher White, on the losing end of the score, does not make Scout B look good. Pitcher White failed. The box score tells the story.

But, there are stories beyond the box score and you must go behind the figures of the batting, fielding and pitching averages to discover why Infielder Brown was sent back to the minors and why Pitcher White became a regular.



Infielder Brown was the hero of the opening day game. More than 30,000 witnessed his feat. His picture appeared in the local newspapers the next day with highly eulogistic articles prescribing the reasons for his greatness. Headlines screamed his batting and fielding talents. Infielder Brown, having labored for a number of years on the baseball lots of minor league towns, suddenly was lifted on top of the major league world, figuratively speaking. A great city proclaimed him its sports idol. Fans showered him with worshipful compliments. He was carried away by the adulation. He basked in the radiance of their praise. And he became lost just when it seemed that he had found himself. He became the victim of worship. He spent his evenings and his nights drinking applause, lifted on the shoulders of a circle of hero worshipers. Then the inevitable happened. He ignored advice as readily as he broke club rules. The manager was forced to bench him because of poor fielding and batting. Next, being unable to break the recruit from the habits he formed as a result of his opening day's success, he followed the usual course of managers, he sent him back to the minors for the remainder of the season as a corrective measure.

### *A Long Talk With Pitcher White*

When Pitcher White lost his first game the manager realized what you, who read only the box score, did not realize. He knew it was not the fault of Pitcher White that he did not win. The manager knew that if his right-fielder had thrown the ball to second base in the third inning, instead of making a useless throw to the plate, he would have saved two runs. He knew that if his shortstop had covered second in the seventh inning, at least another run would have been prevented. He remembered that one of his base-runners thought he saw a hit and run signal when none was given and was thrown out at second while, had he kept to first, he would have scored on the three-bagger that followed. As it turned out the hit was wasted.

Realizing these things, he had a long talk with Pitcher White, told him that he pitched in tough luck and let him know that the fault for the defeat did not belong to the pitcher. He told White that he was really a great pitcher, that luck was bound to break for him the next time and that he was sure to be the talk of the league.

Pitcher White discovered his courage rising. He became confident. The manager developed faith in the pitcher and the result was that his next start resulted in victory. Pitcher White felt

The scout deals only in human material, and that is always fallible.

friendly toward the manager, regarded him as a sincere fellow who meant well, carefully listened to his advice, followed it, and in a few months was taking his regular turn in the box.

Here you have two typical instances of major-league baseball. There are many like them. In neither the case of Infielder Brown, nor Pitcher White, was the scout in the least responsible for success or failure. The downfall of Infielder Brown can be blamed only on Infielder Brown; the success of Pitcher White must be credited to Pitcher White himself and his manager.

On one occasion I asked a successful major-league owner what he demanded in his scouts. His reply:

'All I ask of them is to tip me off who not to buy. Each year I am asked to buy more than one hundred ball players. Anybody can tell you to buy a ball player, but it takes a wise man to tell you whom not to buy. Big-league clubs spend fortunes each year in buying players that never will have a chance to make good in the big leagues. The man that tells you what players to pass up not alone saves you a fortune but he saves you a great deal of trouble and worry and disappointment.'

Scouting in the Class AA and Class A leagues is comparatively easy. It does not require much expertness to detect talent in those circles. The Class AA and Class A leagues are but a step or two beneath the standard of the majors and the players of ability are well advertised. Also, there is a large number of men wise in baseball connected with all of the leagues and they are well able to size up players. They know major-league standards because they spent various periods of their careers there. The scout who is sent on missions to one of these leagues has nothing more to do than find out what the players' faults are and ascertain the chances of eliminating them. He can get this information by inquiring of teammates, opposing players, managers, umpires, owners and home-town fans.

Where scouting ability is put to a genuine test is in the Class B and Class C leagues, college and sand lot baseball. Here the scout finds little help and he must use his own judgment. The material that he observes is pretty much in the raw. Still, it is here that the major-league clubs try hardest. It is from these remote fields that the pick of the major-league players have come. In baseball the highest-priced talent is never the best. The greatest stars of the game cost either nothing or little more than nothing. You may point to George Herman Ruth to disprove this statement. Ruth was purchased from the Boston Americans by the New York Americans for more than $100,000, but Ruth was an established star before New York bought him. He had already proved his slugging ability.

Hans Wagner, Napoleon Lajoie and Christy Mathewson, three of the greatest stars of all time, cost less than $1,500 combined. Again, you may say that this means nothing because ball players cost little and talent was plentiful when Wagner, Lajoie and Mathewson broke in. But there were players in their day that cost more than the three combined and you of the present generation have never heard their names or read them.

But if the three mentioned are too far back for you, consider this list of players known to every baseball patron today, that combined did not cost $25,000 when they entered the major leagues:

Ty Cobb, Walter Johnson, Rogers Hornsby, Grover Cleveland Alexander, George Sisler, Tris Speaker, Eddie Collins, Frankie Frisch, Joe Sewell, Babe Ruth, Dazzy Vance, Donie Bush, George Dauss, Stanley Coveleskie, Lu Blue, Urban Shocker, George Uhle, Ed Rommel, 'Goose' Goslin, Mickey Cochrane, Sam Gray, Waite Hoyt, Urban Faber, Wally Schang, Stuffy McInnes, Johnny Mostil, Burleigh Grimes, Cy Williams, Ray Schalk, Pete Donohue, Eppa Jeppa Rixey, Sam Rice, Cy Perkins, Zack Wheat, George Kelly and Harry Heilmann.

They were gathered from the college fields, the semi-pro lots and the low minor leagues. They came without the blare of trumpets. They entered as shy lambs and within a few years they were the roaring lions of the national pastime.

Several years ago Cleveland needed a shortstop. The club wired to Alabama for a college ball player named Joe Sewell. No scout had ever recommended Sewell. He was not known except in a small college circle. Sewell has been the regular shortstop of the Cleveland club since the day he reported, more than six years ago. What is more, he is one of the best shortstops his league ever boasted. Not alone is Sewell a brilliant fielder but one of the most capable batsmen in the American League and the hardest man to strike out that the majors have carried in a number of seasons.

Chicago paid 100,000 and some odd dollars for a third baseman, Willie Kamm. He is a good third baseman but there has never been a year since he joined Chicago that the American League has not had at least one better third baseman than Kamm. He never became to third basemen what the unheralded Sewell became to shortstops.

The scout who can go into college circles, factory leagues, semi-pro groups and the small and remote minor leagues and pick up a Cobb, a Speaker, a Hornsby or an Alexander is a genius. He is a prophet who sees far and sees well. But of such the game has produced few. Last year one major-league club discharged its entire scouting staff. The club discovered that while its scouts had sent on a large group of prospective big leaguers not one of them measured up to big-league standards, or gave promise of ever doing so. The result was that every scout employed by the club is now at liberty or working for some other owner.

What the average scout does is pick up as many candidates as possible. Then he trusts to luck and a break in the law of averages. As I have already remarked, the scout has nothing to do with the success or failure of a player after he reports. But, since the majority of owners blame him for failure, you can scarcely criticize the scout for taking unto himself credit for the success of those that achieve it.

He spent his nights drinking applause and ignor[illegible] advice as readily as he broke club rules

## Guide to Correct Use of Notables' Names

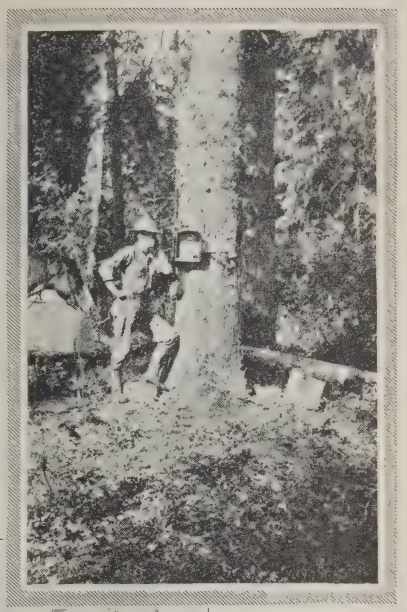
Many literary men and women possess names that are difficult of pronunciation. A number of those frequently used in conversation and easy to mispronounce are included in the following list:

| | |
|---|---|
| John Ayscough | Ask-kew |
| Vicente Blasco-Ibanez | Vee-*thent*-ay Blahs-ko Ee-*bahn*-yeth |
| Johan Bojer | Yohan Boy-er |
| John Buchan | *Buck*-an |
| James Branch Cabell | like 'rabble' |
| Mary Cholmondeley | *Chum*-li |
| Padraic Colum | *Pawd*-rig Kullum |
| Fedor Dostoevski | Dos-toi-*yef*-ski |
| Lord Dunsany | Dun-say-nee |
| St. John Ervine | Sin-jun Ervyne |
| John Galsworthy | 'Gals' like 'hauls' |
| Joseph Hergesheimer | Four syllables; 'ei' like long 'i' |
| Ralph Hodgson | 'Ralph' like 'Rayfe' |
| Sheila Kaye-Smith | Shee-la Kay-Smith |
| William Le Queux | Le Cue |
| Gaston Deroux | De-*roo* |
| Vachel Lindsay | 'Vachel'like'Rachel' |
| Arthur Machen | *Mak*-en; (long a) |
| Somerset Maugham | Mawm |
| Oliver Onions | O-*nigh*-ons |
| Baroness Orczy | *Ort*-sy |
| George Santayana | San-ta-*ya*-na; 'a's' broad |
| John M. Synge | like 'sing' |
| George C. van Schaick | Van Skoik |
| Mary C. E. Wemyss | Weems |
| Stanley J. Weyman | Way-man |

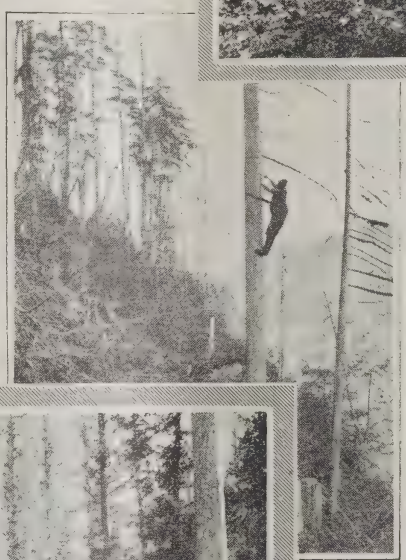
# Phoning in the Woods

## What the Messages Mean to the Forest Ranger

By S. OMAR BARKER



AIRPLANES are being used to supplement lookout towers, watching for dangerous smokes, in many of our National Forests. Radio is playing a part in rapid communication in fire prevention and fire fighting, but neither one nor the other has as yet taken the place of the old lookout tower on the mountain top, with the trusty phone line running down through the woods to the nearest ranger station. Just as Forest Service telephones are built primarily to make easier and more certain the victory against destructive fire, so are they undoubtedly the biggest factor in that battle which has done so much to save our virgin timber. The phone on the ranger's cabin wall is his first assistant, his 'company,' his official medium of contact with superior and inferior officer, and in districts where the fire hazard is great it may be said to be his greatest responsibility.



In nearly every National Forest in the country practically every ranger can talk through the woods to every other ranger, fire guard, lookout, or other forest officer, including his supervisor, in the Forest Service unit. That means that behind the ring that calls him so matter-of-fact-ly to receive its message there are hundreds of miles of strung-out wire, Forest Service telephone lines, the building and maintaining of which make up one of the most difficult and at the same time interesting phases of ranger work. Where there are commercial lines available the service generally arranges to use them at a reasonable rate, but such cases are the exception. Usually the line is Forest Service planned, built, owned and operated; and not so simply and monotonously poled and straight as the commercial lines, either.

Built primarily to protect timber, these lines are for the most part in timbered, mountainous country, where a hundred adverse conditions arise that are not known elsewhere in telephone construction. The Forest Service, as in its other branches, has analyzed all situations and foreseen all difficulties until its men know just what to do in each case to minimize danger of having these lines of communication broken.

Trees are used instead of poles where they are plentiful, where good pole timber is inaccessible or scarce, where rocky ground makes the digging of holes impossible and where mushy soil causes too rapid rot in pole butts. There are, however, other more important, though probably less suspected, reasons for using trees in a timbered country. In the first place, wherever there is timber there are falling trees now and then when the wind blows. Thus the 'swoosh' of one big pine across a telephone wire strung to poles may break the line at the very time it is most needed. And to clear out a right-of-way that would remove all trees close enough to the line to be dangerous would cost more for one forest line than the service can afford to spend for all its improvements.

In tree lines instead of a bracket the Forest Service men use what is called a 'split tree insulator.' Two pieces of porcelain, each half a cylinder, and each with a deep furrow that makes a good-sized hole when fitted together, are wired together with the line wire running through the hole, as one would run a wire through a spool. Then this insulator is 'tied in' to a tree by a piece of ordinary No. 9 galvanized wire from one to two feet long. Thus the line wire is allowed to slide back and forth through the insulator when there is pressure on it, and the insulator is free to swing up and down and take up the motion caused by wind or tree fall without interfering with correct insulation. Then, if a great strain should come on the wire, like that of a heavy tree falling across it, the forest officer has foreseen that, too, and has taken pains to fasten his tie wire to the tree with what is known as a weak tie, using a loosely driven staple. Instead of breaking the wire, it tears the tie loose and allows the wire to sag to the ground. This may ground it in wet weather and make some trouble, but at least communication is not broken off—especially in the dry season when the phone is most needed.

Top to bottom—Ranger at telephone. Hanging an insulator with wire inclosed to the Staple. Flathead National Forest, Montana, through which rangers are shown installing a telephone 'tree line.'

What the ranger must know about telephone building and repair includes all the mechanical details of how to make ties, how to set poles, stretch the wire, install phones, make groundings, sink guy wires, test batteries, et cetera. In addition, he must know a thousand and one things about the methods by which nature attacks his talk lines.

Phone lines are always planned with the needs of a forest for at least five years ahead. Full plans and maps must be made out for the district forester's approval before construction begins. Lines are most necessary between ranger stations on the tops of prominent peaks, and from ranger stations to the supervisor's headquarters. In addition, phones are often installed for prospectors, small storekeepers, settlers, and such persons, when these men can serve the forest as 'per diem' fire guards and have the phone in readiness to report smoke when they see it. These branches often help transaction of grazing business, too, but fire protection is always the primary consideration.

In laying out a line the surveyor does not always need to use surveying instruments. It is wise to make the line as direct as possible, but sometimes it is better to have it near trails or roads so that it can be more easily patrolled. The wire must have four feet clearance on all sides, and the wise surveyor avoids heavy thickets as much as possible to save ax work. Similarly, he must be careful to avoid slopes where snowslides are common, hollows where the snow drifts to thirty or forty feet, and deep wide canyons where a span will be too long. Where the line follows a trail it is always better to have it down the hill from the trail so that fallen wires will not get in the pathway. When a tree line is built up a steep peak to

a fire lookout tower, there must always be some switchbacks to keep from a too rapid change in elevation that would cause the line to pull up and swing loose into the upper foliage of the trees. Pole lines, of course, can run straight.

Then, of course, the uses of the line must be kept in mind. If valuable branches can be built from it to log camps, to high points on patrol trails, et cetera, these variations in route must be considered. Forest Service lines, being usually grounded circuits rather than two-wire metallic circuits, should be kept entirely away from high-tension transmission lines for electric power, light, and even telegraph. Railroad tracks must be crossed at right angles.

With the line laid out, the construction outfit must get its materials on the ground by motor, wagon, or pack horse—most often by the last means. To unwind the 160-pound spool various methods are used, but as a general practice the ranger ties a rope on the end of the wire to his saddle horn, as a cowboy does his rope when he has lassoed a steer, leaves two men to feed it out from the spool and drags the end thus behind him, taking care always to get it on the right side of the trees so it will not need to be cut. Sometimes it kinks and when the higher tension of cold weather comes, it breaks.

*When the Real Fun Begins*

With the wire laid out the real fun begins. Climbing a small, smooth, solid-wooded telephone pole with lineman's spurs and belt is not a difficult trick. Climbing big trees with more or less treacherous bark is another story. First your climbing belt will not reach around, so you lengthen that with about six to ten feet of heavy wire, looping yourself to the tree with it. Then you start to climb. You find that a tree two or three feet in diameter with a smooth, limbless bark offers few holds for your hands. You hang on to your climbing belt. Then you also discover that it takes a very specially acute angle of bow-legged knees to get your spurs to stick into the big, rounding monarch. And when they do stick in the chances are all they reach is bark and that scales off.

Of course, when your spurs slip you do not fall to the ground and break a leg. Your climbing belt prevents that. When you have slipped about three feet it catches you and yanks you into a close embrace with the tree and the more you wriggle the tighter it pulls you against the tree. You can't fall, but the sad part of it is that you can't do much else.

*Lineman Has His Problems*

During the construction period when there are several linemen along it is not so bad, but the lone ranger repairing his line must have both nerve and muscles if he wants to get back to his station in his whole skin.

Wire is swung fifteen to eighteen feet high on trees and when, by some unusual chance, it breaks and must be spliced the ranger has a nice job getting it together where he can reach it. With a rope and clamp tackle, called Buffalo grips, he draws the two wires together. Of course, if the break is not close to a tree, as the ends are drawn together they get higher and higher out of reach and he can't get to them to make his tie. My first experience happened when I was out of splicing wire and I had to pull the ends together and tie them where they met.

I finally accomplished it by standing upright on my horse, after having tied the end of the grip rope to a tree.

In the spring, or before the probable fire season, all phone lines must be gone over carefully. One spring up in the Taos Mountains of New Mexico the ranger found snowdrifts covering the tops of his poles through several bare, rocky gorges, and his repair work had to be done with pick and shovel, digging out the line, for just a few miles over the mountain were sunny slopes of pine, already dry enough to be in danger of catching fire. The line to the lookout had to be opened and he opened it, digging sometimes four or five feet into hard, crusty ice and snow.

There is a lot of chopping in the spring repair work, too, for nearly always trees have fallen upon the wire. Usually a saddle horse can help by pulling poles and logs off the wires with only one chopping but sometimes the ranger must cut up a regular woodpile to accomplish anything.

*The Danger From Lightning*

The danger from lightning while building a line is great, and rangers are warned to keep their hands off wires during electric storms. But even with caution severe shocks are sometimes suffered from distant lightnings.

The phones themselves have lightning protection fuses, even on the outdoor sets, and in pole lines there is a lightning rod for about every tenth pole. In tree lines this is not necessary, since the living tree conducts the current promptly to the ground, often not injuring the wire even when the tree is badly torn up. At that, lightning causes ninety per cent of the phone troubles of the forest ranger, just as it causes many fires. Wind also does much damage, and line trees are often topped and trimmed to prevent them from swaying too much. Big trees sway less than small ones and so are used, though they are harder to climb!

Even here, where trees are serving a valuable purpose as substitutes for poles, their ultimate use for lumber is kept in mind. If the tree is a good pine in an area likely to be cut over soon, the wire used for tying is looped around the tree instead of fastened with a staple. This is done so that no metal will be in the wood to injure some valuable saw at the mill when the tree is finally converted into lumber. Such foresight is characteristic of the Forest Service.

Ground rods where phones are installed must make good contact with moist earth. In some arid regions that is not so easy as it sounds, and it is no uncommon thing for the ranger to be obliged to water his telephone ground rod before he can call up Johnson on the next district!

The ordinary wall set with dry-cell batteries is used in ranger stations and lookout cabins. On the towers and for 'tree' phones in the woods phones incased in heavy iron boxes are used and are kept locked—accessible, of course, to every forest officer, since one standard Forest Service key opens everything.

*More Phones Are Needed*

More phones are needed in the National Forest. New Mexico's forests alone have 1,500 miles of telephones, but twice that much would make fire protection just twice as adequate. Radio and airplanes are helping in some of the big woods, but for fire protection, grazing business, consultation—and, yes, for real human company, not only for the ranger but for his wife, the telephone, homely, trusty, albeit touchy at times, is a real blessing, one that helps further to humanize that most human of Government bureaus—the Forest Service.

# CHATS WITH OFFICE CALLERS

'I had a strange run of luck in trying to go to church recently,' commented ***the New Yorker.*** 'First I went to my own church and I found my minister giving a very slobbery eulogy of the Jews. I was unable to discover the occasion for his outburst, and he was unable to give me a good reason, so I was left to conjecture that the numerous pro-Jewish propagandists had got hold of him also. I happen to know a good deal about the literature disseminated by the propagandists, so I was able to tag practically every statement he made. When ministers grow tired of preparing sermons on religion, they seem to turn to the mass of propagandist literature that is mailed to them, and preach from that.

'Well, next time I tried was prayer-meeting night. It was a long time since I attended that midweek meeting which used to be called "prayer-meeting," and I thought I would like to see what had happened to that ancient institution in the many changes which New York brings. I found it was a "midweek lecture" now, and such was my luck that on this particular night who should be the lecturer but Rabbi Wise! Well, Rabbi Wise is an orator, and although he does not have much worth saying, what he does say is well said.

'The next Sunday I tried again. I said to myself, "The pulpit is blown to and fro with every wind of doctrine and fashion, the old prayer-meeting has given place to a lecture, I'll try the Sunday school. The old Sunday school how well I remember it, and the buzzing of the classes conning the lesson. So I went to a church in my neighborhood at Sunday school hour. As I'm a living man, there was a Jew in the pulpit, a young fellow with something of an auctioneer air and something of a preacher in his voice. A Rabbi Somebody—I didn't care to remember whom. And he was telling the children about the great Jewish people. I hope I am not prejudiced, though most New Yorkers are, but when one of my neighbors greeted me after Sunday school and asked how I had enjoyed it, I fear I surprised him by asking when they taught anything Christian to the young Christian children.'

ɣ ɣ ɣ

'Hot weather and cold weather have affect on you because of what is in you,' declared ***the Man from Porcupine,*** where the thermometer climbs loftily in summer and falls abysmally in winter. 'There is a good deal in keeping cool inside in the summertime, and keeping warm inside when it freezes.

'Last winter I had a friend visit me. We lived in a stout cabin of squared logs, heavily papered, with double-framed windows, and big stoves. It was certainly cozy inside. One morning we went out for a walk to the top of a hill. We had sheepskin-lined coats and fur caps and all the cold-weather gear of the North. He seemed to enjoy the climb—until I called his attention to a sheltered official thermometer in a little booth.

'He came over to look at it. He gave one look, and turned as pale as the snow around us. He saw "fifty-eight below zero," and it was like seeing a loaded cannon pointed at him. I actually had to help him get down to the cabin, and he could not be induced to leave the cabin for three days. Yet, clothed as he was, he was not in any more danger in that climate than a man would be in a more humid region with the thermometer at 10 below zero.

'Since then, I have tried not to look at thermometers, unless I must get the information. I try to keep warm in winter and cool in summer, inside. I never realized before how much the mind has to do with the way one endures the weather.'

ɣ ɣ ɣ

'There is a man who is living—or thinks he is—or we think he is—near us,' said ***the Poet,*** 'and he has a new theory as to how we get our rain and snow. Here it is, as he wrote it.

'It has been known for some time that scientists could not agree as to how we get our rain, drop by drop, and snow in flakes. Having in a measure clairvoyant sight will explain what has been revealed to me.

'The rain and snow all come from insect life. Everything in the Universe is in constant motion, and everything has a nucleus around which to revolve, as we can see in the dust atoms in a ray of sunshine.

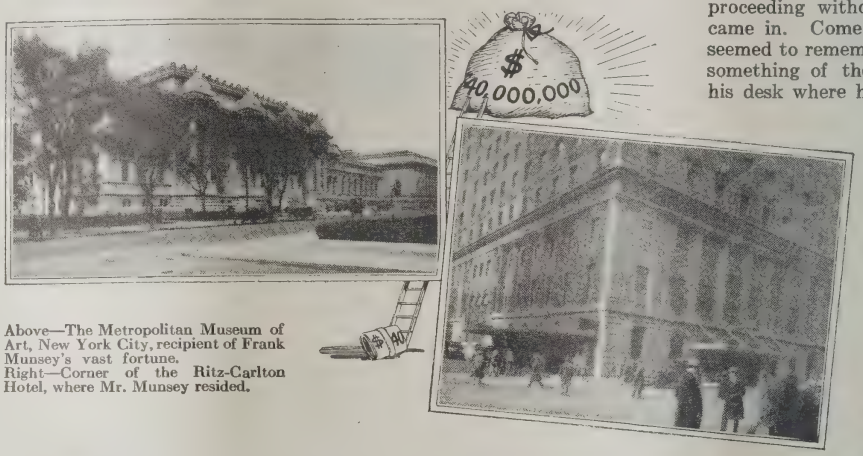
'These insects appeared to my magnified sight, about the size of a small honey bee, in color a light greenish gray, white head that sits flat on the body, there seem to be two kinds, male and female, the female a light gray, four legs, two wings, small eyes like pin points, a sack hanging from the body, that will hold about two drops of water; at the extreme end of the sack is a valve that opens automatically to let the water out. It depends on the atmosphere whether it will be rain or snow. When we get a heavy fall of rain or snow, the insects are very near the Earth, if high (the congregated insects resemble clouds) and the cold air through, which the drops of water fall, we get snow in homeopathic pills, at other times light as thistle down and of beautiful shapes, stars and crosses and diamonds glistening with frost.

'The wind blows, and we cannot see it; so with these insects, they are congregating in the air, and when they form clouds, and precipitate rain, snow or mist, we can see that, but they are so infinitesimally small that we cannot see them with the naked eye. We have what are called cloud belts, where they propagate to such an extent that they obscure the sun, consequently they have few sunshiny days in that locality, the nearest to us is in the vicinity of Rochester, N. Y., I think being in the lake regions; there are other localities where atmospheric conditions are similar.

'During a severe electrical storm, when we have what is usually called a cloudburst, a bolt of lightning strikes a cloud of these insects, killing them and causing a downpour of water. I was telling a Professor from Stockholm, Sweden, about my theory. He wrote an article for a paper there and sent me a copy. Afterwards they had a heavy rainstorm, which changed to ice and sleet. Right after the storm they went in search of the flies and found quantities of them frozen in the ice, and under microscopic examination proved my theory correct. They have no means of defense, are as light as thistle down. I have seen them on a clear day when the sun was shining, they looked to me like a heavy snow flurry, others with me could not see anything any more than they could see the wind blow.'

ɣ ɣ ɣ

'Here is the International News Reel of the 16th Century,' said ***the Curator-Historian*** as he laid a rare de Bry upon the table. It was an illustrated book of travels. 'The reason for its rarity is not that few were printed,' he continued; 'on the contrary, great editions were printed. It was one of the best sellers—one of the first best sellers. We have little idea of the avid appetite of former generations for news about the strange countries of the world. The traveler who had visited distant places commanded an audience like to no other's. Sometimes he was tempted to gull the confiding people with stories of marvels that never were on land or sea, but not always. The de Bry books show a remarkable fidelity to truth even in those matters which were less likely to be understood by the 16th Century. The people literally read them to pieces, and that is why this copy is worth so much money.'

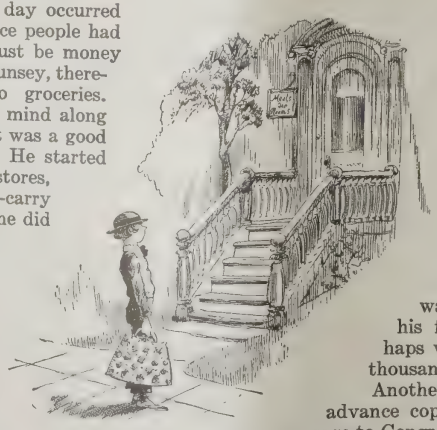


ɣ ɣ ɣ

'It's not the city tourist or outsider who causes most of our fire worries,' commented ***the Game Warden*** as he turned his car into an old log road that skirted the bank of the Black River. 'It's the local people, farmers burning new land and fishermen and hunters from the small towns in this vicinity. They don't seem to be educated to the danger. Many of them are old-timers who remember the day when a forest fire meant nothing but good huckleberry picking later on. We pay twenty cents an hour for labor during the forest-fire season and there are those who are not averse to practising incendiarism if they think they can earn two dollars a day by so doing. Then we have to contend with the wood cutters who follow up the lumbermen, cutting the slash into bolts for the chemical plants. They leave a fine débris that is most inflammable, and as most of them smoke incessantly, there is bound to be some fire. And a fire once going in that stuff before a good strong wind can cover many acres before it is controlled. The people from 'outside' are taught the dangers of forest fires and they are most careful to extinguish their camp fires and practise carefulness where fire is concerned. I'd sooner take chances with a carload of city tourists in a dry woodland than with a similar group from a neighboring country town; up in this district, anyway. The outsider appreciates the beauties of the forest more than do those who reside here, it seems. At least they are more careful in its preservation.'

# The Loneliest Man in New York

(Continued from page 2)



himself could understand. His successors are not so simple. They know what they are doing and why. First, they invented the yellow press. Still, one had to be able to read a little to buy that. Next they created the pictorial paper which does not require that one shall be able to focus his mind long enough to read. And how this pictorial press has boomed! Noting its great growth, the inventor of the yellow press said as he looked at its sprawling pages of foolish pictures: 'There must be something lower than this if we could only think of it.'

Above—The Metropolitan Museum of Art, New York City, recipient of Frank Munsey's vast fortune.
Right—Corner of the Ritz-Carlton Hotel, where Mr. Munsey resided.

Munsey made money so rapidly out of magazines that he was energized to the point of madness. Twenty years ago he was starting new magazines and killing them in such a wild way that the men in his own offices hardly knew where they were at from day to day. All at once the order would come to start a new magazine on this or that subject. A few weeks later another magazine would be started. Munsey was such a good business man that almost every magazine he started produced a profit. But just a profit did not satisfy Munsey. This writer has known Munsey to kill magazines that were making $1,000 a month. Such small change did not interest him. He would kill the little fellows that he had started a few months before and start new ones destined to go to the same graveyard. The Munsey offices in those days were chambers of horrors—madhouses in which what was done today was destroyed tomorrow.

Inasmuch as profits were rolling in that Munsey had to reinvest, it one day occurred to him that, since people had to eat, there must be money in groceries. Munsey, therefore, went into groceries. But he took his mind along with him, and it was a good business mind. He started chain grocery stores, on the cash-and-carry plan. Perhaps he did not originate the plan, though it was twenty years ago that he established his chain of stores over the state of New York and the New England states—a chain, by the way, that still exists. And he ran his grocery stores just as he ran his magazines—they must pay or get out. A store that had not cleaned up $100 by Saturday night was forbidden to open Monday morning.

Munsey did not coin the word 'logical' but he used it more than anybody else of his generation. His conversation was heavily peppered with it. He prided himself on his logic. And perhaps it was his logical mind that, after a while, caused him to proceed from chain grocery stores to investments in newspaper properties.

In the beginning, all he knew about newspapers was how to buy them and run or kill them. If half the stories that were told in his offices about his early ventures were true, he was indeed what the younger generation now calls a 'panic.'

According to one of these stories, he had just bought a New York newspaper when it occurred to him that it should be changed from an evening to a morning newspaper—or perhaps it was the other way about. The day or the night that the change was made, the Associated Press report, for some reason or other, did not come in as usual. After a while Munsey himself called up the A. P. to see what was the matter. The man at the other end of the wire finally asked him if his new paper had an Associated Press franchise—that is, the right to receive and print Associated Press dispatches. Munsey promptly replied in the affirmative. The other man replied that such was not his understanding of the fact. Munsey was told that his franchise was for a morning newspaper—or whatever it was before Munsey changed it—and not for what his newspaper had become. What this meant was that Munsey had lost his franchise, which was perhaps worth one or two hundred thousand dollars.

Another story has to do with an advance copy of the President's message to Congress which that year, for the first time, had been sent out in advance for convenience in putting into type instead of being sent by wire on the day of delivery. When Congress assembled the editor expected the message to come, as usual, by wire. Instead there was a bulletin from Washington: 'Release President's Message Sent in Advance.' About a minute later the other New York newspapers were on the street with the message. The editor of Munsey's newspaper was thrown into a panic. Everybody in the office was hurriedly asked if he knew anything about an advance copy of the President's message. Nobody did. While the inquiry was proceeding without results, Munsey came in. Come to think of it, he seemed to remember that he had seen something of the kind. It was in his desk where he had put it when it came in.

A little later the panic of 1907 came along. This was the luckiest thing that ever happened to Munsey. The stock market acted as if speculators believed the country had gone hard and fast upon the rocks and could never get off. Munsey believed nothing of the kind. And, as luck would have it, he was just at the moment in close communion with George W. Perkins, whose chief financial interest at that time was the common stock of the United States Steel Corporation. Munsey too became interested in Steel Common. For weeks at a time, whenever anyone went into his private office, he was sitting at his telephone telling his broker to buy Steel. He loaded up heavily at prices ranging from ten to twenty and sold out, a few years later, for ten times what he had paid. It was believed that he made about $20,000,000 out of this panic. Yet Munsey never afterward dabbled in stocks. He had got his—and he kept it.

A humorous feature of this panic, with its rich rewards to the House of Munsey, was that while it was at its height some of his employes had the pleasure of lending a week's salary each to 'the chief.' They had no more than been paid off one afternoon before the man who paid them came around to see if the recipients would kindly lend back what they had been paid. The explanation, of course, was that it was almost impossible to get currency from the banks, regardless of how great a sum one had on deposit. Munsey had plenty of money to his credit, but could not get much currency; hence the opportunity that rarely comes to poor men to lend money to a multi-millionaire. Everybody was glad to do it; they understood.

Munsey, at one time, had considerable of an itching to get into New York society and employed a man on his editorial staff both to teach him how to walk on to a waxed floor without breaking his neck and to introduce him to the '400.' But he forgot about his social ambitions. There was nothing to keep him out if he had really wanted to get in. He could make as good an appearance as any of them and his fortune was always sufficient to have made him attractive. Nobody, perhaps, will ever know the marriages that Munsey escaped. But in his will he was careful to state that he had escaped. He put himself

down as a bachelor. Perhaps this indicated a little lack of faith in womankind in general; perhaps it indicated only a legal precaution that, after death, no lady might try to grab off part of his millions by asserting that she was his widow.

Munsey apparenlty cared little for women, and if one of the many stories that were told about him was true there would seem to be no reason why they should have found much in him to interest them. The story had to do with a little company that Munsey assembled in his huge apartment at Sherry's, more than twenty years ago. After dinner a group of fine ladies gathered around Munsey, and it seemed to him that the occasion required that he should do something to entertain them. He did not sing, play the violin or tell stories—what should he do? The answer came to him rather quickly. Only a few days before he had bought a marvelous new device that had just come to the world. He went to his dressing room and brought back a beautiful, gold-plated Gillette safety razor and, for the next few minutes told them of its marvelous qualities. What the women thought Munsey never knew, but he died a bachelor.

Munsey's whole life was a vast reaching out for empty shells. He had three great houses, one in New York, one in the Adirondacks and one on Long Island, but no home, because there was no one at any of these places to greet him when he entered or to say goodby to him when he left. Every summer he went bag and baggage to Europe, going from place to place in search of happiness that he never found.

The tragedy of Munsey's life was revealed in nothing so plainly as in the way he disposed of his great fortune. Realizing, five years ago, that in the very nature of things he could not live much longer, he called his lawyer and made his will. First he provided for his aged sister, some nephews and nieces, some distant relatives, some friends and business associates. In making these dispositions, he employed the same sagacious judgment, hardened with parsimony, that he always displayed in business. Not a dollar too much was left to anybody, with the result that these bequests amounted to one per cent of the fortune that he left at death.

Anyone who knew Munsey can imagine the state of his mind when it came to dispose of the other ninety-nine per cent of his estate. Death was surely going to place it beyond his reach, he had given all he cared to give to any person—what did he care what became of the rest of it? With one stroke of his pen he left the whole business to the Metropolitan Museum of Art in New York City. Never during his entire life had he shown the slightest interest in the museum, except that perfunctory interest which caused him to pay ten dollars a year for its support. Nobody at the Metropolitan knew, until after his will was read, that he cared a copper for it, which in fact he didn't. But the money had to be disposed of, there was nobody to whom he wanted to give it, so he dumped the whole business on the sidewalk in front of the Metropolitan.

At that, the Metropolitan probably would not have got much out of him if he had lived a little longer. Munsey was not feeling well when he made his will, and later he intended to change it. Nor did he realize when he made the will that the museum would get so much. His business affairs were not going any too well, his real estate was somewhat depressed, and he did not rate himself at anything like $40,000,000. For a year or two before he died he had been talking of making a new will and leaving the bulk of his fortune to establish a great training school in which boys and girls could be taught how to make a living. Nothing in Munsey's whole life was so much to his credit as this thing that he intended to do but didn't.

Munsey's critics have long lashed him furiously for the soulless newspapers that he ran and the empty life that he led. I always felt sorry for him. He was not a bad fellow—he tried to be human but he did not know how. I recall that the last time I saw him he came up and sat down by me as I was reading in the club car of a train running between New York and Washington. But all I recall is that he sat down and talked. Munsey conspicuously lacked the ability to establish a little bond of feeling between himself and those with whom he came in contact. Nor did anybody who knew Munsey ever suspect that he was happy. He was interested in the things he did, but not happy.

What an end he had; yet what other end could he have had? Employes all around him as he breathed his last. Employes reading the letters of condolence that came from far and wide. If anything was more empty than Munsey's life it was his death, and all because nobody could get anything out of him that God Almighty had not put into him.

# The Voyage of the Victoria

(*Concluded from page 13*)

and the snow-capped mountains were clothed with rich and varied vegetation. They were in a world of fantastically piled crags and glorious green terraces; of great ravines and sweeping amphitheaters of hills; of overhanging precipices and mountain masses standing against a clear sky; of narrow ribbons of clean, sandy beaches that melted into masses of greenery; of sun-sparkled water rippled by light winds; of silver rivulets and of waterfalls that ended in mist.

All these contrasted markedly with the featureless country that they had looked on during the inactive days in Lomas Bay and in the slow winter in St. Julian Bay. There had been the gray chill of a lonely land and the steady diapason of the ocean's roar. Here were the songs of birds and the music of a thousand living creatures; the barking of seals and the deep booming of sea lions; a million chattering *tijeras*, noisy gray geese, screaming sea gulls. So adventure seemed a pleasant highway.

Then came the note of doubt and anxiety. More than the specified time had passed, but neither the *Concepcion* nor the *San Antonio* had appeared, and two further days of watching and waiting intensified the anxiety. There were not wanting theories and uncomfortable conclusions which soon spread, so that invisible influences swept like a chill wind and sent men into cowering fear. But no man dared voice his fears. The general idea was that the two ships were wrecked and all hands lost. Some remembered Gomez and feared a disaster like that of San Julian.

Then Magellan lifted anchor and commenced to retrace the course, and in the afternoon of the first day, at El Morro de S. Aguieda, they sighted the *Concepcion*, and when they came within hailing distance it was learned that of Mesquita and the *San Antonio*, Serrao had no news. They had parted company on the first day. They had made later search about Dawson Island but no sign of the other ship had they seen.

This channel ahead ran narrow because of islands, so Magellan anchored and sent out boats.

# Rare Americana in Unique Setting

By J. OLIN HOWE

ILLUSTRATED WITH PHOTOGRAPHS FROM THE METROPOLITAN MUSEUM OF ART

Visitors enter the American wing through this room, which is reproduced from the "Old Ship Meeting-House" of Massachusetts, built in 1680.

## Reproductions of Historic Rooms Enshrine Quaint Relics of the Past

THE American wing of the Metropolitan Museum of Art in New York—mecca of hundreds of thousands from every corner of the land since it was opened a year ago—is not the last word in a showing of early American art and craftsmanship. And certainly the museum's officials do not claim that it is.

In fact, I, who have written as much about the American wing as anybody—and more than most—have not known such a statement to be made by anyone in a formal way. Criticisms of this remarkable treasure house based on anything of that kind are quite beside the point.

What the American wing is, however, is a unique setting for a showing of early Americana without careful study of which no one can fairly reach final conclusions on the work of artists and craftsmen and architects in America's first two centuries.

It is much more than that, moreover. It is in itself the only collection of early American rooms—most of them originals transferred bodily—ever brought together under one roof and molded into a museum building whose exterior and interior are of a dignity fully in keeping with the notable architecture of the rest of the Metropolitan Museum.

Only here are to be found any such chronological sequence of typical, representative American rooms of the 1600's, 1700's and early 1800's with fittings and furnishings and decorations, examples of the choicest things produced in the times when the rooms were built and lived in.

The preservation—and even restoration—of houses and parts of houses of historic and sentimental importance is fairly common in states which were among the original Thirteen Colonies—Washington's home at Mount Vernon comes first to mind, and there are many others—but it would be idle to contend that the furnishings in any of these constitute a collection of great moment apart from their associations and the special setting.

Yet here not only are furnishings and decorations from collections which give the Metropolitan first rank in such matters, but the setting itself is a museum collection which stands alone.

Not that the American wing is the first instance of the use of period rooms in which to show the arts and crafts of the fathers, but it is the only such showing sufficiently complete and comprehensive—both as to rooms and their contents—to permit one to follow art and artistry in America from their beginnings on through the first two hundred years of our national development.

Probably the Rhode Island School of Design at Providence was first to install such exhibits in rooms of their time, and the Essex Institute in old Salem followed hard after—but it remained for the Metropoli-

This photograph was taken in a room which, with its big fireplace, is a reproduction of the parlor built about 1640, at Ipswich, Massachusetts. The costume is copied from old documents and is typical of mid-seventeenth century dress.

tan to put together a collection of original rooms and furnish the first opportunity for a broad and balanced appraisal of our American heritage in the field of decorative arts.

The American wing itself and every last thing in the way of fittings, furnishings and decorations in it is an exhibit—a museum piece—and yet I should be loath to father the assertion that, as it stands, here is the greatest collection of the furniture of Colonial America or of the work of the earlier American painters or sculptors or wood carvers.

And certainly the Metropolitan has no claim to preëminence in the wrought ironwork of that day or in the kitchen furniture and other utilities which were produced by the first American joiners and cabinetmakers. There are collections in New England which take precedence at once.

But what does it matter? Especially when the treasures of the American wing are not shown as collections, in the museum sense.

The fact is that the Metropolitan Museum does possess the finest and most complete collections of the choicer furniture and cabinetwork, ceramics, silver, pewter, textiles, and so on, associated with America's first centuries—which in the beginning were brought over from Europe and later were the productions of our own designers and craftsmen—and that the institution has a thoroughly representative collection of early American paintings and sculpture.

And it is from these collections that these rooms of our ancestors have been furnished and the articles are well chosen.

As to collections of American decorative arts, let me say this: Of the many collectors only a few stand out—especially as to furniture. Dr. Irving P. Lyon and Albert Hosmer, of Hartford (the former author of the first authoritative work on American furniture and the latter, himself a cabinetmaker, with an especial flair for seventeenth century Connecticut pieces and most diligent in seeking them out); H. Eugene Bolles, a Boston lawyer, George S. Palmer, a New London, Connecticut, manufacturer; Charles L. Pendleton, of Providence, Richard A. Canfield, Marsden J. Perry—these have been the leaders.

Of their collections only those of Bolles, Palmer and Pendleton remain intact in museums—and the Metropolitan has the first two. Much of the best that was in the Lyon and Hosmer and Canfield collections had passed into those of Bolles and Palmer before the Metropolitan acquired them—the first in 1910 and the second as recently as 1919. When Mr. Palmer offered his collection to the museum six years ago it had been for some time regarded as the most noteworthy collection of Colonial furniture ever brought together.

The high chest, or highboy of the eighteenth century is an excellent example of Philadelphia cabinetwork.

Center—This from Gladsby's Tavern, where George Washington and Martha Washington often went to dance. Musicians played on a hanging gallery, visible in the right upper corner of this picture. Lower left—Lady in yellow brocade gown of the same period as the Chippendale furniture and the silver and china of the tea set.

The Pendleton collection belongs to the Rhode Island School of Design and is shown in a building of Georgian architecture, say perhaps 1790, especially built for the collection, and of fireproof construction. Neither in Providence nor in Salem have original old rooms been brought to the museum, though in the latter's Essex Institute some old wood and mantels have been used in the reproductions.

The Metropolitan Museum of Art has no need to vaunt itself, in any case. What it is and what it has done in but five years more than a mere half-century are perfectly plain for all to see. The Metropolitan is a national institution and one of the five or six truly great art museums of the world. No other in America even distantly approaches that eminence, fine as some of the collections and individual objects are in others.

In several of its departments the Metropolitan's collections are without serious rival the world over and in others it has no superior. And this is true of the decorative arts as well as the fine arts. Indeed, here is one of the most interesting phases of the museum's pioneering—and it leads directly to the American wing.

From the first the Metropolitan Museum has led the way in recognition of the decorative arts. A generation or more ago a suggestion that the decorative arts belonged in an art museum would have been met with a shrug of the shoulders in the Boston Museum of Fine Arts—though, oddly enough, the Metropolitan's present director, Edward Robinson, who is a very high authority on classic art, is a former assistant director of the Boston Museum.

But all art was decorative art at first. The art-for-art's-sake creed is of comparatively modern times. One does not go back many centuries to find where *l'art pour l'art* had its beginnings. And today in America the decorative arts command fully as much attention as the fine arts—which is as it should be.

This brings us to the most important thing the American wing does—it establishes American art as a definite and worthy museum unit. In the days of the fathers there was an American style, however much we may have departed from it since in running after strange gods—an American style

which entitles those works which display it to their place in an art museum.

This has long been a moot point. Foreigners have been coming here for years past to tell us there was no American art and to deride the thought of an American style.

And we have been silly enough to let them thus pose without effective protest.

Only now are we awakening to an appreciation of American art—and to the fact that these aliens were all wrong and their premises utterly faulty.

Even in the first years of this nation, before it really was a nation and possibly before Colonial craftsmen were entitled to be called artists, these did contrive to stamp their work with an individuality which speaks for itself in no uncertain way.

Utility they had to have always, but utility need in no way mean ugliness. Even in their plainer productions of the sort, so highly regarded just now, they ever expressed truth and beauty as they saw it.

No artist can do more in any medium—for that is art!

Once we give American art its deserved recognition, there comes the question of how to show it in a museum. Manifestly, lofty galleries of the usual museum type will not do for this—and heretofore the Metropolitan has not tried to show much of its remarkable resources in American decorative art, except in special exhibitions. (But it has been an assiduous collector—even of early American architecture, exterior, and especially interior.)

The American wing is the answer. It was the gift of Robert W. de Forest, prominent New York lawyer, and Mrs. Emily Johnston de Forest. Mr. de Forest is one of the most successful presidents the Metropolitan Museum has ever had and is a lineal descendant of that Jesse de Forest who led to the New World the Walloon colonists who bought from the Indians more than three hundred years ago the land upon which to establish a settlement which has become New York City.

Nearly every one of the original Thirteen Colonies contributed to the collection of rooms which make up the interior of the American wing. A few are reproductions —some of the earliest 17th Century rooms—for never has the Metropolitan permitted the removal of aught which would have been preserved where it was—and any home which had stood since the mid-1600's is not being torn down today.

But these others were stored against this time when they should be assembled to

***The Graceful Measures of the Minuet***

create an atmosphere in which one just about senses ghosts in bonnet and kirtle, knee breeches and periwig, and almost sees olden time curtsy punctuate the graceful measures of the minuet.

Not only is the building unique as a museum structure, but it is an architectural masterpiece of which Grosvenor Atterbury, its architect, may well feel proud. Ballroom and bedroom, living room and kitchen, of varying heights of ceiling and very different window arrangement, have been combined to make a harmonious and agreeable interior and about them has been thrown a building into which everything fits, while a dignified and balanced exterior is shown to the world.

And then there is that famous south façade, which will eventually look out upon an old-fashioned New England flower garden and upon another building of Colonial architecture which is to house still more of the Metropolitan's Americana.

For more than a century this façade was the front of the old Assay office, or United States Branch Bank, in Wall Street, one of the choicest pieces of architecture of the American Republic's first years. Henry W. Kent, secretary of the Metropolitan and a high authority on early American art, noted that the demolition of this building had begun one day about fifteen years ago.

He immediately got in touch with Mr. de Forest in his nearby office and the latter purchased the structure. Stone by stone, its front was taken down and marked for reassembling. And it has been stored on the East River water front against this time when it should be erected as the south façade of the American wing, its grace and beauty a distinguishing mark and its lovely Colonial doorway an earnest of the treasures within.

These are rich and rare—early American prints and paintings, furniture and fabrics,

***The Silver Work of Paul Revere***

fireplaces, woodcarving, silver, glass, pottery, china, old tile and other ceramics—from the simple accessories of daily life when the first settlers were subduing the wilderness on through the times when easier financial conditions and greater leisure made it possible to give some thought to the esthetic side of life.

I have mentioned some of the Metropolitan's American collections. It has others—notably the unrivaled Clearwater silver and, in addition, much of the handiwork of William Cleveland, Paul Revere, and other American silversmiths of Revolutionary and pre-Revolutionary days; the beautiful glassware of Baron Stiegel and others; the old Dutch tile collected by Mrs. Frederick Allien; a wealth of Charles the Second and Cromwellian pewter; to say naught of the works of American portrait painters of a hundred and fifty years ago—Gilbert Stuart, John Trumbull, and their contemporaries. Several of Stuart's Washingtons are in the Metropolitan.

From within the museum one enters the American wing from the Morgan gallery to find oneself at the top of the building, on its third floor, and begins with the earliest 17th Century rooms, descending with the years as America advanced. There is a central gallery on each of the three floors and here it is a reproduction, using massive, hand-hewn timbers of the period, of the Old Ship Church at Hingham, Massachusetts, which was built about 1680.

In the small, low-ceilinged rooms which cluster about it there is little attempt at ornamentation, yet never indifference to simple beauty and strength of line. Joys were few with these pioneers, and even comforts, but they had brought with them a sincere instinct for honest design and sterling workmanship.

Always the true refinement in the taste of the colonists is apparent—and as one passes from period to period down through the American wing there is a fascinating exposition of what craftsmen, and later artists, did with ideas and modes then finding favor in Europe—how whatever seemed to them of real merit was adopted and adapted to conditions on this side of the water.

Moving in the spirit of bygone years, it is easy to forget that our forests are no longer peopled with Indians and our streams dotted with bark canoes, easy to lose all sense of that Fifth Avenue outside which is filled with rushing motor cars and roaring omnibuses—and to fancy ourselves in a less complex age when life was possibly sweeter and the really fine things of life received more nearly their due meed of attention.

Many fine things from the Bolles collection are in the Old Ship Church room, while in one of the group of rooms from a homey New England house of the 1600's on the same floor is a chair said to have belonged to Peregrine White, first child of the Pilgrim colony, who was born on the *Mayflower* before she reached this side of the water.

The famed Hewlett house at Woodbury, Long Island, has supplied a room on this floor typical of the early 1700's, with a wonderful old fireplace and beside it a small closet door leading into a secret staircase such as was often found in houses of that time.

These earlier rooms are paneled in native woods, often delightfully carved, as the years went on, after Plymouth Rock, but as one passes downstairs into later rooms there is on the walls old wallpaper for which the Metropolitan has scoured the country of late years. Often this is hand-painted and always it is strikingly handsome.

One could write a book about the American wing—and sometimes perhaps it will be done. But now three of the rooms must receive special attention. One is the magnificent room from the Powell house in Philadelphia—much the finest single room of the collection, with paneled fireplace wall of unusual distinction flanked by two doorways and surmounted by a panel enriched by carving. Much of the beautiful furniture in the room as it is now came from the workshop of that remarkable Quaker cabinetmaker, William Savory.

(I could dwell on the room from the home of a country gentleman at Oriole, Maryland, or on another Philadelphia room, wherein are two doorways and a remarkable fireplace mantel decorated with composition ornament commemorative of the War of 1812—but these are not the other two of my trio.)

The second of that is the most elaborate room in the American wing, that from the "Marmion" estate, eighteen miles from Fredericksburg, Virginia, the beauties of whose carved woodwork are enhanced by landscapes, cornucopias, vases, and so on,

***Where George Washington Danced***

from the brush of an unknown artist, plainly of more than ordinary distinction.

Here the Old Dominion has furnished one of the real gems of the collection. There could be no finer example of the painted rooms which had become not uncommon in America by the time of the Revolution. Architecturally, too, this room has already begun the fulfillment of that mission of usefulness to be looked for from all this American wing—it has been copied for the grill room of a New York club and a number of private houses owe the design of unusually fine rooms to it.

The third room in my series has clustering about it a wealth of historic and traditional associations—the famous large ballroom of Gadsby's Tavern at Alexandria, Virginia. This tavern was built in 1793, while George Washington was President and was a hostelry of distinction for years. It appears in pictures of Washington in Alexandria painted at the time.

Here the Father of His Country and Martha Washington often danced, driving over from their home at Mount Vernon, but a few miles away. Indeed, it was the center of the social life of the Virginia gentry with whom our first President loved to be associated. On February 22, 1799, Washington's last birthnight celebration was held here. Lafayette was dined and fêted in this room when he visited Mount Vernon in 1824.

# America's Scattered Children

(*Continued from page 7*)

erned. The children are in school, and are growing up to be good citizens.

Through the Canal one sails across the Pacific, and comes in due time to Hawaii, organized as a territory, and with aspirations to be a state. But these aspirations are curbed by the fact that Hawaii has a population forty per cent Japanese and that population is growing. Moreover, these Japanese are American citizens by their birth on American soil. Until recently they were also citizens of Japan, but the Japanese Diet had ended this dual allegiance and acknowledged their American citizenship.

Thus far the Japanese have not exercised to any alarming extent their political power, which even now would be a controlling factor, and the Japanese consuls in Honolulu have been, as I am informed, uniformly men of character who have worked in harmony with United States interests.

The future of Hawaii, as a state or a territory, depends in no small degree upon this important section of her population. It is hardly to be expected that Congress will admit Hawaii as a state to be controlled by an alien race, especially when what has been done in California is considered. Nor, so far as I can learn, do the Americans in Hawaii desire statehood under these conditions. They prefer to let well enough alone. But sooner or later the question is sure to arise.

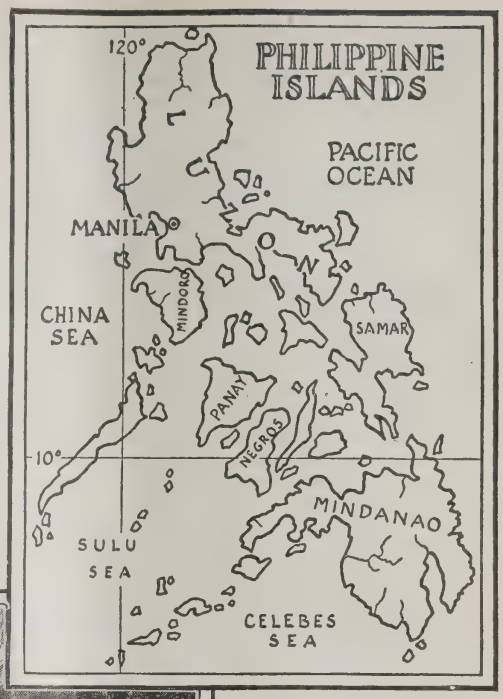
Hawaii is a place to gladden one's heart. All that one has read about the beauty of the islands seems inadequate when one is actually there; and the warmth of the welcome accorded a shipload of American tourists is something which one who has experienced it can never forget.

'Do they actually come out and hang a wreath of flowers around your neck?'

A wreath? Rather, wreaths. I had two of them round my neck before I stepped on the gangplank, and another as soon as I stepped off, and I wore them with a pride greater than I hope I showed. During the few days of my stay there, I was always receiving another wreath or two, and I left with eleven fresh ones, all represented by different friends or groups of friends. Few persons on our ship were ungarlanded.

In Honolulu we are at home. It is a lovely spot, inhabited by as cultured and lovable a group of Americans as one may meet anywhere. I do not wonder that people who write of it forget their positives and comparatives and deal in superlatives.

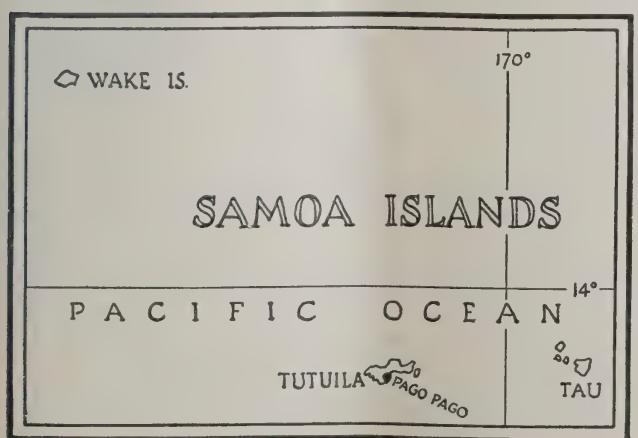
Hawaii has always been ours. Our missionaries laid the foundations not only of its religious but of its commercial life. None of the missionaries became rich, but a good many of their grandchildren did, and they made others including many native Hawaiians rich in the process.



(C) *Ewing Galloway*

Street scene in the business section of Manila, Philippine Islands.

Commercially, politically, historically, educationally and religiously the islands of Hawaii are part and parcel of the United States. When the ship is sailing away, and a hundred hands on deck are holding to the upper ends of narrow paper ribbons whose other ends are held by friends on shore, and the bands are playing and schoolchildren are singing, and people are shouting 'Aloha,' there is a tugging at one's heartstrings that does not snap when the paper ribbons break. Hawaii is ours.



Far, far beyond Hawaii lie the Philippines. They are much farther away than they appear upon the map. In getting to them we go first to Japan, then to China, and then we sail for two days and nights from Hong Kong before we follow the wake of Dewey's ships into the bay at Manila. But after having visited two or three Japanese ports and as many belonging to China (if Shanghai and Hong Kong can be said in any proper sense so to belong), it is a joy to reach Manila.

Here again we are at home. Long lines of faces appear on different levels of the dock, and they are waiting for us collectively and individually. Before long we shall hear our own names called, and shall recognize faces that we know well. We shall meet with our own kind of folk, and we shall leave amid the music of bands, two of them on opposite ends of the pier, playing airs that we love. We shall not be able to keep back the tears, and there will be no shame in that, for other people will have trouble enough with their own eyes and will not be peering into ours. We shall find Manila clean, sanitary, cheerful and hospitable.

But we shall feel a sense of strain. The Government, since the administration of President Wilson, has been thoroughly Filipinized, and we shall hear pitiful tales of graft and incompetence. Governor-General Francis Burton Harrison, who endeavored whole-heartedly to carry out the Wilson Program looking toward immediate independence of the Philippine Islands, may have some friends on the islands who speak well of his administration, but I did not meet them. General Wood has endeavored to return to the more gradual policies of his predecessors, and has suffered much criticism.

One reels sorry for General Wood. The governorship of the Philippines must have been a rather poor consolation prize to a man who thought that he had the Presidency within his grasp. His vetoes are most unpopular, though, as far as I could learn, he vetoed bills that greatly needed to be vetoed.

When we ask whether the Philippine Islands are as yet sufficiently unified and whether they have trained an adequate leadership to make independence safe, the answers that I am able to get are not reassuring.

I asked some of the wisest and most experienced men in Manila, including some who are in full sympathy with the movement for independence:

'What would happen if the United States should withdraw prematurely?' and their answer was:

'First, civil war; and secondly, the occupation of the Philippines by an Asiatic power.'

They all named the power which they thought likely to get the Philippines if the United States should withdraw, and I think I need not mention it, as I prefer not to do so needlessly; but the impression is widespread that something of this kind would occur.

To be sure, there are those who say:

'That is not our concern; we promised to get out, and it is time we were out; we have no concern with the consequences.'

On the other hand, it would appear that, having entered and being in, we are responsible for the time and manner of our exit, and should determine our future course in such manner as to further the welfare of the islands and the peace of the world. At any rate, the islands are now ours, by conquest and by cession of Spain.

Uncle Sam is not at present in the market for more islands, though it would be a safe guess that he is likely to have others wished upon him. At present he literally has so many islands he doesn't know what to do.

This, at least, may do one's heart good, as he journeys from Cuba to Panama and from Panama to Hawaii and from Hawaii to Manila, that Uncle Sam in each of these places has dealt generously with the people and to their profit.

In each of those tropical lands was pestilence and ignorance and oppression. Now there is sanitation and education and a very large degree of freedom.

What the future has in store is yet to be revealed, but up to the present time Uncle Sam has dealt fairly with his islands.

## In Next Week's Issue

### An Army Officer

declares 'the Regular Army is now wavering in spirit and sick of its hopeless task. A Regular Army of 118,000 has been trying to do the work originally laid out for 280,000.' The writer sets forth the needs in plain terms which every taxpayer should desire to read.

### The Pullman Surcharge

When the railroads needed financial assistance, the surcharge was imposed as a war measure, and, as such, is now both obsolete and unwarranted by law. Millions of vacationists who have felt the burden of this charge will want to know why it hasn't been repealed.

### 'Voyage of the *Victoria*'

In the tenth of this series about the exciting expedition of Magellan is an account of the desertion of the *San Antonio* from the party, and discovery of Guam and the Philippines.

### College Days

will soon be at hand. Many young men are battling with the problem of whether they can attend college and support themselves, too. A college faculty man has written out of long experience a helpful article for students who contemplate such a course.

# 'Bad English' Is a Heritage

(*Concluded from page 8*)

a glorious past. The double negative, the triple negative, the quadruple negative, are all found in Chaucer, and the double negative still reappears in the work of careful writers.

Those who fancy there is a psychology in languages might explain that this is because the English language loves to add stage to stage in expression, and degree to degree.

For the same reason, in the Scriptures and in Shakespeare, we see a double superlative, 'the *most straitest* sect of our religion,' or 'the *most unkindest* cut of all.' 'Straitest' and 'unkindest' are coldly reckoned by grammarians as 'superlative' words, or 'last words.'

But the Elizabethans sought a superlative beyond the superlative, as Shakespeare, after something was deemed perfect, deemed that another thing might be 'perfectest.' A method of double comparison is used by Dickens as part of the entertaining vulgarism of Samuel Weller, who speaks of a 'more tenderer' word. But 'more fresher' and similar expressions are common in the writings of the Tudor period. Perhaps no further extension of superlative is possible in the address of Edmund Spenser to the Creator as 'the Moste Almyghtie Spright!'

When our Seth Thompson was a little boy, no form of expression was so frowned upon in school, or so sedulously practised on the playground, as to say 'walkin' ' and 'runnin' ' for 'walking' and 'running.' As one of Seth's chums explained to his mother, 'I've been stayin' after school studyin' about always puttin' in my "g's." ' Here again is a struggle between our current English with its 'g' at the end of the present participle, and another English, older than the use of pigtail queues in China. For those old Saxons, and Angles, and Jutes, formed the present participle in 'nd' or 'nde' instead of 'ng,' and during the Elizabethan period the 'n' alone was the universal ending in common speech and in much of the writing. Queen Elizabeth, who was one of the most scholarly of women in an age of scholarly women, omitted the 'g' in 'beseeching' in a letter to King James VI of Scotland, who was destined to succeed her as King James I, of England.

*In the Age of Queen Bess*

The omission of 'g' would be described by many as a mispronunciation rather than an error in grammar. But the history of this mispronunciation takes us back into the history of grammar. When a boy mispronounces, he follows the tradition of the 'ungrammatical' spoken language, which in its very ungrammaticism rests on an ancient grammar of its own.

We all had sad hours in school, struggling with the sanctity of pronouns, while outside of school these things were treated wholly without reverence. Here also the living speech of careless people goes back to ancient times. If we had no grammars to fix rules for us, and wished to rest our whole language on the example of great writers, we could find in the greater writers of Shakespeare's time such expressions as 'between you and I' and parallels to 'it is me.' The latter expression would be described as ungrammatical because 'it' is in the nominative case and 'me' in the objective case. Yet in Chaucer's time 'you' was also in the objective case and objective only.

Our Elizabethan ancestors began to use 'ye' and 'you,' 'us' and 'we,' 'he' and 'him,' practically without regard to case, and 'who' and 'whom' are used interchangeably. The language in Shakespeare's time had apparently not fixed its form in the matter of pronouns. Now the bookish form is more fixed, but the living speech of the Anglican peoples remains to a large extent in the old interchangeable and indeterminate stage.

Among the pronouns we number another which was precious to the Yankees, the possessive 'ourn.' The Puritans and their descendants might justly cherish this word, this possessive pronoun form, for it is out of the English Bible of John Wyclif. That Bible is no longer read, for a greater and better has taken its place, but 'bad English' has shown its virile power in this word. It is not a vulgarism. It is not a dead word. It is not a grammatical error. It is a living word that has come down from mouth to mouth as the ballads sung in the Tennessee Mountains have come down through the generations.

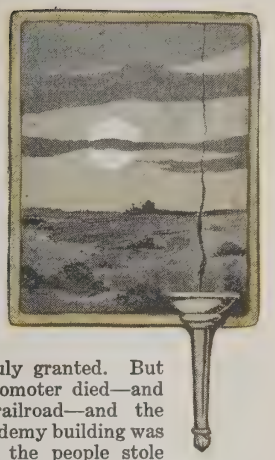
*A Scholar and Christian*

Roger Ascham, the tutor of Queen Elizabeth, was a scholar and a Christian. He loved cockfighting, which he said was 'fit for a gentleman.' Not all gentlemen of today would agree with this. Not all gentlemen and scholars, either, would write, as Ascham writes, of 'ten mile,' or use other of Ascham's plurals without an 's.' A modern English ambassador to Spain would not say 'strenth' for 'strength'—still less would he write it, as did Sir Thomas Elyot, who was sent by Henry VIII to the court of Emperor Charles V.

But we do not have to go to old libraries, with the works of Ascham and Elyot, to hear of 'ten mile' and 'men of stren'th.' They survive among us, like cockfighting. And like cockfighting they are more ancient than some more effete things, and they hark back to ages when gentlemen and scholars indulged in them.

It might be interesting to trace out in the books of the past to find out how much the survival of this Old English, which we call bad English, was due to Lindley Murray and his slavish followers, who preserved every imaginable bad form to give toil to young minds in setting these bad forms right. The pedagogical effect of Murrayism, without doubt, was to make good English repulsive by toil, as has happened to Greek and Latin in thousands of schools.

*Lindley Murray's Responsibility*



Whether he helped to keep alive the condemned forms and locutions by keeping alive the spirit of revolt through his preposterous method of instruction is a subject worthy of some inquiry, for everything relating to the English language is worthy of inquiry.

But in all probability the forms would have survived in some degree, even without Murray's disapproval to make them appear charming to generations of bewildered youth.

If we can look directly at 'bad English' as something perfectly understandable, reasonable, and logical in itself, we may have better fortune with our own use of speech.

# Some Vanished Towns of Kansas

## Cities That Died Before They Had Lived; State Capital Which Could Not Be Found

By J. T. FARIS

HORACE GREELEY is credited with the statement, 'It takes three loghouses to make a city in Kansas, but they begin calling it a city as soon as they have staked out the lots.' A writer in the Kansas City *Journal* enlarged on the statement of the veteran journalist by saying:

'The early Kansan was essentially a town builder. The settler who did not dream dreams of a future metropolis on his quarter section was very much the exception. Every county in the state has had from three to ten towns which flourished for a brief spell and then decayed slowly or went quickly before the violent assaults of some successful rival.'

A pioneer of the early days in the Sunflower State told how, from five to six years before the beginning of the Civil War, interests in town sites—usually twelve lots to a certificate—were almost a part of the wildcat currency of the day. 'Lithographs, showing beautiful parks, with fountains playing, band stands, ornamental trees and shrubbery, surrounding magnificent public buildings, beckoned onward the "tenderfoot" to fortune who never had "speculation in his eye" before.'

There are three or four reasons for this wealth of new towns, many of which never got past the surveying stage, while others became prosperous for a time, then passed into oblivion; the fact that for the first years of its history Kansas was a battle ground between those who favored the extension of slavery and those who were just as bitterly opposed to that extension; the fact that it was on the route of the immigrants to California; the rivalry of claimants for the county seat in a state that was settled almost overnight; and the coming of the railroads, which doomed more than one promising settlement, while they brought into being other towns that have become important.

A scene of desolation down in Kansas showing abandoned buildings.

In many cases all these causes had an influence on the same town. There was Indianola, founded in 1854, about the same time as Topeka. Topeka was then at a disadvantage, not only because Indianola was on the government road from Fort Leavenworth to Fort Riley—a road used by the through stages—while Topeka was far from the recognized routes of travel, but also because Topeka was founded as a free-state town, while Indianola's people were advocates of slavery—and so were on what was, for the time being, the popular side.

In 1865, when the Kansas Pacific Railroad was surveyed, there was joy in Indianola because the route passed by Topeka, but went through Indianola; to reach Topeka it would have been necessary to follow a bend in the Kansas River, and it would be much cheaper to cut across the bend.

The road seemed more than ever assured to them when a contractor gave to people of the town an order for the ties to be used for the new road. The work was done promptly and zealously. But the ties were never paid for. While Indianola was busy preparing ties, Topeka was making cash arguments which led to a change in route. Indianola was to be passed by, and Topeka was to have the road. The ties were hauled back home and used for corn cribs. And when the railroad was finally completed, the inhabitants moved their houses and stores to Topeka. One building—the hotel—was too large for removal, and stood for many years, a grim reminder of the departed greatness of Indianola.

Another railroad was responsible for the failure of Moneka, in Linn County, a town incorporated in 1857. Its proprietors felt sure it would be one of the great cities of the West. When, a year later, there were some two hundred persons within its limits, they thought they had made a good start. The building of an academy was also a promising sign, while another was the presence of a hotel where a number of territorial governors and many free-state leaders were entertained.

The leading citizens planned a railroad from Jefferson City to Emporia, which was to have Moneka for one of its chief stations. The company was organized, the charter was obtained, while Congress was asked to give the right-of-way and make a donation of public lands. Even the surveying was done. Ground was broken, and the right-of-way was duly granted. But the leading promoter died—and so did the railroad—and the town. The academy building was removed, and the people stole away to other communities.

A relative of the railroad promoter entertained in his home John Brown and some of his companions. When Brown left Kansas, he corresponded with him. It is said that the plan to liberate Brown from jail at Charlestown, West Virginia, was made in the house of the Kansas host of other days, and that only the refusal of Brown stood in the way of attempting to carry it out.

Linn County has another forgotten town to its credit—Paris, which, before it passed away, became much larger than Moneka. Its boast was that it was officially located by the legislature, but this legislature was one of the bogus bodies for which Kansas became noted in the troubled days before the Civil War.

Paris was remarkable for the free-state views of its people. They even drove out the man who owned the claim on which the town was located, because he was a Southerner who was not always wise in his method of standing up for his pro-slavery convictions. Later—in 1857—the man who expelled him became the leader in the country's first free-state convention, which was held in a sawmill near the town.

Elections were ticklish affairs in Kansas in those days, and care had to be taken to preserve order and protect the freedom of the ballot. The method adopted in Paris, on the occasion of the election that followed the free-state convention, was to have the voters stand outside the log courthouse, while they called to the judges and clerks inside the names of those for whom their vote was to be recorded.

In 1859 came a much more fateful election. The question at issue was, Should the county seat go to Mound City, or remain in Paris? Paris received 471 votes, but Mound City had 508. But the county officials, who owned property at Paris, refused to move the records to the new county seat, 'whereupon a number of citizens of Mound City, armed with pistols, shotguns, rifles, and a cannon—"Brass Betsy"—appeared early one morning on the public square of the town and made a pressing demand for all the books and records of the various offices. The demand was at first

refused, and the officers denied all knowledge of the whereabouts of the county records. After some strenuous persuasion, however, they yielded and brought them out from under the puncheon floors of several buildings, delivering them to the hands of the invaders.'

And that enforced surrender sealed the doom of Paris. Early in the sixties the town was no more.

Old Minneola was the victim of the failure of even more ambitious plans; it was the purpose of many to make it the capital of Kansas. Lecompton was the capital, but the free-state legislature did not like the pro-slavery atmosphere of the town, and they frequently adjourned to meet in Lawrence. Yet it was thought better to have a permanent capital where the sentiments of the people would be free-state, so choice was made of a site in Franklin County. Nine quarter-sections of prairie land were bought for $3,131. Within six weeks a hotel costing $8,000 was on the ground and a hall for the legislature was ready.

When the legislature, in 1858, made Minneola, thus equipped, the capital, it provided also for a number of railroads.

But the dream of Minneola was not to be fulfilled. Acting Governor Denver vetoed the act making it the capital. An appeal was taken to the Attorney-General of the United States, who decided that the act creating the new capital was not in conformity with the act creating the territory of Kansas, and was, therefore, void.

So Minneola was left to its fate—absolute disintegration. The site—far from that of present-day Minneola, in Clark County—is now farming land.

In 1856 it was decided by an ardent abolitionist to have a town for abolitionists. So Sumner, three miles from Atchison, was chosen.

The first blow to Sumner was the coming of the railroad to Atchison. 'The smoke from the locomotive engines drifted to Sumner and enveloped it like a pall. Sumner's race to extinction and oblivion was rapid. One day there was an exodus of citizens; the houses were torn down and the timbers thereof carted away, and the foundation stones were dug up and carried hence. Successive summer rains and winter snows furrowed streets and alleys beyond recognition and filled foundation excavations to the level, and ere long a tangled mass of trees and brambles hid away the last vestige of the once busy, ambitious city!'

*Then There Was Rome*

Perhaps the local historian who wrote that epitaph was too loyal to Kansas to tell of the tornado of June, 1860, that helped along the destruction. But the tornado must be given due credit.

In 1867 there was but one town in all the western half of Kansas. That town was Rome. It was born of the railroad, and it died when the railroad passed on. But in the meantime its history was glorious. It was a typical pioneer railroad community. The first house was a tent. Soon Buffalo Bill (W. E. Cody) built a handsome stone store, where he did business for a time. Within a week there were five hundred inhabitants, and soon this number quadrupled—business men, soldiers, railroad graders, gamblers, hunters, and cutthroats. The stores did a tremendous business—especially the saloons.

When the railroad built an embankment between Rome and the new town of Hays City, thus cutting off Rome from Fort Hays and throwing the fort's custom to Hays City, the doom of Rome was sealed. A year later came the cholera, which took many of the people who had resisted the appeals of Hays City to move over there. And by 1870 the town was gone.

The annals of Kansas contain nothing more diverting than the story of the bitter fight between Leoti and Coronado, which issued in the extinction of the latter. Leoti had its beginning in 1885, while Coronado—three miles distant—was incorporated a few months later. In little more than a year Coronado contained more than one hundred buildings. But—and this fame to the town—there was a newspaper whose editor waged bitter war with the editor of the Leoti paper. Such country-newspaper conflicts were at that period common incidents of the growth of many young towns; that between the rival Kansas towns was thoroughly typical. Each town—through its paper—charged the other with lies, forgery, fraud, trickery, bulldozing and intimidation, and finally with murder.

*Leoti and Coronado*

The secret of the trouble was that both Leoti and Coronado wished to be named the county seat of the county in which both were located. Leoti managed to get the first advantage by persuading the governor to take a census of the proposed territorial unit, as a preliminary to organization. Now the census-taker appointed was a citizen of Coronado. Leoti might not have been troubled, but for the statement made by the editor of the Coronado paper, 'As a public official Mr. Brainerd intends to do his work impartially, but, as a citizen of Coronado, he is for this town first, last and all the time.'

On November 12, 1886, the census-taker reported to the governor that there were 1,095 householders in the proposed county, with 817 voters. Yet a month earlier, in charging Coronado with unfair action in delaying the organization of the county, the Leoti paper had accused Coronado of tricky legal action which deprived 'nearly one thousand voters of their right of franchise.' And in November a delegation from Leoti went to Topeka to find the census-taker, intending to charge him with conniving with Coronado to delay the organization of the county, 'because they were unable to get enough signers to their memorial to make Coronado the county seat.'

The governor listened to representatives of both towns, and decided to appoint a disinterested commission who should canvass the county for votes for the county seat.

When the result announced was 451 votes for Leoti, and 285 for Coronado, the Coronado people explained the success of their rival by saying: 'No doubt Leoti has a majority of the votes cast. Four townships were intimidated from voting by the presence of 72 teams loaded with rifles, shotguns and imported bulldozers from Walla, Greeley, and Hamilton counties, 242 in number, put there by Leoti agents.' Whereupon the Leoti paper came back with the charge that Coronado men had said that they would win if it cost them $50 per vote, that they had imported men from other counties, and that they had employed a United States marshal, without authority, to guard the polls and that the polls in Coronado were 'covered by men stationed in stairways and second-story windows, armed with Winchesters, and that in addition to these they had 300 armed men to use in case of an emergency.'

The good feeling between the towns was not increased by the trip of a Leoti man to Coronado to argue with the local editor. The argument was carried on with a horsewhip. The editor of a paper in a neighboring county was a partisan of Coronado. He told how 'Leoti was the scene of a genuine cowboy raid. Anticipating trouble over the county-seat war, Leoti had sent to Wallace after a band of fifteen or twenty cowboys, armed to the teeth, to assist in protecting their rights. Not being needed for protection, they proceeded to shoot up the town. The post office was riddled with bullets, every business building fired into, men were compelled to dance at the point of fired revolvers, including the county clerk, and one man was shot through the foot.'

Acting on the report of his commission, the governor, on December 24, 1886, proclaimed the new county, with Leoti a temporary county seat, the permanent location to be chosen later.

In February, 1887, the election was held, but more than 400 Coronado boomers refused to vote, claiming that the election was illegal, because of a legislative action which, they declared, postponed the election until March 10.

Then came disorder, and the killing of several Leoti men by Coronado sympathizers, and the calling out of state militia to guard Leoti against Coronado attack. 'Leoti was closely guarded to prevent surprise from the enemy, and a large rifle pit was dug near the town well at the center of the town. Pickets were also placed around Coronado to prevent the escape of any of the citizens before the authorities could get action.'

Fourteen Coronado men were arrested and taken to the Leoti jail. Later a total of twenty were under arrest, 'all prominent business men, including a banker and the president of the town company. Most of these were released later, for lack of evidence, but one man remained in custody, awaiting trial. A Leoti mob tried to take him from custody, intending to lynch him; they were prevented only by a sheriff who fired into the mob. The man was finally acquitted by jury, though it was necessary to take him to another county for a fair trial.

The next chapter was the visit of a mob from Leoti to Coronado, seeking vengeance. While some Coronado people were hurt, the death of the leader from Leoti was the most tragic result.

*Passed Into History*

Leoti was again victor in the legislature on March 10, 1887, whereupon the Coronado paper came out printed in red, with the picture of a spread-eagle and a crowing cock—claiming the victory because of fraud. It was charged that Leoti had cast 500 illegal votes, and that Coronado had been intimidated from casting a full vote by armed forces intrenched in rifle pits around the polls. But the impartial historian says that 'both towns were fortified by earthworks and rifle pits.'

The fight was continued until September, 1888, when Leoti offered to give lots to all Coronado citizens who would remove to the county seat. The offer was accepted with alacrity, and within a few months nearly every building in Coronado was moved to Leoti. And in the spring of 1889 the president of the Coronado town company was elected a member of the Leoti city council!

So Coronado passed into history. But Leoti did not reap the fruits she had hoped for; she has never become more than a little country town.

# Judy O'Grady and the Colonel's Lady

(*Concluded from page 3*)

that the medical profession of Britain has swallowed the doctrine bait, line and sinker are absurd and childish.

The medical profession by and large, the world over, repudiates Freud, his theory of the neuroses, and his system of therapy. Psychologists have always denied him, and now artists, litterateurs and critics are beginning to line up with them.

To leave this statement unqualified would do Freud an injustice and the public an unfairness. If one were to ask one hundred physicians who had received their training in nervous and mental diseases in the present century whether they were Freudians, probably ninety-five of them would answer in the negative. Were they asked, however, whether they subscribed to some of his doctrines it is likely that more than half of them would reply, 'I do.'

I think there can be no doubt whatever that many of the psychoneuroses, those extraordinary invisible fetters that immobilize so many of us, have their origin in maldevelopment of the sex instinct and in improper distribution and storage of the energy of the sex dynamo. And there can be no doubt also that all men are not born equal, despite the Declaration adopted unanimously July 4, 1776. Some of them are so colossally unfortunate as to be born with the material from which an Oedipus complex is made. There are only a few of them in the world but they merit our commiseration and need our prayers.

Proponents of psychoanalysis point out that the medical profession has often shown hostility to innovation. Members of it have, unquestionably, but the profession as a whole since the days of modern enlightenment, never. The number of physicians in the whole world enrolled under the Freudian banner at the present time is extremely small, probably not more than a few hundreds. The reason it is so small is not to be found in their neglect of it. Physicians have studied it, attempted to adjust its tenets to their experience, and finding it wanting they have discarded it *en masse* instead of piecemeal.

***Vienna and Freudism***

It is not probable that this would be the case were the tenets of Freud's psychology and philosophy sound. The credibility of a thing is what makes it go. If a statement, a happening, a prophecy is incredible, it is next to impossible to get it accepted, and that has been the fate of the teachings of Freud.

It is quite possible that the reason American, French, German, Italian psychologists and physicians have not been able to reach the same conclusions as Freud and his followers is that they work with different material.

Austria-Hungary before the Treaty of Versailles became effective was an extraordinary country. It was a country of many nationalities which had tried the melting-pot experiment for centuries and failed. Its capital reflected culture and sensuousness as did no other capital of the world.

Into it poured an oriental stream of immorality that it absorbed as if it were a desert. It exalted convention and debased morals. And this had gone on for generations.

The result was that Vienna came to number among its inhabitants a greater number, proportionate to its population, of non-conformers to the standards of morals and ethics that modern civilization professes to uphold than any city of Europe. That was the material from which Sigmund Freud fashioned his doctrine and in a measure at least it influenced or permitted his conclusions.

The grist that a mill grinds depends upon the material that is put into the hopper; how it is ground depends upon the mill.

***Hypothesis of Oedipus Complex***

Working from the material that he had, one can understand that Freud might be led to say 'you will not be wrong in attributing to every child a fragment of homosexual attitude,' or to contend for the emotional relationship existing between mother and son, father and daughter, that he does.

That such relationship sometimes exists has not been the secret of the novelist or the priest; everyone who has studied behavior knows it. But only Dr. Freud and his disciples are ignorant of the fact that it is the exception, not the rule.

In some of the countries of the East, whose opulent, unmoral and effete flowed so naturally into the Vienna of former days, incest is not held in holy horror as it is in other parts of the world.

I can understand that Freud working with this material developed the hypothesis of the Oedipus complex, but in latter years as his clientele became more cosmopolitan, or perhaps I should say occidental, he doubts its universal applicability. He has now got so far on the road of regeneration that he admits that there is no Oedipus complex in the normal adult. He still claims we were born with it but we normal adults shed it as a snake sheds his skin.

For this delivery we can never be sufficiently grateful.

Man's self-preservative urge whose signal is hunger is greater than his species-preservative urge whose signal is lust. It is they, and not the shoulders of Atlas, upon which the world rests. Why has not the one molded and impregnated the 'unconscious' as Freud claims the other has done?

Why throw the entire weight of the world on one support when there are two? It is not easy to understand why infantile hunger impulses do not enter the 'unconscious' and why their conversions have not been observed, their transformations noted, their resuscitations studied, their sublimations exalted.

***Has Taken a Few Sick Souls***

It is not, as many of his followers think, the emphasis that Freud puts on infantile sexuality that prevents the rank and file of thinking men and women with open minds subject to enlightenment from accepting his doctrines. It is the arbitrary and arrogant way he insists upon his hypothesis of the 'unconscious' and its content; on the untenability of his theory of infantile disposition with certain resultant psychic mechanisms; on the experience of countless investigators who deny the universality of his 'incest-complex' and who maintain that he has based it on experience with a few uncommon persons.

Finally they resent his effort to apply certain tenets of psychology established from experiment and observation on certain persons, practically none of them normal, to the whole world, when in reality they are applicable only to the world he knows.

He has taken a few sick souls and after studying them he has reconstructed a sick world, a horrible world in which no one save a few mystics and monsters want to live.

The experience of the past ten years has taught us the world is bad enough at best but to make of it a place where the normal development of all boys depends upon a castration complex or a homosexual desire for their father is to make of it a place where everyone would be determined, as Dostoevsky's hero was, 'to hand God back his ticket.'

It is becoming increasingly difficult to recruit for the medical profession the type of mind and character that it attracted in the past. It will be more difficult in the future should the Freudian teachings gain any considerable acceptance. Physicians have too much responsibility as it is. When they realize that they are a transfer station and the only way their patients have of ridding themselves of their Oedipus complex is to transfer it to their doctors, there will be an exodus of doctors from the world that will make the departure of the Israelites from Egypt look like an ordinary first of October.

***Some of the Riddles***

Freud claims that some of the riddles of the science of language have been guessed by his method of investigation but philologists deny him. He asserts that it modifies the hypotheses of philosophy and stimulates philosophic activities in new directions, but philosophers and psychologists with few exceptions contradict him.

Paleontologists do not admit that it brings any new contributions to our conception of evolution, nor biologists that it acts as a mediator between their science and psychology. Sociologists say Freud has spoked the wheel of progress, not spun it, and Roger Fry has recently published *The Artist and Psychoanalysis* to show that art does not originate in sexual feeling.

Only in the field of education does Freud seem to be acclaimed by many. He must be given credit for pointing out that it is dangerous violently to repress instincts in children which seem vicious and abnormal but which, properly handled, are the foundations of virtues which shall ornament their lives. And that these repressions, unrecognized and left to their own devices, often impair the usefulness and destroy the happiness of their unfortunate possessors.

Freudism may inaugurate an era of sex enlightenment. It may aid us to a better understanding of our instinctive nature; it may put some lighted lamps on the road that our inborn tendencies travel to reach the place where our personality becomes full-blown; it may help us guess the riddle of the Sphinx. Should it do any of these things, we shall not only forgive it its sins but bless it as well. But I venture to prophesy that before it can do any of them, it must burn, blow up or otherwise destroy the ark of its covenant.

# I Read in the Papers

'It takes nine tailors to make a man,' is given as explanation in a recent issue of *Notes and Queries*. 'In some place the ringing of the "passing bell" was begun, or concluded, with a certain number of distinct strokes of the bell, intended to be of an informative character and to indicate whether the purson for whom the bell was rung was a mae or woman, or a child. There were usually nine strokes for a man, six for a woman and three for a child.

### *Story of the Bells*

'In North's *Church Bells of Leicestershire*, the author, in speaking of tolling for the dead, says; "These tolls are called 'tellers,' and it has been suggested that the old saying, 'Nine tailors make a man' is a corruption of 'Nine tellers mark a man,'" meaning that three times three tolls or tellers are struck on the passing bell for a man.

'At Wimbletpn it is still the custom to strike three times three for an adult and three times two for a female on the tenor bell, but for children under twelve the treble bell is used, and the strokes are twice three for a male, and twice two for a female.'

A large amount of veneration is attached to some of the ancient bells of England. Many of them are inscribed with the names of the saints to whom they were originally dedicated.

ɛ ɛ ɛ

England, the United States and Canada have recently been treated to an exhibition of that border regulation that keeps European countries irritated with each other. A group of English women, mostly school-teachers, came to New York in the so-called special students' third class, which the steamship companies have established to replace the old immigrant traffic. These school-teachers naturally desired to visit New York City before traveling through Canada, their chief objective. The American immigration officers permit native Canadians arriving from overseas at New York to proceed directly to Canada without the rigorous port examination. But these English women were compelled to go to Ellis Island and strip to the waist to permit a close physical examination by a woman physician; they also were subjected to the questioning accorded suspicious immigrants from the purlieus of Continental cities. Canadian officials state that they informed the steamship companies that such an examination would be imposed upon non-Canadian tourists bound for Canada via New York. American officials claim that the examination was made at the request of the Canadian authorities and that a Canadian inspector was present at Ellis Island at the time of the incident. The question whether Canadian authorities could have obtained a special dispensation for this party, who obviously were not vermin-ridden immigrants, has not been answered. New York is full of people who would welcome enmity between the United States and Great Britain—and, naturally, some of these people—indeed, as a matter of fact, many of them—are in the port service. We have a whole file of tales about the special insults offered obviously English visitors.

### *Canada and Ellis Island*

ɛ ɛ ɛ

The tailors of Vienna are in arms against the so-called American custom of men appearing in shirts and belted trousers during the summer season. These thrifty tailors claim that they will be ruined if Austrian men go vestless and coatless during that portion of the year when the tailoring business is dull anyway.

At the same time a New York City trade notice calls attention to the tremendous increase in the domestic wear of shirts with soft collars attached. This summer has been conspicuous for the almost total disappearance of the starched collar from the necks of American men. It may not be too much to hope that eventually men will follow the lead of healthier women by totally discarding collars.

### *Vienna's Sartorial Revolt*

The style of men's suits is bound to be radically altered. The sack suit is all very well for those men of northern and cooler Europe which has nothing resembling American summers and where comparatively little motoring is done. A good appearance can be presented in such wear and it may be fairly comfortable. But in America the universal use of the motor car has demonstrated that the sack suit cannot stand such usage. The men upon the streets today no longer present a well-groomed appearance. One must go to country clubs and like places where the sack suit has been replaced by appropriate garments to observe men whose appearance is impressive.

The next step in American life will be for men to emancipate themselves from clothes that not only do not work but also militate seriously against one's health. Many a man has been hastened toward apoplexy by dark, tight-fitting suits and a tight, starched collar.

Journalistic ethics among members of the staff of the *Spectator*, student publication of Columbia University, grow broader. Recently the paper carried a story in which its night editor appeared as hero. The story went this way:

### *Journalism at Columbia*

An unexpected occurrence Saturday evening delayed the publication of today's *Spectator*. The night editor, George Elpern, was walking from the subway to the Bagnasco Press on Wooster Street when he suddenly heard a crash of broken glass. Two men rushed out of a jewelry store on the southwest corner of Prince and Sullivan Streets. A policeman who was a short distance away began to chase the robbers and to fire several shots at them.

One or two men, including the night editor, joined in pursuit of the burglars. They stopped short and returned the fire. A bullet grazed Elpern's left wrist. A physician in the neighborhood, Dr. Sebastian T. Courtzonis, fixed him up so that he was able to get the paper out, although seven hours late.

Regular newspapermen, who had not had the opportunity of receiving their training at such a school or on such an excellent college newspaper, were scooped on the story. They began to investigate. They discovered that no police report of the incident had been made. That no jewelry shop existed on the corner indicated. That no Dr. Courtzonis was registered, or listed in any directory. That Elpern bore no sign of a wound.

'Oh,' Elpern said, when they sought an explanation. 'I was in a tight place. I needed a box to fill a space in page one. So I 'faked' that piece. We do it all the time. Everybody in the office knows these things are "fake" when they appear, but, come to think of it, I guess they do fool people on the outside.'

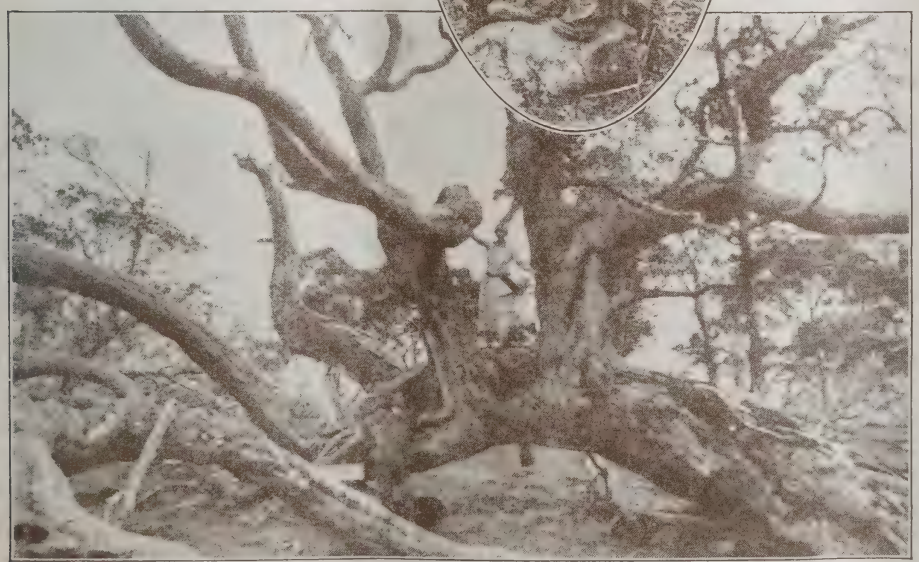
It was the *Spectator* that, last spring, discovered Scott Nearing as a great prophet. In bold type the paper declared: 'Scott Nearing Predicted British Revolution in Address Given on Campus Last February.' The article then went on to explain that Mr. Nearing had made the comparatively safe prophecy that the laborers would either back down or fight. 'And if they do fight,' said the far-seeing speaker, 'it will be a fight with guns!' The *Spectator* apparently failed to see the joke.

ɛ ɛ ɛ

The following 'ad' appears in a Cleveland paper:

Mr. Morris Moskovitz,
1668 Lee Road, Cleveland Heights, O., who has charge of the Kosher Sacramental wine manufactured by John G. Dorn, Sandusky, O., has returned from a trip to Palestine and will again call on Rabbis to assist them in procuring Kosher Sacramental wine which is under the supervision of Rabbi B. Gettleson.

# TREES—



## *Beautiful and Otherwise*

Above—Grass growing on trees—a common thing in Java, where this picture was taken. *(C) International.*

Oval—Curious part of a tree, to which some wag has donated a pair of shoes. Near San Francisco. *(C) International.*

Below—Crooked trees in Koa forest, about a mile from Kilauea volcano, Hawaii. *(C) Galloway.*

Above—A beautiful sight in New Orleans—the old dueling tree in City Park. Many a dispute has been settled under its limbs. *(C) Galloway.*

Right—Although this tree suffers from curvature of the spine, it has attained nevertheless considerable height. At Biloxi, Mississippi. *(C) International.*

UNIV OF ILLINOI

NOT to oversee Workmen, is to leave them your Purse open. Trusting too much to others' Care is the Ruin of many; for, as the Almanack says, In the Affairs of this World, Men are saved, not by Faith, but by the Want of it; but a Man's own Care is profitable; for, saith Poor Dick, Learning is to the Studious, and Riches to the Careful, as well as Power to the Bold, and Heaven to the Virtuous. And, farther, If you would have a faithful Servant, and one that you like, serve yourself. And again, adviseth to Circumspection and Care, even in the smallest Matters, because sometimes a little Neglect may breed great Mischief, adding, for want of a Nail, the Shoe was lost; for want of a Shoe the Horse was lost; and for want of a Horse the Rider was lost, being overtaken and slain by the enemy, all for want of Care about a Horse-shoe Nail.

—*Benjamin Franklin*
(*The Sayings of Poor Richard*).

# BRIEFLY TOLD

THERMOMETERS ARE BEING extensively used by fishing fleets. Cod and haddock usually exist in waters where the temperature averages between forty and fifty degrees.

VISITORS TO THE Wayside Inn on one day in July represented twenty-seven states and five foreign countries—England, Germany, Japan, Canada and Belgium.

FOG HORNS THAT automatically begin to blow whenever a thick mist gathers are being used more and more. Action of the damp air on calcium carbide sets the device in motion.

A BOOTLEGGER, ARRESTED in Toledo, was in the habit of spraying his customers with perfume to counteract the odor on their breath.

POSTAGE STAMPS BEING printed in England for the Turkish republic show the figure of a legendary hero with his pet wolf at his feet.

TWO THOUSAND MINNOWS are being sent from this country to Argentina in an effort to combat malaria there. The top minnow thrives on malaria-carrying mosquitoes.

MORE THAN $400,000,000 is hoarded away in mattresses, stockings, sugar bowls, cupboards, and other household hiding places in this country, according to experts of the United States Treasury.

THE GOVERNMENT RECEIVES an average of 52,000 letters a day asking and volunteering information. The topics range from buried treasure to the best diet for earthworms.

LATEST FASHION IN ENGLAND is for women to indicate their status or mood by ear ornaments. Two earrings means a woman is married; one in the right ear, that she is engaged. Circles and ropes of gems indicate that she desires no new acquaintances, while ear ornaments in the form of bells denote that she is out for a good time.

THE LOWEST KNOWN temperature is 269.5 degrees below zero—the temperature of liquid oxygen.

ONE OF THE EARLIEST attempts at blood transfusion took place in the 14th Century when an effort was made to prolong the life of Pope Innocent VIII. The attempt failed, and three youths who gave their blood died from their sacrifices.

TENNIS ON ROLLER skates is the latest California hobby.

SOLDIERS IN THE Revolutionary Army were paid $6.67 a month. Congress later voted them free land.

IN ADDITION TO CATCHING an eight-inch trout, a fisherman in the Adirondacks got a gold watch and chain, the fob on the chain having caught the line when the fish struck.

THE BRITISH POLICE force was organized in its present form just one century ago. The name 'Bobby,' so often applied to English policemen, is derived from that of Sir Robert Peel, who established the force.

TELEPHONE USERS IN Paris are now told, 'The number you asked for has been changed; consult the directory,' by means of a special phonograph, which is switched on automatically when a wrong number is called.

BUDAPEST HOLDS THE world's record for suicides with an average of five a day for the past several months.

AN INTER-GLACIAL forest—one which grew between two glacial eras and was covered over by the second glacier, thus being preserved for centuries—has been discovered on the north side of Mendenhall Glacier near Juneau, Alaska.

AN ENGLISH PEERESS, Lady Rodney, prepares the meals for the workers on her husband's ranch in Alberta. Among the farm hands are a French prince, a duke, a nephew of Lord Derby, and the son of the Duke of Manchester.

HELIUM HAS BEEN solidified into a transparent mass for the first time by Professor Keesom, of Leyden University. His predecessor, Professor Onnes, succeeded in liquifying helium but was unable to solidify it.

ITALIANS AND NEGROES are the largest purchasers of classical phonograph records, according to retail dealers.

A RADIO SET WITH a loop antenna mounted on a wheelbarrow is used by a Long Island farmer to entertain the employes on his farm while working in the fields.

IN NORTHERN SIBERIA some natives are reported to practise a form of hibernation, sleeping during the winter for days at a time.

FREE LIBRARIES ARE being organized throughout Turkey by the ministry of public education.

STREET-CAR REGULATIONS in Rio de Janeiro require male passengers to wear coats and socks.

FRENCH WAS THE SPOKEN language at the Court of England from the time of the Conquest to the reign of Edward III. English was then made the language of legislation.

WOMEN OF PRAGUE, Bohemia, alarmed at the rapid increase in membership in a bachelor's club, have appealed to the authorities to order the organization to disband.

THE USE OF GAELIC is becoming more and more popular in Ireland.

A POLICEMAN IN RICHMOND, Virginia, whose automobile collided with another car, promptly arrested himself for reckless driving.

ERMINE RECEIVED ITS cognomen of 'royal' from Edward III of England, who so liked the fur that he made it an offense for any persons except those of royal birth to wear it.

SAILORS PREFER the 'highbrow' type of literature, according to the American Marine Library Association. Writers like Scott, Shakespeare and Milton are more in demand than modern authors. Educational books are also popular.

A GASOLINE TANK being tested for army airplanes is bullet proof and so connected that it can be dropped from the plane to the ground in case of fire.

DUELING WAS SO POPULAR in France in the 17th Century that in one period of eight years more than 2,000 men lost their lives on the field of honor.

THE SMALLEST WATCH in the world has been produced by a Canadian watchmaker. It is so tiny that a Canadian five-cent piece will cover it.

HISTORIC FORT HENRY, whose gallant defense inspired 'The Star-Spangled Banner,' is to be restored by the Government. Plans have been made for equipping the fort as it was at the time of the British attack during the War of 1812.

CANDIDATES FOR MARRIAGE are now stamped in Turkey. Each person desiring a marriage license must undergo a medical examination, and to prevent any transfer of the permit the arm of the applicant is stamped with a number corresponding to that on the permit.

# THE ESSENCE OF THIS ISSUE

Mr. Ford's Page this week discusses the place of extremism in world affairs.

---

Americans are the greatest law-breakers on earth—*because there are so many laws to break.* In the past century and a half this country has enacted more laws than all the other countries of the world in all the time since Adam! Arthur Train, noted novelist and lawyer, has made a study of the 'fool laws' with which the nation is burdened. This is a good interview. (p. 2)

---

This is the time of year when thousands of boys are getting ready to enter college—and work their way through. Here is an article written by the assistant dean of men at the University of Illinois, which is chockful of good advice to such boys. Reading it is bound to save many a student a load of hard knocks. (p. 12)

---

Dean Turner tells not only of the common ways for working one's way through college—dishwashing, tending furnace, waiting on table, and so on—but he outlines some of the more unusual occupations—beekeeping, ambulance driving, lettering documents, decorating houses for dances, teaching golf, selling Christmas trees, apples. (p. 12)

---

The books of the New Testament began to be written when it became apparent to the companions of Jesus and eyewitnesses of His work that they must soon die. So they wrote down what they knew. Luke, of course, was not an eyewitness, but made independent research into the facts among the people before whom they had occurred. The story of the compilation of these books has been, until recent years, more or less shrouded in the obscurity of the ages. Now it is being pieced together bit by bit, from ancient documents dug from the sands of Egypt. One of the greatest collections of these scraps of papyri reposes at the University of Michigan. Harry A. Sanders, who is in charge of it, writes this article. He is recognized throughout the world as an eminent scholar. (p. 8)

---

It is unlawful in Los Angeles for street car conductors to shoot jack rabbits from the platforms of their cars! It is punishable by fine and imprisonment in New York City to drive an automobile around a street corner at a speed of more than four miles an hour. It is a crime to run a horse on a highway. A western state decrees that 'when two trains approach each other at a crossing they shall both come to a stop and *neither* shall start until the other has gone.'(p. 2)

---

The founding of another religion, Islam, has always been more or less a mystery to the western world. Moslems declare that their religion has been misunderstood, its true import missed. Muhammed, they say, led thousands of men from idolatry to belief in the one true God. This article is written by one who knows the East like the palm of his hand and, though a Christian clergyman, has a sympathetic understanding of the true spirit of Muhammedanism. (p. 14)

---

Bumptious American tourists are largely responsible for the current 'anti-American' sentiment in Europe. The man who pastes francs on his luggage to show his contempt for France's currency may be reasonably sure of offending every Frenchman he meets. The one who waves a fistful of bills—obtained at a low rate of exchange—in the faces of men who have toiled hard for the money can expect to incur enmity both for himself and his country. (p. 3)

---

Still greater responsibility, however, rests upon blundering politicians here and abroad. The French have been led to believe—by politicians—that their debts would be canceled, or at least reduced to a minimum. Secretary Mellon declares that our late allies knew that the funds advanced during the war were loans, not gifts. But is this as clear as he thinks it? No contracts were required by this country, no agreements to pay, no notes, no formal documents. Such a condition can easily give rise to misunderstandings. (p. 3)

---

The sadness of Abraham Lincoln has been attributed to various reasons. Dr. Barton, eminent Lincoln biographer, has discovered a new explanation in the Lincoln family traits. (p. 6)

---

What's happening to the army? A republic is apt to forget its defenders in the piping times of peace, to cut them off with scant attention. An army officer rises to protest. (p. 7) . . . The Pennsylvania delegation, led by Benjamin Franklin, had much to do with final acceptance of the Declaration of Independence. In view of Philadelphia's present unpleasant dilemma it is interesting to look back at that city's sturdy leaders of 150 years ago. (p. 19) . . . And S. F. Aaron, who writes so interestingly on nature, has a story on Agalena, the busy little spider, that you will want to read. (p. 5)

---

Once safely past the straits, Magellan was a changed man. He became almost affable; but the change was too late. One ship had already deserted, and grumblings were free among the remaining crews. Paul Honoré, on the cover, shows the *voyageurs* as they came to the island of Guam in mid-Pacific. (p. 16)

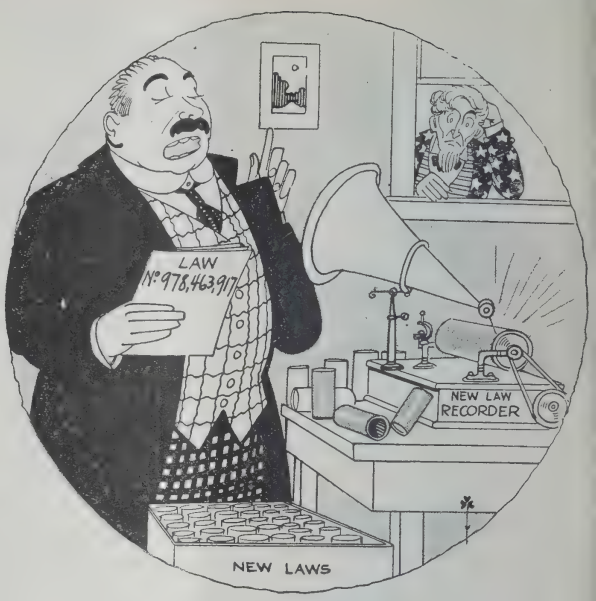
## Congressmen, State Legislators and Others All Join Merrily in That Great American Game—

# Let's Pass a Law!

By J. OLIN HOWE



ILLUSTRATED BY W. O. FITZGERALD

Herewith is Section 413 of Chapter 67, Kansas Laws of 1903, which chapter covers the operation of motor vehicles:

'Nothing in this section shall be construed as in any way preventing, obstructing, impeding, embarrassing or in any other manner or form infringing upon the prerogative of any political chauffeur to run an automobibulos band-wagon at any rate he sees fit compatible with the safety of the occupants thereof;

'Provided, however, that not less than ten nor more than twenty ropes be allowed at all times to trail behind this vehicle when in motion, in order to permit those who have been so fortunate as to escape with their political lives an opportunity to be dragged to death.

'And provided further, that whenever a mangled and bleeding political corpse implores for mercy, the driver of the vehicle shall, in accordance with the provisions of this bill, "throw out the life line." '

Americans have a perfect mania for lawmaking.

THESE United States are deluged with a flood of ill-considered, inconsequential and grotesque laws.'

The speaker was Arthur Train, noted author and attorney. He continued:

'They overlap and often nullify each other. Many times the law on a certain subject in one state is so radically different from that in another as to cause one to wonder if the two states belong to the same nation.

We Americans are the greatest lawbreakers on earth—*because we have so many laws to break!* I'm not talking about criminals who intentionally act outside the law. I'm talking about average men and women—decent citizens — you — I — everyone — who mean to keep within the law, but don't worry so long as the police and other authorities let us get away with it.'

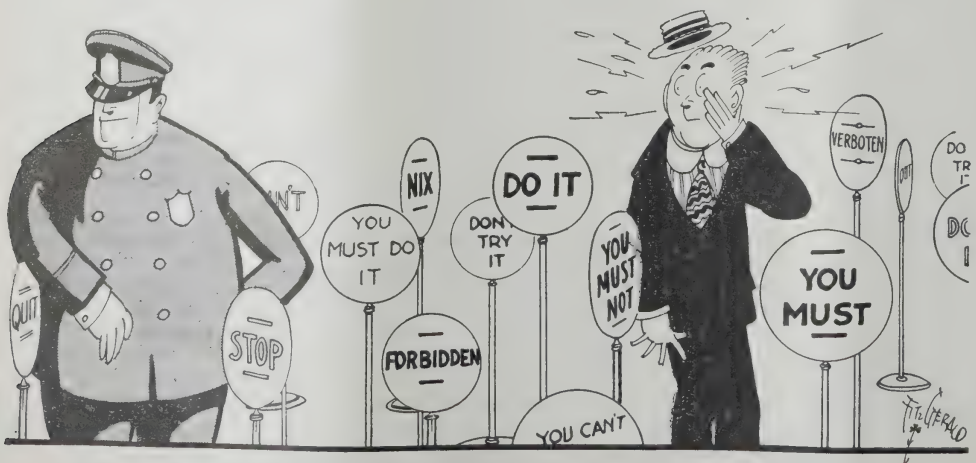
We were seated in that highly interesting library in Train's New York home where he wrote *His Children's Children* and other best sellers, and whence came Mr. Tutt.

He talked at length of the multiplicity of laws which encumber statute books over this country, fool laws, many of them, general laws enacted to cover specific cases, outworn laws or never meant for daily guidance, laws which could not be enforced without disrupting society, laws which you never heard of or dreamed could exist, yet the law of the land, nevertheless, under which all of us are supposed to live and within which we are bound to act by our oaths of citizenship.

'Americans have a perfect mania for lawmaking,' he cried. 'Our federal Constitution was drafted one hundred and thirty-seven years ago, and since that time we have framed and passed more laws to govern the conduct of our citizens than all others passed since Adam!'

How many hundreds of thousands are there? Train didn't know. But their number is growing constantly—covering every subject on the earth, in the heavens above and the waters beneath.

Out of the sessions of Congress and of our state legislatures in the forty-eight states there annually go onto American statute books upward of 15,000 laws—and many of the state legislatures meet but once in two years.



In a recent five-year period more than 62,000 separate laws were passed by these forty-nine bodies—an average of 1,200 or more each for the state lawmaking bodies and the rest for Congress—and it required 65,000 decisions of courts of last resort to interpret these. These decisions fill 630 large volumes.

Nor does this say aught of municipal legislation, ordinances and regulations of every kind under the sun, whose number is literally legion. In addition, there are thousands of interpretations and rulings of state and local departments.

'Even the best-intentioned of us, who go along regarding ourselves as law-abiding citizens,' Train said, 'can never keep from violating more or less of them. Probably most of us who live active lives disregard some law, ordinance, regulation or order about every day.

'The trouble is we make too many of 'em. From the beginning Americans have found little or nothing in human experience too intimate or too trivial for legal supervision and control—whether it be the sin of expectoration or the length of bed sheets.

'What makes it much more complicated is the fact that once laws get on statute books anywhere in (Concluded on page 31)

If the average man sensed his position before the law his pulse would go up every time he saw a policeman. We are the most law-ridden folk in the world.

# That 'Anti-American' Feeling

## Some Psychological Reasons Why It Exists in France

By A. R. PINCI

Americans arriving here have suit and camera cases plastered with French and Belgium paper money.—London news item.

FOR four years American visitors on the Continent have been the object of hostile demonstrations and even targets of attack. In 1922 it was in Berlin. In 1926 it is in Paris. Because both dates coincide with the fall of German and French exchange, respectively, it has been assumed that first the mark's and now the franc's depreciation have been the cause of what is described as anti-American feeling there. Reading press dispatches, or even being the witness to some such demonstrations—as the writer has been—fails to give an inkling of the truth and the facts behind the unfortunate events.

Partly for brevity's sake and chiefly because of its wider appeal, the term 'anti-American' has been used so indiscriminately that now it is reaching pregnantly suggestive proportions. Unless the tendency is curbed, Americans themselves, by loose reference to such a condition, will germinate a seed that would otherwise be sterile. There is anti-American feeling in certain parts of Europe, but as yet it does not exist to the extent which casual reading and hearsay would imply.

An unimpeachable proof of the fallacy of anti-American feeling will be found in the 1922 German experiences. Those led to nothing. Sporadic and essentially local incidents were forgotten as soon as method—method which reached the root of trouble—came to the fore.

Be it not forgotten that these conflicts are taking place in Paris, just as in 1922 Berlin was the chief scene. But what happens in Paris is no more indicative of the French attitude than what happens in New York represents America. By good policing Paris could be made quieter than a church and still the rest of France be ready for blood. The French population as a whole has made no move, spoken no word. The masses are so busy working and challenging the high cost of living that they haven't the time to imitate those who are idling and challenging the cost of high living. Thus the Paris incidents of today are superficial.

Yet a grave question enters here; whether there exists some definite movement for the purpose of ultimately enlisting the French people's support for what is the organized governing clique. What could be more ludicrous than the pretense of 'new cabinets,' of master minds, when these minds are the very ones which wrought what now they hope to remedy? French wage-earners, as elsewhere, must not think that the members of former fallen governments can perform a miracle by juggling a ministry and calling it a 'union government.' It is not a union government; it is a political union. Outsiders have waited in vain for some new blood, some new thought, some new plan.

> One contributing factor is common to both the German and French cases of 1922 and 1926, respectively—the hordes of irresponsible, bargain-mad, offensive American tourists who deliberately, boisterously, unmistakably go out of their way to vaunt the 'almighty dollar' and ostentatiously desecrate the natives' money.
>
> Generally speaking, it is this group which has exhausted the patience of Europeans who, on their part, are ignorant of the divers causes of their troubles. That group inevitably has involved the innocent bystander, so to speak, so that self-respecting visitors must suffer when the 'bum rush' is due and they are unfortunate enough to be around.

At this juncture the dollar appears as the scapegoat for the fall of the franc, with which the dollar has nothing to do. French officialdom has no intention to disillusion the people of France, however. The franc's position must be accounted for—but not at the cost of entrenched political monopoly.

A few American rah-rah boys, plus a few commercial travelers of a type too familiar to be described here, plaster French money where the world may see it as a sign of disdain. This furnishes the ocular proof that politicians are 'right' and Americans are wrong, and upon meeting a few Frenchmen who logically resent the insult, there follows the demonstration that is described as anti-American.

French merchants bewail these attacks as destructive of their 'tourist business,' and punitive machinery has been set in motion to check attacks on the alleged free spenders.

In 1922 I saw a small group at a table in a Berlin restaurant. One, waving a twenty-dollar gold certificate so that every patron could see it, called a waiter and said:

'Fritz, here's God's money! Bring a billion marks' worth of brandy.' As the waiter scurried away the chap turned to his companion and added: 'That's the way to knock these pretzel-benders for a row of tin cans!' (Guffaws.)

In 1924, before matters had gained much headway, but after the seed of discontent was germinating, I noticed a party of young men having their idea of a Continental good time at the well-known *Cafe Americain* in Paris. One of their favorite stunts was the 'peeling off of a bank roll big enough to choke a horse.'

'Let's give these frog-eaters something to think about,' one suggested. Whatever the suggestion, it was carried and on they went, to scatter new resentments, new antagonisms, which in due time would affect the good standing of the United States, its producers, its business.

A thousand respectable American tourists will be forgotten in an instant, while a single act of rowdyism will be eternally remembered.

While it is true that Paris is as highly commercialized as New York, and that a fat pocketbook will heal many a rumpus, dollars or any other kind of money do not buy self-respect. This has been too sorely tried by too many 'show-offs.'

What goes on in Paris in due time reaches the provinces, but fortunately, it requires years before such things can be crystallized into national sentiment. Unless choked at the source, however, incalculable harm may be done.

But has the French Government attempted to head things off? No. A certain amount of order is maintained through the usual police agencies, and Americans are protected from hostile acts, but dollar-unrest is permitted to go on, unabated.

Why?

Because the present governing clique fears that its continuance in office depends upon the easiest way out of economic bondage, which apparently it translates as release from international obligations. In other words, cancellation of the debt to America is a panacea sought. It does not have to be cancellation outright, but any arrangement which would mean non-payment.

It is significant to note that on July 23 Poincaré succeeded in forming what was termed a 'powerful national cabinet' which included, besides himself, five ex-premiers. Americans may well have their doubts as to whether a cabinet made up of so many admitted failures can be successful. Of course, it would be none of America's business, except for one thing, that the debt to the United States probably will continue the major cause of these several cabinets' downfall. French politics is now committed, to a certain extent, to obtaining radical concessions from the United States with respect to its repayment.

In the end it makes no difference what will be done; virtually no one in authority believes that European peoples will be able to repay dollars, in a dozen years or so, to the number which will become due about and after that time, short of an economic miracle which no one expects.

Dissatisfaction with the debt terms and French fury over the depreciated franc are a coincidence. It may be said that it is a desirable coincidence, politically. It furnishes French officialdom with mass demonstrations—whether these be the pummeling of a tourist or the maimed veterans' parade—and abroad are represented as an index of national French thought. In essence it is more a campaign for the success of French political thought than of the franc's stabilization.

Thus we come to the two fundamental causes that, unlike Germany's experience with the mark, have led to the franc's snarl. Those causes are near-diplomacy and cheap politics. Diplomacy which was not clear enough; politics which fostered misapprehension, and too much talk of a semi-private nature, have together led to a state of mind in France which can *never* be disabused. It is too late now, for any adjustment will not relieve France of the conviction that it involves a sacrifice.

The United States indulged in the near-diplomacy. France indulged in the politics. Here and there both have tried a bit of the other. Then came the self-elected 'friends of France,' who sprang in America out of nowhere and befogged the real issues. Help was offered; truth was hidden.

That the franc is hurt by causes which begin and end with the war, and not with the dollar itself, is something which French politicians cannot afford to explain. It would endanger the circle of anointed politicians who take turns in ministries which do not govern. Obviously, so long as the people of France look at the dollar they cannot see their politicians.

The newspapers played up the fact that several financiers recently sojourned in Antibes. It seems odd that these gentlemen should meet in the 2500-year-old former Antipolis at a time when their presence might complicate public opinion. Is it possible, if one took their protests literally, that Cour Masséna was the only object of their interest? Is it any wonder that the French people regarded the matter as boding the franc no good? And just what could those gentlemen do to save the franc?

The American attitude for a time appeared so conspicuously pro-French that France regarded herself as the object of much solicitude. The belief grew that France would be protected from the annoyances and troubles which other nations had to undergo.

> Just why European countries felt that the money borrowed from American taxpayers would not have to be repaid has puzzled quite a few, yet the answer will be found in the fact that the Treasury advanced billions of dollars carelessly, loosely, informally.
>
> Secretary Mellon on the eve of his departure, challenging Britain's contentions, said: 'It is clear that when the advances were made to our allies they knew and we knew they were loans, not gifts . . . ' Is it clear? There were no contracts, no notes, no agreements to repay. The United States did not require any formal documentation, and of course the borrowing governments did not see fit to suggest any. And in the United States no one was shocked when it was announced that nothing but a few memoranda, signed by the respective ambassadors or high commissioners, existed in the Treasury to account for the disbursements.
>
> If foreign borrowers have a loose idea about the debts, one must not be too severe, for the Treasury was very loose in its method of doing business. Even though it involved finance, the fact that it was a deal with foreign governments brought it within the purview of diplomacy. Thus American diplomacy really paved the way for the misapprehension which exists abroad.

The American people played no favorites; they liked their friends, honored their 'allies,' called it square with their former enemies. They indulged neither grudges nor illusions. Withal, the pro-French movement attained astounding proportions.

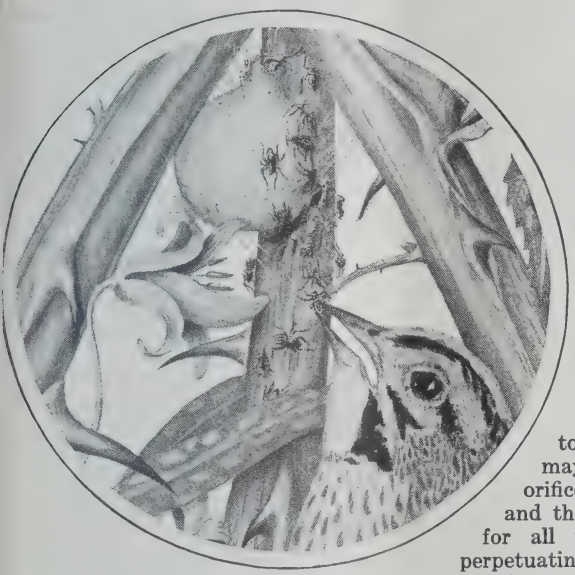
For example, Miss Anne Morgan, at the head of a 'devastated France' movement, did not suspect that the magic of her name might lead to misunderstandings, as it did. Rodman Wanamaker, late in July, suggested that Americans must assist France by establishing some sort of international bank, and the idea, cabled to the publisher of the Paris *Matin*, is another act to mislead the French into believing that the United States is the financial guardian of their country. And last, but not least, there is Myron T. Herrick, American Ambassador to France (under Taft, Harding, Coolidge and for a short time under Wilson), who has been dubbed—I was so told in Paris—the 'best French Ambassador the French ever had in America.'

So thorough was this general state of mind on the part of certain Americans who were prominent enough to export their thoughts where half a world could read them, that when a single dissenting voice was raised in a book written by an American banker the latter found himself minus a job for his effort. Yet he spoke prophetically, as a checking up of his statements will show.

The French situation cannot be as easily remedied as the German was. As soon as the mark was graced with a value adequate to goods and services, the bugaboo of exchange disappeared. Conversely, it killed off the bargain-hunting, offensive American tourist, who was out of the element once goods could not be bought by the ton with a few slips of 'God's money.' Germany pocketed its losses and then proceeded to forget them.

Today, in a little more than three years, the rentenmark has given Germany a self-confidence which France, one of the victors, does not possess. The French will not be as philosophical about pocketing losses as the enemy was, for obvious reasons, for they do not suspect their politicians, unless one might think of Herriot, whose part is insignificant.

Is there an answer?



Yes; one which comes home to roost; one in which the people of the United States had no hand and yet was played up in their name. The fault or guilt lies in about even proportions at the thresholds of the State Department and Quai d'Orsay. The mistakes of the war have been permitted to become the mistakes of the peace.

The war having been one of commerce and nothing more—trade jealousies of all kinds—it is inevitable that such peace as we have today should dwindle to a dollar-and-franc acrimony. The existence of commercialism has been defined by Secretary Mellon himself, but Great Britain, with the pound sterling at par, can afford to talk back and in talking to France, point to the United States. Groping blindly, the French people have jumped to conclusions, especially the conclusion that the dollar is suffocating the franc and that the pound also does it because America does it to Britain.

*This Is the Life Story of Agalena*

# The Silk-Spinning Tragedienne

## Whose Cruel Career Was Ended by One Stroke of the Poisoned Stiletto

Circle—The song sparrow catches a number of baby spiders as they emerge from the egg case.

By S. F. AARON

ILLUSTRATED BY THE AUTHOR

SUSPENDED among three thorny canes of wild blackberry that formed a very miniature tent and partial protection against weather and the prying eyes of hungry seekers of titbits, a buffy-gray, rounded little ball no larger than a Morello cherry remained throughout the long winter.

Stout silken threads firmly attached at both ends held the little ball in place; it swayed in the winds only as the spiny stalks swayed. Other than by these attachments the odd little object belonged in no way to the briers; it was as foreign to all vegetation as were the birds that in summer sampled the shiny, juicy fruit.

This little globular, silken, smooth thing was one of those correctly planned and skillfully made containers that are responsible chiefly for a vast number of crawling creatures. Moreover, it was not unlike in the material of its construction those oval and oblong housings of the immature stages of many night-flying moths: the objects commonly known as cocoons. Therefore, as may be surmised, it was by no means solid and the inside was far more wonderful than the outer surface.

A pair of so-called spinnerets—and no name could fit better—aided by eight relatively long legs, were the tools and appliances most largely used in forming the little ball during the latter part of the preceding summer. Upon its completion it became filled through the small, somewhat bottle-necked opening at its top with nearly three hundred tiny, golden-colored spheres about the size of number twelve bird shot. These lay *en masse* within a soft inner center of flossy silk, an added protection not against breakage, but against the too curious enemies that may thus be confused. The orifice was closed, the ball hung and the little artisan responsible for all this well-planned means of perpetuating a species was idle for a time, her rest well earned. Then, with the waning of the warmth, the falling of the leaves, the more eager hunting of bird and shrew, she vanished, her kind rarely hiding so effectively as to escape all enemies. Yet, all honor to her as a loyal mother that in compliance with the mysterious urge of nature labors thus persistently and daringly for offspring that she never sees, nor would recognize if she did.

The snows came and covered the little ball. The thaws disclosed it hanging there sharply brown against the diminishing white and it is a wonder that it survived. Chickadees, searching closely, came and inspected it, discovered the distasteful silken strands and turned away. So with the nuthatch and the junco. The whitethroat and song sparrow gave it a slight pecking, but there was nothing alluring about it to them. The deer mice, fearing to venture so far from cover, did not find it. The shrew regarded it eagerly; it is a case of nose with this smallest of quadrupeds and it discards nothing possibly edible. Hungrily emerging above the leafy covering of its semi-subterranean burrows it meant to make short work of going through the silken wall. But upon the instant a hawk-eyed shrike interfered and in a moment the stout-hearted little insectivore was decorating a nearby locust thorn.

A long-tailed black, white and russet bird scratched among the leaves about the briers, spied the little ball and craving such diet decided to give one squeeze with its stout bill and then—. But reynard of the rocky hillsides took a notion to cut across this way home and the long-tailed bird, forgetting the silken ball and calling 'chewink, chewink' as a warning to his fellows, went up into the bush tops.

Into the woods came another species of hunting biped—a flock, covey, bevy or herd—entirely bent upon mental food rather than that of the stomach. Arbutus was about to be generally uprooted; someone protested. Another, eagerly searching for hepatica, discovered the silken ball.

'Oh, look! What can this pretty thing be? It's tied fast.'

'That is the egg case of an Agalena spider, one of the funnel-web builders,' instructed the naturalist.

'Ugh! A spider! The nasty thing!'

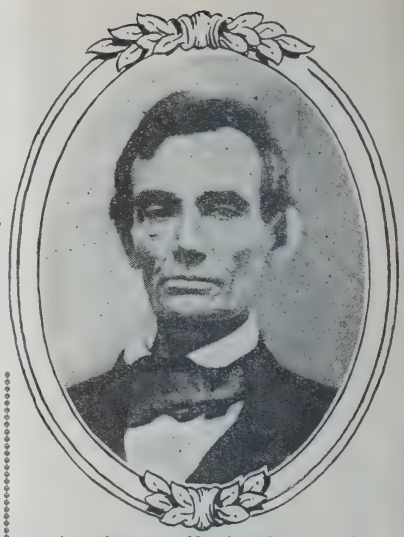
'Oh, Linda, how you talk! They are delightfully interesting.'

'Yes and often very beautiful in coloration and markings, even equaling the most gorgeous flowers and shells,' declared the man of science.

'And aren't they also very useful creatures, destroying flies, gnats and many noxious insects?' offered a fourth member of the party.

The returning and nesting birds, though eager to feed their clamorous young, missed

Agalena turns to fight her deadliest enemy, the potter wasp, whose sting causes paralysis.



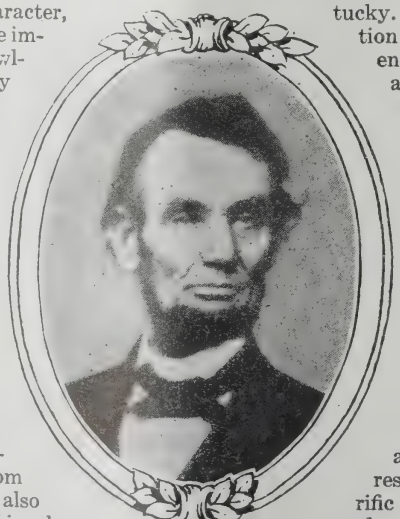
(*Continued on page 27*)

Because Melancholy Was a Family Trait
It Is Here Offered as an Explanation of

# Why Lincoln Was Sad

By WILLIAM E. BARTON

Abraham Lincoln was a man of many moods. At times he was boisterously mirthful, at other times placidly and almost lazily content. There were periods when he had a brooding, meditative sadness, and yet others when he was plunged into the very depths of woe. His law partner, William H. Herndon, who studied him more closely and for a longer period than any other man, said that 'melancholy dripped from him as he walked'



An ambrotype, said to have been made by Pearson, 1853.

MANY attempts have been made at explanation of the abysmal sadness which sometimes engulfed the soul of Abraham Lincoln. Three explanations are familiar. One which has been popularized by a noted dietitian attributes it to Lincoln's habitual indigestion. If he had eschewed hog and hominy and subsisted on a vegetable diet with plenty of bran, he might have been, according to this physician, a cheerful man.

Sentimental writers in no inconsiderable number suppose that Lincoln was never a happy man after the death of Ann Rutledge and that all through his life his alleged habitual sorrow for this sweetheart of his youth came upon him periodically with insupportable weight of woe.

A third explanation, and one which William H. Herndon, Lincoln's law partner, believed, is that Lincoln's domestic infelicity made it impossible for him to be happy excepting when he forgot the nagging disposition, unreasonable spirit, hot temper and stubborn will of Mary Todd Lincoln.

I believe that none of these explanations sufficiently explain this trait in Lincoln's character, and I am sure that one important source of knowledge has been wholly overlooked. Melancholy, as Lincoln knew it, was a family trait inherited from the Lincolns.

The Brady portrait of the President, made in 1864.

The discovery of this fact carries with it some measure of knowledge concerning Lincoln's relations with women, especially that hesitation with which he more than once approached matrimony and shrank from its experience. This also was native to the Lincoln temperament and was a trait possessed by others of the Lincoln family.

Abraham Lincoln grew up among the Hankses, relatives of his mother, but from them we know little of the Lincoln family traits. Of that family the most intelligent and best educated member was Dennis Hanks, a first cousin of Abraham Lincoln's mother. Dennis was a much abler and better educated man than John Hanks, also a first cousin of Lincoln's mother, child of her eldest uncle, William Hanks. Lincoln had more respect for John, but enjoyed a much longer companionship with Dennis.

In 1829 certain of the children of Mordecai Lincoln, eldest brother of Abraham Lincoln's father, Thomas, migrated from Kentucky to Illinois and made their home at the head of the Mississippi rapids nearly opposite Keokuk, Iowa. These members of the family carried on a more or less active correspondence with their brothers and sisters and cousins in Kentucky. A considerable portion of this correspondence has been preserved and is now in my possession. Mordecai Lincoln himself came to visit his children in 1830, the winter of the deep snow, the very winter when Abraham Lincoln was near Decatur prior to his residence in New Salem.

Mordecai Lincoln himself was overtaken in the storm and lost his life as a result of this same terrific snowfall and blizzard. His widow, Mary Mudd Lincoln, subsequently removed to Illinois and many years later died among her children. One of her daughters married a cousin by the name of Ben Mudd, and the Mudds also removed to this County of Hancock, whose county seat is Carthage. The descendants of this family of Lincolns are still there, and their records and traditions go back, not only to the beginning of this branch of the Lincoln family in Illinois, but also through correspondence and other records to their earlier life in Kentucky.

For our present purpose the most interesting fact about these Lincolns is that they were all subject to the same depression and melancholy which was so characteristic of Abraham Lincoln.

Here, then, is our entirely new answer to a question so many times asked and so variously and often wrongly replied to: Abraham Lincoln was a man of moods because that trait was congenital; it belonged to the Lincoln family. The Mudds, also, after their intermarriage with the Lincolns, inherited the same trait and knew from which side of the family they got it; they spoke of it as 'the Lincoln horrors.'

This answer is as interesting as it is novel. It is rather striking that no one has sought it out before. John Hay spent his boyhood in that same general part of Illinois, and he records in his diary his meeting with a representative of this same family. His name was Robert, a son of Abraham Lincoln's first cousin, Abraham. Robert died in Carthage, Illinois, September 5, 1868. Of him John Hay wrote: 'Rode to Carthage in the same seat with Robert Lincoln, a second cousin of the late President. He is forty-one years old, looks much older. The same eyes and hair the President had—the same tall stature, and shambling gait, less exaggerated. Drinks hard, chews ravenously. Rather rough, farmer-looking man. He says the family is about run out. "We are not a very marrying set." He is dying of consumption, he said very coolly. There was something startling in the resemblance of the straight thicket of hair and the gray cavernous eyes, framed in black brows and lashes, to the features of the great dead man.'

I have a particularly large body of material concerning (Concluded on page 22)

# *This Officer Says That It Is Time for a New Deal Because*

# Army Morale Is Sinking

By A STAFF CAPTAIN

IN THE publications of this country of late the Army of the United States has been under fire. First came the *American Mercury* with its articles on 'The Uplift Hits the Army' and 'An Army of Amateurs' which shocked many a conservative colonel and relieved the minds of many a distressed lieutenant, trying to do his best with skeleton troops and quarters dilapidated with age; with rotting sills, leaky roofs, warped sashes, wavy floors, and almost indecent plumbing.

Even at the crack posts of the service, where selected officers are trained in their specialties, these gentlemen are required to concentrate on professional studies in surroundings that would be a disgrace to any educational institution in the land.

Next came Paul Withington in the *American Legion Weekly* describing the appalling living conditions of the star troops of the famous Second Division. Then arose a colonel in the Air Service and criticized the entire War Department with seeming impunity until a court-martial seized him and staged a national show for his benefit, and even permitted him to try to call to account the General Staff and the administrative heads of the Army. Finally the Chief of Infantry stated in his annual report:

> Due to the small size of units, the excessive amount of fatigue necessary to maintain the temporary quarters in which many are sheltered, and the use of troops at the summer camps, there is but little seasonable time in which to carry out individual and organizational training. In the training of enlisted men and organizations, there is much to be desired.

Periodically we must scutinize our policies and our results. In the first years of a venture, we cannot always tell what the situation really is. Work and development shape the details.

The operation of the National Defense Act of 1920 has now been extensive enough for us to survey the situation as a whole. Under the constant pressure for abnormal post-war economy, the picture has been indistinct and the figures have appeared somewhat grotesque. The time has come for the full light of day. A democracy which guides its policies by the will of the people, lives and flourishes by full knowledge.

All parts of the Army are knit together. A cut in the commissioned personnel of the Regular Army is felt by Guard and Reserve units which need instructors. Deficiencies in appropriations for barracks and quarters, utilities and repairs, ammunition and *materiel*, make greater demands upon troop labor and *esprit de corps* and militate against attainment of that combat efficiency which is the goal of military training. Lack of enlisted personnel drains essential organizations, imperils expensive installations, and actually endangers distant garrisons.

Generally the state of morale is low, and is sinking from day to day and month to month. The decline is widespread and touches many interlaced details. But for convenience in consideration, the actual needs must be listed under separate heads.

1. First is the fact that an increase in commissioned and enlisted personnel is sorely needed. Individuals are overworked. They have not the time for that professional study which will develop them for future responsibilities. They hurry from target season to civilian training and back to garrison drill

They are not able to meet the demands made upon their time and efforts by civilian bodies demanding more and more attention, much less to carry out any really effective unit training of their own.

They graduate from special service schools full of enthusiasm to put their new knowledge to practical use, and find the organizations they join so ridiculously regularly on fatigue that a day of drill comes as a surprise.

2. The National Guard is growing. Its units have increasing enthusiasm and confidence. It was hoped that the Guard, under the Act of 1920, might reach a strength of 450,000 and maintain that democratic 'militia' interest which underlies national defense by citizen forces. Reasons of economy, however, caused the War Department to adjust its aim toward the lower figure of 250,000. Present appropriations are insufficient, even for the guard we do have, 180,000-190,000, and only very active political efforts have saved drill pay actually voted by Congress but threatened by executive action by economy-mad politicians. With depleted regulars and skeletonized reserves, the guard assumes prime importance for effective immediate use—and it is crippled, handicapped, and held down, its natural growth stunted.

3. The Organized Reserves are also on the increase, but they are still far from securing the training of 30,000 officers a year deemed desirable. Even such a figure would be small, once every three years for combat officers and once every five years for officers in non-combat branches. Yet even that number seems beyond the limits of a national pocketbook that wastes millions in ineffective prohibition law enforcement. It is at least beyond the limits of the drawing account placed to the credit of the War Department.

4. Reserve Officers Training Corps units are essential to the future security of the nation. They select and develop those youths of character and education who will be battle leaders of future American military manpower. It might seem that if nothing else were done at all, the

(Continued on page 24)

> Throughout the military service, the sentiment is growing that it is time for a new deal.
>
> The National Defense Act of 1920, under which the army now operates, has stood on the books somewhat over five years. Yet the earnest efforts of regular personnel and the enthusiasm of guard and reserve people have been continually hampered by financial considerations of a depressing character. Reductions from the 280,000 strength stipulated in the Act of 1920 to a meager 118,750, and reductions in appropriations from $418,135,257 to $262,134,050, have had a damaging effect on progress and morale.
>
> Officers demoted 'temporarily' three years ago, are still in the lower grades. Even their work has had to be done against constant pressure. The question arises whether the Army can do its job with the facilities available. The answer is slowly taking form—and appears to be a negative answer.

*Papyrus Records Tell*

# How We Got the New Testament

## Gospels of Matthew, Mark, Luke and John Were Preserved Centuries in Sands of Egypt

By HENRY A. SANDERS

FOR over thirty years the sands of Egypt have been yielding uncounted treasures of legal, historical, and literary documents, written on papyrus, many of which go back to New Testament times or antedate them. Neither has this rich material been kept hidden in Egypt, but it has been scattered among the great libraries and universities of Europe and America, wherever there was money to buy and scholars to study these precious records of antiquity. As an example of one collection, and that not the largest, in the library of the University of Michigan, there are nearly 4,000 items listed in the Catalog of Papyri, and members of the Classical and Historical departments are engaged in deciphering them.

The study of these contemporary documents not only gives a better understanding of the Greek of the New Testament, but it furnishes a remarkable picture of the times. We can see the common people of the ancient world busy buying and selling land, produce, clothing, ornaments and slaves, keeping accounts, engaged in lawsuits, petitioning their governors, making marriage settlements, writing wills, settling inheritances, and engaging in all the varied types of a voluminous correspondence.

The military establishments maintained by the Romans throughout the Orient furnish their share of enlightening records and we see again not alone the commanders but even more the common soldiers performing their military duties, mingling in the life of the people, maintaining families in the village near the camp, and at the end of their term of military service becoming Roman citizens together with their families, and remaining as settlers in the land they had defended.

LUKE MARK

Reproduction of one of the wooden covers of the fourth century from the Freer Manuscript.

From somewhat later times come Christian letters and documents connected with persecutions, illustrating in wonderful manner the writings of the New Testament and the history of the early Church.

Two fragmentary papyri found at Oxyrhynchus even contain 'Sayings of Jesus,' and these are not from any known Gospel nor do they agree with what we know of any of the lost Gospels of the early Church, but they excellently illustrate the kind of documents that must have circulated in Christian churches at the time when the present Gospels were written, and for a generation or so thereafter. It may well be that the *Oxyrhynchus Logia*, or 'Sayings of Jesus,' date from the second century in their present form, but the needs of the Early Church called them into being, and those needs must have been present from the very early days of the establishment of Christian communities.

As soon as the eyewitnesses of the great story of Christianity had passed on and the living word could no longer inspire Christians to noble life and pure belief, there came the need for the written record. This need would have been felt earlier in some churches than in others, and in many materials for the formation of a Gospel story would hardly have been adequate. Borrowing was inevitable. Yet we are sure that many forms of the Gospel story, besides those now contained in the New Testament, circulated in Christian communities during the latter part of the first century and much of the second. Such (*Continued on page 25*)

# MR. FORD'S PAGE

THE optimist may be a fool who has lost his balance wheel; the pessimist may be a wise man who has lost his buoyancy, which is faith founded on knowledge. Or the optimist may be a wise man who has declined to recognize one-half of life; and the pessimist may be a fool who has let his reason be overpowered by a set of ruffian facts. In any case, both are useless as far as directing the march of humanity is concerned. There is probably something of value in each of these temperaments, something of truth in each of these points of view; it is characteristic of life that absolute zero is unknown in the human plane.

Yet, the extremist is the one person who is most readily heard, although he is the one person to whom we consistently refuse to give over the reins. Extremes of every sort may become something of 'successes' among us, and may provide another illustration for the argument that we are a thoughtless, mindless, misdirected generation. But there is another point of view.

It may be granted that the readiness with which the majority listen to extremists is evidence of the possibility of both extremes being within most persons, according to temperament. But it may also be said with some confidence in the importance of it, that the fact that people do not follow the extremists in great numbers suggests another use for them which we have not recognized.

May it not be that instinctively, and perhaps inarticulately, the people regard the extremes as limits: not as gates opening beyond, but as marking the utmost limit that we may go in their direction. Now, here may be the deep source of the difference between the extremists themselves and the people who hear them but refuse to follow them or to give them power. The extremist himself believes that his extreme is the mouth of a new river of life up which the race may sail to endless paradise, a gate of new opportunity which has remained sealed to humanity until he came along to open it. The extremist must believe this to be an extremist. He has no idea of marking a limit, he believes that he is signaling a new opening for the race.

The people, however, see, as it were, the channel of their progress marked on either side by these limit lights. On the right hand the extreme warning lights of conservatism, on the left the extreme warning lights of radicalism; on the right hand the extreme of optimism, on the left the extreme of pessimism; on the right the extreme of unearthly and unnatural spirituality, on the left the lurid lights of equally unnatural materialism; on the right an uncontained, unanchored and irresponsible altruism, on the left abysmal philosophy of selfishness. All down the channel these extreme lights, right and left, marking the outer limits of safety, beyond which there is no navigation, but menace of shipwreck.

The people are heeding the lights, but not steering toward them; they are not regarding those lights as port lights; they are steering between them.

These are not the extremes the people seek. These are limits—the shoal lights. The extremes which the people seek are extensions. They instinctively know the meaning of those lights alongside the channel; they know they are to be heeded, but not made a goal; they know that the kind of leading which their souls of progress crave must be of another kind, must shine above the channel along which they move. Limitations, when personal, mark the way a man must go—they are not obstacles but guideposts—he does not go toward them, but between them; and it is the same with the limitations of view marked by the extremists.

It will thus be seen that as society moves along the way that it is to go, a comparatively easy feat is to swing to one side of the march, right or left, and from these extremes of the line attract attention. It is in fact very easy. Extremes, boundaries, peaks, road-ends, walls, shorelines, capes, always attract attention. A man who veers to the extreme 'right' of a question is doing precisely the same thing as a man who veers to the extreme 'left' of the same question, and both of them simply measure for the mass of people the distance the question will stretch sidewise. There is no progress in either. There is no light ahead. To mark the end of the line may serve a purpose, but to bow the line forward from the middle or any other point is a great achievement. It is not of record that the line ever starts its forward march from the right or left extreme. The line cannot be pulled around and through the extreme right or the extreme left, making it the point of departure for a new forward movement. The line moves from the center, as a rule. The whole line moves, even the extremes, for the extremes of yesterday are not those of today, nor have we moved through the extremes of yesterday to reach the position of today.

*NEITHER optimist nor pessimist will ever be trusted with the reins. People are interested in extremists, but do not place responsible power in their hands. Extremists measure the distance sidewise, they do not extend the road in front. They are like channel lights that mark the shoals on either side, something to steer by, but not to steer toward. Extremists are useful as limits—and there are two extremes to everything. But we are not journeying to limits, we are journeying between them. Progress comes that way. It will loose many minds from needless burdens if they can learn to look upon extremists, not as leaders, but as waylights showing the width of the road on either side.*

## *Clemenceau Should Go On*

WHEN Clemenceau speaks the world listens with respect. His open letter addressed to the President of the United States, but obviously intended for the people of this country, is received with more interest than many a correct diplomatic document because of the character and career of the man who wrote it. But with his great gift of plain speech, the wonder is that Clemenceau did not disclose to us the thought of his mind. He seems to assume that the plight of France is due to the United States, yet he does not tell us how. He says: 'France is not for sale even to her friends,' a fact of which we are aware, and whose implications we guarded when it was a question of armed enemies. Unfortunately he did not indicate what he thinks we have to do with the fall of the franc. He implies that the debt France owes us and the payments required are the cause of the trouble, but since no payments have been made, how can that be so? He addresses us with an injured air, but fails to point out the injury which he intimates we have inflicted on his country. He speaks darkly of banks and bankers, but does not name them.

If Clemenceau sees what is the source of the world trouble, he should speak out. He is now an old man who can afford himself the luxury of expressing the fullest truth as he conceives it. The world craves the diplomacy of truth. The letter which he wrote seems but the tentative opening of a conversation, and we wish he would go on. There is no man in France to whom a more careful hearing would be granted by the American people. But he leaves the whole question in the fog which conceals it from our people.

It is clear to us—and it is about the only thing that is clear—that the whole question of international settlements has been sadly muddled. The term 'settlements' is a misnomer; they seem rather unsettlements. The American people have been told by Mr. Mellon that we are not collecting a penny of war debts from France, nor even asking for any. We are told that the only matter pending is the repayment of money loaned after the war. M. Clemenceau should at least have indicated his awareness of such a statement having been made by an important member of the Cabinet and the custodian of our national funds. Does he believe it or not? If it is true, does it change the aspect of the case?

## *News From Mexico*

LIKE the Aimee Semple McPherson matter, the news printed as coming from Mexico reflects the color of its sources and the editorial channels through which it passes. There has hardly been in recent years so determined an attempt to create opinion by headlines unsupported by facts as was evident in the case of the California woman evangelist. As to the case itself, we have no opinion. We did not investigate it. Our interest was limited to the methods by which the press purveys the news to the people and how far it will go in its efforts to make prejudice do duty for facts.

In the city where this is written, our morning paper has regularly regaled us with black headlines across the top of the first page announcing the slaughter of devout priests and worshipers in Mexico. And as regularly our evening paper has printed the *Associated Press* reports denying that anything of the sort had occurred. One or the other is true. But one of them bears every semblance of a press campaign to create a certain temper of public opinion in the United States. Whether the purpose of this be political or religious need not be pronounced upon now. But surely we have advanced far enough in the science of publicity to know that the American people are now immune to headlines and to false statements. They have been misused too flagrantly in the past to be used efficiently now, without the strongest background of certified fact.

For the time being, if the conditions in Mexico continue, the American people will do well to test its news, that an intelligent public opinion may be formed.

## *The Idle Rich—and Poor*

THE idle rich, declares Sir Josiah Stamp, the noted British economist, are no more. Of all the millions of England's population, he classes not more than a thousand as idle rich, an infinitesimal number. And these are rapidly passing the way of their brethren.

That's interesting. It's interesting because it points the trend of the times. Under present economic conditions it is becoming almost impossible to be both idle and rich. Idle and poor is easy enough—thousands of dole-drawing Britons attest that fact—but England is beginning to realize that the dole is one of the greatest economic mistakes of her entire history. And the world is slowly groping toward an

age when *all* men must produce to live. Economic pressure is bearing the idler and the parasite under its rising flood.

Leisure will hold an important place in the new scheme of things—a highly important place—but it will be the leisure of the worker, not the idler. It will be a leisure begotten of labor to enjoy the fruits of that leisure. It will not be, as so often in the past, mere sluggish idleness. The old aristocrat theory that idleness is something sacrosanct and graceful, and that work is of itself degrading, has passed into the limbo of Munchausen's tales. It is almost never encountered now outside of sycophantic novels. The responsibilities of wealth outweigh its privileges.

Men do not have to work as hard as formerly, *but more men work*. Invention and management have combined to lift the heaviest burdens from humanity's shoulders, but in the gradual evolution of the new order the non-producer is being eliminated. The 'idle rich' are becoming the 'idle poor.'

## *The Appearance*

THE new Josephus, or rather the oldest translation of Josephus, lately brought to public attention from Russia, is attracting much attention from the scholars, and equal attention from the public, on account of the readiness of the more scholarly Jewish rabbis to accept it as reliable testimony to the historicity of Jesus of Nazareth. Public attention centers, as is natural, around that curiosity which all have as to the physical appearance of the heroes of the race. The descriptions of Jesus that have been given differ very widely. It is not unusual for equally well-informed men to seize upon opposite characteristics as most descriptive of their friend or hero.

In some accounts He was all beauty and gave forth the impression of compassionate power. In others He was a man of very ordinary, or even less than ordinary appearance. The Christian interpretation of the prophecies relating to Jesus refer to His marred appearance, as St. Paul referred to himself as physically contemptible. The Russian Josephus describes Jesus as a man of middle height, stooping shoulders, a long face, a prominent nose, eyebrows that grew together and could be frightening to the people, altogether a simple pose in strange contrast with the power He exerted.

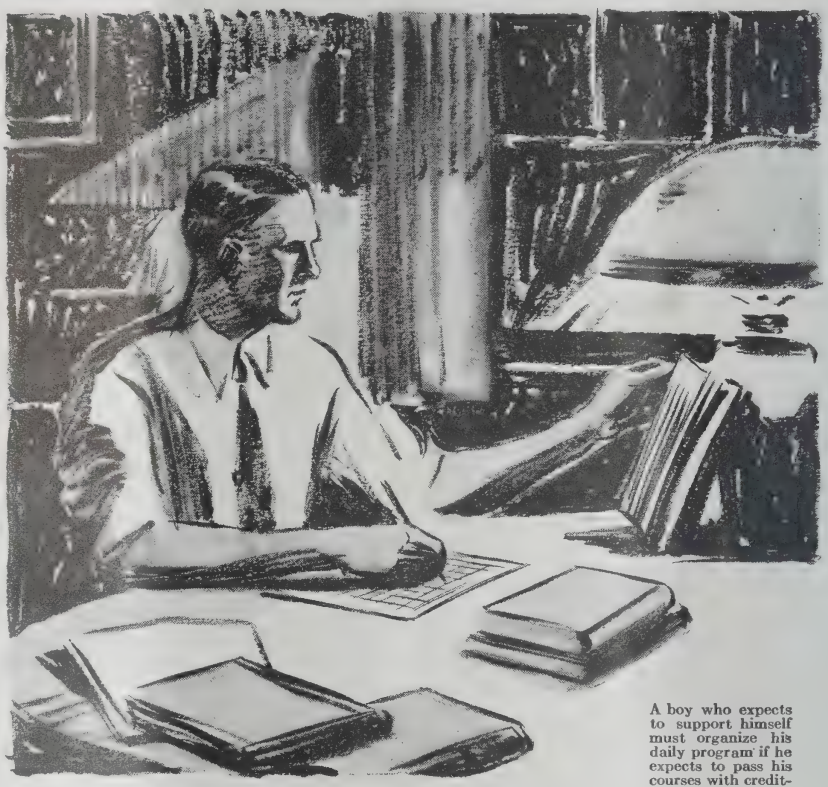
Which may all be true. Of clerical sleekness naturally He would have none. He was something of a nomad. He slept much out-of-doors. He consorted with the poor more than with the rich. Any man seeing the world as He saw it would bear the mark of it on his face. It might even be that if we knew him as He was, we might, in the language of Scripture, see nothing in Him that we might desire Him. Idols in the flesh are usually disappointing. And it was not upon such idolatry that He wished His influence to rest.

## *A Spade's a Spade*

SEVERAL months ago THE DEARBORN INDEPENDENT took note of the fact that four race tracks in Ohio were operating and conducting 'mutual pools' on the results of horse races, claiming that a statement on the backs of the mutual tickets sold (and cashed if the wagers were won) to the effect that the money put up was a voluntary contribution. In full this statement read:

'This acknowledges receipt of sum of ..... dollars voluntarily contributed by the holder thereof as part of the purse, prize or premium to be awarded to the owner of the horse winning first, second or third place (as the case may be) in the race designated by this ticket.'

To the lay mind the transparency of this subterfuge must be evident, yet for two years several tracks operated while the matter was threshed out in the courts and one big track, representing an investment, it is said, of more than a million dollars, was built on the presumption that the 'law's delays' would at least enable its promoters to get their investment back.



On August 5 the Chief Justice of the Supreme Court of Ohio defined the operations of such pools as gambling, despite the subterfuge printed on the backs of the tickets, and issued an injunction prohibiting further gambling on one of the largest of the Ohio tracks.

The loss to the promoters cannot be determined. The successful evasions in local courts has encouraged track promoters and horsemen to continue and increase their operations in the face of the inevitable and they are probably now in for greater losses than they would have been had not their shrewd attorneys fought the cases with all the technicalities and pleas for the delay legal procedure permitted or the courts would tolerate.

While the Supreme Court was in the midst of its final deliberations the officials and employes of one of the tracks were on trial in Cincinnati and their attorneys—one a former vice-mayor, another a former judge who recently declined appointment to the Federal bench, another a former president of the Ohio Bar Association—were gravely endeavoring to convince the court that an ambiguous statement on the back of a piece of pasteboard transformed a bet or wager into a something that was not gambling and was entirely legal.

# This Business of Working Your Way Through College

## A Boy Can Get Things to Do, But He Must Be Ready to Do What He Can Get

A boy who expects to support himself must organize his daily program if he expects to pass his courses with creditable grades.

By FRED H. TURNER

ILLUSTRATED BY J. C. GRAHAM

MANY stories, and very readable stories, have been written about boys working their way through colleges and universities. There is a certain romantic appeal to the whole situation of a boy who hasn't much money and who has the ambition and the nerve and the energy to set out to support himself and at the same time gain for himself an education. He appeals to one's sympathy in the first place and one cannot help admiring the young chap who so earnestly desires a university degree that he will attempt the work of two men in trying to earn his living and study along with the other work.

In recent years, the enrollment of almost all colleges and universities has grown surprisingly, almost alarmingly to the officials who are administering these institutions. This increase in enrollment has brought to the colleges a different class of boys from the class which attended a few years ago. It hasn't been such a long time since the colleges and universities were attended only by boys or children of a wealthier class. A few young chaps braved the hardships of working their way along in those days, but there weren't very many who attempted it.

Today the average group of students in any college is a cosmopolitan group. The son of a wealthy financier from Chicago may sit in his English class next to the son of an Iowa farmer who has found that times were hard in recent years. The boy whose father scarcely speaks English and who works in the mills at Gary may be the laboratory partner in a thermodynamics experimental section of a boy whose father is a man of tremendous importance in the engineering world. Times have changed, for now a young man practically must have an education if he expects to succeed and to advance after he gets in the business world. It is true that the young man just out of college usually starts at about the same salary that the chap who has no education begins with, but statistics show very definitely that the man with the advanced education has a much better chance for more and rapid advancement than the man who does not have the educational background.

So in recent years it has become the thing to go to college and with this general trend there enters each year a large number of boys who are planning to work all or part of their way through the institution of their choice.

In the last few years I have seen hundreds of boys enter one of the great state universities. Of these hundreds, many come eager and ready to do almost anything to support themselves so that they may go ahead in their chosen courses. And from this group, which is so eager and ambitious, I have seen some succeed and some fail. Two very definite conclusions can be drawn from their success and failure:

First—that a boy should not attempt to work his way through unless he absolutely must;

Second—that if it is necessary for a boy to support himself while going to college it can be done, provided he has a strong body and a reasonably alert mental capacity.

If you are not familiar with the situation in the colleges and universities, or if you have successfully worked your way through, possibly you will ask 'why?' to my first conclusion. Why shouldn't a boy work his way through if he can and wants to?

There are a good many reasons why he shouldn't. In the first place, the boy who attempts such a thing is attempting the work of two men. A boy who is starting to work at the age when he completes his high school course can scarcely expect to earn more than enough to live on. At the same time, a boy who enters college at the age of eighteen will find that he has about as much as he can manage to carry fifteen or eighteen hours of scholastic work. The situation is a new one; the teaching is of a different type; his process of orientation is not a simple one; often he is for the first time on his own responsibility. A boy who expects to support himself entirely will find, unless he is an unusual scholar, that he must reduce his schedule of sleeping hours and organize his daily program pretty carefully if he expects to succeed and pass his courses with creditable grades.

If a boy is sufficiently capable there are a great many outside activities which he can turn to rather than work and which in training may be just as profitable. There are countless extra curricular activities, athletics, managerships, oratory and debate, dramatics, the Y. M. C. A., and so on. These are all worth while, for they develop personality and increase self-reliance to a remarkable degree.

There is still another reason why a

boy who does not need to work should not do it. If he does he is taking a job that some other boy, who must have work in order to come to school at all, might have. There are always more boys looking for work than there are places for them to earn their living. It isn't a fair sporting proposition to take a job when you don't have to, since you may be keeping a boy out altogether who would come if he could get work.

Possibly this does not seem very encouraging to the boy who is planning to work his way through when the time comes. It isn't my intention in this to be pessimistic; I'm merely stating facts. I firmly believe that a boy shouldn't try to do it unless it is absolutely necessary, but I believe just as firmly that any boy who must can do it. And he will gain certain things that the boy who does not work will have to get after he enters the business world.

He will have a thorough business training along with his theoretical school work which will place him a year or so ahead of the boy who has not worked. That is, he will have learned that to succeed in business he must be prompt, regular, neat in appearance, thoroughly honest; and he will have been well-trained in the courtesy of the business world.

He will have a knowledge of spending his own money, budgeting it so that it will be spent to the best advantage and with the greatest economy. He will probably be more inclined to save a part of his earnings if he has learned that a dollar will purchase only its own value and that dollars are not particularly easy to accumulate in large numbers. He will have greater foresight in the selection of a position after graduation, judging the position he chooses from the point of view of future possibilities rather than from immediate higher salary.

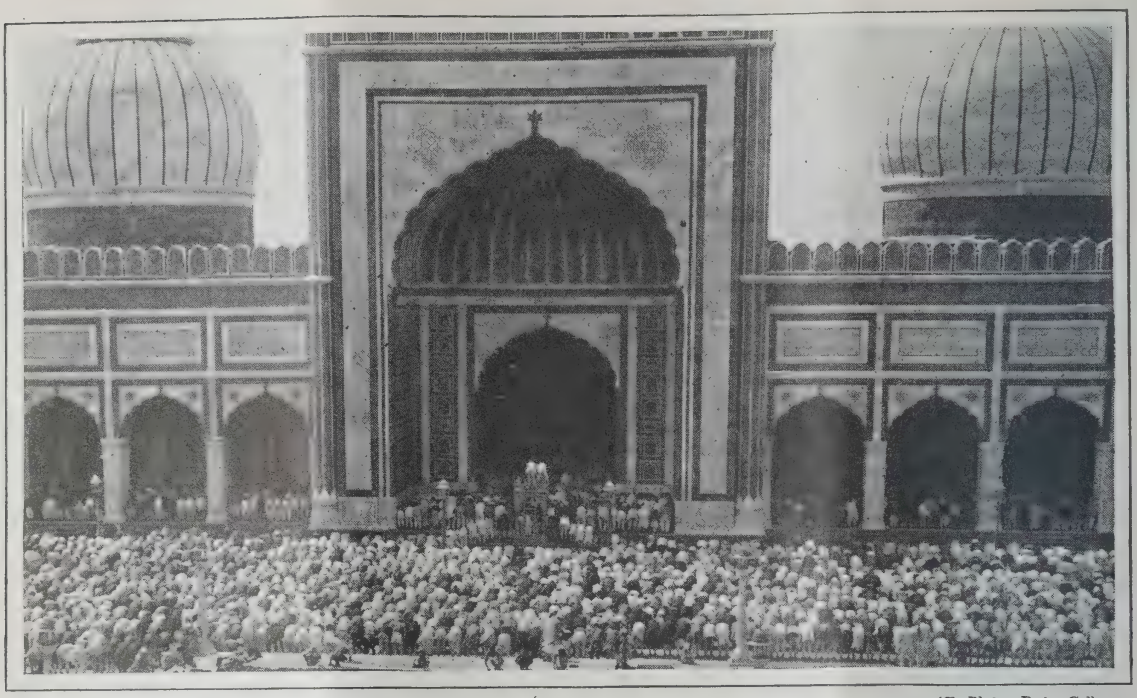
He will be more efficient in his personal habits, for he will have learned that he must plan his day's program to the best advantage if he is to get the greatest benefit from each hour in the day. By that I mean that he will have his days definitely planned with certain duties coming at regular times in the day. He will appreciate the value of recreation and save a certain part of the day for this very important function. He will be more likely to have definite and regular sleeping hours.

Finally, he will have the personal satisfaction of having done a job and done it well.

A great many factors are involved in what a boy who plans to work his way through shall do. He must choose something that he can do. The size of the city in which the institution is located will affect the possibilities quite seriously. All too often he must take whatever he can get, because of the demand for places. His chosen course will have an important bearing on the amount of work that he can do, for agriculture and engineering require much more time in class than courses in commerce and liberal arts and sciences. The attitude of the townspeople and their willingness or failure to coöperate with students needing work will be important.

The freshman in college must realize before he goes that he will not be able to get the best type of work, for all the best places are taken by upper classmen from the year before. The freshman should not attempt to start unless he has enough money to carry him for a time, so that if work is not immediately available he will be able to continue until he finds something. The commonest and best possibility for a freshman is to plan to work for his board, which means that he will get better food than he can buy and save the largest single item in the year's expense.

The freshman must realize that he will not be able to get the best type of work.



There are three types of work which a freshman, or any student, may do to earn his board. He may be a waiter in either a restaurant, boarding club, or organized house. He may prefer to work in the kitchen and there he may be a cook's assistant or a dishwasher. These three types usually require about one hour's work for each meal, so that a student will work three hours a day for his board, but he will get in return food which he could not buy with the money earned on part time for three hours. In general, work for one's board returns in food values sixty-five to eighty cents an hour. A fourth type of work for board is done by upper classmen and is acting as the manager or commissary of a boarding club. The work which such a manager does is to solicit members of the club and keep the table filled and to collect the money and keep the accounts of the members. The larger clubs pay their commissaries a cash wage besides their board.

The selling game is worked to the limit.

Next to working for one's board the commonest method is to work for the room to be occupied. Many citizens of college communities have a room in their homes which they save for some boy who is expected to give in return for the room his services to a reasonable degree. He will be asked to fire and care for the furnace in the winter. In the autumn and spring he will be expected to care for the lawn. If additional work is desired, such as waxing floors, washing windows, and general cleaning, he will probably receive additional pay at a rate of thirty-five to fifty cents an hour. The boy who finds a good home where he can work for his room is indeed fortunate, for he will receive better treatment and have more of a real home while in college than any other student.

Some landladies who keep large rooming houses employ a boy or two to assist in the general policing of the house—making the beds, emptying the wastebaskets, and so on, and give in return a room in their houses. They may pay additional if the work is heavy.

A boy who is lively may secure several furnaces to fire during the winter months and make good money by so doing, being paid a flat rate or by the hour. The average wages amount to thirty-five to fifty cents an hour. He may also se- *(Concluded on page 18)*

Ten thousand Moslems kneeling in prayer at a service in the Great Mosque of Delhi, India.

Muhammedanism, Said to Be a Blend of the Jewish and Christian Faiths, With Hundreds of Millions of Adherents, Claims It Is

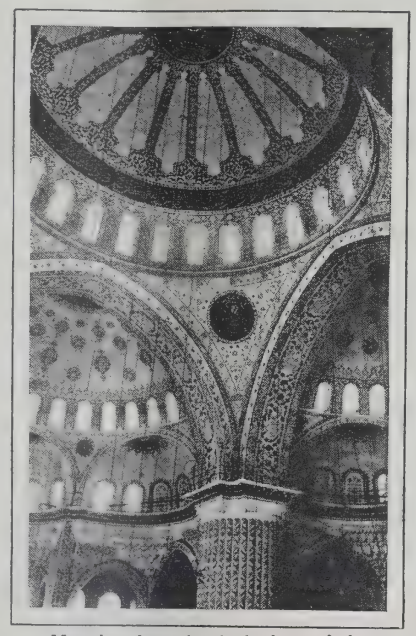
# The Most Misunderstood Religion

By H. HENRY SPOER

THE Moslem religion is perhaps the most misunderstood of the great revealed religions of the world. Many worthy men who should have known better have condemned its founder as an impostor and declared his religion to be due to 'the inspiration of Satan.' It is a narrow judgment and suggests that those who have taken this uncompromising attitude have never understood St. Paul's speech to the heathen on Mars Hill at Athens, nor realized that men may worship a God who remains unknown to them.

There is something touching, soul-stirring, in the effort of Muhammed to find God, something truly heroic in his delivery of his divine message in the face of a terrible and fanatical opposition, and something pathetic even in his shortcomings.

To deny the immeasurable advance of Muhammedanism over the ancient Arab heathenism would be at the same time to deny God's mysterious activity in the history of mankind. If Muhammed had accomplished nothing more than a great moral reform in the lives of a people devoid of the higher morality of life—a reform such as never before nor since has taken place in any nation on so vast a scale—he would still deserve the admiration and gratitude of all ages. But he has done more, infinitely more; he became the instrument by which the one true God was revealed to, and accepted by, an idolatrous race.



Certain objections may be brought against this view, namely that Muhammedan religion has little hold upon the people; that the Muhammedan countries are today, and have been for many years, in a state of decay; that there seems to be a condition of disintegration all over the Muhammedan world, a loosening of bonds which formerly made for greatness, a drying-up of springs from which, in the Middle Ages, Christian Europe received vast stores of knowledge. All this unhappily is in some degree true, but we need not think that the reason for the blight which has fallen upon Moslem countries is to be sought in the assumption that the Moslem religion is due to 'the inspiration of Satan,' as some Christian scholars have asserted, but rather in the narrow interpretation of that religion, or of certain racial and economic conditions and customs, as well as political conditions which forbade the free development of the spiritual thought which has been a saving feature of Christianity.

The Moslem religion, with its 250 millions of adherents, is sufficiently important to be understood in its origins and claims by every intelligent man and woman. I might even say that it is our duty as Christians to know what claims the founder of this religion puts forth, and what the *Qoran*, the sacred Scripture of the Muhammedans, teaches on this point, not for the sake of finding out wherein the shortcoming of their religion lies, but rather to learn its positive values.

At the time of Muhammed there existed a small group of men who abhorred idolatry and decided to seek the true religion; they were called *Hanifs*, that is, the separated ones; they were the 'quiet in the land,' the seven thousand in Israel who had not bowed their knees to Baal. This movement shows that thinking men in Arabia were conscious of the falsity of the religion of the country. It is quite likely that Muhammed had come in touch with some of these seekers after truth; and that his mind and soul, saddened by the idolatry of his people, received new encouragement and sent him away into the solitude to find God.

Like the great spiritual leaders of the world, Buddha, Moses, St. Paul and Christ Himself, Muhammed withdrew from the turmoil of the world and in the solitude of a cave gave himself over to meditation and worship of the true Being of God. It was in the cave of Hira, a true Adullam, that Muhammed received his call to become a messenger of God. The Angel Gabriel appeared to him, he related, and pressed him into a silk cloth and said, 'Preach,'

but Muhammed said, 'I cannot preach.' The angel pressed him again into the silk cloth and repeated his order, upon which Muhammed said: 'What shall I preach?' Then the angel gave him this commission: 'Preach in the name of thy Lord who has created man out of congealed blood. Preach, for He is merciful.' This call came to Muhammed as it had come to others before him, and after much mental and spiritual suffering, sent him forth finally as a preacher of what he believed to be a message from God to his people.

Marvelous decoration in the dome of the Mosque of Sultan Akhmed, Constantinople.

The question now arises: Was Muhammed really a prophet? He himself claims to be a prophet of God, the last of the prophets. What is a prophet? A prophet is a man who is aglow with a message from God which he must deliver, whether he likes it or not. We see this strikingly illustrated in the case of Amos, who was seized by the Spirit of God and sent as His messenger. It was the same divine impulse which drove Muhammed, a naturally timid man, out of his seclusion, to deliver his message to an unbelieving and antagonistic people.

If we were to refuse to Muhammed the title of messenger or prophet of God, because the best parts of his teaching are not original but of Jewish and Christian origin, we should thereby disqualify some of the recognized prophets of the Bible. Muhammed had made these teachings so entirely his own spiritual property that he might regard them, quite justly, as direct inspirations from God, which he was ordered to preach to his fellow-men for their salvation; a fact to which he refers often in the *Qoran*. (cf. Sura 5:7; 6:15; 10:16; 39:15.) And I do not believe that we can justly deny to Muhammed the title of prophet and messenger of God to the people of Arabia. Jesus was 'more than a prophet'; He was the Messiah, the Son of God, who by His death and sacrifice brought salvation to a world lying in darkness.

Muhammed had to proclaim his gospel in the face of great opposition. His former friends turned away from him, mockery and contempt followed him everywhere, and his followers were slaves, freedmen and the humblest of the people. But in the consciousness of his divine mission he persevered, even in the face of actual enmity; so strong was the inward voice that he followed its bidding in spite of personal suffering.

The impression which Muhammed's sincerity made upon some of his fellow-men is best understood by the fact that one of the most influential men of Mekka, Abu Taleb, his uncle, who had absolutely no inclination to Muhammed's new faith, which he regarded as foolishness, protected him against his fellow-citizens till his own death three years after Muhammed's public appearance.

The positive religious influences which worked upon Muhammed were, as already stated, Jewish and Christian. However, that Muhammed had no first-hand knowledge of the Scriptures is proved by the fact that the Old Testament stories which he quotes are far removed from the originals, being enlarged with all kinds of fanciful matter, such as is found in the Haggada. The only correct quotation from the Bible is from Psalm 37:29 (Sura 21:105) 'The righteous shall inherit the land.'

The stories which he relates from the New Testament are equally legendary. The influence of the Gospels upon Islam is less than that of the Old Testament. This is not surprising, as the Jews were very numerous in the district of Yathrib, in the neighborhood of Mekka; nor need it surprise us to find that the central doctrine of Islam—the Moslem Confession of Faith which asserts the absolute unity of God, 'There is no God but Allah'—is taken from II Samuel 22:32, which verse reads in the Hebrew: 'Who is God but Yahve!' and in the Targum, that is, the popular explanation of the Hebrew text, 'There is no God but Yahve.' This is the form which Muhammed's rendering most nearly resembles, which shows again that he drew his information from secondary sources.

Another illustration, showing the dependence of Muhammed upon Jewish and Christian religious thought, is the opening chapter of the *Qoran*, the Fatiha. This sura is entirely composed of Jewish and Christian elements. It is used as a daily prayer, and Muhammed is reported as having said that no divine worship has value in which the Fatiha is not used. It occupies in Islam the position which the Lord's Prayer does in the Christian Church, and, as far as its contents are concerned, it might profitably be used by all:

'In the name of God the Merciful, the Compassionate.
Praise be to God, the Lord of all the worlds,
The Merciful One, the Compassionate,
The King of the Day of Judgment
Thee we serve and Thee we invoke for help;
Guide us into the right path,
The path of those to whom Thou art gracious,
Not of those with whom Thou art angry, nor of the erring.'

General view of Mekka, toward which all Moslems pray. In the center is the Great Mosque, inclosing the Kaaba (the black cubical building) which enshrines the famous Black Stone.

# The Voyage of the Victoria

BY CHARLES J. FINGER
WOODCUTS BY PAUL HONORÉ

Each day the men of the *San Antonio* grew more grisly because of starvation, more pitifully hideous because of disease. 'Did a man chance to catch a rat, there were those willing to pay for it.'

## DESERTION *of the* SAN ANTONIO

*Tenth of a Series*

MAGELLAN made no notes and no observations. Without the diary of Alba, his passage through the strait would have remained a blank. Pigafetta was interested in a romantic kind of way. Sebastian del Cano was always under suspicion and did not commit himself to writing until Magellan was dead. So what we know about the desertion of the *San Antonio* comes from a letter quoted by Navarrete, vol. iv, p. 201, written by Juan Lopez de Recakde to the Bishop of Burgos, and the story told by Sebastian del Cano, Francisco Alba and Hernando Bustamente to the court at Valladoloid, when the *Victoria* finished her voyage. That report was dated October 18, 1522. As to the probable movements of the ships, I set them down after cruising in the same waters, not as actualities but as strong likelihoods.

The *San Antonio* then was under command of Magellan's cousin, Mesquita, upon whom Magellan relied as trusty rather than as navigator. On board was Estevan Gomez, experienced navigator, once pilot of the flagship, a man perhaps not brilliant, but sober-minded, and very efficient in administration according to his later doings when seeking a northwest passage He had quarreled with Magellan, objecting to all that cruelty and revenge at St. Julian, though he was the admiral's countryman and appointee. The *San Antonio* was overcrowded, her original complement of men being increased to seventy. As it looked to the men of the *San Antonio*, when there was stiff work to be done, their ship was sent forward while the flagship lay at anchor. Moreover, because of Mesquita's lack of knowledge of seamanship, given a question to decide, he had to consult Gomez.

The route taken by the *San Antonio* is not known, but at the point where the ships separated, at the northern end of Dawson Island, there were what seemed to be three fjords. That leading northwest Magellan took. It is fair to assume that Serrao, in the *Concepcion*, went due south and rounded Dawson Island to meet Magellan later at El Morro de S. Aguieda. That would leave the fjord opening in a southeasterly direction to the *San Antonio*. That opening is a deep gash in the Tierra del Fuegian coast, now called Admiralty Sound. So the *San Antonio* would have traversed fifty miles of wind-torn water to find the stretch ending in glaciated hills. That irritation found vent in murmurings, murmurings in open discontent, is easily understood.

We piece together this and that as told afterward; Mesquita's order for the ship to work back out of the *cul-de-sac* and make the rendezvous with Magellan, Gomez disputing with him, Mesquita ordering him to retire and enforcing the command by laying his hand on his dagger. Then Gomez leaped at the captain, stabbed at him and missed his eye by an inch. So everywhere was confusion and disorder, Mesquita prone on the deck, Guerra sword in hand declaring himself captain and Gomez pilot, the haggard and worn men quick to catch the mutinous spirit shouting for Spain and the new command. They had taken part in a high-handed game and were homeward bound, and all that boisterous business of blood-letting paled into insignificance for a time. As for Mesquita, he was chained in a cabin. Two days later the *San Antonio* was well on her way toward the Atlantic Ocean.

They touched at St. Julian, anchored awhile and tried to find Juan de Cartagena and the priest, but without success. Guerra, a relative of Christopher de Haro, the merchant, managed things with sagacity and good judgment, putting in at Guinea for fresh water and provisions and bringing the ship to port at Seville, Wednesday, May 6, 1521.*

Meantime, in the straits, when it became known that the *San Antonio* had deserted, for there was a searching of the straits to make sure that there had been no wreck, Magellan seems to have grown alarmed. His saner self seems to have realized with a shock that he had been criminally violent and self-willed. The mood had outcome in a general order, issued November 21, 1520, in which he said that he sought advice from his associates,

*As might be expected, there was an investigation by the India House, and Magellan was denounced for his acts of brutality at St. Julian, for recklessness and for losing time without reasonable cause. The Council of the Indies ordered a ship to go to St. Julian for the rescue of Cartagena, but the order does not seem to have been enforced. Mesquita was put in prison to await trial upon the return of Magellan, and later, because of the activities of other factions, both Gomez and Guerra were arrested.

would welcome the open expression of opinion, and hoped that no man would refrain from saying what he thought on account of the affair at St. Julian.

Whether that order brought any written suggestion can never be known. Sebastian del Cano, the man of self-discipline, certainly never committed himself to writing while Magellan lived. Perhaps any objection or suggestion seemed ridiculous in the face of Magellan's determination to go ahead in spite of everything. However that may be, the fleet passed into the Pacific Ocean on the evening of November 28, 1520, after having been thirty-eight days in the straits, covering a distance of 320 miles.

During that time there had been made no observation of any great value, nor any detailed report. The world knew only that there was a strait, much as it had suspected from the report of that earlier explorer sent out by Christopher de Haro. But for a true description it had to wait until 1579 and 1580, when Pedro Sarmiento did valuable and lasting work. Magellan's only aim was to push on and on, perhaps to find a route to the Moluccas, perhaps to join his friend Serrao with intent to do we know not what, and shall never know. If it was to deliver the fleet over to him, as some have supposed, it was as daring a piece of business as was ever conceived.

On the day when the *San Antonio* sailed into the Spanish port, Magellan's three ships sighted a bluish mist in the Pacific expanse which gradually took on outline as a conical peak. The wind was light and the sea unruffled, so their progress was almost imperceptible until noon, when the wind freshened a little. Magellan altered the course to make for the larger island, and so they came to Guam, where they dropped anchor. It was the first anchorage after ninety-eight days of sailing across an unknown sea, 'so vast that the human mind can scarcely grasp it,' wrote Maximilian, of the house of de Haro.

For ninety-eight days they had been in a latitude in which, according to Varenius, the sailors setting out from Chile could fall asleep without paying attention to the rudder, with the certainty of being gently driven by the wind across the calm waters of the Pacific to the shores of the Philippines. There had been days of maddening idleness when there was brooding stillness on the world, when the sails hung motionless and time seemed to stand still and when the sea became a burnished torment. Day after day the blazing sun climbed a beryl sky, and gaunt and hollow-eyed men stared over an amethyst ocean. There were days of blue and gold monotony when life-weary men stood listless or sat with closed eyes because they knew every seam and furrow in the faces of their fellows, knew every patch and every stain of each sail, knew every knot in the woodwork. And each day men grew more grisly because of starvation, more pitifully hideous because of disease. They 'ate by ounces' and 'as they drank water, they held their noses because of the stench of it.' The biscuit was 'a powder full of worms,' and 'stinking with the urine of rats.' To such torments were they pushed, that 'did a man chance to catch a rat, there were those on board willing to pay half a ducat for it,' writes Pigafetta. At last, 'so great was the want of food, that we were forced to eat the hides on the main yards which were there to prevent the chafing of the rigging. These hides, exposed to sun and rain, were so hard that we were obliged to soften them by putting them overboard for four or five days, after which we put them on the embers and ate them thus.' But at last on March 6, they came to the tree-clad island of Guam where they heard the screaming of birds and scented the smell of the land, and again saw human beings. They were Indians in strange boats, with sails of bark and outriggers, and the natives 'handled them so quickly and skillfully that it was a marvel to see.'

But at last they came to Guam. To the islanders, the strange invaders seemed to have many things for which they had little use.

They had seen land before that, but it was uninhabited. It was on the fiftieth day out after leaving the straits, and on January 24, 1521. Magellan named it San Pablo, and the pilot Alba put it in 16° 15′ S. On February 4, two hundred leagues farther, they came to another island which they named Tiburon, and the two they called Las Desventuradas, but the islands cannot be identified with any accuracy though guesses have been made that they were in the Tuamoto Archipelago and in the Manihiki group. The latitudes and longitudes of these do not tally with the location as given by Alba.

However, we are certain about Guam. For East and West had met and very soon there were misunderstandings and clashings and struggles for mastery and death. It was the old story of society pitted against society in the struggle for existence. On one hand there were half-starved sailors imbued with the notion that they and their people stood on star-crowned heights, that they were lords of the world and that all dark-skinned people were little better than brute beasts. On the other side were the islanders with no ideas of private ownership, no knowledge of anything but a life of unfettered individualism, perhaps regarding all that display of flags and that firing of guns

(Concluded on page 28)

# Working Your Way Through College

(Concluded from page 13)

cure a good many odd jobs of mowing and raking lawns, cleaning windows, and helping in house cleaning. The wages are about the same as for firing furnaces.

Quite a number of boys are able to make from seven to ten dollars a week delivering papers. The work is outside work, and may take the place of outdoor recreation; the hours are not always the best but the work is steady and the pay is good. Still others earn from seven to fifteen dollars a week collecting for laundries. The local laundries hire students to make their collections and some pay a regular salary, or will pay on a commission basis if the student desires such an arrangement.

Almost any business establishment can use one or more students. They may not be able to use student clerks but they can use a student janitor. If they use clerks they will pay from thirty-five to seventy-five cents an hour, and usually give the privilege of allowing the students to buy goods at cost. Such an arrangement is of especial value when the students can secure work in men's furnishing stores, for it means that they will be able to save quite a little on their clothes.

These are the common ways. The other ways are limited only by the ingenuity and the cleverness of the students.

The selling game is one which is worked to the limit. Students sell everything imaginable and make excellent profits; their sales ability and the desirability of the article which they sell might be given as about the only restrictions on the amount which they will earn in the time available outside of school hours.

Almost all students seem to have voracious appetites, and it would seem reasonable that food should be an article which could readily be sold by students to students. I have known several young men who have made from five to ten dollars a night by going from house to house with a basket of sandwiches, little pies, apples, and bar candy.

*Honor Apple Stands*

Honor apple stands have helped a number of boys through universities. This idea was originated about seven years ago, also by an athlete who was an All-American linesman. His plan was to establish small stands on prominent corners and fill the stand each morning with inviting looking apples. A small lock box with a slot and a sign giving the price of the apples completes the equipment, and such stands may be made to yield very excellent profits.

Student agents make good commissions selling butter, groceries, coffee, meats, canned fruits, and high-grade grocery specialties of all kinds to cooks and commissaries. A boy who has one standard article will likely do better at this than one carrying a whole grocery line. He can more easily interest the cooks in some one article than he can a complete line which is in competition with the local stores.

Household supplies will sell almost as readily, not only to organized houses but to townspeople. Furniture polish, floor wax, aluminum cooking utensils, brushes, soap, scouring powder—all these articles are in everyday use and can usually be sold quite readily by an active student agent.

The selling of clothes is a more delicate proposition, but a boy who dresses well and makes a 'good appearance' can ordinarily make good money by going to the fraternity houses and larger rooming houses with a new and up-to-date line of haberdashery. Neckties, belts, handkerchiefs, scarfs, if attractive and reasonable in price, are sold by student agents on every college campus. A number of stores in college towns employ students to take displays of their stock supplies from house to house. The students show the articles and take orders, or they may pass out cards to the men in the house and any student presenting such a card at the store marks up a sales credit for the man who made the display.

*Book-Selling Game Is Good*

There are a number of articles which might be classed as luxuries which student salesmen dispose of readily. The book-selling game is an old one, but is one which has never failed if properly handled. I have watched a boy for several years who took orders for Christmas trees during the autumn and delivered them the week before Christmas. He makes enough to support himself for the full year by this work. Christmas cards are another field which a number of students work to the limit. One man of my acquaintance averages from eight hundred to a thousand dollars a year in profits from selling Christmas greeting cards. With all the social life of a college community, dance programs and expensive novelty favors are a decidedly lucrative opportunity which is not passed by. Fraternity jewelry and crested stationery find a ready market. Sporting goods, especially golf clubs and golf balls, are sold by several students in each community. The best arrangement for such a plan is to work on a commission basis with some local sporting goods store.

Student insurance salesmen often make excellent profits from their sales. A knowledge of insurance is of course necessary, but the man who applies himself and really learns the game can make high wages.

The sale of pressing tickets offers an opportunity for several students to earn their way. The business of pressing and cleaning clothes is carried on on an extensive scale in college towns, and students are employed to sell these pressing tickets which give a reduced rate on quantity purchase in advance.

The recent development of bus service, especially special chartered service, has given work to several students who sell space on buses to football games. The commissions on this type of work are not so regular but they are quite profitable.

The selling game is a good one, but it is no better than still another type of work followed by students who are proficient in some particular trade or who are skilled workmen of one kind or another. Naturally some lines pay much better than others, but if a student is blessed with some skill in a pursuit he will probably be able to help himself materially. These trades may be classified according to the wages which the workers receive. Thirty-five to fifty cents an hour may be made by typists or bookkeepers. Excellent typists may make more, as may also bookkeepers who are unusually proficient. Library and laboratory assistants earn about the same amount. Some universities offer an opportunity for a few students to help themselves by acting as models for classes in art and design.

*A Dollar an Hour Making Pies*

Fifty cents to a dollar an hour, a better wage, may be earned by students who have learned carpentering. They can find many odd jobs of repair and possibly regular work at this rate. Stenographers and mimeograph operators earn wages in this range according to their skill. Almost all barber shops in college communities have a chair at the back to be used by a student barber. He may earn much more than this if he is a skilled barber and can build up his reputation. Students who have learned the tinner's trade, or are painters, may almost always be assured of work. I have known two boys to make a dollar an hour making pies in local bake shops. Engineering students, if skillful at lettering—especially Old English lettering—can make at least a dollar an hour, and if they contract for piece work can often make much more.

Expert table waiters can earn from a dollar to two dollars an hour in their spare time. This usually requires considerable previous experience, but is a good chance for a man who can do it. If a boy has learned engraving while in high school he may be assured of work when he goes to college, provided, of course, that he is a good workman. If a boy has worked as a printer's helper or is a linotype operator he can usually find more work than he can conveniently do.

One or two boys who are excellent golfers can make good money teaching golf and giving lessons in that manly art. Local stores will often cooperate by building an indoor practice driving tee, where the student can teach his pupils and show the equipment which the store has for sale.

*The Field Has No Limit*

Good musicians are always in demand for orchestra work, and piano and violin players may find a great many opportunities to play dinner music. The pay is excellent, ranging from a dollar to five dollars an hour, depending upon the skill of the player. If he is very good and can establish his popularity, he will be in great demand.

I have known students to make their expenses by keeping bees, taking care of the hives and collecting and marketing the honey. Student chauffeurs can usually earn all of their expenses. If a student is artistic he can probably earn money regularly by contracting for the decorating of houses for parties and dances. If his artistic temperament is of a different type he can usually find work instructing in dancing schools.

I have known students to earn their way by driving taxicabs, preaching in small country churches, working in dairies, mining coal, serving as policemen and deputy sheriffs, pressing clothes, driving trucks, carving wood and ivory, acting as engineers' helpers in machine shops and locomotive roundhouses, driving ambulances, helping undertakers, and even digging graves. The field has no limit; if the boy has the ingenuity to plan a new and different job, then he is all the more likely to succeed.

# We Must All Hang Together

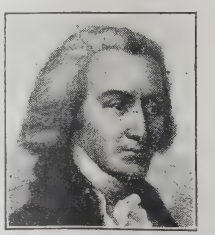
## or We Shall Surely Hang Separately

### Thus Warned Benjamin Franklin and a Unanimous Vote for Independence Followed

By CARL SCHURZ LOWDEN

Copyright, 1926, by Carl Schurz Lowden

IN THE test votes preceding the vote on the resolution for independence from Great Britain, it developed that Pennsylvania and Delaware were the two wobbly states. Upon which side of the question would they fall? Would the action be unanimous?



It was Shakespeare who asked many years ago, 'What's in a name?' Somebody might have propounded the same question to the Pennsylvania delegation of the Second Continental Congress; for Thomas Willing, one of the members, remained obstinately negative. In the final vote Willing and Humphreys opposed the measure while Wilson, Franklin and Morton endorsed it; Robert Morris, for, and John Dickinson, against, were absent, probably paired. Morton, at first doubting the expediency of such a measure at that time, had been eventually won over by Benjamin Franklin. Pennsylvania thus managed to give its endorsement.

JAMES WILSON.

Dickinson had regarded the measure as utterly premature. He had pointed out the lack of funds, the woeful need of munitions, the necessity for a trained army and the apathy of certain colonies. He had also asserted that the people were not ripe for the passage of the resolution, and had thereby drawn the fire of Dr. John Witherspoon, of New Jersey.

'Not ripe!' the minister had protested. 'In my judgment we are not only ripe but rotting. Almost every colony has dropped from its parent stem. Your own province, sir, needs no more sunshine to mature it.'

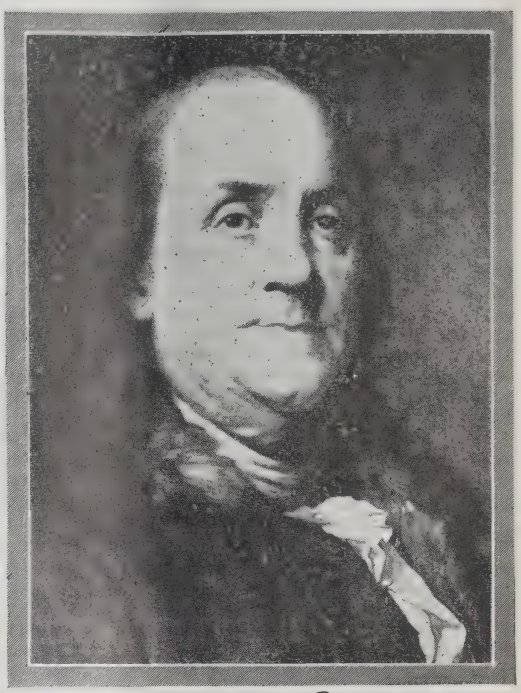
JAMES SMITH.

This incident has been narrated before, but it does no harm to repeat it. Anyhow the action was unanimous after Caesar Rodney, having ridden all day and all night, arrived in Philadelphia and reached Congress just in time to break the Delaware tie.

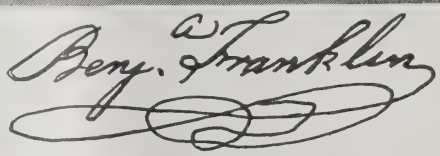
'Gentlemen,' Benjamin Franklin, oldest of the delegates and signers, warned his colleagues with his justly famous truism, 'we must all hang together, or we shall surely hang separately.'

Pennsylvania proceeded to repudiate its three negative delegates. Willing, Humphreys and Dickinson were not returned to Congress. A new election was held on the twentieth day of July when George Taylor, George Ross, George Clymer, Benjamin Rush and James Smith, all strong advocates of independence, were named. These men with those retained, Franklin, Robert Morris, John Morton and James Wilson, made the Pennsylvania delegation the largest among the thirteen; also it was the only group of signers with a majority of its members elected after the decisive action of July fourth.

The oddest or most eccentric man among the signers was probably James Smith, one of the Pennsylvania newcomers. He regularly attended church each Sabbath morning, but no one could persuade him to go in the afternoon. (He had a good excuse.) 'A second sermon on the same day,' he would explain, 'puts the first entirely out of one's head.'



During the war Smith neglected his office and his iron works to organize militia, thus causing him to lose his fortune. He took his comparative poverty philosophically, and relieved his feelings by telling dozens of jokes against the two superintendents of his iron works under whose mismanagement he had suffered heavily; he designated one of them as a knave and the other as a fool, and was scrupulously careful to keep the epithets always properly applied.

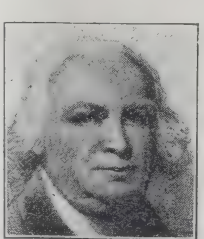


'This morning,' he wrote to his wife in October, 1776, about his health and a newly discovered cure, 'I put on the red jacket under my shirt. Yesterday I dined at Mr. Morris' and got wet going home. My shoulder troubled me, but it got better after I had run a hot smoothing iron over it three times. This is certainly a new and cheap cure.'

I wonder if Morris had suggested the remedy. Morris was subject to asthmatic attacks. He resorted to exercise at the pump as a specific at such times, laboring as though he were saving a sinking vessel; by this means, however, it is said that he bettered himself.

Morris and Smith were good friends, and true-blue patriots. Morris was in a position to be an indispensable servant to his country. Smith had a minor rôle whereas Morris contributed vitally to the success of the Revolution; indeed, we might have failed without him.

In December, 1776, Robert Morris received a letter from General Washington.



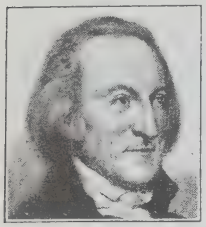
From the Duplessess painting

He needed money fifty thousand dollars, to purchase supplies, get accurate information of the enemy's movements, and to assume the offensive. Delay would endanger the whole army. Morris had helped before, but this time the request found him at the end of his resources. He was worried, so deeply worried that a Quaker saw the look of depression and was moved to inquire:

'What is the matter, friend Robert?'

'Washington,' replied Morris, with a still more serious look, 'must have fifty thousand dollars at once, and you must furnish it. My own purse is empty.'

The Quaker was silent. Why? He did not believe in war. Morris understood. Morris changed the entire complexion of the transaction.



ROBERT MORRIS.

'Your security,' he explained, 'shall be my note and my honor.'

'Robert, thee shall have it.'

This personal loan, promptly accomplished, enabled Washington to give the struggling states the cheering Christmas gift of the Trenton victory, a victory which

buoyed the hopes of the patriots and proved to be a turning point in the war. Behind the splendid work of that blustery, chilling night was Robert Morris, the man who financed the Revolution.

GEORGE CLYMER.

Morris served doubly by the liberal use of his private credit. He provided supplies for the army, and fed it; he also restored order among the soldiers when starvation and mutiny were perilously synonymous.

Practically all of the supplies required for the enterprise against Lord Cornwallis in the south were obtained by means of Morris' credit. Seventy to eighty battering cannon, a hundred pieces of field artillery completely fitted, also ammunition —all of these together with the expense of the food and pay of the troops were purchased on the personal credit of Robert Morris. In fact, this one man issued his notes to the amount of one million four hundred thousand dollars which were finally paid.

In 1781 Morris was unanimously elected Superintendent of Finance. His letter of acceptance to Congress promised, 'The United States may command everything I have except my integrity, and the loss of that would effectually disable me from serving them any further.'

Benjamin Franklin spent several years in England in an effort to obtain justice for the colonies without a war. He succeeded in getting the Stamp Act repealed, but other detested acts were retained. When he saw that it was impossible for him to gain American rights through the power of words, he returned home. The day after he landed he was named a delegate to the Continental Congress. Later he served on the committee to prepare the Declaration of Independence, and upon other committees. He was the oldest signer. He drafted the first plan of government known as the Articles of Confederation. He was our first Postmaster-General.

BENJAMIN RUSH.

He often visited the camp of Washington to consult with him upon ways and means of conducting the war. He went to Canada to invite the people there to join with the United States. He labored devotedly for his country. His words failed in England and they failed in Canada; and yet they did not fail when failure might have meant the death of the new nation.

Who was sent to France before the close of the second year of the war to obtain aid for America? None other than Benjamin Franklin. She immediately gave secret aid, but the United States wanted an out-and-out ally known to the whole civilized world. France did not relish the idea of a clash with Great Britain. But after a year of toilsome effort a treaty was made whereby sixteen war vessels and an army of four thousand men were sent over in the summer of 1778. The coöperation of France was a vital factor in our success, and all the glory of winning France belongs to Franklin.

One of his biographers has said:

'It is flattering to our pride to learn that the mind, character and versatile genius of Franklin have been called an epitome of all that is best in the typical American. He won as the best among us win—by straightforwardness. He introduced "shirt sleeve" diplomacy into Europe. He had shrewdness, good nature, open-mindedness, persistence and infinite knowledge of the world and of human nature.'

It is not generally known that Franklin had a rival as a laconic philosopher, a man who lived in the same state, the same city and who was also a signer of the Declaration. George Clymer, a merchant, said some very good things. I imagine their failure to attain popularity was due to lack of publicity rather than to any lack of merit. For example:

'Mere swearing in conversation is nothing but powder without ball.'

'A habit must be a practice, but a practice may not be a habit.'

'The bow that is always bent loses its spring, and the mind will never do much unless it sometimes does nothing.'

GEORGE TAYLOR.

'Some men's minds are like looking-glasses; for, having no images or impressions of their own, they can but reflect those of others.'

'Monarchy is a high tower set upon a sunken plain; in a republic there may be no tower, but the general level is higher.

Clymer owned a coffee shop in Philadelphia. One day George Washington stepped in. Though the proprietor did not know his guest, he showed him real courtesy and gave him fine service. Out of this happening there developed a friendship between the two men that lasted until their death. Later when Washington and his ragged troops were merely existing at Valley Forge, Clymer gave freely of his wealth to keep the army together.

Dr. Benjamin Rush, another signer from the Keystone State, opposed capital punishment, as also did Clymer, and they worked together so ably that they secured its diminution in Pennsylvania. He urged the establishment of free schools, wrote tracts against drunkenness, attended church whenever he could, was a founder of the Philadelphia Bible Society, was president of the organization for the abolition of slavery, was physician-general of the military hospitals for the middle department during the war, and served fourteen years as treasurer of the United States Mint.

'It is a matter of wonder,' said Dr. Ramsay, one of his associates, 'how a physician who had so many patients to attend, a professor who has so many pupils to instruct, could find leisure to write so much and at the same time so well.'

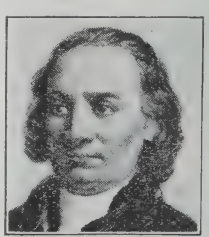
He did not seek retirement or silence, when he wrote; he composed with greater zest in the company of his friends or surrounded by his clamorous children.

Dr. Rush, together with John Adams, persuaded Thomas Paine to take up the pen in defense of the American cause. It was he who gave the name of 'Common Sense' to Paine's first paper.

He never accepted pay from the clergy, from officers of the Revolution or from poor people. He told his pupils he esteemed the poor his best patients as 'God is their paymaster.'

James Wilson, who stood staunchly by Franklin and Morton in the final vote, was a Scotsman. At various times he wielded his pen in favor of the colonies. In 1774 he boldly denied the authority of Parliament in a pamphlet entitled 'Considerations on the Nature and Extent of the Legislative Authority of the British Parliament.'

GEORGE ROSS.



He did not cut much of a figure in Congress. Though he had studied law in the office of John Dickinson, possibly the most strenuous opponent of independence at that time, he was unable to sway his colleague. At the time of the constitutional convention in 1787, however, he had gained confidence in himself and had acquired a commanding personality. The most able debaters in the sessions were said to be James Wilson, of Pennsylvania, and Francis Lewis, of New York. Wilson, enthusiastically democratic, was one of the committee to prepare the form of the Constitution; and the task of drawing up that instrument devolved upon him.

There is little known about George Ross. When Governor Penn in 1775 wrote a letter to the colonial legislature and urged that body to refuse to break with the mother country, Ross was angered. Being one of the lawmakers, he wrote a letter to the governor, and he took pains to speak plainly.

'We are sincerely obliged to your honor,' he told him, 'for your attention to the true interests of the people over whom you preside, and would assure you that we shall always pursue such measures as shall appear necessary to secure the liberty and independence of America.'

It seems that Penn never forgave Ross for his spirited reply; and that he succeeded in keeping the patriot out of Congress for a time. However, he was one of those chosen in the latter part of July, 1776, to replace the non-independence delegates.

George Taylor was a lucky individual. Born in Ireland, he came to America and stoked a furnace for a Mr. Savage who owned an iron works. Savage, noticing his intelligence and education, asked him if he could not handle a pen better than a shovel. Transferred to the office, he became a member of the company later. When the principal owner died, Taylor married Mrs. Savage; in this manner he acquired great wealth.

JOHN MORTON.

After making a bad start with unwilling delegates, the state revised its list of representatives. I doubt if any other state had among its signers three such truly noble men as Franklin, Morris and Dr. Rush.

# CHATS WITH OFFICE CALLERS

'In one of the eastern state capitals,' said ***the Priest,*** 'there is a bureau of eloquence where anyone can get a speech for any occasion. The speeches are neatly printed in large type on sheets of convenient size, and they can be laid on a rostrum and read easily. And the cost—that is one of the beauties of the system—is only three dollars a speech. If a man wants to deliver a Fourth of July address, or speak before a luncheon club, or make an after-dinner speech, all he needs to do is to write the bureau and outline his requirements. And the product isn't bad, in its way. The men who do the writing have been specially trained, and as a rule they know pretty well what they are doing.

'Seems as though this is the age of canned goods, doesn't it? A clay disk brings us the music of the world. A turn of a dial and we can hear a Sunday morning sermon, seated comfortably in our homes. A twist of a can-opener and you have a meal, ready-prepared. Three dollars and a two-cent stamp brings a ready-to-deliver speech to your house. But somehow the substitute music, the substitute sermon, the substitute meal, the substitute speech all seem to lack something. The meal gives a little more heartburn, perhaps, than those mother used to prepare. And I wonder if the speeches don't, too? Somehow I imagine Lincoln's "Gettysburg Address" would not have been so powerful or so appealing had it been prepared by a "bureau of eloquence." '

ɤ ɤ ɤ

'Talk about prohibition,' said ***the Photographer,*** 'the only time I hear much against it is when I strike some of your big cities. I have driven from California to Michigan and have only seen two intoxicated men. Of course, I have traveled mostly through the rural sections and small towns.'

'To what do you attribute this feeling in the cities?' we asked.

'One obvious reason, of course, is the large percentage of foreign population. These fellows aren't interested in American ideals and, of course, aren't interested in upholding American law. Another reason is perhaps that this great bulk of America which lives out on the farm actually has time to think things out for itself. It is largely uninfluenced by wet newspapers and the movies.'

'Then you have no doubt as to the outcome should the matter come up for vote again?'

'Absolutely none,' replied the photographer. 'Did it ever occur to you that the reason we have so many Congressmen who will not state their views on prohibition is the fact that they know how their constituency back in the country feel about the question?'

ɤ ɤ ɤ

The man from ***the West*** dropped into the office.

'I have twice driven across the continent,' he said, 'and each time I have had occasion to get far off the beaten track. If anyone has seen rural America, I have, and the thing about it that impresses me most is the fact that it is fast becoming paganized.'

'What do you mean by paganized?' we inquired.

'Well, unchurched, if you want to put it that way. Do you know that rural churches are becoming a thing of the past? Religious centers seem to have changed. The time was when the strength of the church lay in the rural districts, but now, if anywhere, it seems to be in the cities. If you do not believe this, look at the building programs which are being carried on. The city is no longer putting up the ordinary church—it is building cathedrals. I went to church one Sunday morning recently in a small community church. There were nineteen in attendance. At a ball game in the afternoon there were three hundred.'

'All of which indicates what?' we queried.

'That the church is neglecting the rural field. The present generation may not suffer greatly from this neglect, but what of the next one? Most of these folks were brought up in the church but they are withholding this training from their children. Somehow it doesn't seem to me that this is a square deal for the kids.'

ɤ ɤ ɤ

'I was driving through the country,' said ***the Newspaperman*** 'when my wife remarked the regular sequence of two institutions as we passed along. First there would be a church, then a school, then another church, and another school—schools and churches alternating all along the way.

'That is history. At the foundation of education is religion. The school was in the church at first, just as the drama and medicine were in the church at first. The church taught the people to read; in English-speaking lands, the original purpose of teaching the people to read was that they might read the Bible. The constitutions of most of the states link religion and education as interests to be forever encouraged. Harvard began with a minister's library. Dartmouth and Yale both had religious beginnings. The University of Michigan, in our own state, began with two clergymen, and a most unusual combination it was. One of them was the Rev. John Monteith, Presbyterian, and the other was the Rev. Father Gabriel Richard, Catholic priest. They agreed on education. Most of the small colleges scattered through the land have religious foundations—Oberlin, for example; and Oberlin is the mother of many colleges.

'You see these two institutions throughout the land, everywhere you go. Wherever the church is, there is the school. The reverse does not always follow. Sometimes the offspring forgets its source. You may talk as much as you like about the "secular" public schools, but religion is their cornerstone.

'The drama and medicine sprang from religion. Many of the ancient medical ideas seems crude to us, but Dr. Jayne in his book, *The Healing Gods of Ancient Civilizations,* says that the ancients' idea of disease and its origin, religious and even superstitious as they may seem, are in form much like ours. The ancients said that disease was an evil spirit that entered in at the mouth or nostrils: you have only to change a term to make it a statement of the modern germ theory. The temples were the first hospitals, and "the temple sleep" was curative. So is the quiet mind today.

'Of course they say that these may have sprung from the church, but that they have outgrown the church. That idea is still too young to have proved itself to be true. We may be of quite a different mind in another fifty years. Anyway, religion goes on round the world, and most of the colleges you find today outside of what we call civilization are on church foundations. The church and the school—any countryside will spell you the method of progress.'

ɤ ɤ ɤ

'I have passed the customs many a time,' said ***the American*** traveler, 'and I think I note a deterioration in the quality of the service. For one thing, it is distinctly not an American service. The alien element creeps into it more and more. It would seem to me at least essential that the guardians at America's gates be able to speak the English language. And where the service is American it is not representatively intelligent.

'Last time I came through they asked me where I was born. I said Idaho.

' "Is that in the United States?" queried the customs officer.

' "I don't know, do you?" I returned.

'He looked at me a second and grunted that I could go through.

'The time before I was received by an Hebraic son of Russia or Poland who quite officiously took my case under consideration.

' "Und vere vas it dat you vas borned?" he asked me.

' "That isn't the question," I replied; "the real question is, where were you born?"

' "Don'd get fresh," he warned, but he passed me through without further examination.'

ɤ ɤ ɤ

'The Sesqui-Centennial has received a lot of very bad publicity,' said ***the Philadelphia Banker,*** 'but I think it will come through. There was a very bad start. From one point of view it is possible to criticize many things that were done in real estate and concessions. I think that there can be little doubt that those closest to the affair gave most of the business to their friends. It is rather the usual practice, I believe. And there is a financial deficit. But it is a two-year show, and if the city comes through with a sufficient appropriation—and, of course, it will have to—then, I think, the exposition will finish rather satisfactorily.

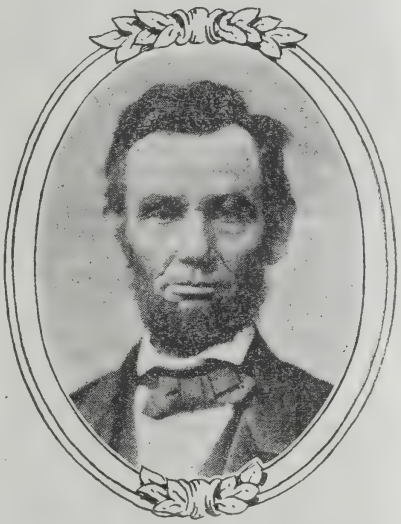
'We feel keenly the shortcomings up to date, but we blame no one but ourselves. Philadelphians have been the worst enemies of the Sesqui. Our people did not pull together, and when a crowd was found that would pull together, it was not conspicuously illustrative of the best in Philadelphia. I know the feeling abroad through the nation that Philadelphia is a corrupt city. But what Philadelphia is today she has been, to my knowledge, for fifty years '

# Why Lincoln Was Sad

(Concluded from page 6)

Abraham Lincoln's first cousin, the younger Mordecai. In many respects he strongly resembles Abraham Lincoln. He had the same kind of mind. His handwriting was strikingly similar. He had a marked inclination to satire which Abraham Lincoln had and learned to control, and Mordecai unfortunately never learned to keep in check. He had the same love of humor, and he had the same type of melancholy. He had a musical gift which Abraham aspired to but did not possess.

Mordecai played the violin. It moved him to such moods that he gave it up. He left his violin in Kentucky, though whether this was because he foreswore music then and there or because of the haste of his departure may be uncertain. He never owned a violin afterward, but whenever he went to the home of relatives or friends where there was a violin his fingers were restless till he had it in his hands, and he would walk the floor playing the fiddle till tears streamed down his cheeks and his emotions grew beyond his control. There were days when Mordecai was too profoundly sunk in melancholy to speak to anyone, days when he would go off in the woods and return at night, perhaps in his usual frame of mind, perhaps rather mirthful.



Mordecai Lincoln was a friendly man, kind-hearted, sympathetic and on occasion generous, but he was sarcastic; he was belligerent; he had an acid temper and a sharp tongue. All these qualities were possessed by his cousin, Abraham, but Abraham learned in some degree to control them. Mordecai serves well to show what were the native qualities of Abraham Lincoln. Nearly all of Abraham's cardinal traits we find writ large in Mordecai and manifest also in other members of the family.

This is wholly new psychology and it is both legitimate and important. It gives us the basis of an understanding such as no study of Abraham Lincoln has hitherto afforded. In the light of this sketch we know some things about the mind of Lincoln which have hitherto been obscure, and the door is ajar for future study.

It remains to add something about Abraham Lincoln's relations to women as they may be interpreted in the light of this present knowledge. The statement of Abraham's cousin, Robert Lincoln, to John Hay, 'We are not a very marrying family,' is confirmed by such acquaintance as we now have with this branch of the Lincolns. This does not mean, however, that either the men or the women of this family were unaware of, or unmoved by, the attractions of the opposite sex. Most of them married and married but once. In the case of the death of a husband or a wife, remarriage was infrequent.

So far as I have been able to learn there was not a single divorce among them. If they were not wholly happy in their married life, at least they were true. Broadly speaking, they were too much given to moods ever to be wholly happy for a considerable length of time. They were happier married, however, than unmarried. While both sexes were afflicted with melancholy, the men seemed to have suffered rather more than the women. Nor did I learn that among the women this trait was unusually pronounced at any given period of their life. The Lincoln women wanted husbands, the Lincoln men wanted wives; yet few of them attained to matrimony without some hesitation and deep searching of heart.

We do not know that Lincoln had any period of hesitation in his relations with Ann Rutledge, but that may be because we know almost nothing of the Ann Rutledge love affair. We do know that in his courtship of Mary Owens he showed an astonishing instability of inclination and choice. We know that his little love affair with Sarah Rickard, whatever there was of that, brought him alternating feelings of satisfaction and self-reproach. We know that his engagement was broken, and that by his own act, and that he suffered so keenly in memory of 'the fatal first of January,' 1841, that he believed himself to be losing his mind. We are not to account for this trait in Lincoln's character wholly by

Countenance of Lincoln on the day he commissioned Grant Commander-in-Chief of the Union Armies.

our knowledge of the disposition and temperament of the three women. We have some reason to suspect that Lincoln would have acted somewhat similarly if engaged to any woman.

At this point we have remarkably interesting information about his cousin, Mordecai.

Mordecai Lincoln lived in Leitchfield, Grayson County, Kentucky, prior to his removal to Illinois. There he made shoes and clothes and did his carpenter work and played his violin. There, too, he fell in love with a girl of good family whose first name was Patsy. There is no reason whatever to think that a serious quarrel occurred between Mordecai Lincoln and his lady-love. He went to visit her one night in 1836 and on his return left Leitchfield that very night and never went back again. I have two letters from Patsy's father. They are well written, dignified letters, written by reason of Patsy's grief, an ineffectual effort either to bring Mordecai back or to obtain an explanation from him. He wrote of the painful circumstances of Mordecai's departure and the deep sorrow which that departure caused Patsy. He says: 'What makes it the more strange is that I cannot learn that anything happened.' Mordecai did not betray and desert Patsy. He does not appear to have left as a result of a lover's quarrel. There is no reason to think he did not love her, but as the time for marriage approached he simply ran away from it. It is not the only instance of the kind in the Lincoln family.

He never married. He retained to the end of his life the reputation of having been a woman-hater.

And yet, with his private papers now in my hand, I find that at least twice afterward he was deeply in love with women and wrote letters proposing marriage, letters which so far as I am aware he never sent. One of them was written to a girl named Elizabeth; the other to a young woman named Catherine, a school-teacher whose name had been slandered and he had risen to defend her. To both these women he wrote offers of marriage. They are well written and ardent. He yearned for Elizabeth's company in his cheerless cabin, but when he looked around she was not there. He longed for the love of Catherine, he wanted it 'the worst of anything.' If she could not love him he hoped she would think of him now and then, because he thought always of her. These letters were not written on his ordinary paper. He went to Nouvoo or Carthage to obtain paper for his letter to Elizabeth and copied his letter on an extravagent sheet tinted in robin's egg blue.

I should like to have been present in the cabin of Mordecai Lincoln on Sunday, October 24, 1858, for on that day Mordecai entertained his cousin, Abraham Lincoln. That was the autumn of Lincoln's seven debates with Stephen A. Douglas and the seven were all finished, the last having taken place at Alton, Friday, October fifteenth. The cousins had not met very often and they were men of just about the same age, being at that time near fifty. Abraham had been married sixteen years and had three sons living and one dead. Mordecai's mother, Mary Mudd Lincoln, who had lived with him the later years of her widowhood, was dead, and he was alone. I wonder what these two men talked about in the light of their domestic experience. I can imagine Abraham's asking Mordecai if he did not find it very lonely as he approached old age, for a man of fifty was no longer counted young. I can believe that Mordecai answered that he was indeed a very lonely man and had often thought of marriage, but that women were such unreasonable creatures he had decided to remain as he was. Abraham, in the light of all his experience, was hardly in a position to deny that women were, at least might be, unreasonable, but I can imagine his saying to Mordecai that even if married life brought with it some discomforts it had more than compensating joys: that he had an attractive, ambitious and aspiring wife who supplemented him at many points, and that he was very happy with his three boys and the memory of dear little Eddie who was dead.

I would give much for a shorthand report of their conversation and a snapshot of the two cousins as they sat and talked together. They were men of such kindred tastes and traits, so like in stature, appearance and temperament, it would be good to know what they talked about that quiet Sunday and what Mordecai thought about it afterward. This we may not now ascertain, but what we do know is that Abraham Lincoln in his characteristic moods and his attitude toward marriage was not alone in his family.

# The Most Misunderstood Religion

(*Continued from page 15*)

We must also bear in mind, when accounting for the strong Jewish coloring of Islam, that even the Christianity found in that part of the world was strongly marked by Judaism, as was shown by the predominance of the Old Testament Scriptures over those of the New Testament in the services of the church. This tendency may be still observed in the Abyssinian Church of today, and Yemen was, for a long time prior to Muhammed, a political dependency of Abyssinia. The persecuted Muhammedans fled in the year 5 A. H. (A. D. 637) to Christian Abyssinia where they were well received, and whence they probably brought much knowledge of the peculiar liturgical service of the Abyssinian Church. There were also many Christian sects in Arabia with Jewish tendencies.

The very word which is used in the *Qoran* for 'revelation' is derived from Christian sources. It is used by Muhammed of his own revelations, as well as of those of the Old Testament prophets. (cf. Sura 3:2; 2:50.)

The Vigils, as well as certain forms observed in the ceremonies of prayer, have been adopted from Christian liturgical services, and it seems, as has been pointed out by Professor Nöldeke, that Muhammed's knowledge of Christianity was derived mainly from extra-canonical literature and the liturgical services. The teaching as to the Great Day of Resurrection and Judgment and the superiority of Jesus over all the prophets, which are among the principal doctrines of Islam, are based also upon Christian teaching.

Another influence of a kind from which Muhammed could not wholly free himself,

***Adoption of the Kaaba***

and which contributed to the shaping of the new religion and to the creation of some of its teaching, was that of the early beliefs in which he had grown up. These included the belief in *jinns*—a kind of spirits some of which he declared became converts to Islam, while others remained among its enemies. Many other heathen beliefs and religious customs were gradually taken into Islam, just as many similar superstitions were absorbed into the Christian Church. Some of these were adopted unconsciously, while others were accepted intentionally with the purpose of bridging over a gulf by which the unbeliever might enter into the salvation offered by Islam.

As such we may regard the adoption of the Kaaba, the oldest national sanctuary of the heathen Arabs, as the central sanctuary of Islam. Muhammed accomplished this astounding transformation by solemnly declaring that this venerable structure had been actually built by no less a person than Abraham, the greatest saint of Islam and the father of the faith of the Old Testament. The heathen rites of this sanctuary were adapted to the new requirements, with the allegation that they were originated by Abraham. Although this concession to heathenism increased Muhammed's temporal power, it was nevertheless a lowering of a spiritual ideal. Yet we must confess that these rites and ceremonies, exercised in the days of Muhammed under the new conditions, had a certain spiritual influence upon those who took part in them as they have still today. When Muhammed had broken off relations with the Jews, he declared that Islam was the true religion of Abraham, which they had corrupted.

We shall now examine the claim which Muhammed made that he was the final messenger of God promised in the Holy Scriptures of Jews and Christians:

There lived in Arabia powerful and rich Jewish tribes, as well as many Christians, whom he wished to gain over to his side,

***Posed as the Paraclete***

as their acknowledgment of him as the promised messenger of God would at once have given him a more secure position. The allegiance of this important portion of the population of the Arabic peninsula would soon have made him master of the situation.

To obtain this desired result he based his claim upon what he believed to be quotations from the Scriptures. Thus he quotes the Almighty as saying: 'My mercy extends over all things; I will write down the same for those who fear God, give alms and who believe in our signs. Those who will follow the unlearned prophet of whom they will find record in the Torah and in the Gospels. —He will take their burden from them and the fetters which lie upon them . . . ' (Sura 7. 155ff.)

To his hearers he then said: (v. 157) 'O ye people, behold I am God's messenger to you all, to Whom (i. e. God) belongs the government of the heavens and the earth, there is no God but He, who calls into life and causes to die. Therefore believe in God and His messenger; the uneducated prophet who believes in God and His words, and follow him so that ye may be guided.' In another place (Sura 3:75) he declares that God had demanded of former prophets that they should state in their writings that a messenger would come after them 'to confirm' what 'they possessed,' that is, their holy writings.

However, the most surprising claim which Muhammed made was that he was the Paraclete whom Christ had promised to His Disciples. His assertion is contained in the following passage (Sura 61:6)—'And Jesus, the Son of Mary, said: "O Children of Israel, I am the Messenger of God to you, confirming the Torah which has been before me, and announcing a messenger which shall come after me, whose name shall be Ahmed." ' Muhammed's claim is due probably to a misreading of the word PARAKLITOS, the Comforter, into PERIKLYTOS, the Praised One, which in Arabic is *ahmed*, which, used as a proper name, is equivalent to that of Muhammed, who therefore applied this prophecy to himself. As he knew no Greek he must have received this interpretation from someone else, seeing in it

***Charged Corruption of Scriptures***

evidence for his claim to the prophetic office as foretold by Christ. But neither Jews nor Christians were able to find in their Scriptures any such prophecy as Muhammed adduced.

The rejection of his claims led him to charge both Jews and Christians with having corrupted their scriptures. The Jews of Arabia were a factor to be taken into serious consideration in everything pertaining to the political and civil life of that country. The possession of an ancient literary tradition gave them a mental superiority over the Arabs. They assimilated themselves with marvelous facility to the nations among whom they lived, without losing their own characteristics.

Muhammed would perhaps never have succeeded against the warlike Jews in Arabia by martial force, if their tribes had not been divided into opposing camps by their share in the wars between the two powerful Arab tribes, the Aus and the Hazrag. The biting sarcasm of the Jews, and their pointed questions in matters of religion, injured his cause more than did armed opposition. Thus one day the Jews came to him and said: 'O Muhammed, this God has created the creatures; but who has created Him?' They naturally had some answer prepared, but Muhammed had no subtlety with which to respond.

Muhammed claimed that his revelations came to him by the Holy Ghost (Sura 16: 104) Whom he regarded as identical with the Angel Gabriel (Sura 2:91). His followers speak of four principal methods by which the divine message was conveyed. The most frequent seems to have been the falling into a kind of trance, foaming at the mouth and copious perspiration running down his whole body. The message received in this state did not become clear to him 'until the angel had left him,' that is, till he had regained his full consciousness. The Arabs called the people who were afflicted in this or in a similar way 'possessed' *majnun*, but Muhammed seems to have regarded this condition as a special medium by which God made Himself known.

Muhammed was much given to prayerful meditation by night, and to fasting (Sura

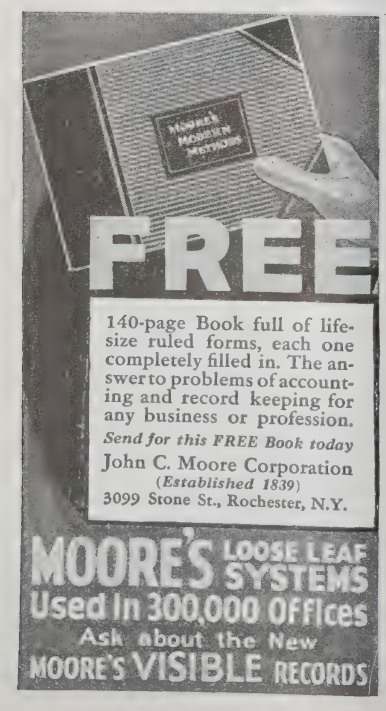
***He Had to Endure Many Taunts***

17:81), by which the power of supernatural vision is much heightened, a fact of which we have examples in the Bible. At other times an angel, in the form of a man, would come to him: 'He speaks with me,' Muhammed said, 'and I remember afterward what he told me.'

Or again, the Holy Spirit would blow the message directly into his heart, or again, an angel would come to him in a dream.

Muhammed had to endure a good many taunts from his fellow citizens. He was always the butt of their jests, which, in the primitive state of the society in which he lived, were not sparing of his feelings. But undaunted by calumnies and aspersions, he stood firm in his conviction that he was God's messenger, and that what he proclaimed was divine truth: 'What was sent down to thee (i. e., the *Qoran*) from thy Lord is the truth,' said the Angel (Sura 11:20). As it was just this claim which involved him in controversies with the idolators, he one day challenged his opponents to produce one single sura equal to his own. It was not the poetic *form* to which the challenge applied, but the *teaching* of the suras, which would have involved repudiation of their idols and the acceptance of Muhammed's teaching.

The challenge was taken up finally in a somewhat different fashion, both in Muhammed's lifetime and shortly afterward. There arose a number of men in various parts of Arabia, and at least one woman, called Sagah, who declared themselves prophets of the One True God. Et-Tabari has preserved for us in a tradition the names of some of these prophets, and the sayings of one of them—Musailama. By this



time, Islam had been recognized, but in the fight for its existence these prophets had been declared, without much ceremony, to be inspired by Satan, and these rivals of Muhammed were finally exterminated.

The little that has been preserved of Musailama's teachings shows clearly that there is a strong resemblance between them and those of Muhammed in essential doctrines, though Musailama has some additional Christian teaching which is not found in Islam (Nöld.-Schw. p. 57). It is therefore most probable that, like Muhammed, he was dependent upon Christian teaching—another proof of the influence of Christianity in pre-Muhammedan times in the Arabian peninsula.

Muhammed lacked that fine perception of good and evil, which is needed to protect one whom circumstances have placed beyond the criticism of others, from committing serious errors, and in consequence did not at times hesitate to employ means which can only be regarded as reprehensible, to further the spread of his religion. It has been well said that: 'Enthusiasm, in its progress, remains as rarely free from fraud, as fire from smoke; and men with the most sincere convictions of the sacredness of their cause are most prone to commit pious fraud.' (Sprenger, Life of Muh. 124f.)

The Muhammedan writers endeavor to gloss over these defects in Muhammed's character, while, on the other hand, many Christian writers find in them the occasion for condemnation of his life-work. But to be just in our estimate we must give him credit for the work he accomplished among a half-barbarous and idolatrous people, a work which he could never have achieved if his soul had not been touched by the Divine Fire.

It is true that toward the end of his career his inward light shone but dimly—it will never be possible for us to know how many of the errors which Muhammed committed are due to the semi-barbarism of the age in which he lived, to his weakness of character, to his lack of reasoning power, and perhaps to deception practised upon him, *ein betrogener Betruger*.

# Army Morale Is Sinking

(*Continued from page 7*)

R. O. T. C. might be expanded. Yet the R. O. T. C. scrimps along on relatively beggarly sums, without prospects of increase. Colleges and schools desiring to establish new units have to be refused—at the rate of nearly three a month—and suitable candidates have to be denied admission to the units already in existence: the answer always being, 'Lack of funds.' Well-bred students are compelled to wear shoddy and disreputable uniforms left over from World-War stocks. Officers on this work face discouragement every day.

5. Citizen's Military Training Camps grow from year to year. It has been said that Congress is willing to support this venture. Yet the fact remains that there have annually been more applicants than places. The fact remains that though the Army has been able to take care of increases after some fashion or other, it has only been by putting to daily labor regular troops who should be pruning themselves to serve as expert demonstration units, by diverting other funds and other material, by stretching duties actually beyond the breaking point of morale. No one claims, however, that much of the training given under these conditions is complete or thorough, as all military training should be if it is to be of any value at all.

This is the personnel situation in the Army of the United States today, and it may categorically be stated that one of the three components which does the heaviest work and has the greatest responsibilities, the Regular Army, is now wavering in spirit and sick of the hopeless task.

*Officers Who Study in Shacks*

What is the use, however, of discussing the personnel question, when the War Department does not have the physical plant to care for what troops are now already under arms? Is the personnel question solely to be considered, when rotten, war-time, 'temporary' barracks are falling to pieces and commissioned officers are supposed to live like gentlemen and study and love their profession in rickety shacks scarcely better than those of plantation negroes in the South?

Funds for upkeep are so far in arrears that it is estimated that an initial outlay of $30,000,000 will be necessary to start even by first repairing present structures and utilities in need of emergency treatment to prevent accelerated deterioration. Four hundred millions of the taxpayers' property is being permitted to go to rack and ruin, while the crowd follows the political vote-catching cry of 'Economy!'

Figure for a moment a situation where the pressure for economy is so great from above that stringent and absolutely unfair measures must be adopted. An officer happens to occupy a single room, twelve by fifteen feet, heated by a wood stove which sticks its ugly hulk into the middle of the floor, in a building with a leaky roof, rotting beams, uneven floors, and loose windows.

In times of emergency, this captain might put up with any conditions, but in times of peace, he will scarcely be blamed for feeling dissatisfied with such a place. Yet to save the government a puny sixty dollars commutation of quarters a month—with which he might fix his place up for greater comfort or beauty, or at least feel that his Government gave him some compensation for his circumstances—to save this sixty dollars, his post commander issues an order stating that the quarters he occupies are 'adequate' for an officer of his grade. Further than that, to make him feel still more cheerful, it was dated in 1923, in compliance with a circular dated in 1924, and issued in 1925—being signed by a man a thousand miles away at the time it was presumed to have been signed.

In law the order was worth nothing. In the army, everything goes. It was a pretty blanket order, issued irrespective of real adequacy, issued in obedience to pressure from higher up, and issued purely to save the Government money. In fact and in the army it did save the beggarly dollars and at the same time exemplified the preposterous injustices that must be imposed under present housing conditions.

*When Land Is to Be Sold*

The War Department has had for nearly two years a housing program that would cost something like a hundred-odd million dollars, to take 40,000 of its troops from under canvas and put them in proper buildings. The law says the funds may be secured from the sale of property no longer needed. But listen to the local politicians howl when you try to sell out land in one locality to build where building is wanted! And does anyone imagine that a grateful Government will credit the War Department with properties already transferred to other departments to the value of $52,000,000 and properties already sold—since the World War—to the value of about $30,000,000? The low-spirited Army has small hope of such a circumstance. The Army saw millions donated to ungrateful Russians, and sees itself treated like a poor relative. Even charity goes afield.

Other matters demanding urgent financial support are of a more strictly military nature, though not a whit more necessary for military efficiency. These other projects must be carried on if the objects of the Act of 1920 are to be attained.

1. Our ammunition is becoming depleted. When the war was over, we had 'lots of bullets.' But that ammunition was going bad in storage, as all chemical compounds do. It was more than was thought necessary for a war reserve. So we shot up the excess surplus. We proved what we could do with facilities. With somewhat increased ammunition allowances, a phenomenal revolution was effected in accurate rifle shooting. We developed experts in greater numbers than we had developed ordinary marksmen before. Now the ammunition allowances are being cut in conformity with the general demands for economy. The war reserves of rifle ammunition decided upon must be maintained. Troops can only fire old ammunition as rapidly as a parsimonious people provide new ammunition to go into storage to replace the old. These purchases are ridiculously small. Firing decreases, and the efficiency in shooting likewise decreases. The largely urban population of this country today is not so adept with the shooting weapon as the earlier colonials and the later frontiersmen. Men must be taught to shoot. They must be taught by actual practice at shooting. Otherwise we might as well drill with broomsticks.

2. Large-caliber ammunition is in much the same state as small-caliber ammunition, except that it is much more important in the case of the big guns to keep a big war reserve on hand. The longer the range, the more perfect must be the propelling charge. The bigger the gun, the harder it is to put the projectiles and the cartridges into quantity production on the outbreak of war. Mute cannon are no defense against hostile attacks on seaport towns.

*Coast Defenses Silent*

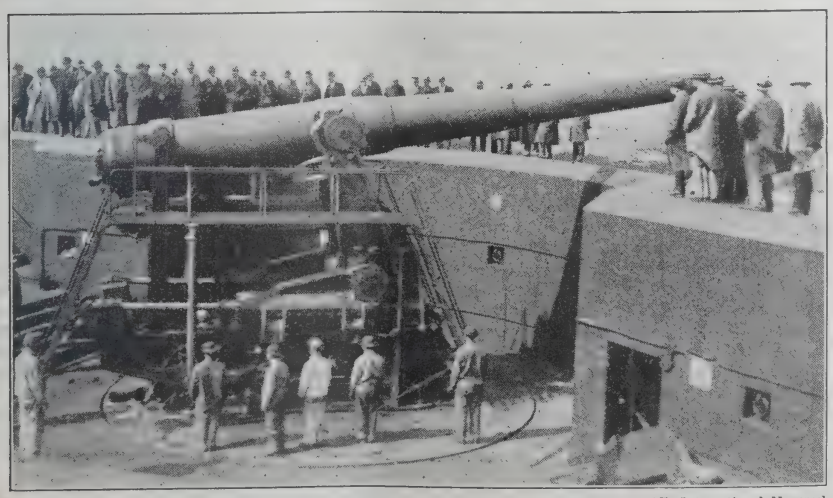
3. Coast defenses stand silent. Reductions in Coast Artillery personnel have placed fifteen out of thirty-five districts and seventy-five per cent of the guns in those fifteen districts in the hands of caretakers with grease pots when they should be in the hands of expert troops trained for their use. Sudden attacks will come on the borders of the sea, and the coasts are garrisoned mostly by rifle-trained Infantry regiments and not with skilled artillerymen as they should be.

4. In the spring of 1923, the War Plans Division of the General Staff completed a study it had initiated itself and made public the so-called Lassiter Report, telling the country what was the matter with the Air Service, and recommending remedies, principal among which was increase in personnel and increase in financial support. The Secretary of War repeated the recommendation in his annual report for 1924. The Morrow Commission has reiterated substantially the same statements and has said the recommendations of General Lassiter's committee should be carried out, and speedily.

In the two years since 1923, the public has been apathetic on the subject, except for an occasional glance at a headline inspired by the startling antics of a single sensational and seemingly insubordinate air officer.

*Army Is Mentally Depressed*

For five years the Army has been battling along, fighting a losing struggle against inefficiency and beggardom that threaten more and more from year to year. At the end of the five-year period, a full and frank consideration is needed. A sensible study of the whole proposition of national defense will reveal whether or not it is possible to carry on under the Act of 1920.



The Army is mentally depressed, and would welcome a complete investigation of military policies, plans, and conditions. Army officers of the Infantry have spoken through their unofficial organization, the U. S. Infantry Association, and have suggested that a committee of Congress or a non-political civilian committee, composed of veterans and publicists and legislators might well conduct an exhaustive study of the entire matter, of the Act of 1920, and of the facilities available in present appropriations or in the Treasury of the country for carrying out the provisions of that Act.

With inadequate resources, a Regular Army of 118,000 has been trying to do the work originally laid out for an army of 280,000. It is cracking under the strain. A new diagnosis is needed and a new prescription, perhaps a new diet. The prescription should take the form of a definite financial program and clear assurance of a ten-year or twenty-year schedule on which various projects might be allotted priority, but in which all the urgent needs of the three components of the Army might find proper place.

We want no more to do with politics. We are tired of such catch words as 'economy' and 'pacifists' and 'clerical reds' and 'revised promotion lists.' We want to see on a broad basis what we have and what we need. We shall not be satisfied with new brass buttons, or with pretty new uniforms, even if they do have roll collars. Let us have the entire matter thrashed out once and for all. We are sworn to serve the country. It is our duty to provide for national defense as the people want it so far as what support the people will give will enable us to provide and plan for it. If we are expected to continue to live in disreputable hovels for the rest of our lives, doing a maximum of manual labor on upkeep of army posts and the like and a minimum of training as a military force, and to drill with powderless rifles, we want to know it.

*Are We to Be Respected?*

Are we to consider ourselves labor gang foremen or officers and gentlemen? If we are to be a respected and an efficient basic organization capable of war-time expansion, we want to know that too, and to be provided with the wherewithal for the tasks that will fall to our hands and our heads when America again needs efficient defenders.

# How We Got the New Testament

(*Continued from page 8*)

samples as the *Oxyrhynchus Logia* give us a picture of the original Gospel, which was read and interpreted to a Christian community by its leader, who had not had the great good fortune of sitting at the feet of Jesus.

The Christian teacher, who could not tell the story at first hand, needed a written guide, if he would reproduce with approximate exactness the teachings of Christ.

This was furnished by the 'Sayings of Jesus,' of which there may well have been many different copies, for different disciples would have emphasized some 'Sayings' and forgotten others.

Of this general character was the original Gospel of Matthew, if we may trust the statement of Papias as quoted by Eusebius in his Church History. Papias was only one generation removed from the immediate followers of Christ and seems to have been an earnest seeker of records about the life and teachings of Jesus. He mentions a collection of 'Sayings' written in Hebrew by Matthew, 'which every one has translated as he could.'

This agrees well with our conception of the original Gospel; but Papias also mentions another by Mark, 'the interpreter of the Apostle Peter,' which contained 'Sayings and deeds.'

This may well be our present Gospel according to Mark, at least in its main features, but Matthew's 'Sayings in Hebrew' cannot be the same as the present Gospel of that name. Neither can we assume that these were the only Gospel stories existing in the time of Papias, as has often been done by unfriendly critics. All that we can infer from the statements is that Papias knew these two Gospel stories and probably thought them the oldest or most reliable.

*Who Wrote Our Gospels?*

That he knew others or was ignorant of others is not said, and he may well have known many, for there were others in existence in his time.

We are thus brought face to face with the question, who wrote our present Gospels and how did they come to be included in the Canon of the Scriptures, while others were omitted.

First let us call attention to certain facts that have a decided bearing on the whole question. Neither the titles of the Gospel nor the earliest tradition about them definitely claim them as the sole handiwork of the men whose names they bear. It is always 'The Gospel according to Matthew,' 'The Gospel according to Mark,' which merely traces that Gospel back to the Evangelist named as the originator of the earliest form of that tradition. How far the later Gospel may have wandered from that first tradition is well illustrated by comparing the present Matthew, with its genealogy, birth, childhood, miracles, teachings, and sufferings of Jesus, with the simple description of Papias, 'The Sayings.'

We cannot even be sure that only one later editor reworked the original Evangelist's story, nor can we be sure that the original Evangelist himself reduced his Gospel to written form except in the case of Luke.

There we find distinct marks of a

literary style belonging to a single author. We have only tradition and the 'We passages' in Acts to help us in identifying this author as the physician Luke, companion of Paul, but there is much that can be said for the identification and nothing absolutely inconsistent with it. Luke is the nearest to a definite literary personality that we find among the Evangelists. There is a certain degree of literary unity in the works, more, to be sure, in the Gospel than in Acts, but in both enough to warrant the assumption that we have the work of a single writer, combining several threads of older tradition, but combining conservatively with earnest care to preserve as much as possible of the old, though recasting it in his own literary style.

*According to Mark*

The Gospel according to Mark has most nearly preserved its original form, yet even here it is not necessary to assume that Mark himself reduced it to writing. The main thread of the narrative together with many of the Sayings are surely the contribution of Mark and were by him learned from Peter. But recent study and comparison with the parallel passages of Matthew and Luke have shown that many verses, especially those containing Sayings, were derived from the same source, that was used by the compiler of the Matthew Gospel and by Luke.

This was an ancient document, long since lost, which contained chiefly Sayings, and the German scholars, who first assumed its existence, names it 'Q.' It is possible that Mark may have plundered this old document to enrich the narrative of the life of Jesus, which he had learned from Peter, but it is hardly likely. The early preacher, who was not in frequent contact with other leaders of the Church, and who had no easy access to written records, could not have felt the inadequacy of his version of the Gospel story, as some later user of it would, who had heard a fuller story from another, or had secured the loan of another Gospel, independent in origin from his own. So this later editor of Mark plundered 'Q' to enrich his narrative Gospel just as some years later the editor of Matthew and Luke were to plunder both 'Q' and Mark to bring their Gospels to a state of relative completeness.

The old document 'Q,' unable to compete with these completer Gospels, perished after all that was best in it had been taken over by its successors. Thus we have the three oldest Gospels edited and ready to circulate among the churches approximately in their present form. But that form was not yet absolutely fixed; there was still the possibility of absorbing an omitted episode or a forgotten Saying as it came to light from some independent source.

*This Was John*

Such is the story of the woman taken in adultery and the Saying of Christ: 'He that is without sin among you, let him first cast a stone at her.' This episode, omitted in all the oldest manuscripts, yet defended by its very content as an authentic bit of the life of Jesus, came near to finding a resting place at the end of Luke, where it is found in some manuscripts, but was finally incorporated in the eighth chapter of John, where all later manuscripts give it without question as a portion of the true Gospel. Yet an early Church Father quotes it as belonging to the 'Gospel according to the Hebrews,' which is completely lost except for this episode.

The Gospel according to John presents a particularly difficult problem. Tradition says that this was John, the son of Zebedee, one of the Disciples, and also assigns to him the three Epistles of John and Revelation. Now the first Epistle, which is much the longest, and alone has a definite theological importance, is certainly by the author of the Gospel, but that writer can hardly have been the author of Revelation. That last book of the New Testament was written by a man whose thought and imagery was essentially Jewish, while the Gospel is filled with Greek thought and philosophical expression. It would therefore be easier to associate Revelation with the Disciple John, but because of its assumed date under Domitian and the frequency of the name John, especially in connection with the churches of Asia, any such identification is more than doubtful. On the other hand, in spite of its philosophical expression and all too frequent dogmatic utterances, there is much that is old and manifestly true in the Gospel according to John. The version of an eyewitness lies at the base of this Gospel, and that one, who was nearer than most and who heard and remembered statements not known to others. The tradition can hardly be wrong.

This Gospel story arose with John the Disciple, but in this case the Gospel remained longer in oral tradition than in the case of the others, and further, the final editor was a man of some philosophical training and of advanced theological views. He may never have been an immediate pupil of John, for he seems to represent views somewhat more removed in time or place from the simpler teaching of Christ, than would have been presented by an immediate pupil, such as John. It may even have been a pupil of a pupil of John, rather than an immediate follower, who finally edited this Gospel story, a conclusion fully in harmony with the date, A. D. 90 to 100, now generally accepted for the Gospel according to John.

*Paul's Letters Were the Oldest*

We have still to consider the writers of the various Epistles. Of these the most definite and striking personality is Paul. Much of his life, his personality, his earnest character, is given us in the preserved letters, and this is in the main in harmony with the picture of him given in Acts. We are dealing here with no shadowy figure and our view of him is given in the main at first hand. These letters are the oldest and most directly transmitted portion of the New Testament, but they are the letters of Paul and not the words of Christ, either directly or indirectly quoted. Neither should we suppose that all of the correspondence of Paul has been preserved, nor yet that all of his correspondence dealt with topics that interested the Church of that day.

We have seen above how frequent was the interchange of letters of business and friendship in early Christian times; Paul can have been no exception. The tireless missionary, the inspired teacher, the almost prophetic guide of the infant churches must have had much to say. Why should not all churches founded by Paul have received letters of admonition or encouragement from him? Copies even of letters meant for individual churches may have been sent to others, if they seemed needed or in point. Some would have been preserved and others not, but in the main they would have been most likely to be preserved by the person or community to whom they were originally sent. Eventually from frequent reading in the churches came appreciation of the real greatness of the message contained and not all too late a collection was made of all the letters that could be found. Not all were of equal importance, even though only those to churches and a few of general import were collected. Some even of the existing collection seem to have been fragments, which had been worked over in later times, as the Epistles to Timothy and Titus, and one that was distinctly not Pauline, the Epistle to the Hebrews, was imbedded in the collection and so saved.

*Peter's Two Epistles*

Of the two Epistles of Peter, the second is plainly of later time. I would not insist that there are no reminiscences of Peter contained in it, but in the main it reflects the religious views and style of address of the second century. With the first Epistle the case is different. This is a product of the first century and even in some respects suggests the work and personality of Peter; yet as a whole the letter gives the teachings of Paul rather than of Peter. Now it is not impossible that Peter in later years yielded to the Pauline teaching on some of the disputed matters, but on the whole that seems hardly consistent with the character of Peter given us in the Gospels and Acts. On the other hand the letter is clearly not a forgery, so it is perhaps best to assume that, as in the case of some of the minor letters of Paul, this letter of Peter experienced a later revision and that at the hands of a follower of Paul.

The second and third Epistles of John and those by James and Jude are too brief to give much of a picture of the authors. The first two are brief personal letters in good style and were perhaps associated with the Disciple John because of his long life. The writer of these letters calls himself the Elder. However, as this became practically a title of honor early in the history of the Church, its value as a means of identification is slight. The Epistle of Jude seems to give the impression of a somewhat later time than that of James, but neither can be connected directly with the Disciples, whose names they bear. When the generation following that of the Disciples found itself without its original teachers, it naturally searched for written records from their hands. The name of the author, if coupled with a document of religious import, or even the religious import alone, was enough to cause the document to be referred to one of the founders of the Faith. Thus in the first and second, and even in the third century of this era, in one place or another, various documents were associated with the church service. Yet as years went on the unanimity of choice became greater and greater until finally on the last disputed point the East yielded to the West and the Revelation of John came into the church service throughout the whole Christian world.

*The Church Chose Wisely*

The choice in all cases seems to have been made by the Church as a whole and with practical unanimity. It was not the selection made by a body of leaders or even by a council of the Church, for such bodies exerted their influence merely to preserve in the service that which had been traditionally there. There is no record of any organized body of Church leaders prescribing the exact books which should be read in the service.

Most important of all is the decision of modern scholars, that the Church in the main chose wisely and rejected wisely.

# The Silk-Spinning Tragedienne

(Continued from page 5)

Within the funnel of her web-trap the Agalena spider lies in wait for insects. A victim may be perceived at the bottom of the funnel.

the silken ball well hidden then within a clump of new leaves. With jocund spring leaping high to earn its name, the long-closed bottle neck burst open at last and a myriad of tiny crawlers, forming at first a cluster, overflowed upon the brier stalks.

And then, as always with these little fellows of every generation, began an enactment of nature's law of prodigality. There are always more than enough to insure perpetuation of a species, as with seeds and pollen. Baby spiders need sustenance and having developed only carnivorous appetites there follows a very natural cannibalistic tendency with no other food in quantity available.

As if by a given signal, though impelled only by a common and simultaneous hunger, the individuals of the cluster with widely extended mandibles rushed upon each other, every one eager to profit by the absorption of the blood of its brothers and sisters. Chance and the first hold determined the advantage. Thus Tiny seized Grayback from the rear and pierced his abdomen, feasting with savage relish, and while thus engaged Yellowlegs leaped upon Tiny, wounding her in the thorax and drinking her blood. Brownie and Spotty met face to face and instantly closed; the contest was decided by Stripes thrusting his hooked and keenly pointed mandibles into Brownie. Whereupon, both becoming satiated, for they had each dined on two or three of their family, Stripes and Spotty quietly drew apart, as others of the warring and well-fed cluster were doing, leaving the empty bodies of the slain to shrivel and blow away.

Reduced to less than a third of their number, the little spiders now scattered widely fearing, as always, other enemies and indeed from these they very soon suffered a further depletion. A dozen or more of them went to allay partly the ever keen appetite of a thrasher; a bluebird dined upon twice as many; a house wren, still keener of eye, fed until she felt compelled to retire to her well-filled hollow-tree limb and lay another egg.

Spotty had been fortunate from the first; she had crawled to the leaf carpet and then beneath a flat stone, half of which was raised a quarter inch from the ground. Stripes, again hungry, had followed closely; Spotty turned quickly, but there was no grapple. Instead a long, sticky tongue shot out from the deepest part of the chink and Stripes disappeared. So did Spotty, but not down the highland salamander's tickled throat. Recognizing a dangerous locality and never one in which to play Saint George with such a dragon, our little adventuress fled, the speed from her eight legs greatly surpassing that of an ant or even a silver bug of twice the baby spider's size.

No larger to begin with than a small letter 'o' of this print, Spotty had little chance to defy anything that was at all aggressive. Beset by persistent dangers on every side, survival would be impossible were it not that such small, dull-colored creatures are exceedingly inconspicuous. Their chief enemies are the birds, the shrews, the ground and tiger beetles, the centipedes, the mason wasps, the larger ants and some adults of their own class, mostly of different species.

As Spotty grew rapidly larger, soon attaining a quarter-inch length of body, she avoided with fine discrimination those other bloodthirsty killers to combat which would mean death grapples or disabling encounters. Instead, she preyed upon the helpless kinds, as plant lice, very young grasshoppers, leafhoppers and small, spineless caterpillars.

So lived and dodged and fed occasionally and grew our little bandit, possessed of the keenest instincts, never losing her caution, nor failing to identify either foes or desirable prey. And within a month of her existence she had desisted from the terribly risky wanderings and selecting almost at random a place that offered foundation had followed the all-dominant hereditary tendency to entrap her food.

From one stout grass stalk to another and then to the end of a stone she spread her rapidly spun cables; then back and forth between these well-anchored foundations she stretched others, working almost incessantly throughout a part of the night so that the morning found a densely woven, veil-like carpet, or better a hammock, with a round, funnel-shaped shaft near one end leading down among the denser mass of grass almost to the ground.

Within this silken shaft or tube, hidden from the prying eyes of the spider-hunting birds, Agalena, now almost half-grown, rested to await possible victims.

This first and early summer web was stretched to cover at least thirty-four square inches of insect-infested ground. It was a close silken mesh sometimes more than six inches long and as wide. All about on this bank of sunlit cinquefoil, low fern and woodland grasses, there were scores of these webs, possibly made by surviving sisters, each differing from its neighbors only by reason of the varying positions of the anchorages—here a stalk, there a twig, perhaps stones or bits of fallen tree branches serving as the supports. And each, as the sun first peeped at it, was bespangled with drops of glittering dew, like diamond-encrusted lacework, a familiar sight to every early riser in the country.

Many are the vicissitudes of these trap webs of Agalena; a passing fox or skunk or mink, a wandering woodchuck, perhaps a deer or less carefully treading bovine may wipe the frail things out of existence—an irreparable wreck—and the small rigger must begin all over again in the same or a nearby spot. Our spider built her third web within five or six days; each time it remained broken until darkness came on, for in the daytime, because of her vigilant enemies, she may not safely venture to emerge from her retreat, except with a marvelously rapid dash out and back again to ascertain the cause of some agitation of the web, or to make a capture of some defenseless insect.

So swift are these sallies from out the funnel and back again that the human eye

can hardly follow them. Thus the Agalena species has earned for itself the name of champion runner of the entire animal kingdom considering, of course, by nice calculation, the matter of relative size. Capturing one of our little friend's kindred by slipping a butterfly net beneath her funnel and then poking her with a straw until she seeks safety below, she may be taken home, turned loose on the bare dining-room table and with stop-watch in hand her time in traveling the six-foot expanse may be calculated. If a racing auto could go at like speed in proportion it could easily traverse a mile in less than five and a half seconds and cover the distance from New York to Chicago in one and one-half hours!

Agalena's last web was larger, neater and more concave than any of its predecessors; one of the supporting strands, fully a foot in length, swayed slightly with the breeze-stirred clover stem to which it was attached. The spider, motionless, lay in wait for prey for hours at a time; yet she was not always idle, for with the silk with which she was still plentifully endowed she was constructing that rounded ball differing not at all from those of billions of generations of her species. It was at once a hope chest and an instinctively inspired cradle.

Once the broad web was disturbed with more than the usual violence caused by entrapped victims, some of the strands even being broken. A long-horned, green grasshopper of the false katydid kind, twice the size of our spider and twice as strong in its leaping hind legs, with broad wings also that it could not use because its claws were entangled in the web, proved impossible to pull loose and drag within the funnel, but the natural savagery of the little heroine must not be denied. Therefore, in spite of beating wings and kicks in every direction Agalena leaped upon the frantic monster and sunk her envenomed mandibles deep, though not before the equally strong jaws of the invader had seized and injured one of the spider's legs.

*The Grasshopper Quickly Succumbed*

Weakened by the poison the grasshopper quickly succumbed, but was still an almost impossible burden, to be overcome in time however, had not a shrill buzzing and the downward dart of a shining black object interfered. Well knowing which of her enemies to respect Agalena fled to her tube, through it and into the grass tangle beneath and not a moment too soon, for the digger wasp followed halfway. Had its eyesight been as sharp as its organs of scent and its imagination in the least developed it would have proved a redoubtable Amazon indeed to have continued on after viewing the dead insects that had been hauled into the tube, sucked dry and discarded below.

The wasp loitered about but a short time, then flew away. Agalena remained hidden beneath the denser basic leaves of the grass much longer. The green, long-horned grasshopper lay dying, struggling a little with a persistent vitality, eventually to be gobbled up by a bobwhite.

It was about this time that Agalena's one and only suitor came a-courting to find the lady of his choice from the first not at all shy, but quite inclined to meet him more than halfway. A webless wanderer he, darker in color and a little smaller than his lady-love; a swift-footed hunter among the lower herbage and surviving because of his agility and caution.

However, after the manner of many stage and screen stars, Agalena tired of him soon after the ceremony and had he not submitted to be chased entirely and forever away, he would quickly have been slain and eaten, as are the countless spouses of other spider species.

At last the silken egg sac was filled with the tiny golden pellets and our little savage had fulfilled to the utmost of her hereditary inclination the brief motherly concern for at least one batch of her offspring.

*Agalena Dies Fighting*

The summertime world is abundantly inhabited by digger wasps and those that are modelers in clay. These insects also are evidences of instinctive propagation in which, like the spider, motherhood knows not its own, but is equally determined to fulfill its allotted purpose.

It was not the shining, coal-black agency of fate which had almost succeeded in catching Agalena that first time, but an equally bloody-minded killer that for the sake of a coming generation hunted closely and did not overlook the stout-bodied occupant of the webby lair.

Our Agalena had grown wary. Not every disturbance on or about the web gained her undivided attention. But when something like a continued struggle was evident she had reason to assume that a victim was entrapped. Whereupon out of her funnel tube she came to meet at close quarters a dark object that she could not, even with her eight eyes, discern in the fraction of a second as an enemy to be feared, rather than one to be seized.

Then there was a sudden buzzing of wings as the wasp made its dash and Agalena turned, but not before one pair of sharp claws sought to hold her.

With a strength equal to that of the wasp and a rapidity of motion quite superior the spider pulled partly away and gained the funnel. The two went down together, Agalena knowing that an effort to escape was better than to turn and fight. As they struggled through into the tangle of stalks and leaves and then to the ground below, the killer still held on, having indeed gained an additional hold with the other foreleg.

Here hung the egg sac fastened beneath a shelving stone; did this inspire an unreasoning defense? Among the close grass stems where she was most at home Agalena had no other recourse than to turn. With her four front legs she reached to grasp and bear down her assailant; with jaws wide she endeavored to seize and inject her potent poison. But hers was the part of Roderick Dhu; she was able to inflict harm, but her enemy possessed wings and withal a skill quite outclassing Agalena's powers. There was a swift clash and grapple; the sudden curve of the slender, hard, steel-blue body toward that of the stouter, soft, gray one; a sudden thrust of a point keenest in all nature. The under side of Agalena's thorax received a wound that was more than the deep puncture of a resistless point and instantly she collapsed; not dead, but beyond all power of movement other than a faint twitching, the poison of the powerful sting having had its effect immediately. Four or five more jabs and poor Agalena was fit only to be dragged out of the tangle at a tremendous expenditure of labor; then carried awing and aloft for a distance that may have varied from a few yards to a hundred or more, finally to be embalmed within a neatly formed clay cell hung to the rafters of a barn. Within this snug chamber the baby wasp dined at length upon Agalena and a dozen others of her kind that had met a like fate, all common examples of those innumerable and utterly cruel struggles for existence that perpetually dominate the processes of nature.

# The Voyage of the Victoria

(*Concluded from page 17*)

as a sort of strange pageant enacted for their amusement. To them, the strange invaders seemed to have many things for which they had no use and which they were willing to give away.

So the natives swarmed on board, and as natives and children will, picked up and took for their own whatever was loose, much in the same way in which white men penetrating new lands take for their own whatever pleases their fancy.

That night the fleet stood out to sea as protection from the ravages of 'this people of little truth' and the next morning the standard of civilization was raised, the first slash in the carving out of a new empire brought blood. For Magellan, who knew not fear, landed in the island in the morning with fifty men, set fire to the village as a lesson, recovered his skiff, and, to use the language of historians, by a bold and brilliant stroke, a store of provisions fell into the hands of the invaders. It was a signal and decisive victory, but over the ignorant and unarmed, and strategy had less to do with it than armaments, for the natives were without weapons except for sticks tipped with fish bones. Indeed, an arrow was a wonder to them, for when wounded, Pigafetta tells us, they drew forth the barb and looked at it with astonishment, 'at which the compassion of the sailors was aroused.'

*The Ninth Man to Die*

Although seven natives were killed in the skirmish, the childlike savage mind either forgot or forgave, or perhaps failed to connect the punishment with the crime, or it may be thought to ward off all that destruction and burning with the giving of gifts.

On March ninth, the fleet again set sail, but as the island fell away astern, the lone Englishman, Master Andrew of Bristol, gunner, died. So, by a narrow margin, Sir Francis Drake, the pirate or buccaneer, was the first of his nation to circumnavigate the globe. Andrew of Bristol was the ninth man to die after the fleet left the straits, counting the Patagonian Indian who had died soon after they left the South American continent.*

Some time before touching Guam, according to Sir Clements Markham's *Early Voyages to Magellan Straits*, Poncevera, master of the *Trinidad*, had conversation with Magellan, and pointed out that their course would not take them to the Spice Islands, whereupon the admiral answered that he had information that there were no provisions to be had at the Moluccas, therefore he was going north, apparently to China. If that is truly reported, it would seem to indicate something very much like an hallucination in Magellan, similar to that hallucination of hearing which afflicted Columbus on the shores of Jamaica.

However that may be, Magellan's course took him to the nearest land sailing due west from Guam, and a week after leaving that island, the lookout man sighted the south end of what is now Samar Island, and Europeans first set eyes on the Philippine Islands, March 16, 1521.

*He had been regarded somewhat in the light of a tame house animal, Pigafetta and the sailors amusing themselves in noting how he conducted himself in his new environment, how he wore his clothes and used a knife and fork. Before he died, he was christened and given the name Paul. The second Patagonian was on board the *San Antonio*. He died before the ship reached the equator.

# Actors As They Are On and Off the Stage

## They Are More Than Products of Elocutionary Schools and Dancing Academies

By QUINCY KILBY

ILLUSTRATED BY RUSSELL H. LEGGE

The rank and file of actors come from the great middle class—fully as likely to have been born in a small town as in a great metropolis.

SOME years ago, in company with several others, I visited the state prison at Charlestown, Massachusetts. Our party included a Methodist minister and W. J. LeMoyne, the actor. After our tour of inspection we were invited into the warden's office for a friendly chat.

'Have you any actors confined here?' Warden Chamberlin was asked.

'Not a single actor. We have never had one in my time.'

'That's good,' commented LeMoyne. 'Any ministers here?'

'Plenty of them.'

Several years later I asked the same question of Chamberlin's successor, Colonel Russell, and he made the same reply. I believe that there have been fewer actors convicted of serious crimes than the members of any other profession, business, or trade, and this in spite of the fact that all connected with the amusement profession are classed as actors, be they players, stagehands, attachés or circus followers. The actor is no worse than the ordinary man, and he is quite apt to be better.

The actor, unless born of a theatrical family, rarely comes from the topmost grades of society. Most of them are from the great middle class. A not inconsiderable percentage are sons or daughters of clergymen. Stars with college educations are rare. The real actor is sporadic; he is as likely to have been born in a small town as in a great metropolis.

True actors are not the products of schools of elocution and dancing academies. The born actor, even though he may be lacking in education and early training, can often give renderings of Shakespeare's lines that the most conscientious and appreciative student can never equal. His gift is one of ear, not of brain. I remember a young man whom the manager used to invite into his office that he might hear him read from Shakespeare.

'Why do you read the line in that way?' the delighted manager would ask.

'Cause it sounds pootier that way, Guvnor.' And that was the true reason. His rendition came by instinct. It was intuition and not education that enabled him to draw from the lines the master's deeper meaning.

The onlooker would be surprised could he see his favorite comedian coming off-stage, inveighing against a 'lot of tombstones out in front.'

Having been connected with theatrical business for many years, I feel that I have a right to express my opinions concerning it. I have seen all sides, from the very good to the pretty bad, and can conscientiously say that I believe actors rise above their early surroundings to a far greater degree than any other class of individuals.

The man who so cleverly plays a part you like may be the son of your washerwoman; but if you compare him with her other children you will find him far above them in intellect, in appearance, in address and in cultivation. His travel has broadened him; the language of the plays in which he has appeared has purified his own; and the discipline of the stage has been of distinct service to him.

The discipline of the stage—that is a subject on which the average layman is provokingly ignorant, his ideas having been gained largely from pictures in humorous magazines, in which immaculately dressed men of the world are drinking champagne in green rooms and exchanging sophisticated cynicisms with scantily dressed coryphées. Nothing could be further from reality. In the first place, loiterers are not welcomed behind the scenes, be they fashionably or shabbily dressed. And, furthermore, drinking within the sacred precincts of the stage is not tolerated.

The stage is the home of most rigid discipline and the actor must be on hand at the exact second when his presence is required, properly costumed and made up, and letter perfect in his lines; and any failure is promptly punished by a fine. Behind the scenes the utmost quiet is enforced lest some unnecessary noise distract the attention of the audience. Unseemly language or ungentlemanly behavior subjects the offender to a fine. In fact, any infringement of the rules is punishable by a fine, such forfeitures being deducted from the weekly salaries and turned over to the Actors' Fund, an institution for ameliorating the lot of less fortunate members of the profession.

The strict rules of the profession compel the actor to be on hand at the proper time, to speak only the lines provided for him, to dress as he is told, to travel on specified trains, often rising at unseasonable hours to do so, to be at his post in all weathers and all temperatures.

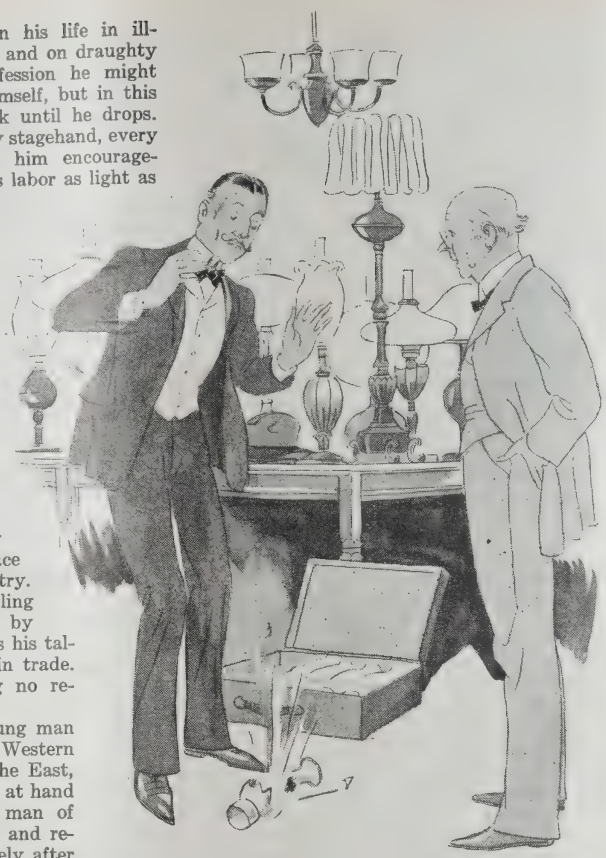
For some undiscovered reason the actor considers the manager his sworn enemy, as the schoolboy does his teacher, and is often moved to express himself at length on the subject, but despite this almost universal feeling he is continually giving evidences of loyalty which it would be hard to equal in other walks of life. Times without number he has dragged himself from a sick bed and gone out into a wintry night to make his way to the theater, there to

risk his health and even his life in ill-ventilated dressing rooms and on draughty stages. In another profession he might stay home and coddle himself, but in this one he sticks to his work until he drops. And every associate, every stagehand, every supernumerary will give him encouragement and try to make his labor as light as possible. Should he fall ill there will be no need of calling in a nurse. Willing volunteers are plentiful and thoughtful words and gifts or fruits and flowers are customary.

There is no need to dwell on the charity which is so well-known an attribute of the profession. Let a great calamity occur in this or any other land and immediately theatrical benefits take place in all parts of the country. The actor gives no thrilling address to be followed by passing the hat. He gives his talent, his labor, his stock in trade. He gives himself, asking no return.

Some years ago a young man in our company died in a Western city. His home was in the East, and the only relative near at hand was a second cousin, a man of high standing in business and religious circles. Immediately after his death I went to his room to take charge of his effects. The relative came in and, among other things, asked, 'I suppose he had some money saved up?'

'I think he had a little in the savings bank,' I replied.



'Well, there doesn't seem to be anything I can do here, as long as there is enough for the funeral expenses. I think I will be going along.' And he went his way and I never saw him again.

On my way back to the theater I met a woman of the company, 'Mr. Kilby, I didn't know Mr. Blank very well, as he had been so short a time in the company,' she said, 'but if you need any money for funeral expenses you may take my salary this week—only please don't say anything about it.'

Continuing along the street I met our ballet-master, a Frenchman who had been in this country only a few years. He stopped me and said, 'Monsieur Keelby, I am not very well-off, and have a family in France to support, but if you need any money for that poor young man's expenses, please call on me for my share.'

There was nothing remarkable about these occurrences. They might have happened in any company. The actor's charity comes straight from his heart and has no stimulus in calculation.

The twisted ideas of the actor's morality are partly due to the fact that he undeniably does stay out late at night, which is in itself a strong argument against him in the eyes of certain individuals. It is true that he is a late bird and may often be seen chatting merrily with his friends during the midnight hours. Most persons need food after their daily work is done, and this particular workingman has put in several hours of labor since his six o'clock supper, a meal not too hearty lest it interfere with his acting. This hour or two after the performance is the crown of his day.

The proprietor came inquiringly forward. Without a word the actor held a chimney high aloft, then dropped it on the floor. Crash! A thousand pieces!

It is unusual to find an actor who has not someone dependent upon him, be it wife, child, parent, brother or sister, or even more distant relative, or friend with no ties of blood.

To those who have had pleasant experience in amateur theatricals, the life of an actor seems like one long playday. At its best it is attractive, but it is full of work, hard work. The applause and appreciation of the audience are inspiring, but a reaction comes after the fall of the curtain. Her work ended, the star returns to her hotel and has supper. If she has anyone but her maid to share it with, she is fortunate.

The life of the leading lady of a stock company is even more arduous and exacting. She has eleven or twelve performances a week and five or more rehearsals, in addition to studying a long new part each week and spending several hours in the hands of a dressmaker, preparing new gowns.

Anyone not versed in the ways of the traveling companies would be surprised to know the extent and character of their reading. Daily papers and magazines, of course, but books of high literary merit are often passed from hand to hand through the entire company and read and intelligently commented on by all. I have heard a stagehand boast of his fine copy of *The Rubaiyat of Omar Khayyam*, and I know a comedy juggler whose choicest possession is a copy of Montaigne's *Essays* which was a gift from another comedy juggler. I am acquainted with an actor of limited education who has made a remarkable dramatization of Longfellow's *Courtship of Miles Standish*. Every line of it is a quotation from Shakespeare. With untiring energy he hunted through the works of the great dramatist until in each case he found a line exactly to fit the situation. The result is an ingenious yet thoroughly artistic piece of mosaic.

The outsider knows by name only a few stars and leading people and does not realize that there are certain members of the profession whom all actors know, whose names are on their lips far more than those of the better known ones whose portraits grace the pages of the Sunday papers all over the land. They may occupy subordinate positions but personally they are dear to hundreds of their fellows, and it is considered a privilege to be associated with them. There are delightful old ladies whose smiles are a blessing and lovable old men with a pleasant word for everybody, who are continually dropping hints of inestimable value to the younger players. There are plenty of young girls in the profession who are just the sort of girls you would like your sister or daughter to be, and hundreds of clean, manly young men who would run their legs off to do you a service.

Like people in all other walks of life, actors often become weary of their profession and desirous of quitting it. Once in awhile he will break away and embark in some other business, to the approval and envy of his fellows, but instances are rare of the deserter's remaining permanently off the boards, especially if his standing thereon has been high. Occasionally, it is true, an actor will secede to the business side of the theater, and remain there permanently, but he is still a member of the profession, and after all it is the profession itself that so tightly grasps its followers.

This reminds me of an actor who once left the stage for a short time, though he soon returned to the calling for which he was fitted, and which he thereafter adorned to the day of his death. Horace Lewis was an excellent actor and had met with success, but he got the thought that the life of a business man was more to be desired than that of a player, so he invested his savings in a store in Chicago where he made a specialty of the sale of lamps. One day an agent came in and sold him an order of lamp-chimneys that were unbreakable, as he proved by bouncing them on the floor and kicking them all over the shop. They were indeed wonderful, and they set Horace to thinking. Finding that the salesman was going to Omaha, saving Milwaukee for his return trip, Horace said to himself, 'I will hie me up to Milwaukee ahead of this sordid huckster and dispose of my stock at advanced prices before he knows what is doing.'

So one cold morning he went to Milwaukee with a satchel full of lamp-chimneys. The mercury stood at 20 degrees below zero, and 20 degrees below has an effect on glass, though he didn't know it; not then. Seeing a store with lamps in the window he opened the door and strode boldly in. The proprietor was in the back part of the shop but came inquiringly forward. Without a word Horace very dramatically opened his satchel, took out a chimney, gracefully unwrapped it, held it high aloft, then dropped it on the floor. Crash! A thousand pieces!

Nothing daunted, Horace took out another, went through the same motions, and dropped that one. Bing! A thousand pieces again! Six successive times did he try it, and six successive times did powdered glass spatter his shoes. Without a word he closed the satchel, turned on his heel and stalked majestically from the place, leaving the astonished storekeeper wondering to this day why that madman came into his place and broke lamp-chimneys all over his floor.

# Let's Pass a Law!

(*Concluded from page 2*)

We shall have to do something to limit the law-making power.

this country, they are likely to stay there.

'You may know that the Sunday observance law in the state of Connecticut was only liberalized to meet vastly changed conditions in that state some ten or a dozen years since—after perhaps a hundred and fifty years of a Sunday law which in its essential wording had come down from the days of King John.

'America's lawmakers are ever exceeding loath to repeal laws which have had their day. The tremendous pressure on them to pass new laws keeps their minds well occupied in the contrary direction, and they have a natural disinclination, in any event, to take responsibility for a change which may turn out for the worse. There is a wealth of dead letters and moribund laws on our statute books.

'Do you know,' he said, 'I believe if the average man actually sensed his position before the law today, his pulse would go up every time he saw a policeman. We are the most law-ridden folk in the world. Nowhere over the globe is it as easy to break the law.

'Why, are you aware that in the city of New York it is punishable with fine and imprisonment—imprisonment, mind you—to drive an automobile around any street corner at a speed of more than four miles an hour?

'Did you ever hear of Charles F. Southmayde, a leading legal light for years? He was so impressed by the great number of new laws constantly coming on that he employed another highly competent lawyer simply to keep him out of jail. So fearful was Mr. Southmayde that he might unwittingly land in one of these "man-traps," as he called them, that he paid the other man well to familiarize himself with the statutes of his own state, especially the new ones, so that he might observe them.

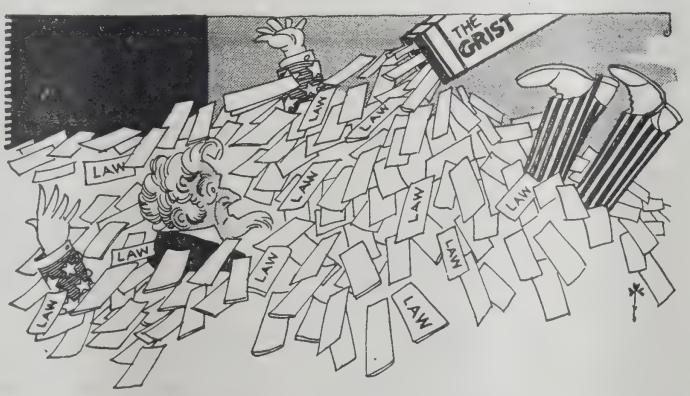
'Hipped on the subject? Certainly not. He was simply a good lawyer and knew what he was up against. His anxiety was perfectly natural.

'Law-ridden, did I say?' cried the author. 'Absolutely that! We root for liberty and then make laws covering every conceivable subject under heaven.

'This is no matter to take lightly. It's deadly serious, really. The more laws there are, the harder it is to enforce any of them! And that leads straight to lawlessness. When the legal saturation point is approached our laws become either jokes or instruments for blackmail!

'Have you ever stopped a vehicle with its left side to the sidewalk? One-way street or not, have you ever done that? Anyway, don't or I may have to get you a bondsman. This is for your own good. Don't fail to tie up securely the newspapers in your garbage can. It doesn't matter what you see the superintendent of your apartment house do. I'm talking to you of *the law*. There is a dire penalty for these offenses.

'By the same token, don't beat a rug on the front stoop. And be very careful not to carry an unmuzzled dog, no matter how small! Don't use the hose on your sidewalk after eight a. m. And, above all things, don't fail to have your chauffeur wear his motor badge on the outside of his coat.'



'But those are merely local ordinances,' I interposed.

'They're the law, just the same!' retorted Arthur Train. 'And don't go so strong on the "merely"—there's a fine or imprisonment, or both, for these and many other things that might seem of small account to you.

'What is more, by the side of some local legislation in American cities these examples are most conservative. I believe the city of Los Angeles still prohibits street car conductors from shooting jack rabbits or other "live game" from the platforms of their cars.

'Los Angeles did have a law forbidding "more than one person bathing in or occupying a bathtub at the same time." Possibly this has been rescinded—I don't know—as perhaps has another Los Angeles ordinance making it a misdemeanor to wear false whiskers, "whether complete or partial."

'It isn't necessary, though,' he went on,

In a recent five-year period more than 62,000 separate laws were passed

'to go as far as municipal ordinances for absurdities. How about this statute in a western state? "When two trains approach each other at a crossing, they shall both come to a full stop and neither shall start until the other has gone!"

'Why, as recently as 1919 the General Assembly of the state of Ohio put this into a statute: "Major surgery, which shall be defined to mean the performance of those surgical operations attended by mortality from the use of the knife or other surgical instruments!"

'And you may not know that the state of Indiana requires a hotel proprietor to put fresh sheets on a bed after the departure of the guest who has occupied it. Nothing compels him to change the sheet while the guest remains such.

'At that, we need not go West at all to find some odd laws. A radical commonwealth certainly New York State is not—proud member of the original thirteen colonies—but the New York State Penal Code has some peculiar things in it. Relics of another day, even after the law has been codified.

'It is a crime to sell skimmed milk in New York State! It is also a crime to run a horse on a highway! It is a crime "to exhibit any puppet show, wire or rope dance, or any other idle shows, acts or feats which common showmen, mountebanks or jugglers usually practise or perform" or "to exhibit any painting, any animal, natural or other curiosity" without a permit signed by two justices of the peace.

'It is criminal to cut ice in front of the premises of another, to require more than eight hours' labor of an employe or pay wages other than weekly, to ride a bicycle on a footpath, to run a horse within a mile of where a court is sitting; to mismanage a steam boiler, to keep a slot machine, secretly to loiter about a building for the purpose of eavesdropping, and so on and on and on.

'These are but a few selected at random. You may have noticed that we have kept away from what people generally think of as "freak laws"—so-called "blue laws," and the like. Many states still have these on their books. Why, within a generation a New Jersey grand jury found a statute under which to indict a woman as "a common scold." Yes, actually, and she was saved from the ducking stool with no small difficulty.

'And as to Sunday laws, it is probably illegal in possibly a majority of our states to drive, or even walk, for pleasure on the Sabbath; while hunting, fishing or the simple out-of-door games are crimes.

'I believe in the law,' concluded Arthur Train, 'and so do you. But the time comes when we shall have to do something to limit the lawmaking power as most states have already limited the sessions of their legislatures to a certain number of days.'

# I Read in the Papers

I met, in Warsaw, a man who was a great friend of the doctor who attended Lenin during the last months of his life.

### *Lenin Died in Despair*

He told me that Lenin died of despair because he knew that the constructive State he must build on the ruin he had created would differ so little from the State that had preceded it. He had carried the doctrines of Marx to their logical conclusion and reduced Russia to a slag-heap. The introduction of the New Economic Policy sounded the death-knell of Communism, and proved that it is impossible to apply the bare untempered mind of science to politics, which is, after all, an affair of human nature. He did it, and it was a huge thing to do, but it killed him. Herein lies, I believe, the key to the present Russian situation. There are still a number of idiots in Moscow who go on trying desperately to fit every problem into the 'class-war' formula. But they are a diminishing quantity. Zinoviev is the biggest of them, and he has gone. Every day the 'economic opportunists' are gaining ground. 'The Dictatorship of the Proletariat' is recognized by most people to be nothing more than an empty-sounding phrase.—Robert Boothby, M. P., in *The Spectator*.

---

The alternative proposal is to introduce a system similar to that which at present exists for the election of the governing body of the International Labor Office. Only the traditional Great Powers—Great Britain, France, Germany, Italy, and Japan (eventually the United States and Russia)—would be permanently represented on the Council. The qualifications of the various nations are calculated on the basis of their industrial importance in accordance with a special index. In the case of elections to the Council the qualifications would naturally have to be somewhat different, so as to indicate not only the industrial but also the general importance of each nation.

### *How the League Rates Nations*

The index numbers might, for instance, be arranged according to the following table:

1. Total number of adults having received elementary education.
2. Elementary education per thousand inhabitants.
3. Academic education per thousand inhabitants.
4. Estimated value in sterling of total industrial output.
5. Total horsepower employed for industrial purposes.
6. Estimated value in sterling of exports.
7. Estimated value in sterling of imports.
8. Total length of railways.
9. Tonnage of mercantile marine.

For each of these categories should be given an index number proportionate to the result obtained by each nation according to official statistics, and the order of precedence between the nations should be determined by the total score they have thus obtained.—B. G. de Montgomery in *The Nineteenth Century and After*.

---

Your article seems to insist that the World Teacher and Mr. Krishnamurti are one and the same person, though both Dr. Besant and Mr. Krishnamurti himself have expressly and repeatedly denied that. The only claim that is made is that the body of this young Indian is used by the World Teacher—not continuously, one understands, but as occasion arises—as in the instance quoted from *The Manchester Guardian*. Using psychological terminology, the case would be called one of dual personality, or rather, dissociated personality. In *Old Diary Leaves*, by Colonel Olcott, the first president of the Theosophical Society, similar incidents are mentioned in connection with Madame Blavatsky and some of her literary work. But no one confused *her* with any of the personages using her body. The idea that it is claimed that Mr. Krishnamurti is 'the latest incarnation of the divine spirit' is a doubtless unintentional, but grave misrepresentation of Dr. Besant's teaching.—J. A. Edward Wren in *The Spectator*.

### *'The New Messiah' —a Letter*

*The International Jew* in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the Untied States*, Vol. IV, 246 pages. Price: 25 cents each; set $1. THE DEARBORN PUBLISHING COMPANY, DEARBORN, MICHIGAN.

---

If Labor members possessed one tithe of the courage or brilliance of the Irishmen of yesterday, we might have some fun. But they add to a ponderous density of mind inferiority complex on such a scale that it is quite impossible verbally to hit back. If any criticism is made of their intelligence, wisdom, or sincerity they at once assume an attitude of outraged indignation. First they become 'hurt' and take up the line that just because their opponents have had a so-called 'superior' education that is no reason for taking advantage of it in debate and 'hitting below the belt.' Then they begin to bellow. So the wretched Unionists have to sit silent while their leaders are described as liars, murderers, and hypocrites, and dare not reply, for fear of turning the House into a bear-garden.—*The Spectator*.

### *House of Commons Is Baffled*

Geographically Palestine is one-sixth larger than Wales and one-fourth smaller than Belgium. Comparable in geographical area with these countries, it is vastly different from them in other respects. Its population is one-third of that of Wales and one-tenth of that of Belgium. In its sparsity of population, its deficiency of national and municipal plant and industrial equipment, its low state of cultivation and its low productivity, it contrasts sharply with both. — W. Basil Worsfold in *The Nineteenth Century*.

### *Palestine the Little*

---

Read Homer and compare him to a poet of the last fifty years. Metrical skill you will find in the modern, a certain dexterity, an occasional flash of intuition; but in the end the conclusion forces itself upon the mind that while time may preserve some jewels from the 20th Century poet, some moments when he rose above the welter of his age and lived in the upper air, his work as a whole is, compared with that of Homer, immature and foundationless. Much of it is a poetry of questioning; but the poet's function is not to ask, but to tell. —George H. Bonner in *The Nineteenth Century and After*.

### *Not to Ask, But to Tell*

---

Science leads us to *know* of what is true in the physical world, as far as such knowledge is attainable.

Philosophy helps us to *think* what is true about all the subjects with which we are brought in contact.

### *A Sheaf of Definitions*

Religion teaches us to *feel* the highest truth in order to receive the greatest practical help toward leading the ideal life.

Theology (often confused with religion in the discussion of these subjects) may be said to stand toward religion in the same way as philosophy to science, and it has been defined as the 'Teaching of some positive religion as to the attributes and existence of the Supreme Being.'

Science deals with parts of the real world, and is analytical.

Philosophy deals with the whole and is synthetic — *i. e.*, taking a general survey. Its aim is to exhibit the universe as a rational system in the harmony of all its parts.

A fact is only known in relation to other facts. There is no such thing as an individual fact. Every statement of fact involves certain general notions and theories.

Philosophy subjects these general notions to a critical analysis to discover how far they are true, or whether they must be restated.

Philosophy, then, is the science of principles.—C. H. Prichard in *The Nineteenth Century and After*.

# Age, Greatness and Novelty in TREES

*(C) Arthur Prentiss.*
Oval, left—Oregon has still a considerable amount of original standing timber, despite modern lumbering operations. Try to find the man in this picture.

Upper right—The famed Biblical Cedars of Lebanon were not immune from the vandalism of tourists, who peeled off the bark. *(C) International Newsreel.*

Oval, above—This curious picture, made on the banks of the Thames River, England, speaks for itself. *(C) International Newsreel.*

Below—Nine hundred years is the age assigned to this giant oak, standing on the property of the Women's National Foundation, Washington, D.C. *(C) Harris & Ewing.*

IT WOULD be thought a hard Government that should tax its People one tenth Part of their *Time*, to be employed in its Service. But *Idleness* taxes many of us much more, if we reckon all that is spent in absolute *Sloth*, or doing nothing, with that which is spent in idle Employments or Amusements, that amount to nothing. *Sloth*, by bringing on Diseases absolutely shortens Life. Sloth, like Rust, consumes faster than Labor wears, while the used Key is always bright, as Poor Richard says. But dost thou love Life, then do not squander Time, for that's the Stuff Life is made of, as Poor Richard says.

—*Benjamin Franklin*
(*The Sayings of Poor Richard*).

## CHRONICLER OF THE NEGLECTED TRUTH

# *Steady—Safe—Care-free on* Firestone Tires

The progressive woman of today considers an automobile essential to her fullest usefulness. But for her family's sake, she demands the factor of safety which Firestone engineers have provided in unusual measure.

Take, for example, the sudden turn with its unseen railroad crossing. When the car is equipped with Full-Size Gum-Dipped Balloons she drives in comfort and security—relaxed and care-free. Thousands of women have learned to trust the scientifically designed Firestone non-skid tread. Gripping the road firmly sudden starts and stops are made without slips or slide.

You who drive should inquire into the many reasons why Firestone Gum-Dipped Balloons give longer, more dependable mileage. Ask the nearest Firestone Dealer about Gum-Dipping and other exclusive Firestone processes. "For Safety's Sake" call today.

# The SENATOR *Nobody Knows*

## Borah *the Enigma—A* Politician *Who Will Not Play* Politics

By ALLAN L. BENSON

TOWARD the end of Theodore Roosevelt's second administration, there came from Idaho to Washington to serve in the United States Senate a square-shouldered, square-jawed man with very black hair and a dimple in his chin. He was in his forty-second year, well-known in his state, unknown everywhere else. He had never held public office until he elected himself United States Senator. It amounted to that. The bosses would not let the people elect him, so he began to organize from the bottom and had delegates instructed for him all along the line until the members of the state legislature could do nothing else but elect William E. Borah, a Boise lawyer, to the Senate.

It is characteristic of Borah that when he wanted to enter public life he began with the highest office that his state, by itself, could confer upon him. Even then, he had a sense of his own power and of his ability to sit in any company and give a good account of himself.

That was nineteen years ago. From that day until this he has been under the observation of the Washington newspaper correspondents whose business it is to form opinions of and write about public men. Most of the correspondents who were in Washington when Borah came have gone. In other words, two generations of writers have practised their profession upon this man. To both generations, Borah has been and is a mystery. The second generation has at least learned that he is a man of power, but it can no more understand him than could the writers of Roosevelt's day. To the early writers, Borah was 'Wild Bill,' but their successors do not so refer to him. They do not belittle him, but they cannot understand him.

This rather interesting situation would be explained at once if Borah were erratic or the Washington newspaper correspondents were stupid, but Borah is not erratic nor are the Washington correspondents fools. The writers at the national capital are men of intelligence who were well steeped in state and city politics before they were sent there. They were promoted to the Potomac because of their ability to write politics. So far as Borah is concerned, what these gentlemen know about politicians is not a help to them but a hindrance. It is a hindrance because it stands in the way of an understanding of him.

Borah cannot be measured by a political rule for the reason that, in the low sense of the term, he is not a politician. And whoever does not apply the low sense of the term in Washington fails to get the correct measurements of most of his men.

A great majority of the gentlemen who adorn the Congress of the United States understand politics to mean the means by which their places are gained and kept. As competent politicians, therefore, what they do or say is done or said with reference to the effect that it will have in keeping them in office. When they start out to cater to a faction or an interest they cater to it regardless of how many or

how serious may be the inconsistencies into which they are led. To understand them it is but necessary to know whom they are trying to serve and what votes they are trying to get, whereupon their courses appear to be as straight as the shortest distance between two points.

ALL of this and more the Washington newspaper correspondents learned long ago when they were back home doing city politics. What they learned then and what they have learned since have combined to make them cynical with regard to politicians. It is not their fault. If they were not cynical they would make many more mistakes than they do in writing of what they see in Washington. They are dealing with politicians and know it and adjust their measuring sticks to the timber at hand.

Under the observation of such men as these, nineteen years ago, came Borah. He was not a babe in the woods. Whatever tricks there were in the political trade back in Idaho he knew and, for all that this writer knows, some of them he practised. Certainly no attempt will be made here to portray him as a political innocent. But Borah, at the outset of his service and to this day, differed radically in one respect from the great majority of men with whom he has served in the Senate. Wherein he differed so much from the others was in the demonstration of his extraordinary attachment to American ideals, as expressed in the Declaration of Independence, and to American institutions as established by the Constitution.

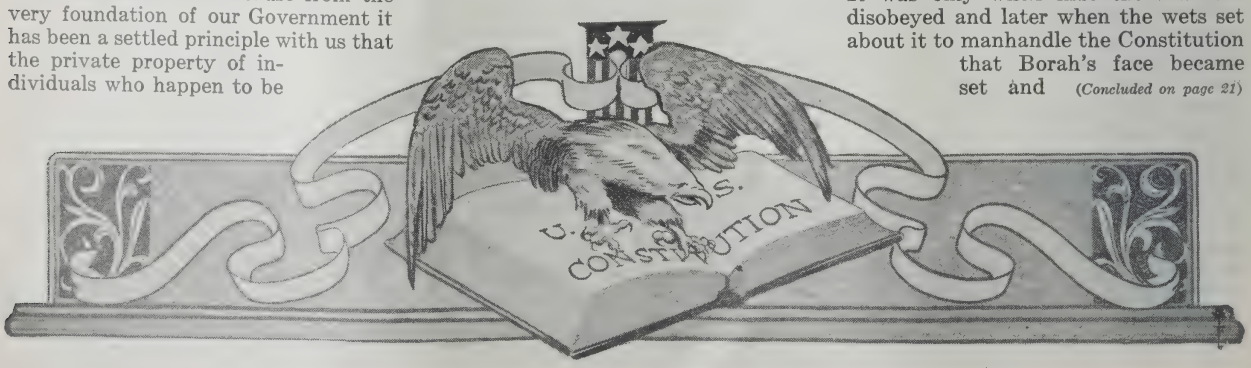
Every politician professes such attachments, but his acts often show either how little he understands those things to which he has pledged allegiance or, understanding them, how little he believes in them. Borah both understands and believes and, moreover, always tries to bring his acts into harmony with his understanding and his beliefs. From a Senator who is also presumably a politician, is this not enough to confuse almost any Washington correspondent?

A case in point: Borah worked hard—and is still working—to have the private property seized from Germans during the war returned to them. He took this course because from the very foundation of our Government it has been a settled principle with us that the private property of individuals who happen to be citizens of a country with which we are at war shall not be confiscated. He did not care a rap about the Germans in particular—he would have done the same if they had been Koreans or Chinese—but it nevertheless instantly occurred to the Washington newspaper correspondents that Borah was playing up to the German vote. Naturally the Germans resident in this country warmed toward him. But before the warming process had gone far Borah did something that tended to interfere with the resumption of the flow of beer toward everybody, including these German friends. Germans wrote to him, more in sorrow than in anger, asking him why he had gone in to help the drys fight the wets. And the Washington newspaper correspondents wrote another article about the 'inconsistency' of Borah who, by blowing both hot and cold at the German vote, had again proved himself a 'mystery.'

FROM the beginning Borah stood as he still stands for the recognition by the United States Government of Soviet Russia. By taking such action, there was not a vote to be gained and some that might be lost. Nor was Borah a 'red.' Borah is about as red as Bishop Manning. Borah came out for the recognition of Russia for the same reasons that George Washington, when he was President, recognized the revolutionary government of France. The French had just killed a king and were about to kill a queen when Washington acted. Washington said that recognition was 'a bloody road to take,' but added, 'there is no other.' Washington believed then as Borah believes now, that recognition of the existence of a government has nothing to do with our opinion of it. We recognized the Russian Government under the czars, but we did not thereby approve the czars. We always recognized the Turks, bloody though they were.

Borah also looks at the matter this way: The Russian people, perhaps a hundred and forty million in number, are good people. They are not to blame for what has happened and they have a right to live. Borah believes it will be for their good, as well as for our own, if we recognize their government. He believes we can help them more by recognizing them than we can by continuing to stand aloof.

Borah also points to the colossal, almost unexplored natural resources of Russia. These resources are going to be developed. In the course of their development, there will be trade. Borah does not see why Americans should not benefit by whatever trade they can carry on with Russia. He believes Russia needs much that we have and that we need things that Russia has.



AS FAR as the danger of propaganda is concerned, Borah laughs at it. He considers Bolshevism so absurd and so discredited that he would not be afraid of the American people swinging toward it if Bolshevist orators were on every street corner, from coast to coast. The average American associates Bolshevism with hell. Few care to make the trip. So Borah feels that we have nothing to fear from red propaganda.

As to these matters, Borah may be wrong, but it cannot truthfully be said that he is inconsistent or mysterious. At any rate, he is guided by the same principles that guided George Washington when he recognized a French government that he abhorred.

It may surprise some prohibitionists to know that Borah voted against the Volstead Act. Here again we see his devotion, not to the letter this time, but to what he conceived to be the spirit of the American ideal of liberty. Personally, Borah is a prohibitionist. He voted in favor of submitting the 18th Amendment. He was prepared to vote for an enforcement act. But the Volstead bill seemed to him to be a little extreme. Some of its provisions for search and seizure seemed to cut across liberties that the spirit of our institutions seemed to him to guarantee. It was not a matter of the letter of the Constitution, but of its spirit. Borah, who always takes the Constitution exceedingly seriously, felt that he could not conscientiously vote for the law and he didn't, though he was in favor of its substance.

During all the years that prohibition was debated Borah never made a speech in its favor. He was for it, but he was more interested in other things. It was only when first the law was disobeyed and later when the wets set about it to manhandle the Constitution that Borah's face became set and

*Ex-Noncommissioned Officer Says That in the World War*

# American Soldiers Were Tried by Court-Martial System of George III

By JAMES W. BECKMAN
FORMER SERGEANT MAJOR, AMERICAN EXPEDITIONARY FORCES.

PERHAPS no greater, more courageous and patriotic army ever went forward to fight the battles of liberty and democracy than the men who went overseas to fight in the World War to 'make the world safe for democracy.'

It is not necessary to recall the virtues of the American soldiers. They have been recounted time and again by the soldiers of the other nations of the world, and by the people of France. They were loved by all because their fairness, kindness and cheerfulness were equaled only by their courage.

The American soldiers were fighting for a principle—that principle the dearest of all to human hearts—the principle of liberty on which this country was founded and for which it has fought every war in which it has ever been engaged.

And yet, in spite of this background of a nation founded on the highest principles of any nation in the history of the human race, the American Army fought in the World War under a court-martial system that violated the very principle of liberty for which they were fighting.

*Doughboys in a deserted French home.*

*'Your articles should do a lot toward bringing about the reforms in our court-martial system which the experience of the late war shows to be so necessary. The only criticism that occurs to me is that you have not adequately stressed the result on the psychology of the soldier of repeated acts of injustice to him and his fellow soldiers. A volunteer soldier, imbued with the highest patriotism, can become so enraged at repeated injustices resulting from our present court-martial system, that while he will retain his love of country, his hatred for the army and the army system will intensify to the point where he has lost his efficiency and effectiveness as a fighting unit. The officer who gets results from his men is he who tempers discipline with absolute justice; the army which gets results from its soldiers guarantees them first of all the justice which is especially due those who put on the nation's uniform to fight and perhaps die for country and for home.'—Excerpt from a letter to the author from a Boston attorney who was with him in the army.*

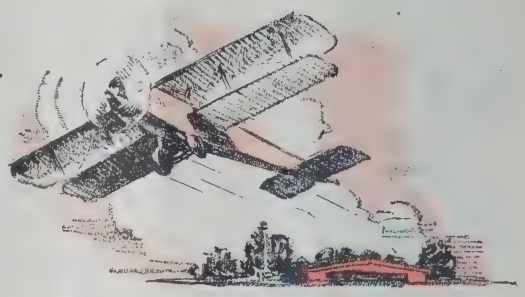
The statements made here were vouched for under oath and confessed by the accused in the Congressional investigation into the charges after I made them in a letter to Congressman Frederick W. Dallinger, of Massachusetts, which was read before the House of Representatives, Saturday, July 12, 1919.

They are being brought forward at this time because there are certain steps yet to be taken if the possibility of injustice in time of emergency is to be eliminated.

That the American people will have all the facts before them and be able intelligently to take the final precautions, I am going to tell the history behind *the American court-martial system.* I shall show what happened to the soldier under that system. Then I shall outline the things that must be done if some still open sources of grievous injustice are to be stopped.

The court-martial system of the United States was inherited directly from King George III in the Revolutionary days because the colonials did not have the time nor the opportunity in the exigencies of the Revolution to adopt any rules or regulations of their own. The very conditions of the Revolution forced fairness on the part of officers of the Revolutionary Army. But in the World War, American soldiers were cut off from the protection of the American people by a military censorship that prevented anything but praise to be written back about the conditions that prevailed overseas, under penalty of court-martial for those who violated this rule. All letters were read and cables censored so that it was impossible to communicate to the people at home concerning the treatment accorded American soldiers.

The court-martial system of George III was the same as that used in the worst days of the ancient Roman Empire, and he inherited it practically unchanged through Gustavus Adolphus, King of Sweden in the 17th Century, who adopted it for use in his army.



It was so atrocious that England and practically every country in Europe, including Germany with her Prussian military régime under the kaiser, had discarded it years before the war and adopted systems that were more just and humane in keeping with modern times; but America still retained it simply because we as a nation were not interested in militarism and overlooked its most dangerous menace to our liberties and democratic institutions.

Under this system, a soldier was simply a chattel. His life and liberty were subject to the will or whim of the king or the military commander. It was not based on the theory that the soldiers of the army were the citizens of the country, as is the case with the United States. The soldiers were not citizens—these chattels of military commanders. They were the dregs of society, criminals,

# Heroes *of the* Air Mail

## They Carry On *Every Day of the Year,* Through Rain *or* Fog, Over Mountains *or* Treacherous Valleys

BISHOP, one of Uncle Sam's aërial postmen, stood beside me at the Salt Lake City station. He had been my host for the afternoon; had taken me in his car out to the lake.

'So you're going on to San Francisco in search of stories of adventure of Air Mail Pilots?'

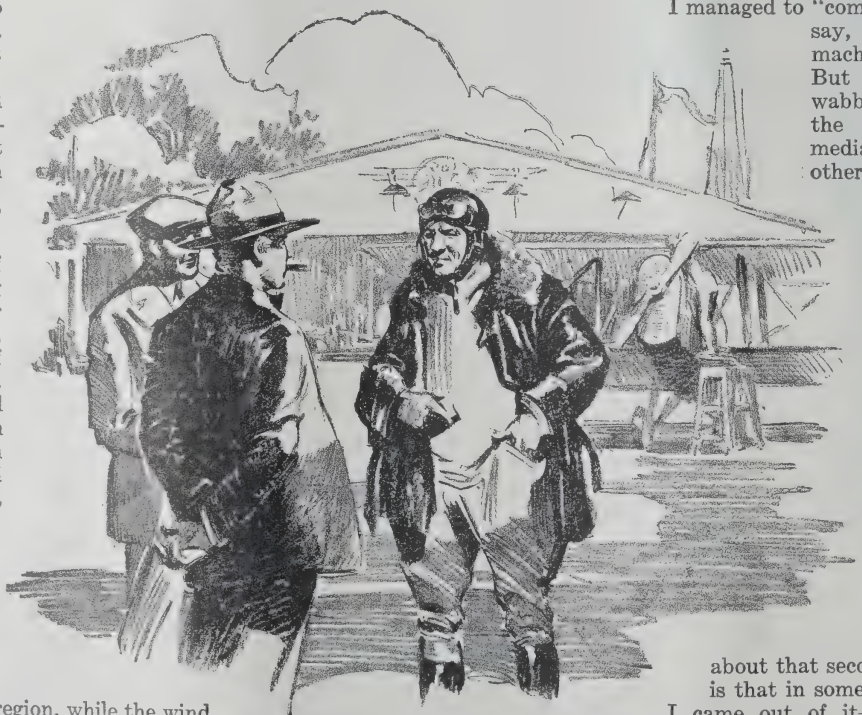
I admitted that I had come all the way from New York for that very purpose.

'Stop here on your way back, and I'll have a story ready for you,' promised this sky-rider of the Salt Lake-Rock Springs 'leg.' 'And be sure to see Boonstra at the Rock Springs Air Mail Field.'

As we stood there, a low murmur—the drone of a great motor—came out of the west. It grew in volume. A plane came into view, flying a thousand feet above the city, and disappeared within a few minutes over the crest of the Wasatch range.

'That's Ellis,' said Bishop. 'Thirty minutes of steady climbing will find him over Porcupine Ridge, at an elevation of almost 10,000 feet. Then come the Bad Lands of Utah and Wyoming, an unpopulated stretch of barren, chaotic, and inhospitable ridges.'

Fog, thick and impenetrable, and hail and snow are frequently experienced in this region, while the wind sometimes blows with hurricane force—actually compelling a sturdy de Haviland airplane, with its powerful Liberty motor, to 'stand still' in the sky.



Several days later I stopped off at Rock Springs.

There was a crispness in the air at the Wyoming flying field that is found only in the Rockies. In the clear atmosphere White Mountain seemed only a mile or two distant, instead of twelve. As I stared to the eastward at the 'saddle,' silhouetted against the cloudless sky, a black spot, which seemed at a distance of six miles no larger than a dragon fly, sailed serenely above the depression in the ridge. This was Boonstra. Within a few minutes he had landed, in a cloud of dust.

'Boonstra,' I began, after he had eaten a sandwich and we had been introduced by the field manager, 'I understand that you've had more than your share of close shaves?'

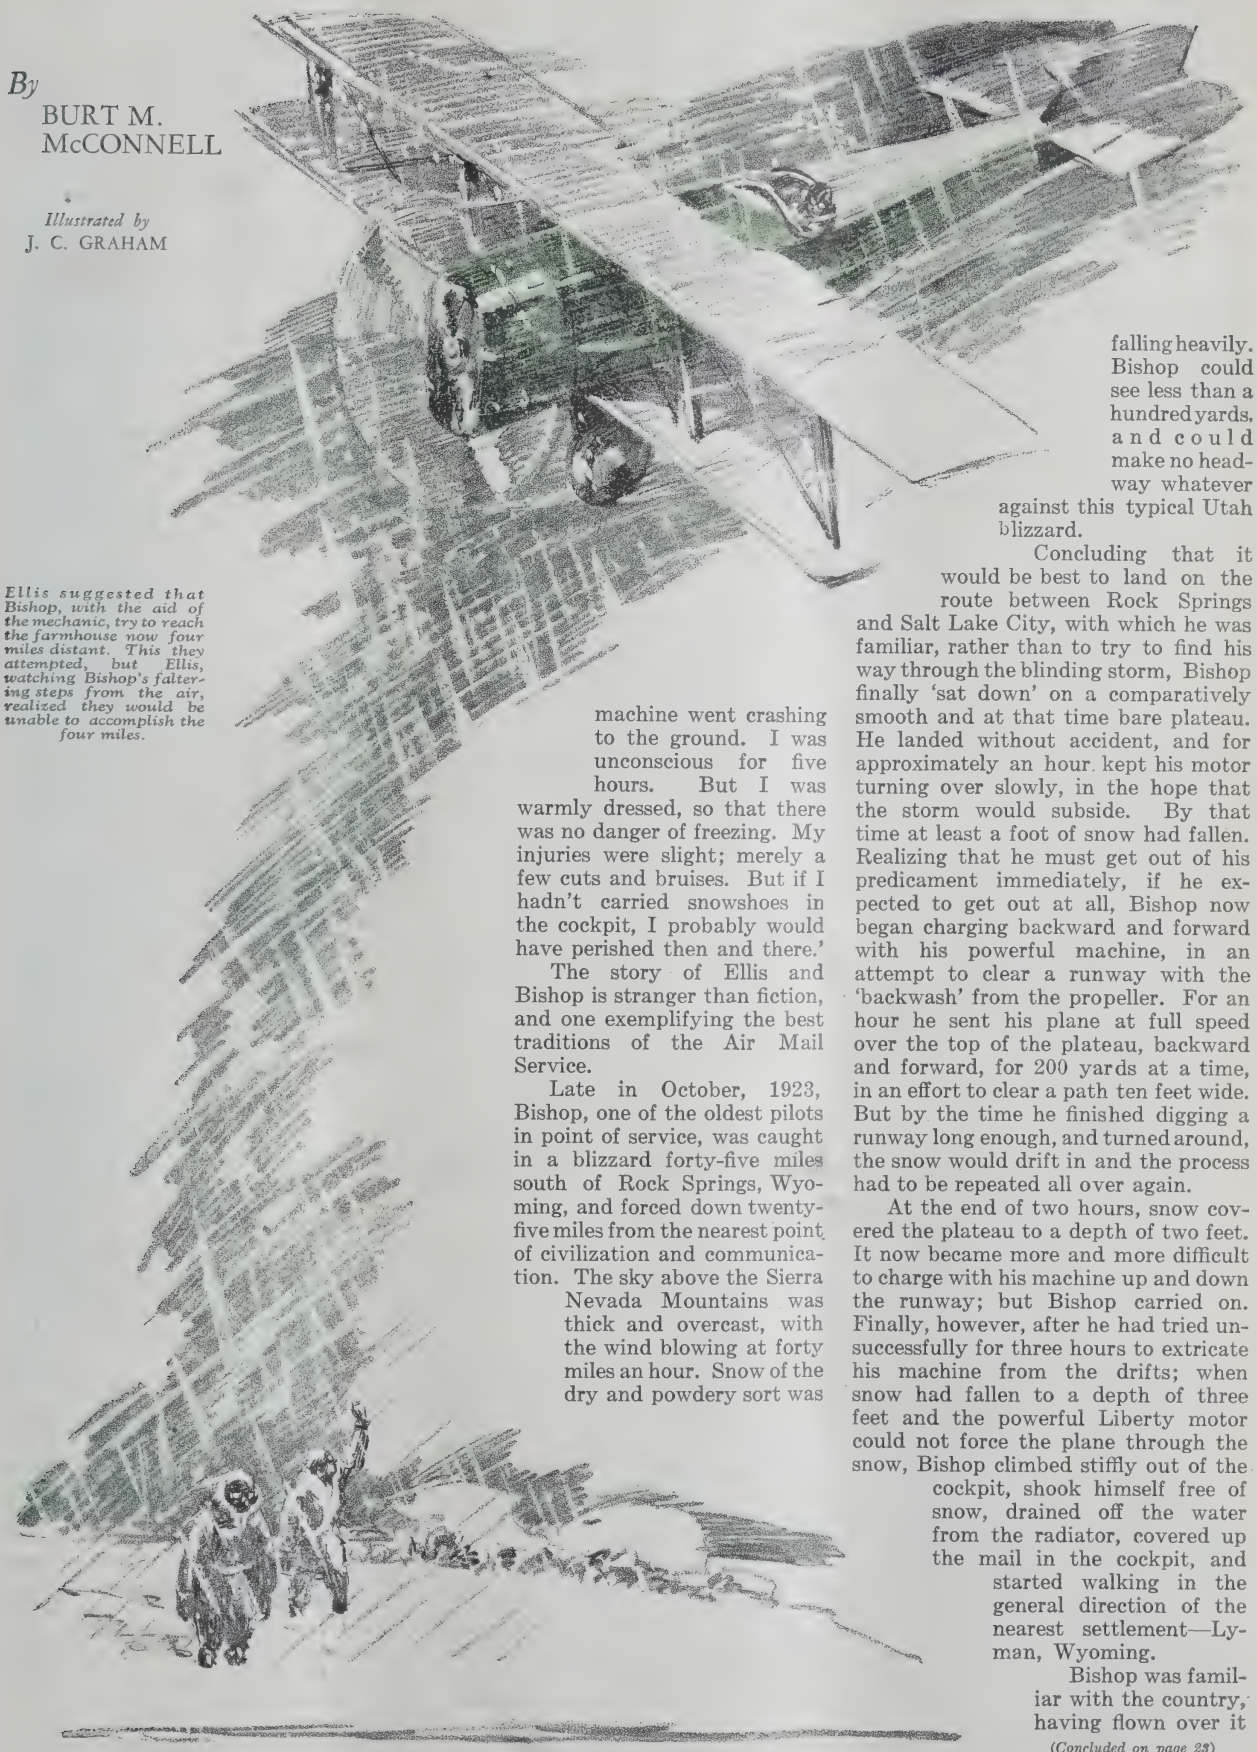
'Well,' he replied, hesitatingly, 'maybe I have, but those things are all in the day's work.'

'You don't have a forced landing in the Rocky Mountains or a tail-spin from 18,000 feet every day, do you?'

*'I undertand you have had more than your share of close shaves?' I began. 'Maybe I have,' he replied, 'but those things are all in a day's work.'*

'No-o.'

'I wish you'd tell me about some of the hazards of the Air Mail Service. You see, the American people have no way of knowing just what you pilots are up against. What about the tail-spin, for instance?'



'I don't know to this day what caused me to fall into that spin. I ran into a blizzard one January day. The wind was dead against me, and I soon found that I couldn't buck it, even though my ship would make two miles a minute. I tried it for half an hour. I flew and flew and flew, trying to get around the storm, but it was impossible without going too far off the route. Then I tried to climb over it and got to 18,000 feet, or about three and a half miles, which is the "ceiling," or limit, of a de Haviland.

'By this time I was rather dizzy and exhausted. Then I lost consciousness. The machine automatically went into a spin. Recovering, at a point about a mile and a half above the ground, according to my altimeter, I managed to "come out of it," as they say, by bringing the machine to an even keel. But I was feeling so wabbly by this time that the plane almost immediately fell into another spin. I have absolutely no recollection of what I did; probably I worked the controls instinctively. There was no banking indicator on my plane, so it was almost impossible, with snow swirling all around, for me to tell whether I was flying on the level. As I say, my memory is hazy about that second spin; all I know is that in some miraculous fashion I came out of it—only to fall into another! I whirled like a falling leaf to the earth. The drop was a dizzy one, I can tell you.

'By good luck, rather than because of any effort of mine, I came out of my third spin. I can't recall going into the fourth—and last—, but I dimly remember bringing the ship to a flat spiral about a hundred feet from the ground. Then I struck a tree, and the

*Ellis suggested that Bishop, with the aid of the mechanic, try to reach the farmhouse now four miles distant. This they attempted, but Ellis, watching Bishop's faltering steps from the air, realized they would be unable to accomplish the four miles.*

machine went crashing to the ground. I was unconscious for five hours. But I was warmly dressed, so that there was no danger of freezing. My injuries were slight; merely a few cuts and bruises. But if I hadn't carried snowshoes in the cockpit, I probably would have perished then and there.'

The story of Ellis and Bishop is stranger than fiction, and one exemplifying the best traditions of the Air Mail Service.

Late in October, 1923, Bishop, one of the oldest pilots in point of service, was caught in a blizzard forty-five miles south of Rock Springs, Wyoming, and forced down twenty-five miles from the nearest point of civilization and communication. The sky above the Sierra Nevada Mountains was thick and overcast, with the wind blowing at forty miles an hour. Snow of the dry and powdery sort was falling heavily. Bishop could see less than a hundred yards, and could make no headway whatever against this typical Utah blizzard.

Concluding that it would be best to land on the route between Rock Springs and Salt Lake City, with which he was familiar, rather than to try to find his way through the blinding storm, Bishop finally 'sat down' on a comparatively smooth and at that time bare plateau. He landed without accident, and for approximately an hour kept his motor turning over slowly, in the hope that the storm would subside. By that time at least a foot of snow had fallen. Realizing that he must get out of his predicament immediately, if he expected to get out at all, Bishop now began charging backward and forward with his powerful machine, in an attempt to clear a runway with the 'backwash' from the propeller. For an hour he sent his plane at full speed over the top of the plateau, backward and forward, for 200 yards at a time, in an effort to clear a path ten feet wide. But by the time he finished digging a runway long enough, and turned around, the snow would drift in and the process had to be repeated all over again.

At the end of two hours, snow covered the plateau to a depth of two feet. It now became more and more difficult to charge with his machine up and down the runway; but Bishop carried on. Finally, however, after he had tried unsuccessfully for three hours to extricate his machine from the drifts; when snow had fallen to a depth of three feet and the powerful Liberty motor could not force the plane through the snow, Bishop climbed stiffly out of the cockpit, shook himself free of snow, drained off the water from the radiator, covered up the mail in the cockpit, and started walking in the general direction of the nearest settlement—Lyman, Wyoming.

Bishop was familiar with the country, having flown over it

(*Concluded on page 23*)

# *Lo!* The Poor Indian

By MARIAN BRUCE CLARK

THE 67th, 68th, and now the 69th Congresses have heard charges preferred, reiterated and substantiated by members of both houses, as well as by responsible witnesses, alleging the abrogation of Constitutional rights of Indian citizens by the Indian Bureau. Resolutions calling for a Congressional investigation of the entire Indian situation have been repeatedly introduced and the members of the Committee on Indian Affairs have recommended an investigation as the only procedure through which the starvation of the tribes, the misappropriation of the property of Indian citizens, the exploitation of neglected children, the torture of prisoners for trivial offenses, and the deprivation of the Constitutional prerogatives guaranteed to these United States citizens, the original Americans, may be rectified.

(C) Harris & Ewing.

*Crow Indians from the reservations in Montana and South Dakota who visited Washington to be present at the burial of the Unknown Soldier. They also paid their respects to President Harding.*

Seventeen thousand Indians fought in the World War for the United States, and of these three out of every four volunteered for service. Ten American Indians were decorated with the Croix de Guerre by the French Government and one of them was selected as the model of the original American soldier. One hundred and fifty Indians were decorated for bravery, and yet, on their return to the country of their ancestors, they were obliged to go back as prisoners of a reservation agent, *and a special act of Congress was necessary to enable them to become American citizens.* These, at the present time, are deprived of their Constitutional rights and privileges, through the classification of 'restricted' Indians.

*An Indian being a citizen, what is a 'restricted' citizen?*

Until passage of the special act just two years ago by which the American Indian was granted full citizenship rights, these original Americans were the only human beings born upon United States soil, who were not endowed as natural-born citizens, while at the same time a Zulu, a 'Battling-Siki,' or an African head-hunter—since the immigration law does not 'restrict' such—might become an applicant for United States naturalization, and his American-born offspring, legitimate or otherwise, become natural-born citizens with full Constitutional guaranties, regardless of whether the parents became enfranchised or not.

The persistent campaign of extermination waged against the American Indian by the United States governmental policy of despotic bureaucratic domination by the Indian Bureau during the past ninety-four years has completely retarded their mental, moral, and physical development through three generations. This campaign of religious persecution, denial of property rights, subornation of agents, exploitation of childhood, and, as openly charged on the floor of the Senate, 'highway-robbery, outrageous, dishonest and scandalous misappropriation' of Indian property, has written one of the blackest pages in the history of the 20th Century.

It is an incontrovertible fact that no allotted Indian today, citizen though he be, would dare to criticize the Indian Bureau or its agents, under penalty of jail without trial, with no right to be represented by counsel, with no right to bail, and with no appeal from the sentence imposed upon him in violation of his Constitutional rights!

## *A Citizen Who Has Few Rights*

The bureaucratic authority which is enforced upon the unnaturalized Indian is continued illegally upon the person, property and right of guardianship over minor children of the citizen Indian. *Laws authorizing such 'restrictions' over the rights of a freeman are beyond question unconstitutional* and Constitutional rights take precedence over Common Law rights in the case of one citizen as well as another.

Since 1924, when he was enfranchised, the Indian citizen has been deprived without due process of law of his property, his children, his liberty and his Constitutional rights and privileges by the sole authority of a 'rule' of the Indian Bureau.

These conditions are not the fault of any one Indian commissioner, they are not the fault of any one Secretary of the Interior; they are the fault of an indifferent Congress and its politically appointed committees, which block the efforts of those members of Congress who have tried to remedy these evil conditions.

Among the 225,000 'restricted' United States citizens, whatever that may mean in the dictionary of the Indian Bureau, there may be, and probably are, incompetents, but in all the 2,000 laws and 350 treaties now on the statute books relating to Indian affairs, there is to be found no provision which confers authority upon any Secretary of the Interior, any Indian commissioner, any individual or group of individuals, to decide upon the competency of any United States citizen, whether by birth or naturalization, without due process of law.

Representative Frear, of Wisconsin, member of the House Committee on Indian Affairs in support of his resolution calling for a Congressional investigation of the entire situation concerning Indians confined on reservations notwithstanding their United States citizenship, said on the floor of the House:

'It should be understood that the Indian Bureau under existing law has practically complete control of the person and property of the Indians. This is not an indictment of the present Indian Commissioner; it has

lasted for years; but his opposition to any efforts to break this ironclad control should bring condemnation . . .

'The commissioner is not responsible for matters of long ago, where tragic tales of waste of Indian funds have been notorious, but responsibility is fixed when opposition to any degree of control by the Indians of their own property is today pressed by the Indian Bureau and the Department of the Interior. I do not care to split hairs to determine the actual responsibility of the bureau compared with the department, because the difference between tweedledee and tweedledum is of slight moment when great questions of Constitutional rights and of common justice are involved.

'What can the Indian do with his own property? Practically nothing. The commissioner has $90,000,000 in money and securities and $1,650,000,000 of Indian property according to his own report which he administers. Indians who have been given their citizenship, and that includes all Indians since 1924, are still kept in leading strings. The 225,000 "restricted" Indians, including those holding allotments, have no rights of property except in name. I do not wish to make any statement excepting within the facts. Let us see what the facts disclose:

1. The allotted lands can all be leased by the Indian Bureau without the consent of their Indian owners. These lands can be secretly leased, they can be leased without competition and sometimes without consideration save the supposed improvement resulting from the white man's use of the land.

2. The land of a dead Indian allottee can be sold by the Indian Bureau without consent of the heirs.

3. The will of an allotted Indian has no validity until approved by the Indian Bureau, and the bureau can destroy the will without court review.

4. The Indian Bureau determines the heirs of an allottee and there is no court review.

5. The allotted Indian cannot hypothecate his property, which is held or controlled by the Indian Bureau.

6. The allotted Indian's contracts and leases are void until approved by the Indian Bureau.

7. The allotted Indian funds are in the hands of the Indian Bureau and can be disposed of by the bureau without interference by the Indian or reference to Congress, except where special laws direct cash payments be made.

8. The allotted Indian can have no accounting from the bureau, his official guardian.

9. The allotted Indian cannot hire lawyers to represent his interests without the approval of the Indian Bureau.

10. The allotted Indian cannot be declared competent or able to care for his own property or secure possession thereof without the approval of the Indian Bureau.

'I believe that I have stated the Indian's rights or rather lack of rights, that go with his new American citizenship. The fact that no court review or oversight is permitted in any of the above cases, save in a partial way in Oklahoma but that the Indian and his property are under exclusive bureau control, even to the determination of his "competency," is a monstrous proposal not found elsewhere in the world.'

Thirteen specific charges were set forth by Representative Frear, which ran all the way from financial shadiness to physical cruelty. He said:

'A representative in Congress should guard against needless criticism or unjust criticism of other departments of Government, but he should not be fearful of giving needful criticism of agencies responsible for wrong conditions . . . I will not willingly do injustice to the Indian Bureau or any official connected with it but I again charge:

1. That the Indian Bureau, without possible excuse, recommended the confiscation of $100,000 of Navajo Indian funds and I will submit testimony that proves this fact beyond reasonable doubt.

2. The Indian Bureau has recommended other Indian reimbursement charges against the Navajos, Pueblos and other Indian tribes as reprehensible and indefensible as the $100,000 Navajo item.

3. The Indian Bureau approved and helped manage a scandalous settlement of more than $1,000,000 of the property of Jackson Barnett, a half-witted Indian, the terms of which were as reprehensible of an allotted Indian's property as other charges made as to tribal property. This is evidenced through an admission of the facts by the department that I will present.

4. The Indian Bureau has practically exclusive control of $90,000,000 of money and securities and $1,650,000,000 of Indian property held in trust for what it terms 225,000 'incompetent' Indians. No right of court review or appeal from the bureau's arbitrary decision is given to a single Indian.

5. The telegram of Governor Blaine, of Wisconsin, to President Coolidge was unqualifiedly true wherein he complained that a Wisconsin Indian charged with a misdemeanor was fastened with ball and chain in a foul, insanitary cell 6 by 9 feet in size. Evidence of this fact is practically undisputed.

6. I again charge that a ball and chain was used for punishing an Indian on the Fort Peck Reservation charged with a misdemeanor, and I submit convincing affidavits.

7. I submit evidence that the bureau by threats and intimidation endeavored to smother the facts last cited, and I submit startling affidavits of the Indian Bureau's control and intimidation of Indian witnesses in Washington.

# Did High Freight Rates Occasion *the* Discovery *of* America?

By RANDOLPH G. ADAMS

IT SEEMS that high freight rates once had a beneficent effect—they resulted in the discovery of America. This—that is to say, the knowledge that commercial motives dominated the voyages of discovery—is not new. Even the old-fashioned histories, and indeed many published within the past few years, retold the old story that the Turks, by capturing Constantinople in the 15th Century, began to close the old European trade routes to the East, and that this forced the Europeans to seek another way to the East, which they did by sailing to the west, and thus incidentally discovered America. It is a good story—but unfortunately in recent years it has been shown to be without foundation. The Turk is no longer to be given the blame (or credit) of causing the discovery of America.

*Photographs from original engravings by Theodore de Bry.*

*One of the points of transshipment, which were so numerous between Europe and Asia that merchants were compelled to support expeditions searching for new routes. Note the store of arrows in the 'fighting top' of the ship in the foreground.*

Dr. A. H. Lybyer, of the University of Illinois, is to be credited with doing what should have been done years ago. He sat down and studied the history of prices and of commerce in the 15th Century. His findings are still having some difficulty emerging from the academic publications into the popular ones.

Back in the Middle Ages there were many things the Europeans wanted which they did not produce. Of course Europe produced its own food and clothing. In America today we produce our own food and clothing too. But that does not prevent our drinking Brazilian coffee and Chinese tea. We produce necessities, but we import many luxuries. So it was in medieval Europe. England produced good beef and mutton, and Englishmen wore the best woolen goods in the world. But these homely necessities are not all of life.

In the days before refrigerators, something had to be done to disguise the fact that the mutton or beef might have been kept a little too long. In the days before modern plumbing, heating and ventilation, something had to be done occasionally to make the air of a much shut-up winter residence a little more pleasant. Moreover, there have always been persons who wanted to wear fine textiles. Wool was no more pleasant when worn next to the skin in the 15th Century than it is in the 20th.

The charitable mantle of oriental spices could cover up the deficiencies of crude cookery and coarse food in medieval Europe. The delightful fragrance of oriental incense would certainly improve the atmosphere of a baronial castle in a cold November in Northern Germany, when all the windows were shut and had been so closed for weeks. The ladies who lived in those castles did not always know that oriental rugs had to come from the Orient—nor did they appreciate that the finer fabrics, such as muslin, cashmere and damask, took their very names from the far countries and cities, Mosul, Kashmir and Damascus, in the East.

Before the period of the great discoveries, the trade with the East was one of the things that lifted the life of Europe above the level of savagery. The articles which were brought over the trade routes across Asia and the Mediterranean Sea were of the utmost consequence—and they were very expensive. That the spices, the silks and the incense were prized above gold and silver in medieval Europe is evident to every reader of medieval literature.

Who does not remember the gifts brought to the infant Jesus by the Three Wise Men of the East? What did these men bring as the most precious commodities which they could present to the Child in the Manger? Gold, frankincense and myrrh. Of gold we can understand the value. Surely it is not difficult to comprehend that to dwellers in the Western Asia and Europe of the first fifteen centuries of the Christian Era, the products of the

(Concluded on page 20)

# MR. FORD'S PAGE

ONE has only to hear a sincere and able visitor from abroad make his first observation upon American life to understand how much of our opinion of distant peoples is prepared by others and how little is due to our own reactions. And of the little that is our own, how small a part is more than the sense that we find others 'different.'

This was brought home forcibly when a recent visitor, an able and a well-meaning man, expressed the belief that we were so busy in America that we had no time to think of the high concerns of the world. What he wanted to say was that we were 'too busy chasing the dollar.' That is what was in his mind, for that is what he is constantly reading in his home land.

Had he analyzed his reactions with a view to accurate expression of them he would probably have said that since he had arrived on our shores, *he* had been so incessantly surrounded by the signs of American energy and enterprise that *he* had found no time to think and therefore concluded that *we* could find no time either.

It was apparent that if, in his wisdom, he could become for a moment a god, he would have changed us to something which he thought more becoming, something which more fitted his conception of what we ought to be. And then, whatever we should be, we certainly should not be American.

If America is of any value to the world, it is because America is American. And America's value cannot be increased by making her anything else. If, as Europe has so often told us, America is to be the life-saver of the world, it could be true only by our being American, and only American. Of course, this view of America as the life-saver of the world may not be true, probably is not. Nations are not saved that way. They are saved by the elimination of the disease which pulls them down and by the development of those constructive qualities which build them up.

But this passion for changing America into something new and strange belies the statement that we are a great and strong world savior, because if we are that it is by reason of our being what we have been, and it is therefore inconsistent to demand that we change from what we are. What our critics probably mean is this: that by being ourselves, and our type being rather wholesome and energetic, we have accumulated some things which the Old World would like to borrow, not to build itself up into our likeness (for quite frankly they are not enamored of, even if they do not despise, our likeness) but to perpetuate in themselves the things which we, for our part, think the Old World ought to discard.

It will not be surprising if the so-called League of Nations, in its action upon our World Court reservations, inclines to show us that we are not so big in the world—not, 'as we thought,' but—as they wished us to think. Perhaps, in one point of view, it was really better that there should have arisen the criticism of us which found vent in London and Paris not long ago. It restored the balance and had at least the virtue of blunt truthfulness to a certain degree.

*THIS passion of visitors from abroad for changing America into something new and strange belies the statement that we are a great and strong world savior. America's value to the world consists not in the money it may lend but in its being a demonstration and a challenge. We have demonstrated that there are always being thrown up from the midst of the people men who can meet the future and make way for the future. We disclose our errors, whereas the ruling tendency elsewhere is in a comradeship of concealment. And thus we are a challenge to other people, that they should put their social foundations at the bottom instead of on top.*

We should not overlook the fact that America's value to the world consists not in the money it may lend but in its being a demonstration and a challenge. We have demonstrated, against many prophecies of failure, some of which still are heard, that the people who founded this country and whose descendants and spiritual allies hold it, are capable of self-rule. We have demonstrated that for all practical purposes there are always being thrown up from the midst of the people men who can meet the times and make way for the future. We have demonstrated, as Great Britain has in spite of systems that may seem to say the opposite, that nobility is if anything a national and not merely a family asset, that the people which can produce a nobility must itself be noble, and therefore capable of the utmost self-rule. Not that we have attained perfection, for it has been nowhere obtained; the taints upon us are serious and we feel the shame of them, nor do we wish to absolve ourselves by making comparisons; but the fact is that even politics in the United States is perhaps cleaner than anywhere else on earth. We disclose our errors, whereas the ruling tendency elsewhere is found in a comradeship of concealment.

And thus we have become a challenge to other people, not a challenge for them to change their government, but that they should put their social foundations at the bottom instead of at the top. Our visiting friend saw all the people expending energy eagerly, for the concerns which elicited it were their own. We have more time than he thinks. No one has so much time as the man who does most. He has time because he knows what time is, and a man who knows what time is has all the time there is.

## *Oust Him! He's an American*

BECAUSE he did his duty to America as chairman of the House Committee on Immigration and Naturalization, Hon. Albert Johnson, Congressman from the Third District of Washington, is being singled out for attack. The fact that it was the American people and the American Congress that demanded and passed the Selective Immigration Act, makes no difference to the un-American elements. They are going to hit out where they can.

When for the first time in its history, the United States adopted a sound policy toward immigration, Congressman Johnson had to challenge influences all too well known in this country. It is to his credit, and the good fortune of the country, that he did not falter. The more disagreeable the fight waged against an American policy respecting immigration, the more determined was Johnson to see the mind of the American people clearly expressed on our federal statute books.

In championing the Selective Immigration Act, Johnson did so in the belief that 'American institutions are best appreciated by, hence safest in control of, those people who for generations have been practised in the duties and obligations of free citizenship. Freemen are not made in the twinkling of an eye.'

The immigration law has been working to the entire satisfaction of the people of the United States. It shut off the tide of undesirables which flooded this country after the Great War. We need only read the reports of our consular officers to realize the character and enormity of that tide. Wherever the problems of race are seriously studied, and more particularly in our crowded cities, the importance of Mr. Johnson's work is recognized.

It is a public disgrace that an official who has rendered such signal public service should have to meet in his campaign the ranks of un-American and anti-American forces that are arrayed against him. It remains for the Third Congressional District of the State of Washington to retain the national renown and honor it has won through its Congressman, and return him to his seat in recognition of his great service and their pride in it.

## *British Sportsmanship*

GREAT BRITAIN has ever been jealous of her sea power and swift to cope with any threat to jeopardize it. Her ready acceptance of General Andrew's proposal to coöperate in stopping the inflow of liquor into the United States is not only an example of national good will and tolerance, which is dictated by the moral sympathy of Britain with our prohibition endeavor, but is also an avoidance of possible criticism that Britain's sea power is being used to the disadvantage of a friendly nation.

England realizes that no country can deal in prejudices or take refuge in deceptive technicalities. The British Government realizes that there is nothing to be proud of and nothing to be gained, in a national sense, from a traffic, no matter how profitable, that gives moral offense to a great and friendly nation.

## *Mr. Mellon Arises to Say—*

FROM Rome recently have come numerous dispatches concerning the supposed activities of a clique of international bankers. From Rome recently also came the following Associated Press dispatch, quoting Secretary of the Treasury Mellon:

> I notice in a Paris newspaper a statement dated Rome to the effect that I have been occupied since my arrival here by conversations with Count Volpi and Premier Mussolini and with others of financial interests upon state affairs and subjects connected with the stabilization of the lira. I wish again to state that my visit here has been entirely of a private nature and that the statements referred to are entirely unwarranted and false.

The interesting feature of the dispatch is that Mr. Mellon considered the report important enough to deny. It is seldom his policy to be quoted. He rarely grants newspaper interviews. What is there in this report that sets it aside from others for special and emphatic denial?

## *In His Own Backyard*

FATE was in a jovial mood down in Ohio on that day when Farmer Butte thrust a spade in the ground to dig a grave for a departed porcine, and uncovered the bones of a dinotherium. Fate, as Puck explains, loves to play those little antics on us humans. Probably the good farmer had passed the spot many times before and wished it was more tillable or had some other use apart from burying ground. When he cleared nearly $1,000 in dime admissions on the first week-end after his discovery, no doubt he changed his idea decidedly as to the value of the 'worthless' property.

Fate would not have been content to have had the relics uncovered by the Andrews expedition, out on the Gobi Desert. Nor would

its jesting mood permit some other hard-working investigator, zoölogical or otherwise, to find them. It had to be a humble farmer. Nor could the remains be located while drilling for oil, or in some other excavating. They had to be brought to light in ground set aside for a hog's obsequies.

Delving more deeply into this prank of Destiny, we see other farmers plying with the spade other 'worthless' bits of ground. Perhaps they too may stumble upon hidden riches. Similar treasure hunts have followed since the beginning of time, and out of it all, this good will come: somewhere a spade will strike an irrigating canal, and the 'worthless' desert will be made to bloom; somewhere a 'worthless' rock will be split and yield an element useful to man's progress; somewhere a forgotten tomb will be opened and the civilization of centuries long buried will be spread before our eyes.

The finds do not always go to the seeker but from finds we are able to get new seekers; and their finds in the long run are the important ones, even as those of Andrews, Howard Carter and all the others. But Farmer Butte and his pig also have a place in the scheme of things.

## *Pistols for Sale*

IN THESE days of unrestricted shooting and street gunplay, do not overlook Pittsburgh. Pittsburgh has not figured importantly thus far among the cities, as have Chicago and Detroit with their daily target practice, but it has every promise of an early début. All of which is predicated in an issue of a newspaper just received from that city containing six or seven different advertisements from mail-order houses, offering to sell revolvers and automatic pistols at prices varying from $6.24 up to about twice as much.

Such extensive advertising of weapons cannot presage the coming of the game season, nor is it an appeal to the industrious householder to arm himself against midnight marauders. It does not set forth the need for self-defense, nor does it lay claim to military preparedness. And we note from the masthead of the newspaper that it particularly circulates among the colored readers in that city.

If this campaign led law-abiding citizens to respond through the purchase of guns for safeguard while going home late at night, it might not be so regrettable. But these advertisements, like Jehovah's rain, fall alike upon the just and the unjust; and the citizen is invariably the one who is minus a weapon when he meets a holdup. No character references seem to be required before the purchase can be made.

We are glad to say that thus far we have not found any appeals, through the mail or otherwise, to buy blackjacks, 'jimmies,' skeleton keys, and similar tools. Possibly as soon as the pistol campaign is over, some other enterprising firms may come forward with additional accessories. Eventually, we may be able to order a complete gunman's outfit, all from a single house. Later on, it may be possible to get equipment for other classes of lawbreakers, of which there are many.

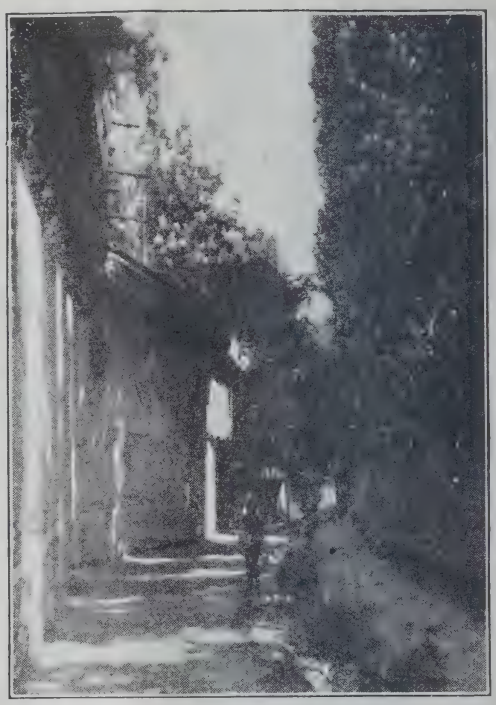
And yet, if we can display hip-flasks, cocktail mixers, drinking sets and silver corkscrews in our store windows, why should we not advertise automatic pistols for sale through the mail?

## *Bad Taste Commercialized*

THE recent 'discovery' of Lord Kitchener's body is now reported as a publicity hoax, engineered by a motion picture company. The episode has caused a furor in Britain, where one newspaper declares, 'It is a ghoulish thing thus to exploit the fame of one of England's greatest soldiers.' This country—the Promised Land of the publicity faker—can well understand Britain's disgust. We have our full quota of press agents here, and while they have not dared go to such extreme lengths as in the Kitchener case, they have passed so far beyond the bounds of propriety as to violate all sense of good taste. It is a noteworthy coincidence that publicity charlatans and movie magnates have grown up, hand in hand, and that each leans heavily upon the other. It is also noteworthy that recurrent bad taste enters so frequently into the activities of both.

## *The Docile Doctrine of Contentment*

THE world moves forward on the wheels of discontent.



Centuries ago some discontented individual stood by the side of a wide stream and longed for the green opulence of the far shore. He invented the first boat. Another hero, weary of plodding along on his own tired feet, leaped astride a passing beast. He revolutionized transportation. Another unknown noted that his insides ached when he ate flesh from animals too long dead. He was not content to remain with his fellows, forever eating carrion. Instead he sallied forth in search of fresh food—and became the world's first hygienist.

We hear much preachment these days about the glories of contentment. We are told to be satisfied with our lot in life. We are told to take things as they come, without complaint, without revolt. We are told to be contented with our surroundings, with our fellows, with ourselves. Contentment, we are informed, is the greatest of all attainments.

Had our fathers followed this docile doctrine, we of today would have no railroads, no sewing machines, no printing presses.

# Exploring Where Paul Preached

## Notable Architectural *and* Art Treasures *Unearthed on the* Site *of* Ancient Antioch

By EASTON T. KELSEY

MEMBER OF THE SECOND UNIVERSITY OF MICHIGAN EXPEDITION TO THE NEAR EAST.

Photos by G. R. Swain, Near East Research, University of Michigan.

*The excavators, with natives in picturesque costumes.*

CONSTANTINOPLE lay behind us. We were bound at last for the interior of Asia Minor, to join forces with the University of Michigan expedition that was already at work laying bare the ruins of ancient Pisidian Antioch.

Antioch, mentioned in the Bible in connection with the Apostles Paul and Barnabas, was a city prosperous before the time of Christ. Under the protecting mantle of earth that had drifted over the ruins through the centuries, we hoped to find treasures in knowledge of ancient life and peoples.

The ruins of the city, which was probably destroyed by the Arabs about A. D. 713, were first located by the English clergyman Arundell in 1831.

Since his report, investigation of the discovery had been slight, and our excavations were intended to bring to light facts of inestimable historical importance from the untouched remains. Under the sands of Central Asia Minor lay a whole city, where hundreds of feet had once packed the earth solid, waiting to have its secrets opened to the world.

Our share in the expedition, for the present, was to conduct the all-important automotive equipment—a truck and a sedan—to the scene of excavation. In Central Turkey, some dependable means of transportation must be imported with the expedition, for railroads are scarce and native carts impossible.

So at Constantinople we had negotiated the vehicles aboard a small tramp steamer, whose hoisting tackle proved too weak to lift a machine, and set sail down the Sea of Marmora on the first leg of our journey.

After disembarking at Mudania, enough daylight was left to drive the twenty or more miles to Brusa, where we spent the night. Four hundred miles separated us from Yalovadj, our destination.

*Headquarters of the expedition—a combination dining room, library, photographic dark room and sitting room.*

That distance, which is scarcely more than a long day's drive, in Turkey requires four gruelling days. Roads in Turkey, with their washed-out bridges, highways that often dwindle to mere cart tracks, and mud to the hub caps, would leave the American motorist speechless.

We left Brusa early, and midmorning found us inching along in a driving storm that drenched us completely. Our progress was slow, bringing us to the village of Iniguel, where we had our first meal *a la Turque*. In its essence, a Turkish native meal consists of one large plate, from which every diner secures his food as best he may with his fingers! Personal hygiene immediately becomes a thing of the past. For our second course, a large bowl of curdled milk called *yaourt*, we were permitted to use spoons.

We managed by nightfall to reach a small settlement on the famous Berlin-Bagdad railway, spending the night on the floor of a hut. Rising with the sun, we drove all day, passing the night under the stars, and on through the next full day. Our dreams of a comfortable night in a bed at Ak Shehir, our next stop, vanished before an onslaught of bedbugs and mosquitoes, after which we retreated to the tightly sealed sedan!

There now remained about forty miles to Yalovadj, although a direct line was only fifteen miles. The road leads up and down severe hills, one a twenty-per-cent grade for three miles, finally crossing the Sultan Dagh, or mountain range, at an altitude of 5,800 feet. Most of the bridges along the route had long since been washed out, forcing us to work around them in imminent danger of capsizing. This was the route we were later to follow often in transporting supplies.

# *The* LOBSTER Is Supreme *in the* Village *of* Cape Porpoise

By MAY B. WHITING

*Pencil Sketches by*
STANLEY W. WOODWARD

GRASS is growing on the pier at Cape Porpoise. There is no soil except the dust of decaying wood, no moisture but the fog and rain, but there is plenty of faith, for it flourishes along with peppergrass and yarrow, and the lovely bloom of rose mallow that strikes its roots just beyond reach of the tide.

In many places the boards have fallen away, and there are holes through which you can see the tide ebbing dizzily among the piles. It seems like a haunted wharf, for no mortal would dare to tread it except by daylight; but ghosts must love its crazy planking, the row of giant reels for nets swaying in the misty breeze, the grassy crevices, all a sign that its fishing glory has departed.

Not that Cape Porpoise is a place of ruins. On the contrary, it is a prim little village, as picturesque as any on the coast of Maine, and well worth a visit. If you come by automobile, ask the way early and often. If you come by train, follow the same principle. You ask the conductor and he will ask the brakeman because he has been in that region longer, and the brakeman will ask the engineer because he is an older man, and one will say go to Biddeford, another to Kennebunk, and the third to Kennebunkport.

From Kennebunkport there is a bus, very uncertain as to its comings and goings, but with the imposing title, 'York Utilities.' After rattling up hills and wobbling down slopes, you jiggle around the curve of the bay, and the driver announces that you have reached Cape Porpoise.

Of course there is only one road, for no fisherman will live away from the shore, but it is a long road, for a splendid harbor makes up, landlocked by the five islands at its mouth. Seafaring men's ideas of architecture are always original, and there are sloping ells and gables in unexpected places, or an odd-shaped cupola like an extinguisher to put out the rest of the house. Sometimes there is a rudely carved codfish for a weathervane, looking almost pathetic so far removed from its native element.

Flowers grow everywhere, by the doorsteps and the walks and in old dories, and the decorative value of red geraniums in tin cans is not forgotten. The hills sloping back from the harbor are covered with juniper and fragrant bayberry, and there are fields rosy blue with lupin and morning glory, and mowings with wild strawberries thick in the tall grass. Throughout the hamlet is the poignant odor of salt and tar, a perfume sweeter than that of the Spice Isles to one who loves the sea.

Perhaps, on a rack beneath the trees, are hake drying in the sun, reminiscent of the days when there were codfish drying on the 'flakes' for the market. Hake is a fish commonly not appreciated, but the fisherman knows its worth. 'Corned,' that is, light salted for a day, and then boiled, it is delicious; and dried, it may be 'stripped up' and eaten or freshened like the familiar cod.

I can't tell why, unless it be for the wing-shaped sides, but hake drying on a rack makes me think of fallen angels. There is nothing particularly beautiful about a hake in life, with his brown striped back and whiskered mouth, and when he is decapitated and split open with a blue fly buzzing above, disgusted at the salt, he is still less lovely. Yet drying hake and fallen angels go together in my mind.

Of course Cape Porpoise has its stores. There is the general provision store with barrels of this and barrels of that and a coal stove in the corner. And the proprietor is a Nunan. The Nunans used to be a mighty fishing family. They came from Provincetown and twenty-five years ago they owned nine vessels, as fine a fleet as sailed the seas. Three of them are still 'alive' but only one clears from the home harbor.

Then there is the general dry goods store, full of everything except breathing space. There is one window devoted to flowers which might make a florist envious, and, beside the door, beneath a notice of the strawberry festival at the church, is a bulletin board where are posted, not advertisements, but poems. The proprietor is a woman, a poet herself in a modest way. She belongs in a storybook with her flowers and her poetry and her overflowing store, but Cape Porpoise would miss her if she should make the change.

Fireman's Hall is the amusement center, and in the country dances where 'Old Pete' fiddles, at least half the numbers are 'squares.' Sailors, the world over, love to dance, and their calling keeps them nimble. One has to be spry to go out in the boats fishing.

Fishing is a trade not nearly so simple as the landsman thinks. The spring is its gala season. Then the mackerel, that beautiful and mysterious fish, appear in great schools along the coast of Maine. Where they come from and where they go to no one knows, but every year, impelled by instinct,

they go up the coast, the vanguard at such speed that they are tough and leathery. As soon as they are sighted the nets are unwound from the reels, and each little boat starts out at night to try its luck.

The nets are set ten or twelve miles offshore, cork bobs hold one side to the top of the water, while the other side drags about eight feet below. One end is fast to the boat, and a lantern on a cross is set at the other. The boats 'lay by' all night, and two or three times the fisherman rows along and picks off the fish. At daylight he must take up the net, clean his catch, and get it to market.

Gill netting is another form of net fishing. Here the nets are set on the bottom and extend up about twenty feet, for cod, hake, and haddock. The nets used to cost sixty-eight cents a pound, while today they are two dollars and twelve cents, so that there are not many gill netters on Cape Porpoise. Cod is also caught by handlines and by trawls. Trawls are long lines with a hook set every six feet.

The fisherman starts out about three in the morning with four trawls baited with sardines. He pays them out one after the other, then starts back at the first and hauls in, snapping off the fish into the 'kids' or boxes. Then he starts for market, cleaning on the way, and is home in the early afternoon when the trawls must be baited for the next day's work.

Years ago, when wiers were set for salmon on the Kennebunk River, the seals were a great nuisance, so that the state offered a bounty for each seal's nose. The Passamaquoddy Indians became very skillful in manufacturing seals' noses, cutting a junk from the hairy part of the creature, sewing up the skin and weaving in bristles.

Sometimes today a few descendants of the old tribes wander by, selling baskets of sweet grass or beads.

The great standby of Cape Porpoise fishing is the lobster. Every man is a lobsterman, and all along the reefs of the islands are lobster bobs dancing on the waves. Now a certain mystery enshrouds the lobster. You may chat about the luck with the mackerel, the horrors of dogfish, or the relative merits of Portland and Boston as markets, but when you mention lobstering, there is a certain *hauteur* that discourages further conversation.

The seafaring man is not like the landsman. There is the law of the sea that is made on the sea, and the sailor who transgresses it is forever disgraced. Then there is the law of the sea that is made on the land and the sailor usually obeys. But the sea breeds adventure and every snug little cove has its legend of smuggling.

Cape Porpoise was an active member of the 'Horse Marine' when, in 1812, imported articles were taken from the boats and carried by land. Today, so rumor has it, it is the lobster. New Hampshire permits the sale of lobsters a bit shorter than does Maine, and, Portsmouth being handy, 'they say' that many a lawful inhabitant of Maine waters is hustled over the border into New Hampshire markets. But the lobstermen agree to throw back the 'snappers,' or the young.

Although Cape Porpoise has an ideal harbor, the outer shore of the sheltering islands makes a dangerous coastline. On the beach is half of a coastwise freighter that ran aground in a fog about four years ago. Two miles off Cape Porpoise is a bell buoy set in thirty fathoms of water, and sixty miles off is another also set in thirty fathoms of water. The captain made the inshore buoy, sounded, and believed that he had plenty of sea room. Without waiting to sound again he ordered full steam ahead and then went to his bunk. Before he could turn in, his boat crashed on the beach. There was no sea running, and it was easy enough for all hands to get to shore, and as only the prow of the boat was stove they sliced her down neatly and towed the stern to Boston.

The sea, with its alluring mystery, is always promising treasure to its devotees, and the seekers for gold are by no means all of a past generation. A few years ago a bubble appeared on the coast of Maine, glowed in enticing colors, and burst. This bubble was a scheme to pump gold from the bottom of the sea. The promoter gave a demonstration at Eastport while his partner busily sold stock. His equipment was meager, yet sure enough he pumped up gold before the eyes of the spectators. He had not invited equal publicity when he planted it.

Among the onlookers were wealthy summer residents of Kennebunkport who did not buy stock, but planned to do still better. On Fort Island, off Cape Porpoise, they erected a 'clubhouse' but instead of the customary furnishings they installed pumps of the largest and most expensive make. For a week they pumped. They pumped the ocean side and they pumped the harbor side, but mud remained mud and sand remained sand with never a gleam like that which had illumined the bubble.

The busy days of ropewalking and vessel fishing have gone from Cape Porpoise, but the spirit of beauty remains. It stays on the little tumble-down wharves and the fish houses with their heaps of lobster traps and buoys, it wanders along the creeks where old dories are stranded, gray against the gray green of the marshes, it walks the curving village street, and lingers lovingly on the grass-grown pier.

*Artistic composition an artist found in a weather-beaten house and a ramshackle wagon on the Wells Road.*

# Can COURAGE Be Cultivated? YES, *But It Takes Time*

By THOMAS L. MASSON

ONE of the most valuable things to learn about courage is that *it must constantly be reasserted,* to meet changing conditions.

We cannot fall back on the courage of yesterday: we must summon new courage for today.

Today's news about courage is more important than anything else: for courage determines what we are and what we shall be.

Courage is always personal. Courage is not of yesterday nor tomorrow, but *now.*

'I knew a young soldier who died in the early campaign,' says Emerson, 'who confided to his sister that he had made up his mind to volunteer for the war. "I have not," he said, "any proper courage, but I shall never let anyone find it out." '

How can courage be brought home to us, so that we can apply it in our lives, first by understanding it, and then by using it in increasing measure until we exercise a full control? Let me point out the difficulties before giving the answer.

In the beginning, our main difficulty lies in the fact that we get rattled. We seize upon anything, snatching mostly at straws. The very condition of being rattled lays us open to every cure-all that comes our way.

But if you tell a rattled man not to allow himself to be rattled, you only make him worse.

And now I am going to say something which may astonish you: *it does no harm to be rattled;* and it may be much better not to try to stop it. I don't mean that a man should just be a coward; I mean only that when he is thoroughly rattled, that is something which, for the moment, cannot be helped; it is better to let it run its course.

The real thing to do, in the very beginning, is to separate himself from himself as much as possible, so that he can see why he is rattled. This process is not one which can be forced. It lies largely in the idea of it.

Many years ago I was suddenly taken very sick. I had secured a fine position which had in it great promise, and I was making an income sufficient for a family of two children and a wife—indeed, more than sufficient. Also, I was thoroughly wrapped up in my work. Without realizing it, in the space of about three months I lost a great deal of weight. I developed a cough which I could not throw off; but neither of these things aroused my wife or myself to any sense of danger. One day however, I had to take to my bed, and we called in a local doctor.

He did not alarm me, merely saying that he thought I would be all right if I went away somewhere and took a rest for a month or so. A friend of my wife's, however, who happened to run in and see me, remarked at once on my changed condition, and insisted on our getting another doctor. I rebelled against this, and in fact was quite irritable about it (first signs of fear), but my wife gave me no choice, and the next day, without my knowledge of it, another doctor appeared. This doctor was no amateur. He subjected me to a rigid examination, which lasted several days. In the end he came in and said that one of my lungs was already badly affected and with great care I might possibly get well in a year, but he considered it doubtful even at that.

Was I rattled? Looking back on my experience, it seems to me now that I must have been the worst rattled individual in the whole world. After-

*Illustrated by* J. C. GRAHAM

*'I have not,' the young soldier confided, 'any proper courage, but I shall never let anyone find it out.'*

ward I learned, of course, that I was only one among thousands, and that I was really much more fortunate than thousands, because, while my case was very desperate, I did have resources. I had a brave wife, I had money enough to carry me along, and I had a profession whereby I could maintain myself, even if I were too sick to live in an office. But the truth is that none of these favorable things moved me in the slightest degree. They never do, when we are suddenly upset by a hitherto unsuspected disaster. I was so badly rattled that it made me utterly incapable of doing anything. A few days before, while I felt miserable enough, I had been able to get about without difficulty. Now I became so weak I could scarcely stand up and I fainted at the slightest provocation.

Looking back on this experience, however, I am thoroughly convinced that the second doctor was right in telling me the truth, or what he believed to be the truth. He was a man of very large practice, and he broke the news to my wife and myself with tact, intelligence and courage; for it does take courage on the part of a doctor to tell the truth, where it involves so much in the lives of a small group of human beings. If he had glossed over my case, and given me a large hope, he would not have done his duty. He scared me stiff and cold. But if a man is going to be killed by fright, he is bound to be frightened to death at some time or other, and he might as well have it over with. Fright does not kill. It sweeps over a man, completely devastates him, puts him temporarily down and out. It is the most drastic medicine I know. But looking backward, I can say quite sincerely that I am deeply grateful for those periods when I was scared out of my wits. In the end, they seemed to be the only moments which led to the restoration of what wits I may have developed afterward.

We can build on a right foundation only by digging deep. That is what fright does.

In my thoroughly rattled condition, I still had glimmers of hope. I don't believe that hope ever quite deserts anybody. My first feeble thought was that this doctor was a liar. I passionately resented believing him. Yet the thought of consulting another doctor filled me with renewed terrors.

*Certainly nothing is more constructive than fear. It not only scares the life out of you, but it scares the life into you.*

In these moments, however, things seem to be decided for us, and not by us. In an incredibly short space of time I found myself on the way to the Adirondacks. Swathed in blankets, my wife, myself and my two small kids discovered ourselves in a mountainous region, not more than a mile and a half from where Robert Louis Stevenson had lived during the illness which eventually carried him off.

The knowledge of Stevenson and his long and desperate fight against tuberculosis—the fact that he had eventually succumbed to it—of course only increased my terrors. Without the help of my wife, I should never have been able to face the third doctor, who had been duly apprised of my coming. He was a cold-blooded, scientific looking man, with keen gray eyes, which seemed to point their way right through me and spell the word doom. Later I discovered that he was very human, very much like myself. His first words completed the perfection of my fright. He opened a letter which the second doctor had sent, and remarked:

'Yes, I know that you have tuberculosis.'

That word, already burned into my very soul, seemed to finish me finally. I could only gasp in reply. For years afterward that fearful word would send my heart into my throat.

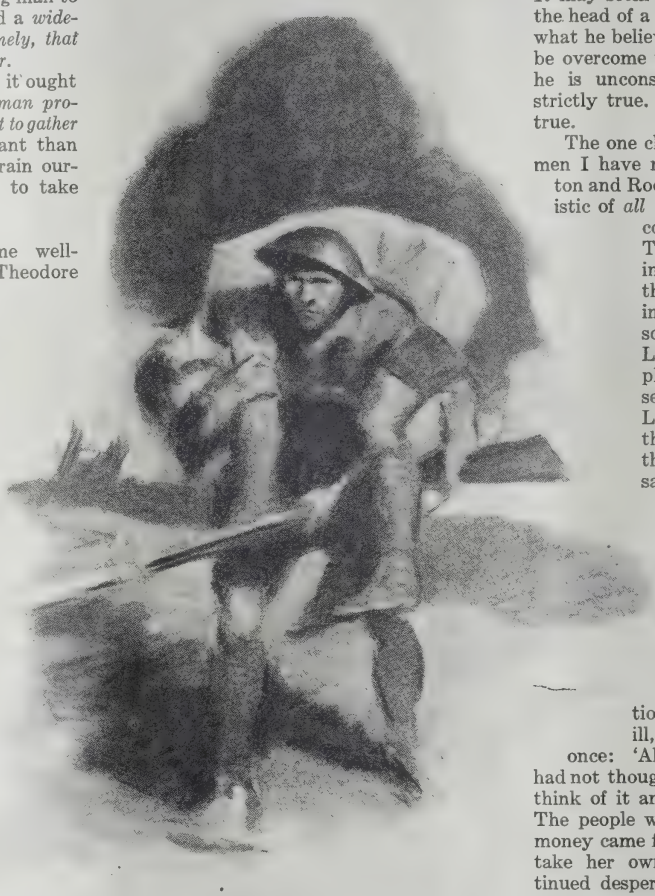
I have no intention of boring the reader with a recital of more of my agonies than are sufficient to be of service to those who, at the present moment, may be in the throes of unexpected terror. Although the four or five doctors who examined me at the start all shook their heads, in a year—with certain reservations—I was pronounced out of danger, and sent back to my work. A month later I broke down completely, with hemorrhage after hemorrhage. A year later I was no better. By this time I had become accustomed to the thought of passing out. My ultimate recovery was due to the fact that I followed instructions exactly and at the same time reconciled myself to the inevitable. I know now that through it all I was secretly and perhaps subconsciously determined to get well. It was largely through fear I did get well. There is probably nothing more destructive, *and certainly nothing more constructive, than fear, for it works both ways. It not only scares the life out of you, but it scares the life into you.*

The other day a young man said a very significant thing to me. This man was only twenty-four years old. He was in business for himself. He had just been offered a salary much larger than the income he was making out of his business. Also, he had a wife. I asked him why he didn't take the salary.

'Well, it's this way,' he replied. 'If I wait until later on to go into business for myself, I won't have nerve enough to do it. I am young enough now to fail a couple of times, while I have the nerve.'

Now that was a very philosophical and a very intelligent remark for a young man to make, but it unconsciously revealed a *widespread and wholly false belief, namely, that we lose our courage as we grow older.*

If this is true in too many cases, it ought not to be true. *As a man or a woman progresses in life, he or she certainly ought to gather courage.* Nothing is more important than courage, and therefore if we can train ourselves into it, we certainly ought to take advantage of this training.



How can it be done?

Consider for a moment some well-known examples of courage. Theodore Roosevelt was known as a very courageous man, not only physically but morally. On many occasions, it looked as if he went off half-cocked, but the truth is that he did not fear to make himself ridiculous. He wasn't afraid of anything, not even death. In his autobiography he tells how, when a boy, on his way to the mountains, he was attacked and his life made miserable by some other boys who were stronger than he was. He thereupon made up his mind to train himself to fight and he did this with good results.

There are numerous cases on record of men who have displayed great physical courage, who have been moral cowards, and not a few who displayed great moral courage, who have been physical cowards. The two things don't always go together. But one of the great reasons why Theodore Roosevelt was the idol of his period, and why his memory will be cherished as long as America endures, is because he was both physically and morally courageous.

Both Lincoln and Washington were the ideals of Theodore Roosevelt. I think that he probably derived a very large part of his inspiration from a study of those two great men. They, without doubt, furnish the greatest examples to all Americans of sublime courage in times of enormous strain, times that tried men's souls. Lincoln, when asked how he lived through it, replied that he lived from day to day. Washington's letters to the Continental Congress, always characterized by dignity and restraint, reveal the very limits of sustained courage. His impatience, while in evidence, his despair, while in evidence, were both *below* his consciousness of his duty. That is very important to remember. Courage is a *rising* quality. In these men, and in many others who might be mentioned, *courage did not diminish as they grew older.* A recent instance may be given in the life of Cardinal Mercier, who died so sublimely.

The history of the world is filled with examples of the most sublime courage, not only physical but moral. It would almost seem, indeed, as if the majority of human beings are heroes and heroines for staying alive as they do; and that, in a sense, is quite evident and true. But it must be remembered that *kind nature protects us from the most unnecessary of our fears,* and it would almost seem as if *she provides us only with those fears that are necessary for us, as tests, or as teachers to give us eventual courage.*

*A man who displays great courage on the battlefield does so because, under the spell of war and his training, he becomes completely forgetful of self.*

If, therefore, courage is so common; if it can be acquired; and if so many of us seem to lack it when we most need it, it is worth while to see if it is actually something that can be built up.

Owing to my own recovery and from the fact that I wrote some books afterward, for many years I have been in receipt of letters from all parts of the country, the writers of which have told me their troubles. In many cases I have been able to help them. From them all I have a kind of composite picture of a vast number of people who are struggling daily with problems which seem quite too much for them. It is not necessary for me here to go into these matters in detail. I merely wish to point out a path which, based on my own experience and on the experience of many others with whom I have come into contact, does lead to an increasing courage and does help to keep one, so to speak, on top of the world.

*No human being is naturally a coward,* but is made so only by ignorance of the rules of the game. As soon as he comes to understand those rules, he immediately rises out of his cowardice. And this is as true morally as it is physically.

The first thing to understand is that *all fear rises from selfishness.* This selfishness is quite natural and in many cases inevitable. It may seem strange to say that a man at the head of a family, suddenly stricken with what he believes to be a fatal illness, should be overcome with terror, as I was, because he is unconsciously selfish. Yet this is strictly true. Let us now see why it is true.

The one characteristic of the three great men I have mentioned (Lincoln, Washington and Roosevelt) and which is characteristic of *all* men who have shown marked courage, is their unselfishness. These men were not only willing to sacrifice themselves (and this means their families) but in most cases they actually did so. In the case of Abraham Lincoln, the whole country was plunged into mourning over his seemingly untimely death. Looking back now we realize that the death of Lincoln was the spiritual culmination of sacrifice.

No matter what situation he may be in, the head of a family permits himself no more destructive privilege than to give way to fear. Not long ago a woman wrote to me in great distress, telling me that she was on the verge of starvation, that her husband was very ill, and so on. I said to her at once: 'All you can lose is your life.' She had not thought of that. As soon as she did think of it and realize it, her fear left her. The people who had been pressing her for money came forward and told her she could take her own time. Her situation continued desperate, but slowly righted itself.

A year or so ago a man wrote me that he was in great trouble. He had a wife and two children and his wife was about to have another. He lost his position and became ill. What to do? His letter was filled to the brim with terror and desperation.

Now the truth is that in all cases like this, things are never so bad as they seem. I know this to be true because I have seen a lot of them. In my own case, my terror was such that I abandoned even the natural props I had. I conceived of myself as dead and buried and my wife and children walking the streets, although our assets were considerable. This false instinct of exaggerating one's troubles is perfectly characteristic of fear and always accompanies it. When this man wrote me, therefore, I was able, from my own experience, to discount his statements. I told him what seemed at the time to be a very cruel, indeed, almost brutal thing to do, to dismiss his wife and children from his mind, that is, not to worry about them, that his responsibility was good only so far as he was able to carry it out. I

asked him *if he ever stopped to think who was running the world* and if he hadn't been thinking he was running it himself, which was a very large order for one man, especially a man who was sick and had just lost his job. The next week he got another job. His wife went to a hospital, the new baby was beautiful, the bills were paid, and everything was smooth.

Right here I wrote him again and advised: 'Don't get too frisky. Be duly thankful for what has happened, but remember that you have much work to do yet before you are out of the woods.' A little later disaster again overtook him. Thus he wandered about for a year or more in a wilderness of fear and doubt. Little by little, however, he found himself. What really happened to him was that he was able to overcome this innate selfishness I write about. As soon as that happened, in proportion as he gained an understanding of what he had been doing, did he get on his feet.

Courage, in its perfection, is merely self-forgetfulness.

Many men who have gone to war and have been decorated for great courage have returned home only to get into trouble with their wives. Sometimes these men actually abandon their wives; or else they involve themselves in other difficulties. What I am showing is that a man who displays great courage on the battlefield does so because, under the spell of war and his training, he becomes completely forgetful of self. When he returns home, however, and endeavors to take up life where he left it, he reverts to his former self, and what was ignorant and selfish in that former self, under new and often trying conditions, rises up to do its work of destruction.

Marital troubles, which now seem to be so common in this country, and indeed all over the world, are due, of course, to a multiplicity of causes which lie down deep in human nature. Many are medical cases and many are financial. Leaving aside the medical part (although this also can be traced back to the same cause I write of in the majority of cases) my experience with many cases and close observation shows that selfishness is at the bottom of nearly all the trouble. But *the cure for selfishness* is still in its incipiency, because those people who are afflicted with it very seldom realize that they have it, and they are invariably resentful if you suggest to them that they have it.

To big men, the mere providing for their families is an incident. To any man who cultivates unselfishness and therefore courage the mere support of himself is nothing at all. It simply doesn't count.

To develop true courage is to control your destiny. To eliminate selfishness is to begin to develop true courage. And to do all this one needs only to begin with the smallest things.

A man at the head of a family, be it large or small, is responsible for that family only as far as his own conduct goes, and no farther. If he keeps his own conduct straight, his family will go straight. He does not have to worry about them in any way, and this leads me to say just a simple word in conclusion, about everyman's religion.

The basis of every religion is faith, and every man has faith. I have observed very closely a great many highly successful men, and have invariably found that they had faith. When you meet a highly successful and intelligent man who is, apparently, a skeptic, you will find upon examination that he is only a skeptic in certain directions.

You may be certain of this truth: that if a man has faith in himself he has faith in God. We must have faith in something, and this something, by whatever name we choose to call it, is of necessity that which we came from.

It takes time to develop courage. As we progress with it, we grow stronger, and as we grow stronger, we come to see at last that this whole process is due to a faith that we gradually achieve from the sum total of all our experience.

## Lo! The Poor Indian

(*Concluded from page 7*)

8. I repeat that the Indian Bureau has possession of an amazing report by the American Red Cross on Indian Bureau neglect and inefficiency affecting the health of Indian tribes, which has been smothered, and that Senators and members who have asked to inspect the report have been refused that right.

9. The Indian Bureau has failed and neglected the health and care of Indians in Wisconsin, California, Arizona and other states, as set forth in statements of reputable medical witnesses and commissions, none of which were disputed except a reference to the Pima tribe, that, I submit, was incorrect.

10. The Indian Bureau has caused to be introduced Bill H. R. 7826, which as prepared provides that all Indians on reservations may be tried by ten-dollar-a-month "judges" and sentenced to six months in jail in addition to a $100 fine for disobeying rules or regulations of the bureau. No right to a jury trial, attorney, bail, or appeal guaranteed under the Constitution is offered by that bill, which was opposed by every Indian tribe represented in Washington, excepting a white attorney for some Indians in South Dakota.

11. The Indian Bureau has approved a grossly unjust Indian oil leasing bill, affecting 22,000,000 acres of Indian reservations, and that while oil men and bureau officials urged its passage before House and Senate committees not one Indian representative of any tribe was heard on the bill.

12. The Indian Bureau under existing law and custom has practically unlimited control of the person and property of 240,000 Indians, excepting in case of eight felonies, without right to jury court appeal or judicial review in determining matters of "competency" or other rights guaranteed to every other American citizen.

13. Serious complaints against the Indian Bureau lodged by Menominee Indians of Wisconsin, Blackfeet and Flathead Indians of Montana, and Pueblo Indians of New Mexico, and of other tribes, have not been answered.'

These charges are serious enough in character to warrant the most searching investigation into the bureau's administration of Indian affairs, and if such investigation shows basis for the charges, then the Government's policy of Indian administration must be revised.

# Freight Rates and Discovery of America

(*Concluded from page 8*)

East were more valuable than gold.

All these commodities were expensive for an excellent reason. *The freight rates were very high.* The cost of transportation was enormous. If in the year 1920 Iowa corn rotted on the ground when people starved in Russia, is it any wonder that in the year 1400 the people of Europe were willing to pay huge prices to get nutmeg and cinnamon which might at that very time be a veritable drug on the market in the East Indies?

Consider the freight and transportation methods of five hundred years ago. The much-desired spices came from islands near the Philippines. Follow the stages of their transportation to Europe. They were put on boats in those islands and shipped to the head of the Persian Gulf. At that point they were put on river boats and shipped up the Tigris or Euphrates rivers in modern Mesopotamia. At the source of the rivers they were placed on the backs of camels and transported overland to ports on the Mediterranean Sea where the Genoese and Venetian galleys picked them up and carried them to these Italian cities. In Italy they were placed on other vessels for the long sea voyage around to England or Holland or Germany. Or perhaps they were sent on mule-back up through the dangerous passes in the Alps and then reshipped on boats down the Rhine.

*Caravan of merchants plodding across the land routes of Asia Minor, 16th Century. The armed guards are the measure of the cost of insurance.*

Is it not obvious what made the goods expensive when they reached London, nor Hamburg, or Cologne? In the preceding paragraph, did you count the number of transshipments? Six different times, at the very least, those goods had to be handled. Today it is an elementary fact that the fewer times the goods have to be handled, the smaller the price for which they can be sold. Moreover, in the Middle Ages there were bandits and pirates on every stage of the voyage. East Indian pirates, river pirates, hordes of roving bandits in Asia Minor, the Mediterranean always filled with the swift galleys of the Barbary pirates—is it any wonder that many a vessel and many a caravan never reached its destination? All these had to be taken into consideration in assessing the final price which the ultimate consumer had to pay for his spices. To add the cost of insurance to the final price of the goods is perfectly proper, and always has been.

Naturally, then, men began to ask whether there was not some way of avoiding the transshipments and the hazards of these dangerous trade routes across Asia. The all-water route is often the cheapest. Even today bulky goods are shipped via the Panama Canal from San Francisco or Portland, Oregon, to New York, though the rail route directly across the continent is much shorter. That is why our forefathers began to look for an all-water route to the East. Perhaps the all-water route was longer, and certainly it was unknown. But it was worth finding to avoid the terrific costs of the overland trade routes.

In 1453, the Turks captured the Christian city or Constantinople—the great trade emporium of the Eastern Mediterranean. As has been mentioned, it was long the fashion to say that this broke up the trade routes and caused the discovery of America. But in fact the Turks did not break the trade routes. They did not capture the southern routes until long after Columbus' voyage to America. When they captured the Levantine cities, they did their best to induce the Genoese and Venetian merchants to come back and buy more. The great urge for the all-water route to the East began long before the Turk got control of the trade routes.

Naturally the people who felt the pinch of the high cost of living were those who lived on the outer edges of Europe, those who were reached last of all by the merchants who brought the spices. That meant Portugal, England and Holland, and to a lesser degree, Spain and France, who had Atlantic as well as Mediterranean ports.

The first discoveries are to be credited to the Portuguese. Long before Columbus sailed on his voyage, the adventurous mariners of Portugal started down the west coast of Africa in an effort to round the Cape of Good Hope. In fact one of them did reach the southernmost point of Africa some years before the discovery of America.

Certainly the Turk did not build an obstructive wall across the trade routes. There were other motives back of the restless enterprise of the nations of the Atlantic seaboard. Readers of the contemporary documents can see that one of the things that led the rulers of Portugal to encourage their sailors to try to sail around Africa was a desire to find new lands into which to carry Christianity and so, on the surface, the crusading zeal appears in these early voyages. But a close reading of the instructions and directions given these early voyagers shows that time and again the merchants who put up the money for the voyages insisted on getting from their monarch a concession for a monopoly on the trade in the lands they should discover. What is more important, the king always granted this demand. If a business man was going to hazard his capital in a mercantile enterprise overseas, he often wanted something more than the credit of spreading the benefits of European civilization.

There could be no clearer illustration of this than the present 'mission' to the Philippine Islands by a personal representative of President Coolidge. Of course, the United States has done a magnificent job of educating the Filipinos. Of course Americans are proud of the disinterested and beneficent work her teachers and her administrators have done there. But the Philippines can produce the rubber with which American manufacturers hope to break the Anglo-Dutch monopoly.

So, too, there is no wonder that the men who put up the money for the first voyages across the Atlantic wanted to be sure they would get something out of the trade opportunities which would inevitably result. It is certainly not proper to explain the discovery of America solely upon the economic grounds of the commercial pressure. But can anyone look at the two pictures which accompany this article without realizing that the reason why these pictures were drawn in the 16th Century is because these things impressed the artist as important in the life of the world in which he lived?

In one of them there may be seen the caravan of slow-moving camels.

In another picture may be seen the act of transshipment.

Was it, after all, necessary to invent that elaborate fiction about the Turks and the trade routes to account for the discovery of America?

# The Senator Nobody Knows

(*Concluded from page 2*)

stern. Nobody can manhandle the Constitution on any subject when he is around and get away with it if he can prevent it. He doesn't object to the wets trying to repeal the 18th Amendment, but he does object to every sort of subterfuge the purpose of which is to nullify it.

He believes Al Smith will never get far toward the Presidency by the nullification route. He believes Smith has taken a position in which he can be destroyed. One moment Smith says, 'Repeal the New York enforcement act,' and it is repealed. The next moment he says, 'Let New York and each other state decide, each for itself, how the prohibition act shall be enforced.' Smith first refuses to enforce the law and then asks that his state (and of course each of the others) shall enforce the law as each state shall see fit. Borah cannot quite see how a man can get by with this kind of a program. Smith's position, as Borah sees it, is one that cannot be defended. A good many others apparently think the same. Borah has had many letters from the Solid South saying that if Smith should be the Democratic candidate they want a chance to vote for Borah. The South is in earnest about prohibition. Whoever tries to pull any rough stuff on the 18th Amendment down there is sure to get into trouble.

Borah feels that the most important political task confronting the American people is to steer this government back to American principles and keep it there. He feels that the international banking interests have swerved us far from our course and are trying to swerve us still farther. He objects to the colossal investments of American capital that are being made abroad, unless it be with the clear understanding upon the part of our investors that in case of trouble they need not expect the armed forces of America to collect their debts or insure their profits. Borah is for peace and he is therefore against every sort of involvement that may lead to war. Borah may have quite a lot to say, during the next few months, with regard to the international banking group in general and its potency in connection with the Government of the United States.

Borah has always been a Republican, but no one who knows him would go so far as to say he will always remain a Republican. Borah is much more interested in principles than in party names. That he is not wholly satisfied with the Republican party everyone knows. He would like the party better if it were more courageous. If he can make it more courageous he will try to do so. He will remain in the party as long as he believes he can do more good in it than he could out of it, but he would not remain in it if he believed he could do more good outside of it than inside.

Borah believes the Republican party can maintain itself only by gathering courage for the right, though the slowness with which it is moving in this direction sometimes makes him suspect that some other organization will have to do its work. In the past Borah has never been a third party man, but it would be rash to suppose that a third party could never tempt him. Some of those who have talked with him have come away with the feeling that in his opinion events are shaping to put a third party into power.

Every move that Borah now makes is viewed by the correspondents with reference to his supposed ambition to achieve the Presidency. Probably Borah would like to be President. Is there a man in America who wouldn't? But this much at least is true—Borah has never been willing to play politics to be President. He is 'inconsistent' in the opinion of Washington writers because he insists upon viewing each question by itself and applying old principles to new facts regardless of whether votes are won or lost, and he is a 'mystery' to them because they cannot believe that a politician can be more interested in the maintenance of American ideals than in his own reëlection.

Of course, there is a little more to it than that. These correspondents know that their editors, in their editorials, knock Borah. It is always good form in Washington to knock those whom one's boss cudgels. The correspondents do not know that the boss' banker might have suggested the advisability of panning Borah—and it would not make any difference to the correspondents if they did know it. Their business is to furnish what the old man at home wants and they don't need to be told twice or even once to do it. A glance at the editorials each day is enough.

There will have to be a political revolution if Borah ever becomes President. Such a revolution may come within the Republican party or it may come outside of it. Certainly Borah is the last man who would be desired by the international banking interests that usually look to the Republican party for what they want. He does not play their game. He is an old-fashioned American, as far as his political ideals are concerned.

Personally Borah is charming. He has a keen mind, a sense of humor and a good supply of such qualities as go to make a likable man. He has dignity, but it is never oppressive. He is affable, friendly and frank, but not chummy. He smiles often and laughs some, but he hasn't Al Smith's boisterous, 'Sidewalks of New York' laugh. Smith's laugh is all right, at that; Borah's just isn't like it, that's all. Borah's chief charm is in the keenness of his intellect and in the readiness with which, on suitable occasions, he becomes intensely in earnest. Nobody needs to doubt him then. No politician is talking. When he speaks, for instance, about the necessity of getting back to American principles and governing America for Americans one knows that he is aflame with his subject and means just what he says.

It is difficult, when in his presence, to realize that on June 29 last Borah became sixty-one years of age. There is not a sign of gray in his black hair, his complexion is ruddy and his step quick. When he rises to speak in the Senate, always slowly and with a suggestion of diffidence, a stranger might mistake him for a new member from a back state. Yet Borah is probably better known in Europe than any other American except the President and a growing number of his countrymen are coming to understand him, even though he remain as a sealed book to the Washington newspaper correspondents.

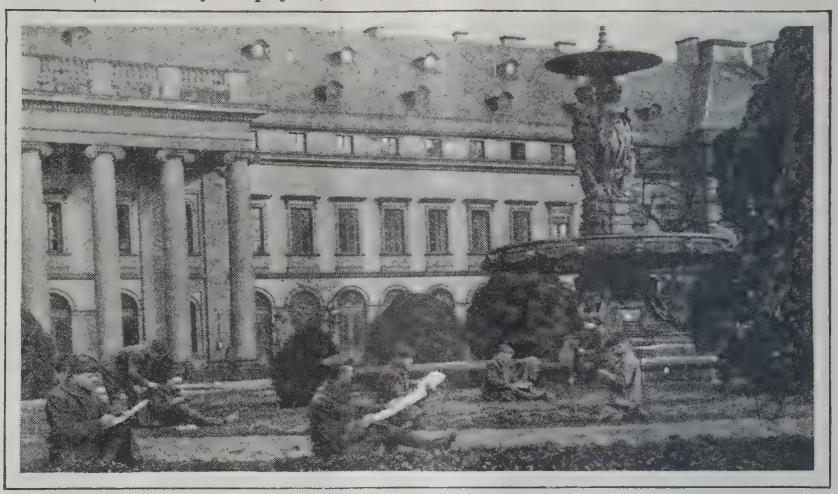
# Soldiers Were Tried by Court-Martial

(*Concluded from page 3*)

serfs and slaves, either hired, forced or sentenced to serve in the armies of the ancient kings, in the days when the king's right to take life or liberty was unquestioned.

Martial law was but the will of a brigand who dominated solely by force. No less distinguished a military man than the Duke of Wellington, conqueror of Napoleon, stated in a debate in Parliament that martial law was neither more nor less than *the will of the general* who commands the army. It was, he said, no law at all. The general who declared martial law and commanded that it should be carried into effect was bound to lay down distinctly the rules and regulations and limits according to which his will was to be carried out.



General Winfield S. Scott, general-in-chief of the American armies in the Mexican War, in a general order issued during the war, stated regarding the insufficiency of the written military code to cover certain crimes that 'a supplementary code is absolutely needed. That *unwritten* code is martial law, as an addition to the *written* military code, prescribed by Congress in the rules and articles of war, which unwritten code all armies in hostile countries are forced to adopt . . . For this purpose it is ordered that all offenders in the matters aforesaid shall be promptly seized, confined, and reported for trial before *military commissions*, to be duly appointed, etc.'

Until the revision of the court-martial manual of 1919, most offenses were punishable as the court-martial might direct. Now most penalties are defined. *All must be.*

Under the court-martial system used in the World War by the American Army, *a soldier could prefer no charges.* He could but make a complaint or protest to his commanding officer against any condition that prevailed; but when his commanding officer was a man such as 'Hard-Boiled' Smith and other convicted officers, with the official support of his superior officers, the soldier was in the helpless position of a man protesting to thugs who are assaulting him.

A soldier recommended for trial by court-martial was a marked man, doomed before he was brought to trial. Otherwise, he was not tried.

A man brought to trial in many cases was one who, except in the case of a criminal, which is another matter, had incurred the dislike or ill will of his commanding officer or some other officer, either with or without just cause. The situation usually was allowed to exist until the man either intentionally or unintentionally got himself into a position where he could be charged with some violation of an article of war. Charges were then preferred by an officer against the soldier. These charges were referred by the commanding officer to an officer under his command for investigation to see if they could be sustained.

—Press Illustrating.

*The fountain at the ex-kaiser's palace in Coblenz served as an object of study for American soldiers interested in drawing.*

It is generally found that the charges can be sustained, unless they are investigated by an officer who is very fair or not friendly to the officer preferring the charges. If witnesses can be found who will testify against the man, the commanding officer orders him to trial before a court-martial.

The same commanding officer appoints other officers under his command as members of the court-martial and the judge advocate of the court-martial, who until the forced reform of the court-martial system was prosecutor of the man and adviser to the court as to the law in the case and how it had to decide legal issues. It was a case of the prosecuting attorney telling the jury how it must decide the case.

It must be remembered that although the accused was to have the right to select his counsel, 'if such counsel be reasonably available,' he could only choose an officer who he felt was friendly to him. As the officer was not a man versed in legal matters and the judge advocate was a man of special legal training, the accused was practically without defense, especially as the defense counsel and the court had to abide by what the judge advocate said was the law in the case, thereby making acquittal practically impossible unless the court failed to abide by the instructions of judge advocate as it was required by military law to do. If the officer defending the accused had no personal concern in the man, or was afraid of incurring the disfavor of his fellow officers and the commanding officer by putting up a real defense for the accused, the man was helpless.

There are still certain defects in assuring an accused man justice, and these will be brought out in a later article making recommendations as to how they can be overcome.

—Press Illustrating.

*For the first time in 100 years, since the days of Napoleon, the chains around the Arch de Triomphe in Paris were removed to allow a great military parade of American soldiers to pass through.*

*(To be continued in an early issue.)*

# Heroes of the Air Mail

(*Concluded from page 5*)

dozens of times, yet, being a careful and methodical pilot, he took the compass from the machine. He had no emergency rations. He had neither snowshoes nor rifle. He saw no game. There was no shelter within twenty miles that he knew of. If worst came to worst, however, he could still return to his machine and start a fire with his batteries and some gasoline.

Soon Bishop was wallowing in drifts higher than his waist. But he continued on. The storm still howled about his ears and shut off his view ahead. But with his compass he kept a course toward a farmhouse which he knew nestled at the foot of a mountain some twenty miles to the westward.

After an eight-hour battle with the elements, the pilot had arrived at the stage where he was absolutely exhausted and almost in despair. How simple a solution of the problem, he thought, merely to lie down and go to sleep.

Bishop now gave up hope. It had stopped snowing, but a moderate gale still howled out of the Southwest. Bishop sat down to rest and think things over. He was now on a 'hogback,' perfectly level and almost free of snow. As he sat there, a miracle happened; a miracle to stir one's blood. 'Bob' Ellis, Bishop's companion, flying from Salt Lake City to Rock Springs, had seen his machine on the ground, but had noticed that the engine was running. Anxious to keep to the schedule, and believing Bishop was not in difficulty, since his motor was functioning, Ellis continued on. But soon after his arrival at Rock Springs, the Salt Lake field reported by wireless that Bishop was missing. Ellis thereupon asked permission of the division superintendent to retrace his flight to the spot where he had seen Bishop's plane on the ground.

Taking along a mechanic in case of accident to his own motor, and food and coffee for Bishop, Ellis set out in the face of the gale to find among a thousand hills a stalled machine and its helpless pilot.

After a flight of less than an hour, Ellis and his mechanic sighted Bishop's machine, half buried in the snow; a dead thing. There was no sign of Bishop. Moreover, his trail had been blotted out by the drifting snow. But Ellis, flying low and in wide circles about the stalled machine, asked himself what he would do in similar circumstances. Immediately he concluded that he would make for the farmhouse, twenty miles away. With an Air Mail pilot, to decide is to act, and within fifteen minutes, Ellis, flying a hundred feet above the snow, had 'picked up' a floundering figure halfway between the stalled machine and the farmhouse. Carefully choosing his way, in order not to break the undercarriage of his plane and thus leave all three at the mercy of the blizzard, Ellis and his mechanic landed near their exhausted comrade.

After a meal and some hot coffee, Bishop was able to 'sit in' at a council of war. Ellis' machine, they agreed, could carry the three of them, provided it could get into the air. But ground conditions were so unfavorable—the drifts were so deep—that this seemed impossible. It was then agreed that they would 'taxi' the machine to a comparatively clear spot six miles to the westward, from which to take off.

For four miles, with each mile rapidly eating up their fuel supply, they churned their way through the powdery drifts, with Bishop huddled in the cockpit, and the mechanic, comparatively fresh and warmly clothed, clinging to a precarious position on one of the wings. Finally, Ellis, realizing that his gasoline supply was becoming dangerously reduced, suggested that Bishop, with the aid of the mechanic, try to reach the farmhouse, now some four miles distant, while he flew back to Rock Springs to report Bishop's safety. This they attempted, but Ellis, watching Bishop's faltering footsteps from the air, realized that they would be unable to accomplish the four miles. Swooping downward, Ellis again landed near the struggling pair, helped them to climb aboard, and swore that he would get the ship off the ground with the three of them on board, or 'bust her up.'

Finding a ridge almost free of snow, Ellis, with his motor racing at full speed, and his plane reeling drunkenly amid the entangling sagebrush and snowdrifts, succeeded, after swaying and dipping for two hundred yards, in getting into the air. Little by little, an inch at a time, then a foot, with his propeller racing faster than it had ever gone before, Ellis finally climbed twenty-five feet into the air. By facing directly into the wind, the pilot utilized its velocity to attain an altitude of a thousand feet. Then he turned, and with the wind at his back, flew with his passengers to Rock Springs in half an hour.

USL USL USL USL USL USL USL USL USL USL USL USL USL

USL "A" Power Supply

## USL
## Radio Power Devices

USL Radio Power Devices represent the last word in radio convenience and ease of operation.

There is the USL "A" **Power Supply,** which furnishes "A" power from the light socket; the USL **Trickle Charger,** which converts any 4 or 6-volt "A" storage battery into a complete and continuous "A" power supply; the USL **Universal Charger,** which will charge either "A" or "B" storage batteries over night; the USL "B" **Power Supply,** which provides "B" power from light sockets and the USL **Automatic Control Switch,** which automatically eliminates all switching "off" and "on" of all radio "A" and "B" power devices.

Ask your USL battery dealer how you can improve your present "A" and "B" power supply by the use of these devices. He will gladly help you choose the particular devices which best suit your needs. Prices on these power devices are surprisingly low.

## The Problem Solved

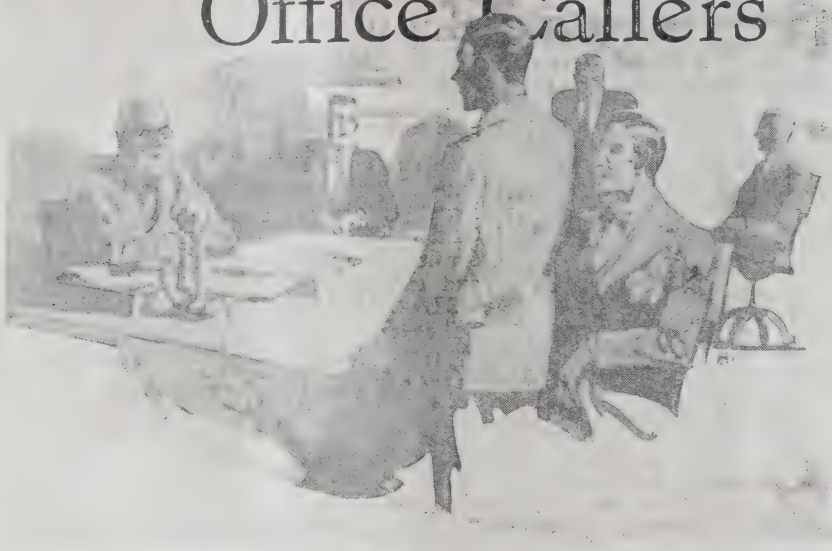
$2 \times 2 = 4$

$2 \times 4 = 8$

Bass Rangeley Moccasins offer an easy and economical way to solve the problem of school shoes.

These Moccasins wear like iron and, best of all, allow the youngsters perfect foot freedom under all conditions. If you want your boy's and girl's feet to grow the way nature intended and at the same time to cut down your shoe bills, equip them with Bass Moccasins—the same type of shoe which the American Indian wore.

Write for our big free catalog. In it you will find illustrated Bass Moccasins for Dad and Mother as well as for the youngsters.



**G. H. BASS & CO.**
**WILTON MAINE**
*Shoemakers Since 1876*

Just one of the many Bass Styles for School Wear.

Shoe Dealers interested in a Bass Sales Franchise should write immediately.

# Chats With Office Callers

'You have many beautiful flowers in your mountains,' said ***the Man from Switzerland*** just returned from the Rockies. 'In our remote Alpine villages, particularly in the Bernese Oberland, there exists an ancient custom of proposing marriage by flowers. A girl accepting a bouquet of edelweiss from a young man accepts him as her fiancé. The thought behind it is that the man has risked his life to obtain the flowers and is therefore worthy of reward. The edelweiss, you know, is famous, not only for its beauty, but for its rarity. It thrives only in the most remote regions of the mountains. The girl knows that it required courage and hardihood to reach it.'

❦ ❦ ❦

'I'm not much of a talker, and I think my worst fault is singing aloud on a fine Sunday afternoon as we roll over the roads and out into the country,' said the ***Irishman from Pennsylvania,*** but I have one complaint that I've got to get off my chest. I mean all this applesauce the newspapers are carrying about the rich dividing up with the poor!

'Everyone seems to be sympathizing with the poor. The rich are constantly being told—through newspaper columns—what to do with their money. Take the case of a well-known writer who gives advice each Sunday in a New York paper. A few weeks ago she cited the case of a man who left $40,000,000 to his son with the hope that it be kept as nearly as possible in one person's possession, and asks "why?" Then she goes on to say that he could have left it in the form of four hundred handsome fortunes to four hundred simple, hard-working persons, and thus bring new happiness to a lot of people who otherwise would be forced to struggle for existence.

'Now wouldn't that be just grand! Suppose that $40,000,000 is invested in some industry. Would the writer have the industry ripped to bits so that each beneficiary could get his slice? And would each of the four hundred, when he dies, leave his portion to four hundred others? Why, incidentally, stop at four hundred? Why not let the millionaire select 40,000,000 persons and leave each one a dollar? Or 400,000,000 and leave each a dime? If the next twenty-five men who leave $40,000,000 apiece would only combine and divide their wealth with this great generosity and equality, they could enrich every Chinaman in China by about thirty cents. Don't misunderstand me. If at any time a man leaving $40,000,000 selects me as one of four hundred to receive $100,000, I shall lose no time in accepting. I approve this idea of dividing up—but only if I am one of the dividees.

'My early-life antagonism against the rich began to disappear when I found that the real head of the firm, the individual who has the money, was head and shoulders above the foreman in character. I found that the narrowest of men were working men like myself. I have many times been more severely dealt with by a foreman than I would have been by the head of the company. As a simple workingman I resent these articles that keep iffing and butting about riches as between the rich and the poor. Which would be better: to keep this $40,000,000 intact in an industry where it is supplying jobs at fair pay to many people, and where it is making a good product at a reasonable price; or wrecking the industry to split it among four hundred individuals, thus probably making them loafers and non-producers for the remainder of their lives? If a noted writer can hold his or her place in the sun through articles speculating with ideas as ridiculous as that of millionaires leaving their wealth in the form of $100,000 fortunes to hundreds of poor families, then I think it is because the readers of this bunk are seldom heard from. I have never had as much as $5,000 at one time in my life, but I've had health and I've always managed to find fairly interesting work, and excepting when I was "off to war," I have always managed to eat fairly substantial food fairly regularly. When the rich start to divide up—with me—I'll be a happy man. Likewise I expect to enjoy a nice, fat, green-cheese sandwich from the moon.'

❦ ❦ ❦

The ***Stenographer*** came in with some correspondence that she had typed in a remarkably short space of time.

'Good work,' we complimented. 'How many words a minute does this represent?'

'I haven't counted, but it must be a long way from the world's record.'

'What is that?'

'Well, I am not sure, but typewriting for a whole hour at the rate of ninety-four words a minute was recently accomplished by Mlle. Piau, a French woman employed by the League of Nations. This means that her fingers tapped the keys at the rate of nearly ten times a second, or more than 35,000 times in the hour.

'Greater speeds have been achieved, but not over such a length of time. Miss Rose Fritz, an American girl, typed ninety-five words correctly in one minute at an exhibition at Olympia in London some years ago, and is said to have worked at the rate of one hundred and seven words a minute for twenty consecutive minutes. In 1907, an employe of an engineering firm in Newcastle, England, broke all records for long-time typing by writing 30,096 words from dictation in seven hours. This was equal to half the length of an ordinary novel.'

'How does this compare with penmanship?'

'A really rapid penman can write thirty words a minute, or one every two seconds. To do this his pen must travel through a space of not less than sixteen and a half feet. At this rate, if he writes for five hours, his pen point will have traveled about one-third of a mile.'

❦ ❦ ❦

'The right of free speech is demanded by every individual, particularly when he desires to denounce his pet aversion,' declared the ***Brother of a Former Cabinet Member.*** 'Free speech, a free press and the privilege of peaceable assemblage for lawful purposes are our inalienable rights. The man who attempts to suppress or repress these violates the Constitution and marks himself as an anarchist in the making. There is no legitimate reason why people should not discuss *any* question which affects the public welfare. We claim that this is a free land where the broadest possible liberty exists and where the exchange of ideas is uncensored. I sometimes wonder whether our boast is justified.

'Free speech in the British Empire is not only permitted but is protected. It is the custom in England for anyone who thinks he has an idea or a grievance to mount a soap-box and speak to just as many people as he can get to listen. He can say what he wants, no matter whom he abuses or criticizes. It is a common sight in Hyde Park to see the police protect the speaker and arrest anyone who interrupts or attempts to interfere with him. *The English practice what we preach.*

'In New York City free speech and freedom of assemblage are permitted—*provided* the utterances of the speaker and the purposes of the assemblage are approved by the powers that be. All must be careful of what they say.'

*Silas: What do you say? Mistress Luce: I say yes!*

# The Strange Transient Woman

## *A One-Act Play by Katherine Metcalf Roof*

*CHARACTERS*

*Mistress Luce Pettingal,* the woman
*Master Silas Needham,* the constable
*The Judge*
*The Parson*
*The Tithing Man*

TIME: About 1670.

PLACE: One of the early settlements in Massachusetts.

SETTING: A low raftered room in a small house of the period. A door center back; on either side two small windows with small panes. A large fireplace right, with pewter plates set upright on the mantle shelf. A log is burning on iron andirons. The bare floor is sanded. In the center of the room a plain table of the trestle type, upon which is set a large pewter plate filled with red apples, and a large Bible. There are several of the stools in use as chairs at that period, and one straight-backed-slat chair, placed back to the wall, left. At the right window, back, Mistress Luce sits spinning. She is seen to be a young girl whose golden hair, unconfined by the Puritan hood, falls in ringlets at the ears and is coiled at the back of her head. Her simple, full-skirted gown is of a clear lavendar blue. Her apron and the kerchief crossed on her breast are snowy white. As she raises her head and looks out she sees something on the street that catches and holds her attention painfully. She rises, clasps her hands, and stands awaiting the knock which makes her start when it comes, and although she has been awaiting it, she smooths her hair and gown and moves softly to the door, yet stands there irresolute without opening it.

*This play not only presents an interesting picture of life in the early days of the Puritans, based on a true incident, but will be a notable addition to the repertory of those groups which produce short plays. Requests for permission to produce 'The Strange Transient Woman' should be addressed to the author, in care of this magazine. No royalty is charged.*

*Katherine Metcalf Roof is historian of the Colonial Dames of America. She had direct ancestors who were officers in the Colonial Army and who occupied high governmental positions three hundred years ago. A number of her one-act plays have been successfully produced, and two of her longer plays have been accepted for production during the next season in New York.*

(*The knock comes again, louder this time.*)

MISTRESS LUCE: (*In a trembling voice, her hand at her throat*) Who is there?

VOICE: An officer of the law, mistress.

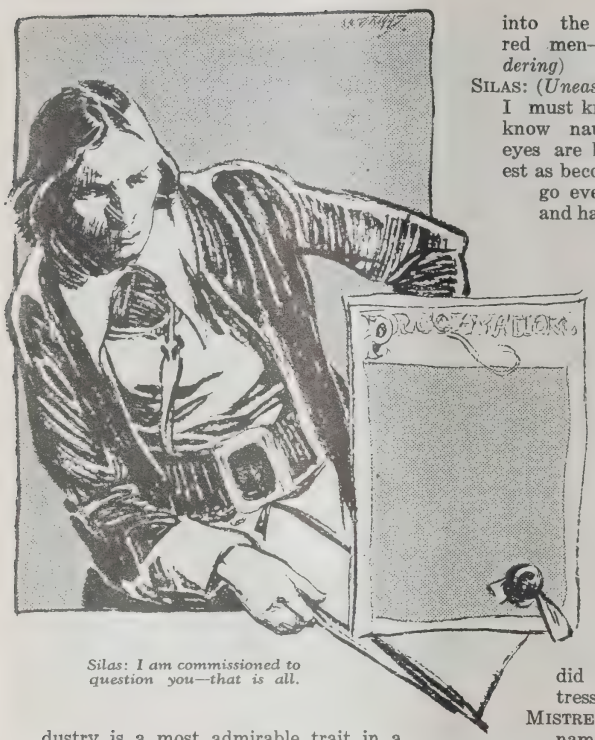
MISTRESS LUCE: (*Terrified, with clasped hands*) Oh, what shall I do!

VOICE: Open the door. (*As Luce still hesitates*) If you do not —*I* must!

MISTRESS LUCE: (*Frightened*) No—wait, I will open. (*Again Luce hesitates, wringing her hands, then draws the bolt, admitting the constable, Silas Needham, a tall vigorous man ruddy-cheeked, a true pioneer. He doffs his wide-brimmed hat as he enters.*)

SILAS: (*Consulting a paper in his hand*) Mistress Luce Pettingal?

MISTRESS LUCE: (*A frightened hand going to her face*) Oh—it is the constable!



SILAS: (*In a strong, comfortable voice*) Of a certainty the constable. And you—I would hear you say it—are the Mistress Luce Pettingal?

MISTRESS LUCE: (*In a small frightened voice*) Yes, that is my name.

SILAS: Do you not bid me have a seat, mistress? I've some'at to say to you.

MISTRESS LUCE: Your pardon. Pray be seated, sir. (*She indicates the chair with a back.*
*Silas sits. Luce remains standing looking at him.*)

SILAS: Do you not sit also? (*She slowly resumes her seat beside the wheel*) I would not interrupt your stint. In-

*Silas: I am commissioned to question you—that is all.*

dustry is a most admirable trait in a woman.

MISTRESS LUCE: (*Agitated*) Oh, sir, you have so frightened me. I fear I should break the thread.

SILAS: (*In an alarming voice, bending a suspicious frown upon her*) And what cause have you to fear a call from an officer of the law?

MISTRESS LUCE: And who would not! (*Pointing with a trembling finger at the paper in his hand, scarcely able to command her words*) What is it?

SILAS: (*In a gruff voice, not looking at her*) 'Tis no great cause for fright. I am commissioned to question you, that is all.

MISTRESS LUCE: To question *me!*

SILAS: (*Pompously*) The town council, the freemen and the parson have ordered it.

MISTRESS LUCE: Oh sir—why? Do I not go each Sabboth to meeting? Have I done aught that is ill or unseemly that the freeman should send you to cast me in prison or set me in the stocks?

SILAS: Softly, softly, mistress. It is not so bad as all that. (*Tapping the paper in his hand*) I am advised herein to visit a strange transient woman recently come to our neighborhood, calling herself Mistress Luce Pettingal, and warn her that she cannot remain with us lest she become a public charge.

MISTRESS LUCE: (*Her hands flying to her face*) Then I must move on again?

SILAS: (*Catching the word*) 'Again' is it! I like not the sound of it.

MISTRESS LUCE: (*Her eyes traveling about the room*) And I was so happy here. The brook makes a little song all the night so I am not so lonely. And the day I came a little black kitten entered with me when I opened the door, and sat upon the hearth. They say it is luck to have a black cat come to you.

SILAS: So it be not a *witch's* cat—

MISTRESS LUCE: (*Not hearing*) And now—I must leave it all—fare farther into the wilderness where the red men—(*She breaks off shuddering*)

SILAS: (*Uneasily*) Mayhap not. But I must know more of you. We know naught save that your eyes are blue, your carriage modest as becomes a woman, that you go every Sabboth to meeting, and have not yet asked the town for aid. But that is not enough. The colony hath little liking for solitary women.

MISTRESS LUCE: (*Passionately, throwing out her hands in a pretty helpless gesture*) Oh, good sir, I ask you—is any woman of her own will solitary?

SILAS: (*Avoiding her eyes*) Ah, hem,—mayhap not. But for all that I—ah—am here to *ask* questions, not to answer them. (*Consults his paper*) You did give your name as Mistress Luce Pettingal.

MISTRESS LUCE: That is my name.

SILAS: (*Frowning*) Luce. 'Tis a strange handle for a woman.

MISTRESS LUCE: (*Eagerly*) 'Twas a little childish name my parents gave me. I was christened Lucinda.

SILAS: (*Relieved*) Lucinda. That is more like. (*Leaning forward*) Your parents, say you. Then you have a father and a mother, sisters and brothers perhaps.

MISTRESS LUCE: (*Her eyes down*) I *had* father, mother, two sisters, a little brother.

SILAS: *Had,* eh. Well then, if you *had* parents where are they, what have you done with them?

MISTRESS LUCE: Gramercy, Sir! Have we not all had parents? Have you ever heard of one born without them?

SILAS: (*Roaring a little*) Highty tighty, you've a smart tongue in your head. Is that the way to answer an officer of the law empowered to arrest you? Now tell me this. If you had once a family what have you done with it? (*Mistress Luce puts her hands to her face. It is a moment before she drops them.*)

MISTRESS LUCE: All are dead, sir; killed by the red men.

SILAS: (*More gently*) *All* of them?

MISTRESS LUCE: (*In a low voice*) All. (*A silence in which the good Puritan's pity gives place to suspicion.*)

SILAS: No news of recent massacre has come to us. When was it the red men killed them? (*At the dreadful remembrance his words bring up Mistress Luce closes her eyes and shudders, but after a moment she speaks.*)

MISTRESS LUCE: It was some months ago, sir. In early summer. The apple trees were but just in bloom. The air was sweet with them. (*She breaks off, shuddering*)

SILAS: Early summer. Then you did not flee *here* from the Indians?

MISTRESS LUCE: (*With a little gasp*) No, sir. Since you force me to tell it—I fled from—a man of God.

SILAS: (*Rising*) Merciful heaven, the woman is a witch!

MISTRESS LUCE: (*Rising also in terror*) No, no, sir! no! You must listen to me. It was that he wished to marry me.

SILAS: (*Frowning, still suspicious*) Then he did you great honor, mistress. I like not the sound of your tale.

MISTRESS LUCE: (*Her blue eyes fixed*) Honor perhaps, sir, but he is old and I am young. Oh, he has had so many wives! They lie there in the churchyard. And many children—the oldest twice my years. Oh, sir, for a man I love I could work these hands away. But for an old man and fat—what if he be a man of God—I cannot wed him.

SILAS: Silence, mistress, silence! Do you name the avenging God thus lightly? (*Bending a frowning gaze upon his paper*) Your deposition saith that you are Mistress Luce Pettingal, spinster, without kith or kin, born in this colony.

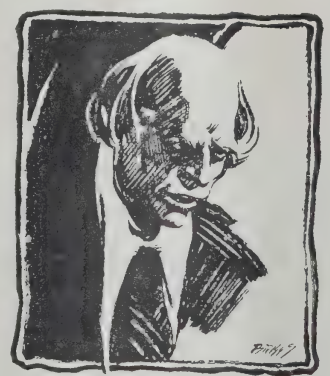
MISTRESS LUCE: (*Nodding her head*) All true.

SILAS: So far as it goes. Beyond this we know only that you come hither in a red man's canoe carrying a small packet in your hand—

MISTRESS LUCE: (*A pathetic note in her voice*) 'Twas all that I possessed.

SILAS: (*Resisting pathos*) Did you count to find kith or kin here among us? (*She shakes her head*) Nor friends who knew you and yours? (*She shakes her head more slowly this time*) Then why came you hither, mistress? Why did you choose our township?

MISTRESS LUCE: (*Slowly*) Because I thought it looked like home.



SILAS: (*Staring*) But you had never seen the town before.

MISTRESS LUCE: True, sir. Methinks it was something about the way the town lies soft-curled in the strong arm of the river—

SILAS: (*Hastily glancing away*) Upon my word, a womanish fancy!

MISTRESS LUCE: And the smoke rose so gently from the broad chimneys. There was a smell of warm bread on the air, a shepherd's dog wagged his tail at me, and I said to the red man, 'Draw your boat to the shore. I will rest here.'

SILAS: 'Pon my word! Because a dog doth wag his tail at you and smoke

*The Parson.*

curls from a chimney top—a most common sight—and you smell the housewife's bread in the oven, you come to dwell in a town of strangers! Good mistress, I've compassion on ye You are young and—and—e r—a—comely—to live thus alone. But of a truth there is something awry with this tale of yours.

*The Judge.*

MISTRESS LUCE: It is the truth, good sir. I take my oath upon the Holy Book.

SILAS: It doth not satisfy me why one so young and of the female sex comes to bide alone here without kith or kin.

MISTRESS LUCE: (*Sadly*) I have told you I have neither kith nor kin.

SILAS: (*With growing suspicion*) If the red men slew all your family, how comes it that you escaped?

MISTRESS LUCE: I was not at home that day. I had gone into Charleston to buy shoes.

SILAS: Were there no shoes nearer home?

MISTRESS LUCE: None to fit. (*Innocently, thrusting out her foot*) My foot is small.

SILAS: (*Looking hastily away after a brief glance at the foot*) Um, ah, I note it. (*With an effort resuming his threatening frown*) And was the settlement all burned? (*She shakes her head, overcome*)

Then surely, Mistress, though you had no flesh and blood you had friends. Why should one so young choose to seek out strangers?

MISTRESS LUCE: (*Overcome*) Oh, sir, do not ask me to tell you what I found when I came back that night to what had been my home—I could not stay after it, our home, our dear happy home, had became a slaughter house. I was half mad. As I sat by the roadside, not knowing where to turn or what to do, a red man came softly out of the wood. I screamed, tried to run, but he spoke to me kindly. Then I saw that it was the young chief, Popohanock, whose cuts I had bound with oil once when he came wounded to the door. He told me that there would be more killings, but that he would take me in his canoe to safety, so I went with him.

SILAS: You went—where?

MISTRESS LUCE: To the nearest settlement where we had friends. I stayed there three months. Then the good man asked me to wed him—and I could not.

SILAS: And then?

MISTRESS LUCE: And then, as it chanced, Popohanock came again in his canoe to sell skins, and I asked him to take me away in the twilight when no one might know where I went.

SILAS: Beseems you hold uncommon trust in red men—the murderers of your flesh and blood.

MISTRESS LUCE: Good sir, surely you understand, as do we all, that there are red men we can trust, and red men that are savages. Seldom do they forget a kindness, and, of a truth, there is their side to the quarrel. I say it, though they have taken all from me. They were here before we came.

SILAS: Why have you not told this tale before?

MISTRESS LUCE: (*With an effort*) Sir, I could not speak of it.

SILAS: (*Clearing his throat*) It irks me to ask so hard a question, but 'tis my commission, mistress—have you wherewithal to keep yourself?

MISTRESS LUCE: Not for long. I must tell the truth. But I am young and strong. I can spin, bake and make garments. (*Anxiously*) Surely I can find work amongst you.

SILAS: The colony doth not look with favor upon unmarried women—or men, either, for that matter. (*A silence*) You are a fine, pretty lass. Hath no young man to your liking asked your hand in marriage?

MISTRESS LUCE: There was one. (*After a brief hesitation*) Young—but not to my liking.

SILAS: (*Indignant on behalf of his sex*) Indeed! I fear you are somewhat over choice! What ailed him? Did he squint or stoop? Had he the misfortune to lose some teeth? Was he of a quarrelsome disposition? Was he miserly or a fool in his cups? (*As Luce shakes her head at each item*) What then?

MISTRESS LUCE: How can one say why a man doth not find favor in a woman's eyes. I liked him not. Is not that enough?

Silas: Hi yi, a pert retort for a maiden in your circumstance. (*Turning his paper in sore perplexity*) Now what report am I to make on this! I would some other had the task!

MISTRESS LUCE: (*Eagerly*) What I have told you, good master. Then belike they will let me stay and earn my way.

SILAS: (*Severely*) I fear you are not of the right comportment for a serving maid. There is little of a God-fearing look about you. (*Appreciating her dainty gown, her uncovered golden hair*) I note you take scant apprehension of the new laws concerning raiment, and fear not to flaunt yourself in bright-colored apparel like a proud daughter of Babylon.

MISTRESS LUCE: (*Timidly, fingering the blue stuff of her garment*) I do not well see, sir, how it is that men do make laws against the works of God.

SILAS: (*Horrified*) What blasphemy do you speak!

MISTRESS LUCE: No blasphemy. Is not the sky blue, like my gown?

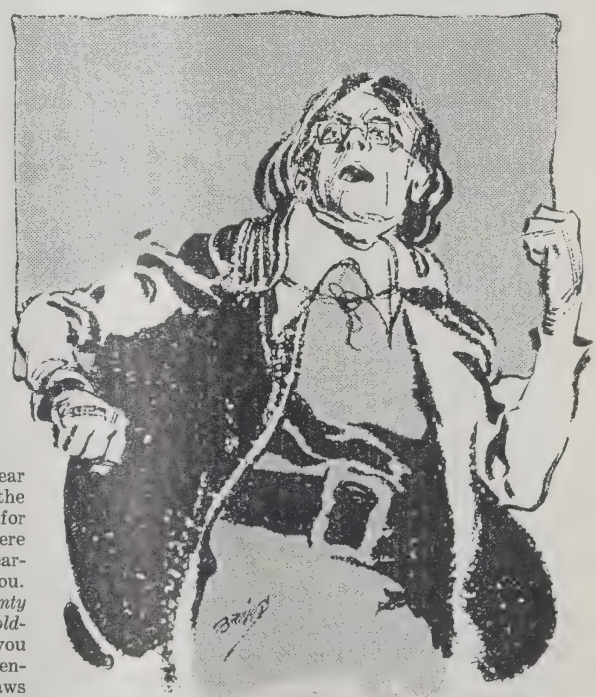
SILAS: (*Inadvertently staring at her*) Ay, and your eyes—

MISTRESS LUCE: Hath he not made the flowers of all hues? Hath he not clad the birds in the trees, and the flowers of the field, in all the bright colors of the rainbow?

SILAS: On my word I believe you are a Churchwoman! These are Papish sentiments. Once let the judge or the governor hear them and you'll find yourself on a ship set sail for England!

MISTRESS LUCE: (*Casting down her eyes*) Indeed, sir. I am a good Puritan and sleep not through the longest sermon.

SILAS: Which brings to my mind that the parson here hath late lost a wife.



MISTRESS LUCE: (*Wofully*) Are there no *women* in the colony to claim my services?

SILAS: (*Uneasily*) Belike—if they do not find your eyes too blue, your cheek too soft and (*His eyes passing downward*) the foot too small.

MISTRESS LUCE: (*On the verge of tears*) Do not you mock me!

SILAS: I do not mock. I am, indeed, deep concerned at your plight, for I fear it is past helping. I am come, mistress—only I had not the courage to say it before—to bid you move on before—ah—the next twelvemonth. The town is poor and can ill afford to take on other burdens.

MISTRESS LUCE: (*Brightening*) The next twelvemonth. Oh, but that is three months! This is September.

*Tithing Man: He had her in his arms!*

SILAS: (*His eyes on his paper*) Said I twelvemonth? I misread myself. It reads—'Before the next moon.'

MISTRESS LUCE: The next moon! Why—why—that is but three days! (*Her lips begin to quiver, tears gather in her blue eyes.*) I had not believed your councilors so cruel! Freemen, they call themselves. And is there no freedom for women also? Must not a woman *live*, though she be alone? Have your good men such poor humanity that they would whip me from their town?

SILAS: (*Uneasily, troubled*) Softly, mistress, 'tis not inhumanity. The colony hath all too little for its maintenance. And there be those who recall the early years, close to starvation.

MISTRESS LUCE: (*Piteously*) The settlement needs hands to work—here are mine. (*She holds out a pair of delicate hands which for a time seem mightily to engross Master Silas Needham's attention. He looks up from them, meets her eyes, and his return hastily to his paper. For a moment he looks down at it in silence. Finally he rises.*)

SILAS: Well, mistress—I'll give you time to think upon it. I have an errand up the road. In an hour I'll return to take your word to the council.

MISTRESS LUCE: (*Despairingly*) What word to take, sir? I am driven out like a dog that no one wants. What further word is there for me to give you?

SILAS: (*Glances at her—looks away*) I'm sorry, mistress.

MISTRESS LUCE: Oh, is there no way out? Think, sir, if your daughter—

SILAS: Daughter! I have no daughter. (*Offended*) Think you I am as old as your fat parson? I'll warrant I'm scarce ten years your elder. I was married young—, and my good wife hath been dead three months, come Thanksgiving.

MISTRESS LUCE: Oh, your wife is dead. (*Drops her lashes, looks up at him, softly*) Then, sir, if you too have lost one you love, have you no heart to pity me?

SILAS: (*Desperately*) I can pity you, lass, but bless my soul if I know what is to be done about it.

MISTRESS LUCE: (*Casting her eyes about, discovers the apples on the table*) You can sit down and advise me, sir. Be not in such haste to move on. Sit here at the table and—and eat an apple.

SILAS: An apple eh! I mind me 'twas with an apple that another woman, one mistress Eve, tempted a weak man into trouble.

MISTRESS LUCE: But you are not a weak man. And an apple surely, is a most common refreshment. I would I had better, (*Moving toward the table*) but they are of a fair kind, known as sweetings.

SILAS: (*Glancing at her*) Sweetings, eh. (*Seats himself*) A fine name for a winsome lass but a somewhat foolish name for an apple.

(*Luce seats herself opposite him.*)

SILAS: Now I swear, you sit down in my wife's place!

MISTRESS LUCE: (*Blushing goes to move her chair*) I thought not to wound you, sir.

SILAS: (*Putting out a restraining hand*) You do not. Mehitable is gone to her judgment, God rest her soul; but she was of a stern disposition. Do not move, mistress. I do not dislike to see you there. I'll swear this apple was well named. (*Luce casts down her eyes to cover her confusion; she reaches out for an apple*)

SILAS: (*Observing her hand*) Hm, a fine lady's hand. I'll take my oath it's not done that work you prate of.

MISTRESS LUCE: Indeed, sir, I am a fine expert with my needle and the spinning wheel and a most superior cook as well. My mother ever spared me the rougher tasks because, as a child, I was not strong, and she feared to lose me.

SILAS: You've outgrown it, I'll swear. Roses bloom in those cheeks today.

MISTRESS LUCE: You are most kind, sir. (*With a touch of coquetry, from under dropped lashes*) Have you now told me the worst that doth await me?

SILAS: (*Pausing in his consumption of the apple*) I have told all except—save—but—

MISTRESS LUCE: (*Frightened again*) Ah, I knew there was a 'but' somewhere!

SILAS: A trifle. It is only that the parson, the judge, and the tithing man come here presently to learn if my command hath been delivered.

MISTRESS LUCE: (*Starting up in terror*) A—a *parson*? (*Silas nods*) He who hath lost his wife?

SILAS: There is but one.

(*Luce sinks back into her chair and lets her face fall upon her arms on the table.*)

MISTRESS LUCE: A parson, a constable, a judge and tithing man! What is one lone maid to do against them?

SILAS: (*Bringing his fist down on the table*) I swear you are not alone. *I* am with you!

MISTRESS LUCE: (*Faintly*) I thank you, sir—but what can you do against them?

SILAS: I can—I can—

(*A thundering knock at the door.*)

(*Luce gives a wild cry and starts up again.*)

SILAS: (*Bringing it out in a strong voice*) By God, mistress, I can *marry* you.

MISTRESS LUCE: (*Turning stares at him. Slowly*) Marry me . . .

(*A thundering knock. A voice without*) Open in the name of the law.

SILAS: (*Rises, his eyes upon Luce*) What do you say? (*Another knock*)

MISTRESS LUCE: (*Suddenly flinging herself upon him*) I say *yes!*

(*The door is thrust open. The parson, the judge and the tithing man, all clad in black, enter and stand in a row like ravens behind them. Silas and Luce move apart.*)

JUDGE: (*In a terrible voice*) Brother Needham, what doth this mean?

PARSON: You were sent here to order this strange transient woman from the town. Instead we find you—(*Examining table*) eating apples with her—like your forefather, Adam.

TITHING MAN: (*In a shrill voice*) Eating *apples!* He had her in his arms!

JUDGE: Have you notified her that she must go before the next moon?

TITHING MAN: Under penalty of the whipping post?

SILAS: (*To the tithing man*) Hold your tongue.

(*To the judge*) Before the next moon (*His glance passing on to include the parson*) this sweet lone transient woman will be my wife.

ALL: (*In irregular rhythm*) Your *wife!*

SILAS: The bans shall be published tonight.

JUDGE: (*Frowning sternly upon Luce*) How long have you known Silas Needham?

LUCE: (*With modestly downcast eyes*) Some'at less than an hour, your honor.

JUDGE: How then can you know that you will find him to your liking?

LUCE: (*Suddenly lifting eyes which are flashing*) La, sir, I knew that the moment I laid eyes on him!

(*Gives both hands to Silas who takes all of her as the curtain falls. While the parson, the judge and the tithing man stand with uplifted hands of consternation behind them.*)

*CURTAIN.*

# Exploring Where Paul Preached

(*Concluded from page 13*)

Spread below, as we reached the summit of the pass, lay Yalovadj and the ruins of Antioch. Across the valley a succession of hills seemed like ocean waves, while the mountains that bound the valley, from thirty to sixty miles away, piled up in lofty majesty to a height of ten thousand feet.

The 'hotel' of the town was leased for the expedition. The ground floor was occupied by the one club of Yalovadj, which vacated when we threatened to move unless the club members ceased their regular evening riots! A large room served as kitchen, dining room, library, photographic dark room, and sitting room.

Less than ten per cent of the people could read or write; not more than ten newspapers arrived regularly to supply the whole town, while scarcely a handful of mail was delivered in a week. We encountered one uncommon individual—a Turk who had educated himself at an American university, was an expert linotype operator, and kept a set of the *Harvard Classics* on his table!

The homes of these people are built of mud-brick, facing on narrow streets through which an automobile could barely pass, shaded by fruit trees in abundance. Small streams from springs along the base of the mountains flow down the middle of the streets, serving as drinking water supply and sewage disposal system in one!

To our dismay, we found that the natives have incorporated in their residences some fragment of a frieze or ornament from Antioch's ruins, situated about half a mile from the modern community. Public cemeteries and monuments had also been built at the expense of the ancient city's beauty.

As for public safety, we found Yalovadj and the district around it safer far than our home cities, due to the admirable mounted police. During our stay, they were absent two weeks seeking bandits, all of whom they captured for sentence. Even so, the captain always insisted upon dispatching a guard with us on the trip to Ak Shehir.

This, then, was to be our home during the hot summer months while we were searching among Antioch's wonders. Whether our hopes were to be fulfilled we could not then foretell. With all the necessary equipment now on the location, actual digging only could prove whether enough of the destroyed city remained underground to reward our efforts

(*This is the first of two articles by Mr. Kelsey. The next will appear in an early issue*).

# I Read in the Papers

### War Said to Have Only One Substitute

As far back as 1871 the late Sir John Seeley wrote: 'There has been found hitherto but one substitute for war. It has succeeded over and over again. It succeeds regularly in the long run whenever it is introduced. This is to take the disputed question out of the hands of the disputants and refer it to a third party whose intelligence, impartiality and diligence have been secured, *and to impose his will with overwhelming force.*' It is suggested that we have now simplified the problem of disarmament to a calculation of the 'overwhelming force' which is necessary to secure the reign of law. Looked at from this angle, disarmament is not merely a question of a reduction in numbers, the lopping off here and there of certain units of military and naval establishments. Attempts to achieve results on this basis have been continuously in progress during the past half-century. During this period more than twenty Peace Congresses have been held at which schemes for disarmament have been discussed. All these Congresses insisted on a reduction in military and naval expenditure; they all preached the doctrine of self-defense; they all passed pious resolutions condemning war. They have all ended in disastrous failure, because this was a negative rather than a positive policy, and because it does not follow along the lines of natural development. It has been found and is still being found almost impossible to formulate a standard by which this lopping-off process can be effected. Common agreement has been sought in vain.—David Davies in *The Contemporary Review.*

ɤ ɤ ɤ

### Boyne Day Quiet in Ulster

An Irish correspondent writes: No untoward incident marked the Boyne celebrations this week. Sir James Craig found an excuse for not attending, but one or two of his Ministers put in an appearance; and it is only fair to say that the extremists who controlled the various demonstrations had the grace to refrain from exultant war-whoops over the Border victory. Belfast Orangemen had the strange experience of hearing tributes from their leaders to the moderation and good sense of Free State Ministers, and the principal resolution submitted to the gathering urged the promotion of good will among all sections of the community. Southern Orangemen at a great muster on their own side of the border protested their loyalty to the Free State Government, and declared that instead of suffering disabilities under the new régime, they enjoyed the same freedom as under British rule. While it would be easy to exaggerate the political significance of these things, they do show the growth of a better temper on all sides.—*The New Statesman.*

ɤ ɤ ɤ

### The Mystery of the 'Marie Celeste'

More than half a century ago the *Marie Celeste,* an American brig, sailed from New York to become one of the mysteries of the sea. A few weeks after her departure, to be exact, the seventh of December, 1872, the ship was sighted in the Atlantic off the coast of Spain. An English vessel, the *Dei Gratia,* came alongside but could see no sign of life. The *Marie Celeste* was boarded; but the mystery only deepened. There was no trace of the crew. All the boats were in place. A cat was asleep on a locker and part of a meal was still warm in the cabin. But the ship was devoid of humans. It was taken to Gibraltar and the story sped around the world. Various theories and conjectures were offered, but for more than fifty years the mystery remained unsolved.

Now comes John Pemberton, naval pensioner of the Civil War, with an answer to the riddle. Pemberton, who is seventy-seven and resides in England, declares he was cook on the *Marie Celeste.* From the very beginning, he says, the fateful trip was ill-starred. The brig loaded oil at New York, but as there was more than she could take, her company chartered the *Dei Gratia* to carry the surplus. Captain Briggs of the *Marie Celeste* also borrowed three sailors from the companion ship to complete his crew. Trouble started when the ship was only three days out. During a heavy storm a piano broke loose and killed Captain Briggs' wife. The skipper, mad with grief, leaped overboard. Later the mate had a fight with a member of the crew and threw him into the sea. Possibly fearing punishment, the mate deserted the ship while it was near Santa Marta in the Azores, taking with him the boatswain and another man.

Thus Pemberton and the three borrowed seamen were the only ones left on the brig. They headed for Gibraltar as best they could, and while off the coast of Spain they met the *Dei Gratia.* With three of the men members of the *Dei Gratia's* own crew, it was comparatively easy to keep the secret. And why did the skipper of the latter vessel report the *Marie Celeste* a derelict? Well, under maritime law she was far more valuable to him as 'salvage' than any other way.

Pemberton's story may not be the true one, but it at least adds an interesting chapter to one of the baffling tales of the sea.

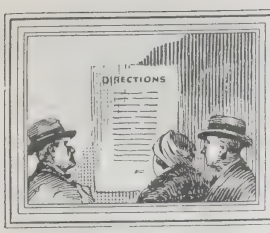
### Psychology of the Modern Girl



A large proportion of modern girls are trained so exclusively with a view to celibate careers that they acquire a type of mentality fatally unfitting them for home life. The matter is often looked upon as if it were merely an affair of practical domestic knowledge. People say: 'Oh, a clever girl will soon learn all that is needful in the way of housework, cooking and so on.' But the root of the trouble lies far deeper than this. It is the entire psychology of the modern girl that unfits her for married life. A passionate love of personal freedom, however valuable it may be in other directions, is one of the worst possible qualities with which to enter upon a state which demands much self-discipline. And the easy-going *camaraderie* now customary between the sexes is a thing so wholly of the surface that it is no preparation whatever for a relationship which touches the deepest instincts of the race. It is probably no accident that America, where this superficial familiarity has gone furthest, is also *par excellence* the land of quick divorce!—Meyrick Booth in *The Nineteenth Century and After.*

ɤ ɤ ɤ

### Some Thoughts on Braham's 'The Messiah'

Like many another remarkable man—Napoleon, Erasmus, Edmund Kean, and that master of hysterical laughter and most tragical tears, the 'great little Robson'—Braham was very short. For a number of years, Braham lived at what is now 38 Baker Street, Portman Square, and died at Brompton on February 17, 1856. He lies buried in Kensal Green Cemetery, under the wall to the right of the main entrance.

I sometimes dream of the cast for the *Messiah* as it will be performed on the Day of Judgment. I think the ethereal voice of Jenny Lind will be heard in the soprano solos and the full-throated, emotional, and dramatic tones of Malibran in the contralto. Sir Charles Santley will sing, with noble, silvery resonance and wondrous technique, 'Thus saith the Lord' and 'Why do the nations,' whilst Braham's voice will resound through the dome of heaven in all its marvelous sensibility and triumphant glory.—J. Mewburn Levien in *The Nineteenth Century and After.*

# Can You Tell Me?

QUESTION: Who is responsible for the enforcement of the Anti-Trust Laws?

ANSWER: The Department of Justice is responsible for the Sherman Act which forbids contracts, combinations and conspiracies in restraint of trade. The Department of Justice and the Federal Trade Commission have the enforcement of the Clayton Act, forbidding combinations and contracts in restraint of trade. The Federal Trade Commission has jurisdiction over all unfair methods of competition in interstate commerce.

QUESTION: Does the United States Government have a Federal blue sky law? What can the Government do to those falsely representing or advertising stocks for sale?

ANSWER: There is no Federal blue sky law. If falsely advertising through the mails, the Post Office Department can issue a fraud order and can prosecute for illegal use of the mails. The Federal Trade Commission probably has power to stop any fraudulent interstate stock-selling scheme on grounds of unfair methods of competition in selling of fake stock, thus impairing the market for the sale of good stock.

QUESTION: Is there any place under the United States flag where rubber can be grown?

ANSWER: Yes. The growth of rubber has met with some measure of success in certain of the Philippine Islands.

QUESTION: Does Congress issue a daily paper? Do the administrative departments issue a daily bulletin or paper?

ANSWER: Neither Congress nor the departments have a daily bulletin or paper. Congress prints a daily record of its proceedings known as *The Congressional Record.*

QUESTION: Has the Federal Government made any study of the possible savings in wastage by logging with tractors?

ANSWER: The Department of Agriculture has made a study of the recent logging activities in California, where the tractor has been introduced, particularly with reference to damage to young trees and seedlings. It was learned that tractor logging is considerably more destructive than horse logging due to the wider roads required and the heavier equipment used, but that it is much less destructive than the heavy logging machinery commonly used in California during recent years.

QUESTION: How do our domestic exports from Canada, and our imports, for the past fiscal year compare with the preceding year?

ANSWER: Total domestic exports from Canada during the past fiscal year amounted to $1,315,192,792 as compared with $1,069,067,353 during the preceding year while imports totaled $927,402,732 and $796,932,537 during the respective periods.

QUESTION: How many bankruptcies were there during the fiscal year 1925? During 1926?

ANSWER: Figures are not yet available for the fiscal year closing June 30, 1926, but for 1925, the cases pending at the close of the previous fiscal year were 58,758; cases filed during the fiscal year were 45,641; cases concluded during the fiscal year were 44,440; cases pending at close of fiscal year were 59,959; petitions dismissed, 1,327; compositions confirmed, 876. The nature of the business of the bankrupts in the cases concluded during the year were as follows: farmers, 7,874; wage earners, 14,478; merchants, 11,515; manufacturers, 1,557; professional, 765; other classes, 8,251.

QUESTION: Does Philippine mahogany belong to the mahogany botanical family?

ANSWER: According to recent testimony of scientists before a Government commission, 'The only wood entitled to be called mahogany . . . is the product of the *genus swietenia* which grows in the West Indies Islands, Southern Florida, Southern Mexico, Central America, Columbia, Venezuela, and Peru.' Some scientists further restrict the species. '"Philippine Mahogany," so-called, is not mahogany.' It is the product 'of not only different genera but of different tree families.'

*In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.*

QUESTION: Does Japan maintain a system of military training in schools and colleges?

ANSWER: Yes. Under their 'Universal Military Training Act' compulsory military training is effective in all of their public schools above the sixth grade. It is estimated that about 500,000 Japanese youths are now under military training in schools, colleges and universities. More than 1,100 active army officers, in addition to reserve officers, are engaged in this work.

QUESTION: Who constitute the Federal Narcotics Control Board?

ANSWER: The Secretary of State, the Secretary of the Treasury, and the Secretary of Commerce. L. G. Nutt, 834 Rittenhouse Street, Washington, D. C., is secretary of the board.

QUESTION: Will you please quote the inscription that is in gold letters on a marble tablet on the landing of the white stairway in the American Red Cross Building in Washington, D. C.?

ANSWER:

'A MEMORIAL
Built by the Government of the United States and Patriotic Citizens
TO THE WOMEN OF THE NORTH AND THE WOMEN OF THE SOUTH
Held in Loving Memory
By a now United Country
That their labors to mitigate the sufferings of the sick and wounded in war may be qerqetuated this memorial is dedicated to the service of The American Red Cross.'

QUESTION: What was the cost of the State, War and Navy Building in Washington?

ANSWER: Approximately $11,000,000.

QUESTION: Is there a statue of Daniel Webster in Washington?

ANSWER: Yes, it is just west of Scott Circle, Sixteenth Street and Massachusetts Avenue, N. W.

QUESTION: Is it an Indian or the Statue of Liberty that tops the Dome of the Capitol in Washington?

ANSWER: It is the Statue of Freedom. The original plaster model may be found in the Smithsonian Institution. The statue is called 'The Armed Liberty.'

QUESTION: What is a 'capital ship'?

ANSWER: A capital ship is a naval ship of the battle line, namely, a battleship or a battle cruiser. The Washington naval limitation treaty defines capital ships of the future as men-of-war, other than aircraft carriers, whose displacement exceeds 10,000 tons, or which carry guns of a caliber exceeding eight inches. Capital ships are limited by the treaty to 35,000 tons displacement and to guns of a caliber not exceeding 16 inches.

QUESTION: Does the Government own the building occupied by the Department of Justice?

ANSWER: No, it is a rented building.

QUESTION: Who was the Secretary of the Democratic National Convention that met in New York in 1924?

ANSWER: Charles A. Greathouse was Secretary, and Edward E. Britton was Associate Secretary.

QUESTION: How is a gun's 'caliber' measured?

ANSWER: The caliber of a naval gun is expressed in inches, and is the diameter of the bore of the gun, measured at the muzzle.

# Briefly Told

GREYHOUNDS ARE SUPPOSED to be the oldest breed of dogs in the world. They have been traced back for thousands of years. Their figures are found on Egyptian frescoes, and history relates that they were used for coursing by Xenophon.

NEW YORK CITY WILL SOON receive its milk supply in tank cars, each having a capacity of 6,000 gallons. The cars are lined with glass covered with cork, thus providing almost perfect refrigeration.

A POTTSVILLE, PENNSYLVANIA, coal miner who just died, aged 106 years, ate sauerkraut at least once every day.

'THE SECRET OF REMAINING young in spite of years and even of gray hairs is to cherish enthusiasm in one's self by poetry, by contemplation, by charity—that is, in fewer words, by the maintenance of harmony in the soul.'—Henry Frederic Amiel.

THE NOISE AND clamor of modern city life are producing a race of elephant-eared men and women, according to an eminent Vienna ear specialist.

THE FIRST NEWSPAPER ever published was the Roman *Acta Diruna* (Daily Deeds). It appeared in 691 B. C., but it is not known whether it was of parchment, board or brick. The first daily newspaper was published in Germany, and the first advertisement—offering a reward for two stolen horses—appeared in a London newspaper in the 16th Century.

BERMUDA HAS NO automobiles but it is proposed there that motor buses be placed on rails. It will be called a railway.

IN NEW YORK CITY the visitor sees armored cars with machine guns and armed guards transporting valuables in the financial district. In London he sees five millions of gold consigned to the Bank of England driven on an open dray without a single guard, and only a tarpaulin over it.

TRUCK AND DELIVERY horses owned by the municipality of Berlin have a three-weeks vacation each summer on a 300-acre horse sanitarium in charge of skilled veterinarians. Reports indicate possible envy on the part of human laborers.

KING ALBERT of Belgium rides a motorcycle as an example of economy.

THE WORD NICK, as used in the phrase 'nick of time,' is a modification of 'nock' or 'notch,' the ancient method of keeping tab on time or money by means of a series of notches in a stick.

FOODS ORDINARILY PURE and wholesome such as cheese and sugar will, if confined in an air-tight space, generate gas which becomes dangerous to humans.

PAINTINGS BY THE OLD MASTERS of Europe will be put beneath the X-ray by a Harvard expert who claims by this means to be able to detect copies and fakes.

FIVE THOUSAND Doukhobers in Russia want to go to Alberta, Canada. They have already made overtures with the authorities.

A CANADIAN outdoor rose, the 'Agnes,' won the American Rose Society's Walter Van Fleet gold medal. It was grown by Dr. William Saunders, father of Dr. Charles Saunders, discoverer of Marquis wheat.

THE BEST CATCH in sixteen years by Canadian sealers is attributed to the coöperation of air men who from their machines indicated where the animals congregated in the largest numbers.

ALL TELEPHONE LINES IN Japan are to be placed in underground conduits.

TENNYSON'S HOUSE at Somersby, near London, and two miles of the stream he immortalized in 'The Brook,' are to be sold at auction.

CINCINNATI policemen will carry cameras to preserve evidence of crime and accidents.

A WATER TORTOISE submerged and remained under water for ten consecutive hours in a test undertaken by a Harvard professor.

ULYSSES S. GRANT was originally christened Hiram Ulysses Grant. History's error was caused by confusion on the part of a Congressman who recommended Hiram Ulysses Grant for West Point. His name was mixed with that of his brother, Simpson Grant, and the erroneous name became fixed.

TWENTY-THREE per cent of the area of Norway is forest, of which nineteen per cent is public property.

THE ARABIC language predominates in the Holy Land.

THE WORD 'apron' was originally 'napron,' derived from the word 'napkin' or 'napery.' Some early writer dropped the 'n' and we have 'apron.' The same is true of 'orange' which was originally known by the Spanish name 'naranja,' which became in English 'norange.'

A REGULAR SERVICE of flying physicians and dentists is to cover thousands of square miles of inaccessible country in Australia.

THE DEEPEST workable mine is said to be at Morro Velho, Brazil, where gold and other minerals are found at a depth of a mile and a quarter.

A TRAFFIC COURT on wheels is an innovation in California. The court consists of a truck which takes its station at a convenient place along the highway. Luckless speeders are haled before the judge immediately upon arrest.

THE BANK OF ENGLAND recently issued an order to its clerical force to the effect that mustaches were not to be worn during business hours.

PIGEONS ROOSTING on the minute hand of the town clock in an Indiana town caused the inhabitants to miss their noon-hour meal by forty minutes.

AUXILIARY LUNGS enabling airmen to reach unprecedented heights are said to have been perfected by a French inventor, who claims that they will enable a flyer to rise to 50,000 feet.

A SPECIES OF warlike ants which will not hesitate to attack a man bodily are found on the banks of the Amazon.

THE CONFEDERATE half-dollar is the rarest coin in the world. Only four were minted, of which only two are known to exist.

THE FIRST compulsory voting law in Australia has resulted in an increase from 77.69 per cent to 91.31 per cent.

THREE YOUNG persons were recently fined ten dollars each for carving their initials on the bark of a big sycamore tree in Orange County Park in California.

# NOTES · COMMENTS CRITICISMS

Mr. Ford's Page this week discusses the value of America remaining American.

---

Borah is an enigma to Washington, *because he is an American.* He believes in governing America for Americans. He believes in the Constitution and the Declaration of Independence, not only on speech-making days but in everyday life. (p. 1)

---

*Courage is fear translated into action. Fright is devastating, but it is the most powerful medicine known. It not only scares the life out of you;* it scares the life into you! *Thomas L. Masson took a chapter from his own life in writing this story. It carries a message of hope for every person who has ever felt the panic of real fear. Masson, a well-known author, is associate editor of the 'Saturday Evening Post.'* (p. 16)

Thomas L. Masson.

---

Most political writers cannot understand Borah, for they try to gauge him by the ordinary politician's yardstick and Borah is a politician who will not play politics. Allan L. Benson, well-known editor, author, and political authority, uses a different method. (p. 1)

---

High freight rates—once proved a secret blessing. They resulted in the discovery of America. Randolph G. Adams, in presenting this article, *rewrites* history; for history has long attributed the discovery to fallacious causes. Professor Adams is custodian of the famous William G. Clements Library of American History at the University of Michigan. (p. 8)

---

In a recent issue John Edwin Hoag, interviewing William A. Rowe, snake expert, wrote: 'I asked him about the joint snake—the snake that "goes to pieces when struck—the pieces running in all directions, and later getting together again." I asked him about snakes that are alleged to swallow their young as a means of protection.

'To each of these questions he replied: "There is absolutely no scientific proof to support a single one of the popularly believed snake stories. They are inherited misinformation, pure and simple—great-grandmother tales . . . "'

From Charles W. Prouty, Rockford, Illinois: 'I want you to inform Mr. Rowe that I personally saw a common three- or four-foot black snake open her mouth and let half a dozen three- or four-inch baby snakes crawl down her throat. The mother snake then crawled from the road and disappeared in the grass. This happened in the good old state of Vermont.'

---

From Ed E. Sanders, editor, *Picher District Leader,* Picher, Oklahoma: 'My personal experience disqualifies Mr. Rowe as regards these two varieties of snakes, at least, as I killed three of the joint snakes when a lad, and have seen two of the hoop snakes. These, when I disturbed them, apparently took the end of their tails in their mouths and rapidly rolled away at a pace that would have given a fast horse a good race.

'The joint snakes killed flew to pieces, each about two inches long, when struck with a stick, and kept up an easy wriggling motion, not crawling away, for some time after being struck. I watched two of them until near sunset. When I visited the spot next morning there were no signs of any part of the snakes . . . '

---

From B. W. Farrar, bank cashier, Summerville, Georgia: 'I have no feeling in the matter except to prove to these so-called experts that they don't know everything about snakes. Some day I will catch one with the young inside, and ship it to the curator of reptiles in New York . . . '

SUBSCRIPTION PRICE in the United States and its dependencies, also Canada, Cuba, Mexico and countries where the United States Domestic Postage Rate applies, $1.50 a year; other foreign countries, $2.00 a year. Single copy, five cents.

CHANGE OF ADDRESS. 1. Notify us at least two weeks in advance. 2. State both old and new address. 3. Write clearly.

*May B. Whiting always writes delightfully. This time she describes the village at Cape Porpoise, where the lobster reigns supreme. Miss Whiting, a teacher of French in Boston, holds degrees from Boston University and Tufts College. She has spent many summers among the fisherfolk of New England, and has been markedly successful in transferring them to paper. This story is written in her best vein.* (p. 14)

May B. Whiting.

---

American soldiers in the World War fought under a court-martial system originated in the days of George III of England. Many were subjected to almost unbelievable persecution. Virtually unlimited power was placed in the hands of officers; and *some* proved unfit for the trust. Their actions were a black stain on the nation's war record. (p. 3)

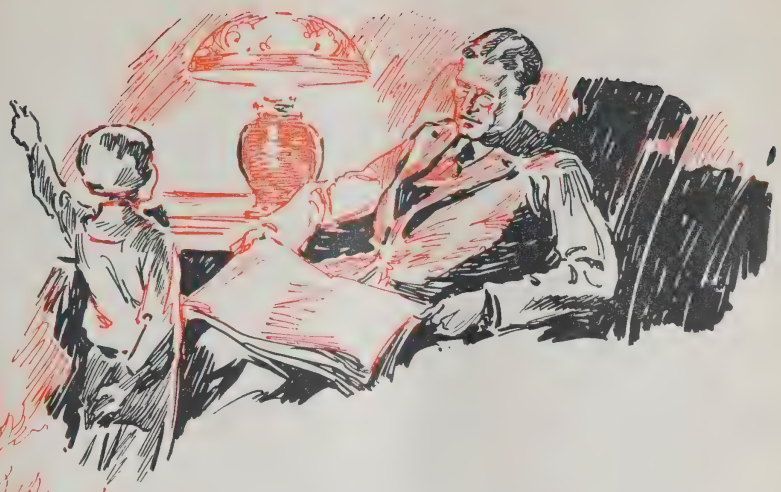
---

One man, after the Armistice, carried the fight of the 'buck private' to Washington. That man was James W. Beckman, once secretary to Elbert Hubbard, later sergeant major in the A. E. F. He tells here an amazing tale of the abuses to which some of the country's fighters were submitted. (p. 3)

---

The cover, showing the fishing vessels at Cape Porpoise, is by Stanley W. Woodward, one of the best known marine artists in the East. Illustrations for the story are pencil sketches by him.

---



New England figures again in this issue—in a play of Puritan days by Katherine Metcalf Roof, historian of the Colonial Dames of America, and author of many short stories, articles and plays. In the welter of the so-called realistic drama of today, this comes as a welcome relief. It presents a true picture of early Massachusetts times. (p. 25)

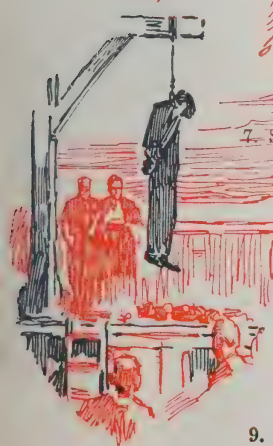
---

Among the other contributors this week are Burt M. McConnell, member of the editorial staff of the *Literary Digest* and an authority on aviation . . . Marian Bruce Clark, who has held state and federal posts of importance . . . Easton T. Kelsey, a member of the Second University of Michigan Expedition to the Near East.

# The CHILD'S INQUIRY

*From* McGUFFEY'S THIRD ECLECTIC READER *Edition of 1843*

1. Son — How big was Alexander, Pa,
That people call him great?
Was he, like old Goliath, tall—
His spear an hundred weight?
Was he so large that he could stand
Like some tall steeple high;
And while his feet were on the ground,
His hands could touch the sky?



2. Father — O no, my child: about as large
As I or uncle James.
'Twas not his STATURE made him great
But greatness of his NAME.

3. Son — His NAME so great? I know 'tis LONG.
But easy quite to spell—
And more than half a year ago
I knew it very well.

4. Father — I mean, my child, his ACTIONS were
So great, he got a name,
That everybody speaks with praise,
That tells about his fame.

5. Son — Well, what great actions did he do?
I want to know it all.

6. Father — Why, he it was that conquered Tyre,
And leveled down her wall:
And thousands of her people slew—
And then to Persia went—
And fire and sword on every side
Through many a region sent.
A hundred conquered cities shone
With midnight burnings red—
And strewed o'er many a battle ground,
A thousand soldiers bled.

7. Son — Did KILLING PEOPLE make him great?
Then why was Abdel Young,
Who killed his neighbor, training day,
Put into jail and hung?
I never heard them call him great.

8. Father — Why, no—'twas not in war—
And him that kills a single man,
His neighbors all abhor.

9. Son — Well, then, if I should kill a man,
I'd kill a hundred more;
I SHOULD be GREAT, and not get hung
Like Abdel Young before.

10. Father — Not so, my child, 'twill never do:—
The Gospel bids be kind.

11. Son — Then they that KILL, and they that PRAISE,
The Gospel do not mind.

12. Father — You know, my child, the Bible says
That you must always do
To other people, as you wish
To have them do to you.

13. Son — But, Pa, did Alexander wish
That some strong man would come
And burn his house, and kill him too,
And do as he had done?
And everybody calls him GREAT,
For killing people so!
Well, now, what RIGHT he had to kill,
I should be glad to know.
If one should burn the buildings here,
And kill the folks within—
Would anybody call him great,
For such a wicked thing?

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

DRAWN BY J. C. GRAHAM

TODAY, this golden day is mine, my gladness is complete; the washing's hanging on the line, and I have things to eat; I have a suit of clothes to wear, a suit of honest tweed, and scented bear's grease for my hair, and everything I need.

So many men are shedding tears in sackcloth sad and gray; they view the chances of dead years, the chances thrown away. If they'd done this, if they'd done that, 'way back in '93, each might have diamonds on his hat, a yacht upon the sea. If they had only bought some shares, long since, in Goldbrick Oil, they now might sit in easy chairs and gladly count the spoil. If they had only kept the land they once unwisely sold, the land on which big buildings stand, they now would reek of gold. All men have made their foolish breaks, let chances slip away; and he is wise who calmly takes his fortune day by day.

Today is mine, the breeze is sweet, the sun adorns the sky; the prospect seems as good as wheat, the goose is hanging high.

Some men are brooding o'er the past, to some the future seems a thing to make them stand aghast, it spoils their midnight dreams. But I have found that dreaded woes don't often come on time; and if they do, we take their blows with fortitude sublime. And it may be we'll even find enjoyment in the scrap; to knock a silly sorrow blind is solace to a chap. At all events it doesn't pay to brood o'er coming ills; why not enjoy this present day, and from it get some thrills.

I do not cry a vain 'Alas!' I wear a cheerful grin; the future hasn't come to pass, the past's too dear to skin.

—WALT MASON.

## What We May Expect *from the* Airplane *of* Tomorrow

By WILLIAM B. STOUT

FLYING is not a new thing.

Back in 1903 was the first flight of the Wright Brothers. At that time motor cars were almost unknown.

The motor-car industry since then has become the most important single occupation of this country, while aviation still is struggling along trying to rise above the restrictions which story-tellers have put around it.

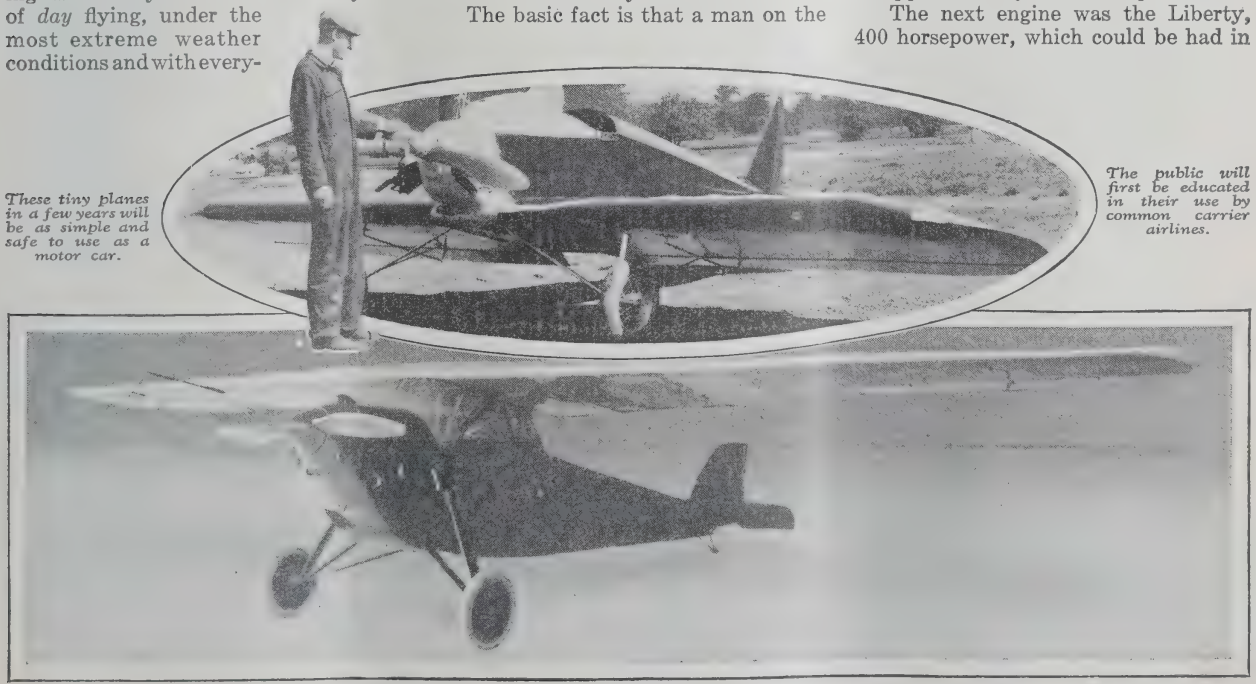
The first thing the public questions about aviation is safety. European airlines during the past year have covered a distance equal to more than 240 times the distance around the world and with casualties too few to mention. In four years' operation of the German airlines, using metal ships, and with about 75 planes in use, there has been but one bad casualty and no fatality.

Our own Air Mail has been flying between New York and San Francisco both ways daily for five years, and for the past year and a half has been flying nights and days. In the last two years of *day* flying, under the most extreme weather conditions and with everything working against them, there has been not a single fatality in the Air Mail.

Night flying, which is still experimental, has not been so fortunate, but most of the problems are now solved, so that even this branch very shortly will be safer than land travel.

There have been many reasons why aviation has not taken hold in the United States.

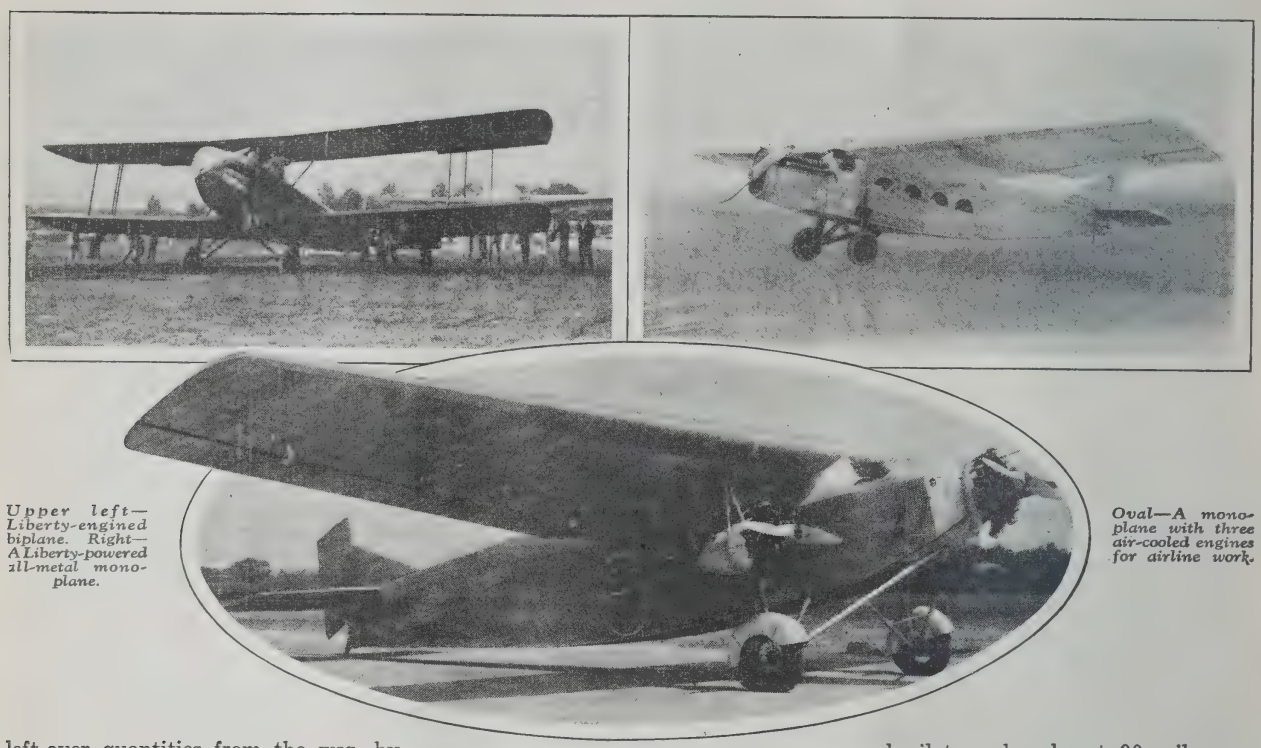
The first has been that capital was afraid of it and business men of real ability steered clear of it. It has been an industry of 'nuts' and near business men, but has only recently taken a stand in a commercial way.



During the war, designs which were far from rational were put into production and the public was forced to accept these as airplanes. After the war, aviation became the medicine-ball of politics, with investigation and counter-investigation all to the detriment of the industry.

The basic fact is that a man on the ground cannot talk in three dimensions, no matter how wise he may think he is; and Congress and the Senate, no matter how well meaning, cannot be competent to judge what should or should not be done in air matters, unless they take to the air themselves and study first-hand the problems which now confront the world for the first time, and which have no analogy to any previous industry.

First, we must have *intelligence in aviation.* Luckily this is coming, and the past year has seen a vast change.



In this country, also, we have been held rigidly to two types of airplanes. One type was built around the old Curtiss OX-5, 90-horsepower, water-cooled engine. This engine was obsolete when the war started, but was put into quantity production because it was the only one available. In spite of the cut-and-dried design, it still remains the best small motor that we have, and the only one which can be purchased of approximately this horsepower.

The next engine was the Liberty, 400 horsepower, which could be had in

*These tiny planes in a few years will be as simple and safe to use as a motor car.*

*The public will first be educated in their use by common carrier airlines.*

*Upper left—Liberty-engined biplane. Right—A Liberty-powered all-metal monoplane.*

*Oval—A monoplane with three air-cooled engines for airline work.*

left-over quantities from the war, by purchase from the Army or Navy. This was an excellent engine in its day, and is still remarkable in reliability, since so many have been built and used that the 'bugs' have been taken out of it. It is too big, however, for privately owned planes, and today even unfit for military use.

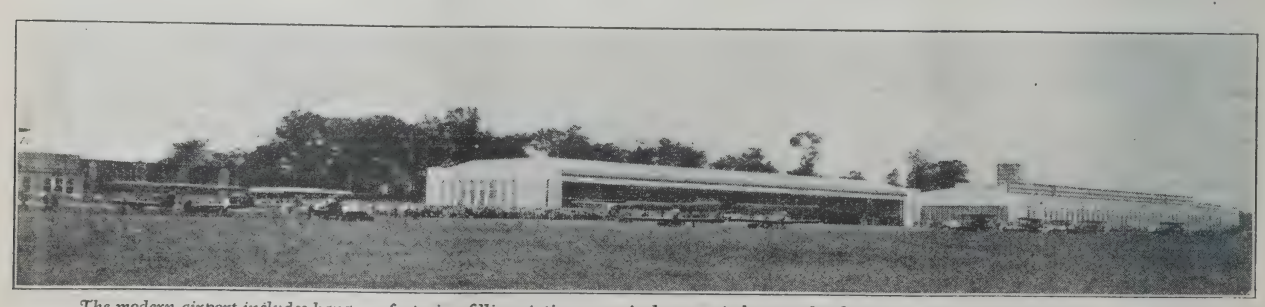
All aviation in America, up to date, has been limited to these two engines, the first small and heavy and suited only to 'two-seater crates' and the second large and heavy and fit only for freight transport planes operated by corporations or the Government itself.

*Until we get new engines at a reasonable price and of modern design, there will be no private aviation in this country.* When we do get such engines that can be purchased for, say, five dollars per horsepower, or even ten dollars per horsepower, aviation will come in speedily.

This country has produced some excellent ships around the 90-horsepower OX-5, and I do not know of any accidents that have occurred with these new planes, in spite of the fact that several hundreds of them are in use; but a modern engine, air-cooled and light, could double the safety, as well as the performance, of these little planes without much difficulty.

This engine must have less front projected area than in any present-day plane, so that there will be less resistance and hence more performance in the plane itself.

It must be cheap to build, so that a 60- to 100-horsepower engine can be produced for $300 or $400, or even less.



Eventually this engine will run on fuel oil, rather than gasoline, to eliminate the fire danger that is now present in all planes, even though this hazard has become an extreme rarity. Once such an engine can be purchased, as I have said, the industry will be here, even with the heavy OX-5 which weighs with its radiator and all about five pounds per horsepower.

Some firms are building as many as six small planes a week, and still are months behind on their orders. There are little ships that carry two passengers and pilot, make almost 90 miles per hour and 15 miles per gallon and are safer to drive per mile than a motor car. One can learn to fly them in from five to eight hours of instruction, and if the student is then satisfied to do straight flying and not try to clip the chimney off the roof of his best girl's house to show how good he is, or to make his turn standing on his ear, instead of in a normal bank, he will live longer than his neighbor who drives a car, and get a lot more out of life.

The future airplane will be built around new engines.

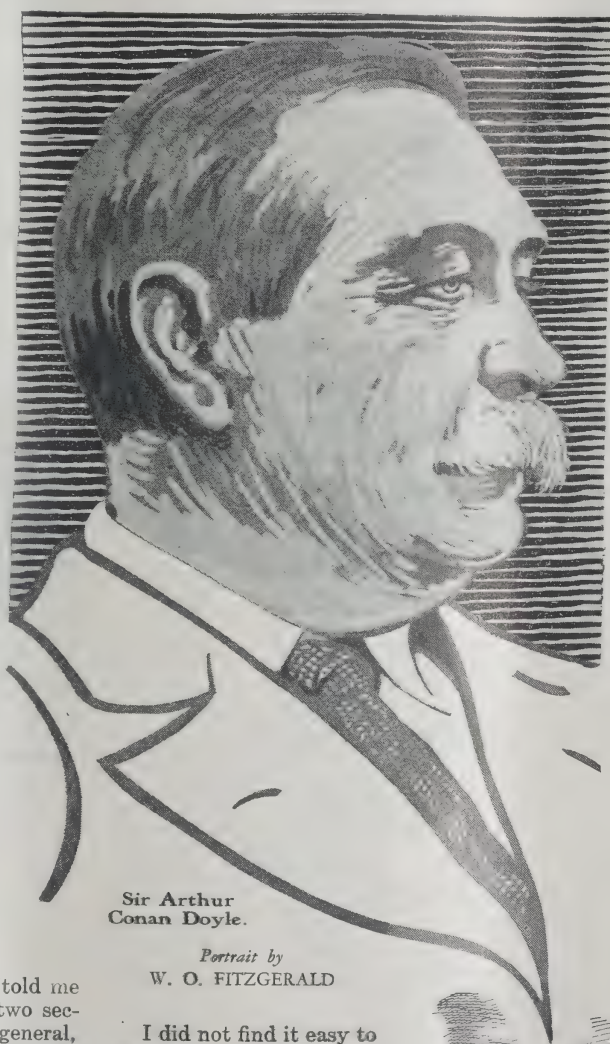
In cutting 200 or 300 pounds out of the power plant, there is cut a total of 300 to 400 pounds out of the total ship. This means that with the same 90 or 100 horsepower, one could carry four passengers at real speed and safety, or to stay to the present two-passenger-and-pilot sizes, which is more likely, you can do more with 60 horsepower than the present 90, and thus add one-third more to the range of the plane without coming down.

That plane *which can do the most with the least horse-* (Concluded on page 19)

*The modern airport includes hangars, factories, filling stations, repair depots, wireless weather bureaus, waiting rooms and 'what have you?'*

## Arthur Conan Doyle Speaks On

# The Psychic Side *of* Crime



## *Can Criminals From the 'Beyond' Suggest the Commission of Sins to Living Persons?*

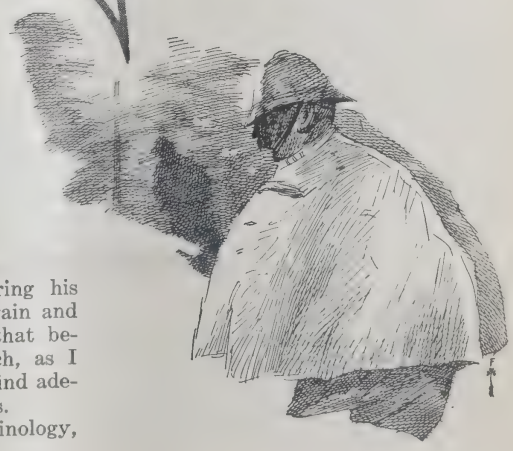
By W. TEIGNMOUTH SHORE

SOME years since a select company of criminologists and experts in crime banded together for the purpose of frank discussion of crime problems and of the psychology of the criminal. Among them are such well-known men as Sir Edward Marshall Hall, K. C., perhaps the most distinguished British criminal lawyer; Major Sir John Hall, who has written much and very well on criminal biography; Max Pemberton, Gilbert Frankau, W. B. Maxwell, the novelists; and among the members who, alas, have joined the 'great majority' were Professor Churton Collins, Lawrence Irving, Lord Northcliffe, Sir Herbert Beerbohm Tree and 'Harry' B. Irving. And among our—I am glad to be able to say '*our*'—best-known members, and most valued, is Sir Arthur Conan Doyle. The discussions at the meetings of this club, which we call 'Our Society,' are most interesting and stimulative, as it is possible to speak with entire frankness, for we strictly adhere to Rule XVII, namely that 'Both Members and Guests of the Club are to consider the proceedings as absolutely private.'

The other day I met my fellow member of the 'O. S.,' Sir Arthur Conan Doyle; we had a chat about crime and criminals, and I am at liberty to record here parts of our conversation. What he told me may fittingly be divided into two sections: crime and criminals in general, and the 'fictions' which he has woven so entrancingly around imagined crimes and criminals, and around the detection of crimes.

He mentioned as curious and as generally not noted, that in the Sherlock Holmes series in the first dozen or so tales he has succeeded in creating an atmosphere of horror and mystery that has gripped readers so strongly that it is seldom noticed that in a fair proportion of the cases no real criminal offense has been committed! The wily and astute Sherlock is busy unraveling mysteries rather than running criminals to earth.

**Sir Arthur Conan Doyle.**



*Portrait by*
W. O. FITZGERALD

I did not find it easy to induce Sir Arthur to talk much about his own work. In my experience most truly big men are modest; the bigger, the more modest. Sir Arthur, it need scarcely be said, is a big man mentally; physically also he is big—a stalwart, genial, kindly Irishman; bearing his years remarkably well; and again and again a twinkle in his eyes that betrays a sense of humor, which, as I think, unfortunately does not find adequate expression in his writings.

Speaking of the study of criminology, Sir Arthur told me that he started his collection of crime books by the purchase of all the special 'criminal' library which had belonged to Sir William Schwenk Gilbert—the Gilbert of 'Gilbert and Sullivan'—who wrote the famous criminal poem about 'making the punishment fit the crime.' As each of the hundred-odd volumes carries the autographs of Sir William and Sir Arthur, I propose adding to my own crimes by stealing a few—or many of them—one day quite soon.

'No,' he said in answer to a question from me, 'I didn't consciously invent or construct the character of Professor Moriarty; he grew bit by bit. I felt the necessity of a worthy, powerful antagonist for Sherlock Holmes; some man as big as a criminal as he himself was as a detective. So I began to think out a man who acted behind the scenes, as it were; never actually committing a crime with his own hands, but pulling the strings on which his puppets danced. And that was not going away from fact, was it? What about

# The West Has *More* Cowboys Than Ever

## Punchers *of* Fiction May Pass Away, *But* Ranch-Hands Go On Forever

By DONALD HOUGH

*Illustrated by* AUSTIN EUGENE BRIGGS

THE French people think that all Americans are cowboys. The British are of the opinion that the ordinary American west of New York is a tall, handsome person who wears chaps and a magnificent hat.

New Yorkers are quite positive that every able-bodied man the other side of Omaha is a cowpuncher and that he carries two revolvers to prove it.

But the average American above the age of fourteen is convinced that the cowboy faded out of everything but the movies when the old West passed and that he is of purely academic interest as a relic of a colorful age.

Everybody is wrong. The cowboy is neither the dominant American nor the dominant Westerner, but neither is he a museum piece. The discussions about the cowboys—whether they are extinct or not, and whether they still wear chaps or carry guns—are reminiscent of the scientific papers about the carrier pigeon or some other natural order. But the cowboy is not a species of wild animal, like the bison, nor is he an isolated type of humanity, such as a person who believes that the world is flat.

As a plain matter of fact, he is an employe on a ranch. Wherever there is a ranch, there are cowboys. Where there are no ranches, presto!—there are no cowboys! The cowboy is somewhat like a sailor in this respect. Where there are ships there are sailors, and always will be; but on the other hand where there are no ships there are no sailors.

A cowboy is a ranch-hand, and his position corresponds to that of a farm-hand on a farm. Some ranches, like some farms, have only one or two; some have forty. The cowboy, however, has been arbitrarily placed in a different category. He has attained to somewhat of an epic figure, and his status has been changed from that of a ranch-hand to that of a romantic swashbuckler. The principal job of the legendary cowboy, as every child knows, is to shoot up towns with six-shooters, to rescue charming maidens, to take part in heterogeneous high adventure, and to lead an all-round Quixotic life. His name has been given to every be-chapped individual who ever roamed the West.

However, we are not concerned in this article with the cowboy of history, nor with the cowboy of the motion pictures or other legend. We are out to discuss the cowboy as an ordinary mortal, and especially to find out why he is always spoken of in the past tense.

There still are cattle ranches in the West. Therefore there still are cowboys. There are undoubtedly a great many more—a hundred times more—cowboys in the West today than there were in the hectic days of yore. Therefore any person who has an idea that the cowboy is a disappearing species is doomed to disappointment. He is increasing, and he will outlast the farm-hand because there are no machines to take his place.

To get at this matter in a business-like way, we must start at the bottom. I have found that most Easterners have a very hazy idea about what a stock ranch consists of. It is not a large inclosure over which herds of steers roam. A ranch ordinarily consists of a comparatively few acres of land. It must include a house, the usual outbuildings common to any farm with the exception of the hayloft, which is omitted because it

couldn't be made large enough and the hay is stacked in the fields, a corral or a system of corrals for handling stock, perhaps a pasture for the horses.

A corral is a heavily fenced inclosure and it may be of any size from twenty feet square to several acres. Ordinarily they are an acre or less in extent. The fencing is never wire, often consists of plank panels ten feet or so in height, and the best corral system I have ever seen was made of the trunks of cedar saplings set shoulder to shoulder and supported by wires. The corrals are arranged so that they form a system of inclosures into which the stock may be driven and subsequently divided, segregated according to age, sex, or marketability. One, called the feeding corral, is larger than the others and usually not so firmly fenced.

That's all there is to a stock ranch, irrespective of the size of its herd, excepting that in the North, in such states as Montana and Wyoming, where the winters are so long and severe that it is necessary to feed hay to the stock during the cold months, the ranch must have fields or meadows of a size adequate to supply this need.

Well, that's the stock ranch. It is obvious that the size of a ranch is not measured in terms of acres, as that of a farm is. A man can engage in a stock venture of considerable size on an acre or so of land. The reason for this is that the ranchers do not own the land on which their beef crop grows, as the farmers do. The land is owned by the Government. Most of it is now included in national forests. Most of the homesteads and ranches are in the lowlands at the base of the foothills, where they are situated because of springs or other running water. Back of them rise the foothills and the mountains. These, partly forested, partly grass, constitute the Government land, or national forests.

The stock owned by the rancher is run, by permit, on the public land during the warmer seven or eight months of the year. As the snows of late autumn fall in the higher reaches of the range, the stock moves lower; presently the descending snow-line has chased them into the least of the foothills. Now comes the round-up. All of the ranchers in a certain district band their cowboys together and these go out and round up the stock and separate it according to the brands. The size and importance of the round-up, however, is diminishing because of the fact that under present Government regulation the range is less 'open'—the individual herds are more or less segregated throughout the grazing season—and the practice of banding together the cowboys and bringing in all of the herds at once is decreasing.

At any rate the stock is corralled, the marketable steers cut out and either sold or held over, according to the market and other considerations. After the cowboys have driven the marketable animals to the nearest railroad, they settle down to the routine task of feeding the hold-over steers, the cows and the bulls; and this is their daily work for the balance of the winter.

In the Southwest it is not necessary to grow hay. The stock spends the summer in the higher altitudes and as winter approaches comes down into the semi-arid or desert lowlands where the snow dares not venture and there they remain during the winter. After the round-up, the stock is turned loose again, the only ones corralled consisting of animals to be marketed. Thus the southern ranges are divided into two classifications: 'summer' range and 'winter' range.

Since the cowboy of the West is not an independent individual, the history of the ranches is the history of their hired hands, the cowboys. The first ranchers operated on a grand scale. They were unhampered by regulations and rules. They summered vast herds in the grassy hills of Montana, and when winter came they drove these great herds across the prairies to Texas. The whole West was the range in the days of the cattle barons. As the country settled, as homesteaders fenced in precious waterholes, as sheep—they still call them 'range maggots'—got a foothold, as the railroads came and fences appeared, the herds of the West diminished in size but they increased in number, and that is exactly what they have been doing ever since.

But it was the early régime that provided the adventure and romance enlarged upon and preserved in present-day literature and movie reels. The range was as free as the sky; it was wide open; and because the herds were so large and because they roamed so freely it was virtually impossible to keep accurate track of them. Thus grew up two classes. The first were rustlers who cut out stray steers or blocks of steers from the vicinity of the main herds, and even made foraging attacks on the herds themselves. These they disfigured by new brands burned over the old, or changed the old ones by certain additions. The other class, moving closer to the borderland of legitimacy, picked up stray mavericks, or motherless calves, and branded them. A maverick was, and to a large extent still is, considered the property of the finder.

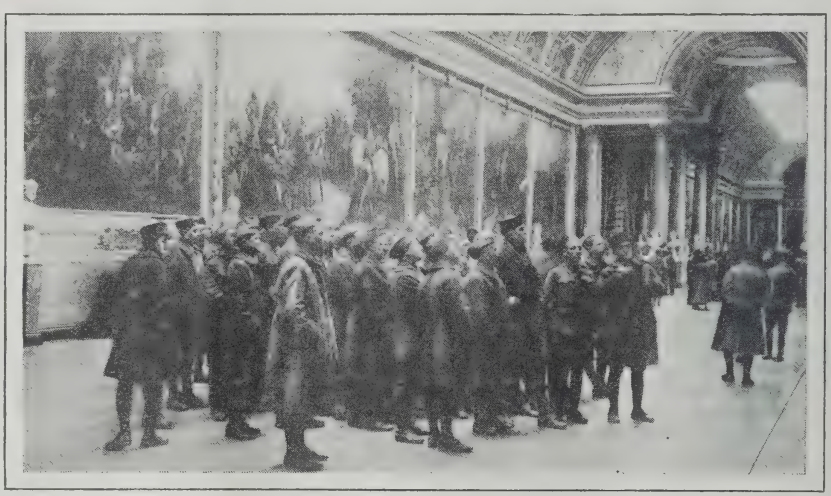
Thus most of the cowboys in those days carried revolvers because the rustlers were sometimes quite bold. But the revolver never was a part of the business equipment of the cowboy and neither did the cowboys wander around shooting at each other—not any more than do the citizens of Chicago today. There was—as in Chicago—a breed of lawless individuals, refugees from justice, 'bad men' and common criminals, but these were not cowboys. To the average Easterner, a person of the West who dresses in a certain manner is a cowboy. But the dress of a cowboy is not the badge of his trade. It is a practical uniform used by all riders in the West.

Just as the small ranchers and the fences and the other changes in the big open ranges were discouraging the running of big herds, a significant happening put an end to the last hope of a magnificent, roving empire of cattle barons. and (Concluded on page 24)

## Under the Present System of American Court-Martial

# Are Soldiers' Rights Safeguarded?

*Second of a Series*



By JAMES W. BECKMAN
FORMER SERGEANT MAJOR, AMERICAN EXPEDITIONARY FORCES.

UNDER the revised system of court-martial, a soldier in theory has almost as many rights and as good an opportunity for defense as he would have in civil courts. He is permitted counsel of his selection and the counsel, as well as the judge advocate, must be skilled in the law. A law-member, who also is educated in law, is required in a court-martial and this man, not the judge advocate, instructs the court in points of law. For every assistant the judge advocate is allowed, the accused must be provided with additional counsel, equally qualified in law. The accused may also have civilian counsel.

There are still certain defects in assuring an accused man justice. Under the old system crimes similar to those charged in the following paragraphs took place in every prison camp in France for American soldiers. The revelations were so shocking that Congressman Isaac R. Sherwood, of Ohio, himself a general in the Civil War, and Congressman Thomas D. Schall, the blind man from Minnesota, both bitterly denounced General Pershing in Congress.

My charges dated June 20, 1919, at New York City, and placed before Congress on July 12, 1919, by Congressman Frederick W. Dallinger, of Massachusetts, contained the following statement and the subsequent investigation proved every assertion:

'As a former soldier, who volunteered to fight the fight for democracy and who served in France about one year with the American Expeditionary Forces and who was recently returned to America and honorably discharged with the rank of sergeant major, I wish to lay before you, a Member of Congress, facts relative to the treatment received by loyal American soldiers by the American authorities at Paris. Every charge I make, you will see, is substantiated by copies of affidavits which I attach. Every charge can be proved. I believe you will agree with me that they are of such a horrible nature that they warrant the attention of every loyal American, and especially every Member of Congress. Thus their repetition will become impossible. It should be borne in mind that there is good reason to believe that the same things are going on in France today. If there is even a remote possibility of that being the case, I am sure every father and every mother who has a son over there will demand the proper action by Congress, and I believe that the 2,000,000 soldiers who served in France and their parents, families and friends will want to know of every Member of Congress why he failed—if you and your colleagues do fail—to do his part to correct conditions when they were brought to his attention.

—*Press Illustrating.*

*American doughboys on furlough, visiting the famous 'Gallerie de Batailles.'*

'When a man was picked up in Paris without a pass or with a pass that had expired, by members of the American military police, he was taken to the provost marshal, in Ste. Anne's Hotel, Paris. At this place he was given no opportunity to explain his case, but was accused of being absent without leave, a thing that was true in only comparatively few cases. Most of these men were casuals returning from hospitals or traveling under military orders, but, through lack of knowledge of the Prussian military regulations of the American Army governing Paris, fell victims of the unspeakable American military police system of Paris.

'An example of the contemptible manner in which the military police conducted their operations in Paris is the advertisements they ran in the American editions of Paris newspapers that American soldiers in Paris would be welcomed at the Ste. Anne's Hotel. This was the headquarters of the American military police and soldiers who responded to these advertisements in good faith were arrested if there was the slightest irregularity about their papers. This was a frequent occurrence, because most American officers were so ignorant of Army paper work that they seldom knew how to get any but the simplest military orders right. Once in the clutches of the military police at Ste. Anne's Hotel, the Bastile was only a day away.

'Another way men were trapped and betrayed by the military police was that when a man arrived in Paris, say at the *Gare du Nord*, a railway station of Paris, perhaps having come from a hospital and not knowing just were to go, he would go up to the provost marshal at the station, explain his situation, and ask for instructions. The military police at the station would be very sympathetic and say to the soldier, "Oh, yes; that can be very easily fixed up if you will just go and see the provost marshal at Ste. Anne's Hotel. They will straighten everything up for you and tell you what to do." So the man would go to the headquarters of the military police as directed by those in authority. But he would be sent without a pass. Naturally, he could not be expected to know the local regulations.

(Continued on page 26)

# Enforcing Prohibition in Mr. Mellon's Own State

## Alcohol Flows Freely From Pennsylvania's Many Distilleries in Spite of Amazing Disclosures

By JOHN D. ERWIN

WHOLLY sincere people are asking: Can prohibition be enforced? The answer is that no one will know until it is given a fair trial by friendly enforcing officers.

The controversy over enforcement is clearly illuminated by a mass of evidence gathered by the Pennsylvania Department of Justice, under Governor Gifford Pinchot, whose 'dry' predilections are too well established to be the subject of dispute. The chief significance of the revelations in Pennsylvania is that they give a picture of prohibition enforcement in the home state of Secretary of the Treasury Mellon, who is in authority over the whole prohibition organization. A picture is presented, based on official records, which needs no embellishment.

If the conditions are bad in Mr. Mellon's own state, where he may be assumed to have a more or less intimate knowledge of conditions, and where the enforcement officers are said to be appointed with his personal approval, why should it be expected that there will be a more sympathetic attitude on the part of federal law enforcement officials in other states?

A YEAR ago a federal grand jury in Philadelphia reported that that city is the center of the alcohol traffic in the United States. With the tightening up on smuggled liquor and the greater difficulty of manufacture of whisky and beer, alcohol is the big item in the illicit liquor trade.

A reading of the evidence gathered by Governor Pinchot's Department of Justice—incidentally one of the most efficient state forces to be found anywhere—will illuminate this situation.

Federal District Attorney Buckner, of New York, estimated the value of liquor made from redistilled denatured alcohol in the states of Pennsylvania and New York to be more than $3,600,000,000 a year. The manner in which federal prohibition agents have overlooked alleged transgressions of the law in Pennsylvania and have allowed permits to be renewed or extended to persons and firms frequently accused of law violations, supplies the real reason why Philadelphia is the alcohol center of the country.

Some two years ago Governor Pinchot went to Washington and laid before Secretary Mellon evidence gathered by the Pennsylvania law enforcement officials. If Secretary Mellon ever did anything more than to file these reports away, it has not been indicated by developments in the way of proceedings against any of those concerned.

SOME of the more conspicuous and glaring instances of a friendly attitude on the part of federal prohibition officials toward Pennsylvania concerns said to be engaged in violations of the law are cited in the reports prepared by the Pennsylvania officials from which these cases are gleaned:

As far back as April 11, 1923, federal prohibition agents reported that the accounts of the Consolidated Ethyl Solvents Corporation showed 'several thousand gallons of alcohol unaccounted for.' This is a company which was under fire because of its alleged connection with violators of the law. One R. J. Aylward was president, according to reports on file in the office of the Commissioner of Internal Revenue at Washington. The reports on file allege that he 'was guilty of flagrant violations of the prohibition and internal revenue laws.' He was said to be connected with the organization controlling the Stewart Distillery, which had been pronounced a 'notorious violator of the law.' Of these matters and other investigations into the Consolidated Ethyl Solvents Company, Commissioner Haynes (Mr. Mellon's prohibition enforcement officer at that time) was advised on July 18, 1923, by his Chief of General Prohibition Agents.

The prohibition chief at Washington was said to have been further advised on July 29, 1923, that the Consolidated Ethyl Solvents Company was a 'mere blind' for the Burlington Distillery in New Jersey. In the face of this warning, which was further stressed in a communication to Commissioner Haynes on September 27, 1923, the Consolidated Ethyl Solvents Company was granted permission from Washington to withdraw, denature and sell 375,000 gallons of specially denatured alcohol each month, until May, 1925, and 275,000 gallons from then until they were indicted in July, 1925, for diverting pure alcohol as denatured and conspiring to violate federal statutes.

Despite the fact that in 1924 more than 25,000,000 proof gallons a year of alcohol were authorized by federal permit to be produced in the Philadelphia district (designated by a federal grand jury as the very heart of the illicit alcohol trade of the United States), the Quaker Industrial Alcohol Corporation applied for three basic permits to operate an industrial alcohol distillery, bonded warehouse and denaturing plant, and got them.

Its president was Edward S. Lauer, who was brought into the notorious Beach Chemical case, and the Philadelphia Brewing Company case. Its secretary was Albert A. Millman, whom the federal agents are said to have reported as president of a sales corporation in Philadelphia which was alleged to have been connected with a reshipment of 2,500 barrels of whisky from France, seized in a raid in Philadelphia. These 2,500 barrels, the federal records state, 'were part of Overholt returned from France, placed in warehouse in Eddington and later seized in Lipschutz raid.' (Overholt is the distillery controlled by the Mellon interests up to the time Mr. Mellon became Secretary of the Treasury.) Referring to the *disposition* of the Quaker Industrial Alcohol Corporation's *application* for a permit to produce alcohol, the agents said, 'we also recommend disapproval for any concern that Mr. A. A. Millman is connected with.'

AFTER a little stock transfer to confuse or cover up the real ownership of the Quaker Industrial concern, Commissioner Haynes was then willing, as he stated in a letter dated October 8, 1924, that this company should be granted a permit for making, warehousing and denaturing an unlimited amount of alcohol, and *the permits were granted.* This was accomplished by a simple expedient. The stock of two men, Lauer and Millman, was transferred to John McGlinn, the vice-president of the Quaker Industrial outfit, and this apparently appeased Commissioner Haynes. And this despite the fact that McGlinn was said to be connected with the Philadelphia agent of the notorious Rossville Distillery of Indiana, that he had been an officer of the Philadelphia Brewery and Beach Chemical Company, and vice-president of the Rossville Company, Inc., said to be New York agent for the Rossville distillery.

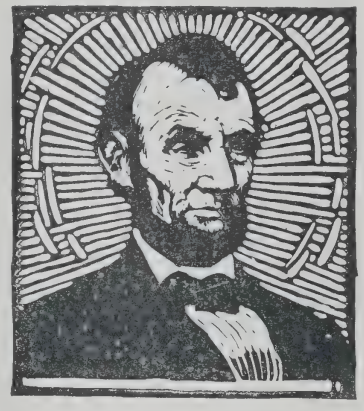
It would perhaps be an interesting contribution to the record if Haynes would tell why he took favorable action on the Quaker company, after the stock exchange had taken place.

To refute the *(Concluded on page 20)*

# 'But You Can't Fool All the People All The Time'—Did Lincoln Say It?

By WILLIAM E. BARTON

*Drawing by*
GERALD VAN DER HEYDEN



THERE is a widespread belief that Abraham Lincoln said, 'You can fool all the people some of the time, and some of the people all the time, but you can't fool all the people all the time.' I am in constant receipt of letters asking me whether Lincoln really used this sentence, and if so when and where.

I should like to give a positive answer to this question. The quotation sounds like Lincoln. It incorporates what was his known opinion, that, ultimately the common sense of the common people can be trusted. But did Lincoln say it?

Twenty-one years ago the Chicago *Tribune* and the Brooklyn *Eagle* undertook a simultaneous investigation of this question, and the results of their research now lie before me. Also I have the results of my own investigation, possibly more thorough than either; at least, having their material and some other I was able to go into the matter a little further than they. And within the last month I have made an investigation of the subject on the ground where the speech is alleged to have been delivered.

The first place to look for the answer to a question of this character is to the published writings and speeches of Abraham Lincoln. These are voluminous. John G. Nicolay and John Hay collected two thick volumes in rather small type, and these were later expanded into twelve volumes, with considerable padding and none too careful editing. It would be a hard task to read these through whenever such an inquiry arises. All that one who is familiar with this material, and some that has been added in volumes like Tracy's *Uncollected Letters of Abraham Lincoln* can ordinarily do in reply to a question by mail is to say, 'I do not recall having seen the quotation in any of Lincoln's accredited writings. I have looked in the places where such a quotation would seem to me most naturally to have occurred, and do not find it,' or to turn to the right volume, find the quotation and certify it. These two things I do, not quite every day, but very often. The result of correspondence of this character is such as to give me great respect for a jingle a friend wrote and sent to me:

Lives of great men all remind us
That when we are safely dead,
Liars will attribute to us
Many things we never said.

Alas, they do not even wait till we are dead, and it is almost hopeless to attempt to correct them when they are once in print. Still less is it possible to correct a false report of the speech of a dead man. He is not able to deny it himself, and all that other men can say is that they were present when the speech was alleged to have been uttered (if a time and place are mentioned, as they usually are not) and that they do not remember to have heard the words. Positive disproof is seldom possible and never very effective.

Of more than half the alleged quotations submitted to me, I am compelled to reply that I have not found them in any of Lincoln's acknowledged utterances. But sometimes I get a reply saying, 'I saw it in a paper somewhere,' or, 'I heard a man say he was present and heard Lincoln say it,' and my labor is wasted. It is a wearisome process looking through several volumes of closely printed matter to satisfy an idle curiosity that has already made up its mind what it wants and intends to believe.

If Lincoln said, 'You can fool all the people some of the time, and some of the people all the time, but you can't fool all the people all the time,' the natural place to look for the quotation is in Lincoln's speeches in the Lincoln-Douglas debates. That was the opinion Lincoln had of Douglas, that he was fooling the people, and doing it very successfully; but he thought the period of Douglas' success in this matter of fooling the people was nearly at an end. It is just such an utterance as might well have expressed his view.

And if Lincoln uttered this sentiment, that is when he did it, according to the one and only report that I have seen of the matter. It was not, however, in any one of the seven joint debates, but in an intermediate speech in the same campaign.

For it must be remembered that the seven joint debates represent only a small fraction of the actual talking which Lincoln and Douglas did in the autumn of 1858. Douglas professed to have made almost a hundred additional speeches. His advertised appointments do not show that total, but he spoke often at functions and impromptu gatherings in addition to his set addresses. Lincoln did the same, but did not speak as often as Douglas. I have made a careful list of their advertised addresses, showing where each man was on each day of that autumn.

This utterance of Lincoln is alleged to have been made at Clinton, Illinois, between the second and third joint debates. While the Clinton speech is not given by Nicolay and Hay, a quotation from it appears in another compilation, published in ten volumes by the Current Literature Company in 1907. Major William H. Lambert, of Philadelphia, at that time owner of the finest Lincoln collection in existence, and a discriminating Lincoln scholar, lent his name and much of material to this edition, and the copyright was his.

# MR. FORD'S PAGE

THE facts are indispensable as long as you are dealing with facts, but they are not the truth. Nevertheless, this should not be used to belittle the facts. There are those who feel themselves superior to facts—they may be poets who inhabit the region of truth, or they may be liars who traffic in falsehood. But whenever the analysis of truth is made, it will be found to involve a lot of facts, facts as indicating the quality of the truth, or as challenging the quality of a falsehood.

Therefore, do not despise facts, and never rely too implicitly on those who are careless of facts—in observing, weighing, acknowledging or reporting them. A fact may not be worth as much as some advocate insists; it may not be so negligible as another advocate insists; but if it be a fact, it has its place.

Facts are neither good nor bad. One would sometimes think they are, to judge by the way some facts are extolled and others concealed. Enmities have been made because facts have been set forth which some persons were interested to have suppressed, or facts have been suppressed which some persons have been interested to have published. Incidentally, it is not much of a fact that can be suppressed. It is like trying to lock up an explosion. A fact that is of public importance will out. There are, however, many facts that are of no public importance, although one would hardly arrive at this conclusion from a perusal of the evening newspapers. Most of the facts which the newspapers make a point of *not* suppressing would wither instantly if they were not dragged out by force into the vitalizing air of public attention, while facts of the first importance must literally explode in events before newspapers can be induced to acknowledge their existence.

However, when facts mass into weights which turn the judgment, they compel us to form a system of measuring them. It is possible at one and the same time to assemble a mass of social facts which will prove social progress or rapid social ruin, according to your mood. And both will be right, up to the moment the statement is made. You may see a river flowing east and a ship upon it sailing west, two opposite things, and both true. You may conclude that therefore at some moment the ship and the river must leave each other, all the water having flowed east; but people would be too wise to accept your conclusion. They know more about ships and rivers of water than they know about people and the river of life, or their final end.

A statement of approaching social ruin may be true until it is spoken. Then directly life begins to make it untrue. For the facts are in flux. 'All the rivers run into the sea,' which would seem to justify someone in saying that some day the sea will overflow. 'Yet is the sea not full.' For the circle is not only that from river to sea, but from sea to cloud again, and back to land and river. Life is moving. Motion brings change. Change is everywhere *pervious* to hope, open to improvement; change is the chink in the armor, through which life steals and works its miracle. Your statement of unrelieved pessimism may be right; it may be, as you say, that a river running east must sometime run out, like a dish emptied; it may be, as you say, that with so many rivers running into it, the sea will some day overflow. As far as you go with the facts you acknowledge, you may be logical; but the addition of a very few facts upsets your view forever.

*IN DEALING with facts be sure that they are facts. A fact that is of public importance will out. To try and suppress it is like trying to lock up an explosion. Some facts are in a state of flux; they may be true one moment but false the next. Action is a fact, but your view of things, if based solely on action, will be always wrong; you must remember that there is also reaction. What we are dealing with ultimately is not facts, but Life, of which facts are the flying sparks. Settle one or two questions about life, and you have your gauge for everything else. Life is living more.*

Since you last judged the world, it has changed. Maybe you may say, for the worse. But the wheel dips only to ascend. Don't omit any essential fact. Action is a fact, but your view of things, if based solely on action, will be always wrong; you must remember that there is also reaction. The history of human inclinations is a story of action and reaction, attraction and repulsion. Directly one force is set in motion, other forces move. Directly one tendency appears, its check, its counterbalance, moves on to the field. There are reactions, checks and balances; you cannot judge anything alone and be right about it. Nothing stands alone.

What we are dealing with ultimately is not facts, but Life, of which facts are the flying sparks. Settle one or two questions about life, and you have your gauge for everything else. Is life dying? is it ceasing? is it growing feebler? Is life more hospitable to what normal people regard as evil, than it is to what they consider good? Answer these, and you have a standard to go by. Life is not decreasing. It is, in one sense, a rather curious statement to make, but life seems to be on the increase. More forms are living, and they are living *more*. And life is hospitable only to what plain folk consider good, Now there are two facts worth an ocean-full of so-called facts made up of the splintered circumstances of a day. These two are facts that continue

## One Out of Nineteen

HOW much government does each citizen of the United States need? Here are some figures on what he gets:

> One person out of every nineteen 'gainfully employed' in this country draws his salary from public coffers.
>
> There are between 2,500,000 and 3,000,000 persons on federal, state and municipal payrolls.
>
> Each American family contributes an average of $123 a year from its income for the support of these job-holders.

Surely with this imposing array we should be the best-governed nation in the history of mankind. With some tentacle of government reaching into almost every phase of our daily lives—advising us in this activity, supervising us in that—we should be happy. We should be living in a Utopia of governmental perfection. But surprisingly, we are not.

The unhappy truth is that we have too much government. Federally we have become a vast bureaucracy with ramifications so extensive as to be almost unbelievable. Locally we have set up countless jobs for deserving politicians. One out of nineteen a public employe! Only when we encounter facts such as this do we realize the extent to which our lawmakers have gone in setting up machinery for the regulation of our lives.

The people, it has often been asserted, are the government. Certainly great numbers of them are—in America.

## Candy-Coated

THE drug store is becoming a symbol of the times. Bitter medicines that once decked its shelves are fast disappearing. In their places are numerous candy-coated substitutes. 'Easier to take,' the druggist explains; and his explanation echoes the general demand of the people. For all harshness, all bitterness must be strained out of the life of today. Modern life must be made candy-coated!

The great glossing process begins with the training of youth. Discipline is now largely a matter of suasion. Force, punishment, have been ruled out. Indulgence is the keyword. Education must be made as pleasant as possible. The pupil must be saved effort at all cost. The teacher must instill information into the pupil; never should the pupil be required to acquire it for himself. And it leads—this great glossing process—quite naturally to the vitals of the nation. All penalty for crime must be candy-coated. Not only is the criminal to be hedged about by all manner of safeguards while in court; but later in prison his way must be made as comfortable and as easy as possible.

Most interesting, however, of the phases of this glossing process is its inroad into the church. The stern, uncompromising religion of our ancestors has been treated to a diet of sugar and cream. Hell has lost its terrors, heaven its rewards. The doctrine of eternal punishment has passed from the pulpit to the stage—where it is bandied as a joke. Those who cling to the old faith are butts of ridicule. Those who have ready explanation and make easy allowance for all shortcomings seem the real leaders of the day.

Perhaps all this is better so. Perhaps it is a mark of progress to refuse bitter medicine. Perhaps our fathers were wrong in believing that strong character is molded in the crucible of adversity. This is an enlightened age, and maybe they are right who would serve us truth in candy capsules.

## Back on His Log

THE schoolbooks of former days contained one story that had a great appeal for youthful readers. It concerned an old Indian chief, seated on a log beside a white man in trapper's garb. 'Move over, please, I want more room,' the Indian would say, and the white man would obligingly comply. But presently, he had been pushed to the edge of the log, and he protested when the Indian asked him to move once again.

'There is no more room to move,' he said.

'That is just what you white men have done to my people,' the Indian retorted. 'You have crowded us westward into the barren land of the desert and the fastness of the mountain. You have crowded until we are now at the edge of the western sea, and we can move no farther without perishing.'

The story comes to mind in connection with a report from Washington that the Department of Justice has listed the number of cases in which the Indian is plaintiff. Claims for more than $100,000,000 have been filed against the Government and different states. The claims are filled with charges of bad faith, of agreements broken, with tales of injustice inflicted by petty officials. In the early days of the nation the harsh treatment accorded the Indian may have been partially justified. The Puritans of Plymouth and the Quakers of

Pennsylvania scrupulously kept every compact they ever made with the Indians, but in the inevitable conflict for land that followed, many things were done by both sides that are best forgotten.

But all that is past now and the conflict is ended. In taking from him his land, the nation has assumed a sacred responsibility for the Indian's well-being. We are quite apt, when we think of Indians nowadays, to picture the wealthy Osages, favored of fortune with their oil royalties. But the Osages form only a very small portion of the surviving Indians. The condition of the others is in many instances pitiable. Many of their claims for justice, filed in Washington, have lain buried for years. That these claims are now to see the light of day is encouraging. Isn't it time to give back to the Indian at least a piece of his log?

## *Success—At Last!*

AFTER months of weary endeavor, the Sesqui-Centennial seems on the way to being successful. By invitation of the director-general of the exposition, Jack Dempsey and Gene Tunney will meet in Philadelphia's new stadium some time this month in what is heralded as a championship battle. To be sure, the battle will be somewhat different in character from those of 150 years ago, which the exposition is ostensibly celebrating, but it will probably draw crowds of a sufficient size to satisfy even the Sesqui concession-holders—and this difficult achievement appears one of the principal aims of the promoters. By itself the Sesqui has proved a bit of a fizzle. Philadelphia's politician-promoters have revealed a woeful lack of knowledge of the ideals and aspirations which prompted the fighting of 150 years ago. No doubt they will display better familiarity with the brand of fighting which is Mr. Dempsey's.

## *Uncle Shylock*

AMERICA—the savior of the world in 1917, the Uncle Shylock of today—paid her way in France as she fought. She paid harbor charges for the transports that carried American soldiers to the battlefields of Europe. She paid for the land on which the great training camps were located. She paid generously for supplies purchased from France. She paid railroad transportation charges to France for carrying her soldiers to the front. In all she paid more than $1,000,000,000 to France, besides lending that nation enormous sums to 'carry on.' The war was European in origin, not American, yet when the United States entered she did not call upon her allies for help. Instead she gave lavishly, open-heartedly, in men as well as money. The title of Uncle Shylock, as many sober-minded Europeans are beginning to realize, is ill-applied. The sharp revulsion of feeling in Europe against the 'straffing' of America is in itself a noteworthy condemnation of that propaganda which is trying to shame us into cancellation of the debts.

## *The $25,000 Smile*

THE New York physician, who left a legacy of $25,000 to a little East Side girl whose smile had kept its place in his heart, belongs to a class of benefactors seldom seen these days. We have met them in fiction—these busy, elderly gentlemen, usually rough in manner, who write wills bequeathing fortunes to honest and worthy young men who snatch them from in front of street cars or help them across difficult thoroughfares. Occasionally the benefactors are elderly ladies who leave their fortunes to hardy adventurers who rescue pet parrots and poodle dogs from precarious positions. This fiction is pleasant to read and there may be some gallants who perform their acts of gallantry with one eye on the elderly gentleman's or elderly lady's pocketbook. But there are thousands of others who perform trifling acts of kindness toward strangers with no thought of reward save the satisfaction it gives the doer.

## *Half a Book Apiece*

IT IS the claim of Professor J. F. Thorpe, of England, organic chemistry expert, that there are too many books in the world. 'The space occupied by our increasing libraries,' he declares, 'is cause for alarm to those who contemplate the possibilities of the future.'

The statement seems so preposterous on its surface as to be worthy of little serious consideration, but it may prove valuable in calling attention, not to the number, but to the lack of books in this country. The United States undoubtedly has the greatest library system in the world. Yet there are on the shelves of all the public libraries in the country only about 70,000,000 volumes, or a little more than half a book for each inhabitant. Sixty cities with populations ranging from 10,000 to 100,000 are without libraries. More than 650 communities whose populations vary from 2,500 to 10,000 have none. Nearly half the people are without library facilities, and in rural districts this figure mounts to eighty per cent. The spread of knowledge through the printed word is one of mankind's greatest accomplishments. Mr. Thorpe heralds a danger which the nation can face with equanimity.

*The poet Lowell and his home, partly hidden by a dense growth of foliage.*

# JAMES RUSSELL LOWELL *As* Julian Hawthorne *Remembers Him*

THE name James Russell Lowell recalls to my mind many things—among them, that ancient distich—

'The Lowells speak only to Cabots,
And the Cabots speak only to God'

as evidence of the importance which the two families attached to themselves, or were reputed so to do by their contemporaries. And indeed there were grounds for it. I am no genealogist, nor skilled to sift the evidence; but it is, or ought to be, of common knowledge that Giovanni Caboto, of Genoa, Italy, afterward a citizen of England and a voyager and discoverer of world-wide renown, followed Columbus, and although he did not fall into the venial error of mistaking Central America for the East Indies, yet did visit the northern shores of our continent, and died in 1498, under the name of John Cabot.

This great mariner had a son, Sebastian, born an Englishman, in Bristol, the great western seaport of the island, in 1474; and he, in the service first of England and afterward of Charles V of Spain, performed exploits not inferior in value to his father's, and was president of the Company of Merchant Adventurers, licensed to establish trade with Russia. He died in London about the middle of the 16th Century. And I must presume (though I have no authentic data at hand to prove it) that he left descendants who emigrated to the West, and doubtless abode and propagated in New England while that fortunate region was still in its chrysalis or colonial condition. And when, in due time, the Lowell clan

came to the surface, and attained local celebrity, the Cabots would naturally fraternize with them in lonely grandeur: therefore, the distich. But so far as I am informed, there was no actual intermarriage between the members of these two noble lines, though the late Senator Henry Cabot Lodge's ancestry seems to have been more fortunate. I am not informed, either, as to how the Lodges came to be that way; there was, I believe, one Thomas Lodge, an English man of letters of Shakespeare's times; but I doubt if he comes into the story.

We are on securer footing with the Lowells. And I now recall that the first Lowell of historical record—the Francis Cabot Lowell of Newburyport, Massachusetts—does, by his middle name, suggest some former alliance with the Cabots on the part of his fathers or grandfathers.

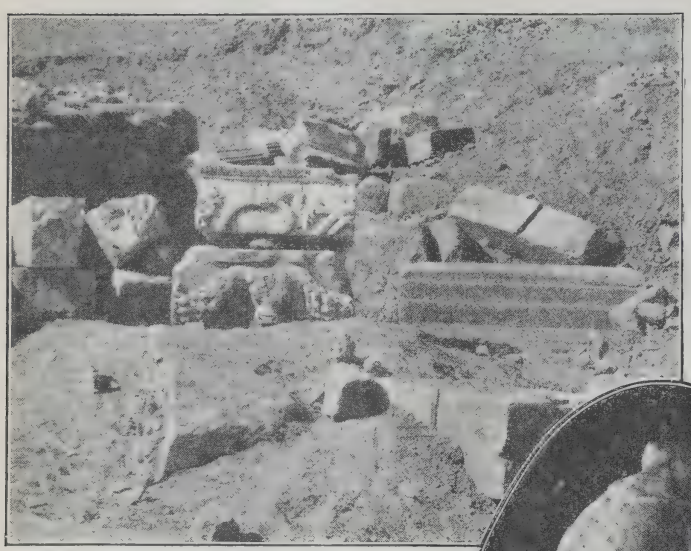
To return to Francis Cabot Lowell. His fame and wealth were founded not on world-adventure and exploration, nor on warlike exploits, nor even on statesmanship: they hung, rather, we might say, on a thread of cotton, which he spun up into a fortune. A younger brother of Francis Cabot was Charles, the father of our own James Russell Lowell.

WE are now on the threshold of our present enterprise. I should, however, mention that James Russell had a sister Mary, his elder by several years, who wrote several books, married a Putnam, and lived to be nearly ninety years old—she survived her famous brother by nearly a decade.

James Russell Lowell, apart from his writings and his diplomatic avocations, was an interesting personage intrinsically. In his younger days he was reticent, shy, magnetic, prowling, solitary, but resolved to be a poet, and from his thirty-first year onward he wrote and published poetry. But he was really of a sociable nature, and, like many patricians, democratic in theory. It is easier to condescend than to reach up, and young Lowell, when at a loss for fitting companions of his own social rank, would put on a rough suit of clothes, take tobacco and a pipe, and ramble forth in quest of Yankee farmers and such like, would sit beside them on a log and engage them in talk, getting insight into their native qualities, and remembering their phrases, idioms and pronunciation for future use in his own literature—as the famous series of *Biglow Papers* bears witness. I don't know that better 'dialect' was ever written; indeed, these *Papers* surpass the dialect itself, and one might almost suspect him of inventing it, as Bret Harte is charged with inventing his Wild-West speech in his stories. But it conveys the accepted character of the speakers and their point of view, and outdoes them in wit and humor, not to speak of satire.

Satirist, wit and humorist Lowell certainly was, and he made them tell, in politics as well as elsewhere. John Bull could make no adequate rejoinder to his criticisms, and it is to the credit of John's magnanimity that he welcomed him as Minister to the Court of St. James a dozen years after 'Hosea Biglow' had ceased to call attention to British hoggishness. We have never sent a representative to that country who was better liked there, or more congenial than he—though he never apologized for his squibs, or abated his Yankee independence. In truth he was more English at bottom than the English themselves, and could write his well-known essay 'On a Certain Condescension in Foreigners' because he himself was such a master of condescension. He knew English literature from top to bottom, and could talk Chaucer like a gentleman of the 13th Century.

He was one of the family, and criticized so keenly because members of the same family commonly are inspired and equipped for that sort of intimate animadversion: they know where to hit. Meanwhile the breadth of his sympathies is indicated by his contemporaneous flights of sentiment and imagination: we have all been familiar with his lovely query, 'What is so rare as a day in June?' and some are still living who have taken off their hats at the grave music of his 'Commemoration Ode.' It may be admitted, however, that editors of current magazines would be readier to open their pages to such an effusion as 'Zekiel's Courtin' '; a bit of homely realism which we may expect the high gods of the silver screen sometime to adapt to their medium—of course, with additions and improvements. The 'Ode' is all right, but even Mr. De Mille couldn't persuade the box office to consider it.



THE fact that Lowell's literary proclivities carried him in directions so diverse may lend weight to the suspicion that he never was nor could be an honest-to-goodness divine-afflatus poet. He knew too much, was too scholarly, never whole-heartedly believed in his own poetic faculty. He was a victim of too early culture and education; his aristocratic environment sapped the integrity of his faith. If a man's memory is not a virgin page for his own perceptions, but is written and crossed over with the thoughts of former persons, he is in constant doubt as to whether he is 'original,' or is merely giving a fresh wording to old stuff; whereas, if he write from the heart, he is free from anxiety, for one man's heart can never see or feel like any other's. A true poet, if he have brains, can make occasional use of them; the lyrics of Keats and Shelley, and the songs of Shakespeare, carry no taint of brains, but are fresh as morning skies and flowers.

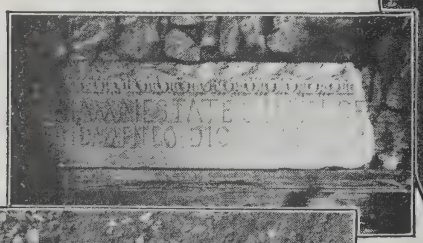
There are happy moments when Lowell almost forgets himself as an American gentleman of the highest type and most refined culture and as a scholar of wide erudition. It was a great deal to forget, but he managed it, now and again. He had brains, pressed down and running over, and they were graceful sirens to mislead him. He himself was aware of it, but, unlike Ulysses, he hadn't taken the precaution to have himself bound to the mast before venturing near the sirens' isle.

He was more satisfactory in prose, because not aiming so high. His essays are charming reading. One book of his —*Fireside Travels*—which I found on that bookshelf of my father's, was a delight and an education to me in my teens. It is dedicated to 'Storage,' that is, William Wetmore Story, the sculptor, who was an intimate friend of Lowell in Cambridge. He was, I think, a classmate of Lowell at Harvard—Lowell graduated in 1838, at the age of nineteen—and Story was a bit of an essayist and poet; the two young fellows were sympathetic; but Story, too, would have been better with less book-learning; his statue of Cleopatra suffers from it; Story would have done better with it had he been as un-bookish as Rodin, for instance. But New England must have the defects of its merits. Lowell's prose style was so good as to conceal its art.

HE was a delightful companion, even to a boy so unrepentantly ignorant as I was when I came to know him personally, in 1866-67. He had not then begun his diplomatic career. Of course he had been, long before that, a friend (or acquaintance) of the family, and I think my mother knew him before my father did, owing to her friendship with the girl who was Lowell's first wife, and who died early. Hawthorne kept to himself until *The Scarlet Letter* forced him out of his hermitage. Lowell, at first, was shy, as I have said; 'He glares,' my mother used to say, 'from the red jungle of his beard.' The death of his wife affected him profoundly. And when, years later, he married another young woman he seemed to avoid his friends still more. She too died after a while and he was left with a daughter, Mabel, a beautiful and impressive girl, but taciturn and reluctant in society.

In 1867 I ran across an energetic young fellow at Harvard, rather rough and obvious in manner, who said, 'I'm going to be a farmer; I'm taking a special course for it.' Now, Lowell idolized Mabel, and beseemed not, as Hamlet says, the winds of Heaven visit her face too roughly. I couldn't think of her as anything other than a religious recluse, a sort (*Concluded on page 28*)

Above—*Fragments of the ruins of the temple. Note the finely preserved carving, particularly the bull's head, of which there were a series bound together with garlands of leaves and fruits. The massiveness of Rome was combined with the delicacy of Greece to produce a dazzling masterpiece.*



Oval—*The Greek statue of Victory, one of the finest heretofore discovered. It will take its place with the best specimens found in our schools of art.*

*This six-foot high carved piece surmounted the temple. It is a magnificent piece of workmanship, worthy of comparison with examples of the golden age of Greek art, such as the choragic monument of Lysicrates at Athens. The acanthus leaves, with their graceful scrolls, and the figure by which they are surmounted, constitute a perfect scheme of decorative design. The details are remarkably well preserved.*

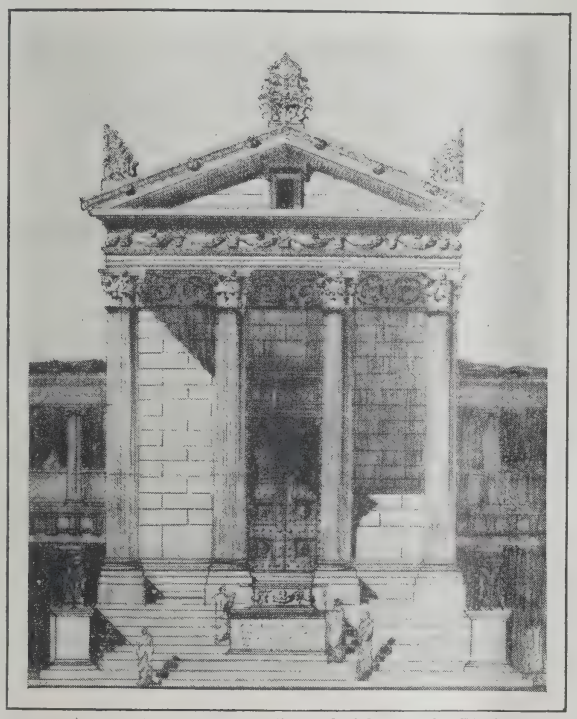
# A Church Where Early Christians Worshiped



By EASTON T. KELSEY
MEMBER OF THE SECOND UNIVERSITY OF MICHIGAN EXPEDITION TO THE NEAR EAST

## *Buried for Centuries, the Ancient Edifice at Antioch at Last Tells Its Story*

*PART II*

ANCIENT Pisidian Antioch was at last being brought to life. Our whole expeditionary force was now on the ground, with necessary equipment, and various members were at work directing native laborers in the hot summer sun. What fresh discoveries were in store for us no one knew, but indications were promising. Antioch, colonized by Greece, then dominated by Rome, and finally destroyed by the Arabs, was about to be disinterred.

Labor, fortunately, had given us no trouble. For the munificent wage of forty-five cents a day the natives began at sunrise and stopped at sunset. Although only occasionally were more than a hundred men needed, the whole population of Yalovadj was anxious for employment because of a famine that had swept the vicinity the previous year.

—From a sketch by Frederick J. Woodbridge.
*Restoration of the Temple of Augustus, which had four massive Corinthian columns in front and a semicircular colonnade at the rear.*

The first aim of excavation was to uncover the basilica, or early Christian church. Of this sufficient massive courses of stone, too heavy to have been removed by natives, remained visible to indicate the outline of the edifice. These remnants, coupled with a few standing sections of a Roman aqueduct, were all of the once thriving city exposed to view.

As the digging progressed, it became evident that Antioch had been cleared of nearly all the building material above the surface that could be carried away. Sections concealed by earth, however, had rested peacefully for centuries, except where natives had occasionally quarried the stone themselves. Fortunately for us, however, enough dirt had accumulated over the ruins to protect them, but did not seriously retard excavation.

The basilica floor was carefully dug out, only to reveal that most of its concrete squares had also been removed. Enough remained to indicate essential details about the basilica.

What lay below this flooring held more interest for us. Acting upon the supposition that a still earlier building had once stood on a lower level, we resumed digging with great caution. About two feet down, the remains of an exquisite mosaic floor began to appear, done in cubes of five colors and arranged in designs of remarkable beauty.

Despite the previous destruction of much of the floor, we could piece out the design of the structure to which it had belonged—a metropolitan church. The preserved fragments disclosed four Greek inscriptions, two of which read:

'In the time of the very reverend Bishop Optimus, Eidomeneus, a reader, having made a vow to God, paid his vow.'

'In the time of the very reverend Bishop Optimus, I, Eutychianus, having made a vow to God, fulfilled my vow to God.'

*Each piece had to be moved with infinite caution, so that it could be replaced exactly in its former position.*

Our question as to the date of the church was answered by these inscriptions, which placed it in the latter

# A Man Who LIVES by What He SEES

## Observation Is Made a Fine Art by This Detective, Who Has Exposed Many Frauds

By FRED C. KELLY

*Illustrated by* W. W. CLARKE

IN THE upper reaches of a New York skyscraper is the modest office of a man who devotes himself to observing minute details that most folks would overlook. The man is really a scientific detective; but he himself would shy at that description. He would say that he is merely a student of questioned documents.

His business is to draw correct inferences from observations in handwriting, typewriting, paper and ink. He frequently makes successful attacks on bogus documents representing millions of dollars.

His work has incidentally given him exceptional opportunity to study the workings of the human mind. He once mystified a stranger by telling him, without previous knowledge of him, that he was born in April, May, or June, 1861, that he was born in a northern state, and that his father was a northern sympathizer during the Civil War. All this he knew just by noting that the first two initials on the man's calling card were 'E. E.' First he had observed that the man appeared to be about the age of one born during the Civil War. Then he remembered that the first northern hero was Captain Elmer Ellsworth. He knew that thousands of babies born within two or three months after Ellsworth's death were named for him. He hazarded the guess that this man was one of them.

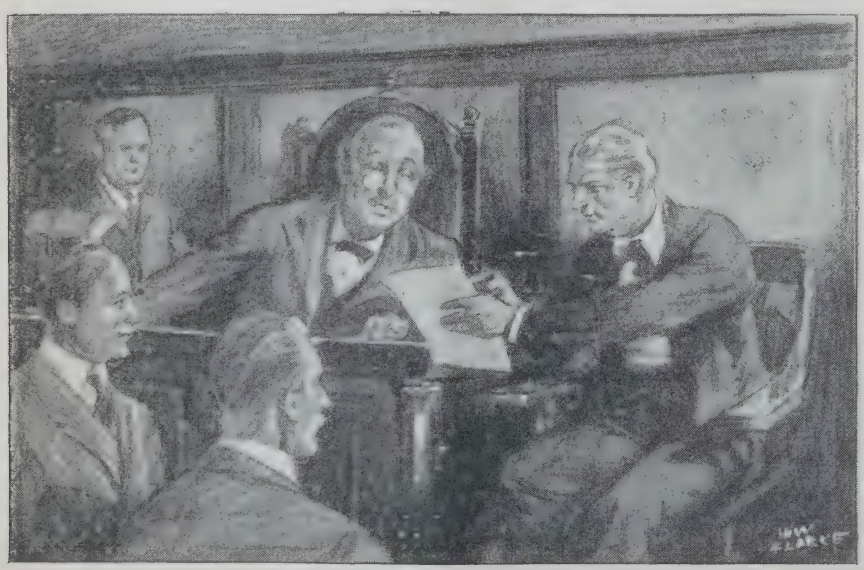
In a court room one day, this man was asked to examine a note, Exhibit A, in a case involving several thousand dollars. The supposed author of the note was dead and the question was whether the signature was genuine. Lawyers for both sides insisted that they wanted only the truth. After studying the document a few moments, the witness said:

'Yes, the signature is probably genuine—'

One lawyer looked pleased.

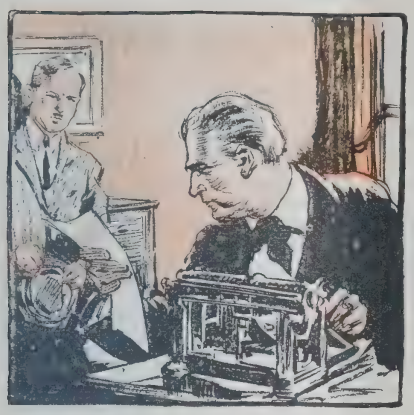
'But,' the witness continued, 'the note itself is *not* genuine.'

It was the other lawyer's turn to look pleased.



The witness pointed to a crease in the paper.

'You'll observe,' he said, 'that this crease has worn through the glazed surface of the paper. Yet the ink in the signature is not blurred—because it was written *before* the crease was made, on a hard, smooth surface. But where the crease crosses certain words in the note itself the letters are blurred, just as if they had been written on a piece of blotting paper. They were written *after* the crease had worn through, and long after the signature was attached.'



This conclusion was so self-evident that the opposing lawyers, after a brief conference, agreed to have the case dismissed.

Members of a family having an interest in a million-dollar estate asked this specialist to examine a will. If the document was genuine, certain heirs would receive about $300,000. Otherwise they would get practically nothing. The will was written on long sheets of heavy paper. The expert, after carefully going over the document, held each page up to the light to note the so-called watermark, the manufacturer's trade-mark. He discovered that on one sheet part of the watermark chanced to show at both top and bottom. He knew that when paper is manufactured, the watermark is imprinted in the soft pulp from a rotary device called the dandy roll. Hence the distance between two watermarks must be the circumference of the roll. If one of the marks had been in the middle of the sheet there would not have been room for another to appear on the same page. The paper was not even long enough to hold two complete designs. But enough of the watermark showed at the top and bottom to establish how far apart they must regularly have been imprinted on paper manufactured at that time.

After identifying the manufacturer who used that trade-mark, the specialist went to a paper mill in Massachusetts. There he consulted the superintendent of the plant and also the chief accountant. From them he learned the exact date when the company had last installed a new dandy roll. Measurements showed that the dandy roll then in use was slightly larger than the one used three years before. In other words, one roller printed watermarks 12 inches apart, but the other printed only 11½ inches apart. From all this it was possible to establish that:

*The conclusion was so self-evident that the lawyers agreed to have the case dismissed.*

The will was dated eight years ahead of the time the paper on which it was written had been manufactured!

Another will case was upset, to the great vexation of one or two heirs, when the man noted the kind of little brass devices that bound together the pages. That type of binder had been in use only eight years, but the date of the will was nearly ten years earlier.

In still another will case, the whole question of whether certain heirs should receive more than $100,000 depended on the length of the cross mark on a typewritten 't.' Typewriter manufacturers change the design of their type slightly from time to time. The cross on this 't' was one one-hundredth of an inch too long for its date and the will failed. It was obviously fraudulent, the expert proved, because, though it was dated 1906, it contained typewriting from a model of machine not on the market until 1915—after the author of the will had died.

The next thing to find out was who had drawn the dishonest will. Two men were under suspicion, In their offices were a number of typewriting machines. Only one of these had type of design quite like that in the will. But just when had the will been prepared. It was possible to determine this, almost to the day! The problem was not so difficult as it sounds. The office contained various records that had been written on this same typewriter. By arranging these in the order of their dates and studying them, it was possible to pick out sheets of a date on which the state of type imperfections and condition of the ribbon tallied with those on the forged part of the will.

Some years ago this document man was called upon to determine who had sent a threatening letter to the head of a mining company in Alaska. A list of samples of the work on all the typewriting machines in use soon demonstrated that the threatening letter had been prepared on an old and unusual machine called the Bennett. An examination of every typewriting machine in Dawson City showed that there were only two Bennett typewriters in town. It was easy enough to learn which of these two had been used to write the letter, and who was most likely to have written it. The guilty man was confronted in court with this strong circumstantial evidence, and found guilty.

Another case involving typewritten evidence, solved by powers of close observation, grew out of an anonymous charge of attempted bribery in a letter believed to have been sent from an office in a state capitol. It so happened that thirty typewriting machines of the same kind had been bought at the same time for use in various state offices. With so many machines that had suffered about the same wear and tear, it looked like a hopeless task to tell which one had been used for one letter in particular.

But typewriting machines develop individuality after use for a comparatively short time. Since typewriter letters are not flat but concave, to fit the curve of the printing surface, a letter out of alignment, no matter how little, does not print evenly. Such defects, in combination with broken letters, establish the identity of a machine as definitely as scars or moles might identify a man. Cleaning the type faces often serves only to make certain nicks or blemishes more distinct.

With samples of writing on every machine in the state capitol, and ability to see minute details, it was possible to show that the anonymous letter had come from a particular office.

A still more difficult case had to do with a typewritten letter in which a prominent business man had made promises that he later wished to deny. Since his letter was embarrassing to him, he branded it a forgery.

'I wrote a letter,' he admitted, 'but not *that* letter. I kept a copy of the letter I actually did write. Here it is.'

The document man took this copy and studied it. Then he told the writer so much about his past performances that the man perhaps still wonders if he was dealing with a mind reader.

'This is a copy of a letter you wrote,' the expert said, 'but not a copy of the one you *mailed*. The one of which this is a copy you never intended to send. You didn't even write it on your regular stationery, but on so-called second-page paper. Then you destroyed the original but kept this carbon copy as a piece of fake evidence.'

HOW did the specialist know this? By placing the carbon copy under a microscope and measuring the width of the letters with a fine instrument. If you write on a thin sheet of paper, you can get a clean-cut impression on a second sheet, from the carbon. If the paper is thin enough, the impression of any letter will not be much wider than the type itself. But if through a thick sheet, the impression is flattened out and the letters are much wider in the copy. The width of the letters in the copy will vary, then, somewhat according to the thickness of the paper used for the original. Experiments with carbon copies printed through different kinds of paper from the man's office desks showed the facts. The scientific detective learned that a letter written on the regular stationery, ordinarily used for the man's correspondence, would have produced a different kind of (*Concluded on page 22*)

*'The bill is probably bogus,' the expert declared. 'It is probable that no such goods were bought.'*

# 'But You Can't Fool All the People'

(*Concluded from page 8*)

'Between the second and third debates with Douglas, Lincoln spoke at Clinton, Illinois, on the afternoon of September 8. In this he uttered the famous expression: "You can fool all the people some of the time, and some of the people all the time, but you cannot fool all the people all the time," pointing the epigram at Senator Douglas.'

AS FAR as I am aware, the first nation-wide hunt for the quotation began with a communication in a Cincinnati paper in the latter part of 1904. It was signed E. E. Pierson, of Bloomington, Illinois, and told the story of the speech as he had learned it from a respected citizen of Clinton who professed to have heard the address. This letter is so explicit and consistent, it is well worth quoting in full:

'Perhaps the most reliable evidence supporting the claim that Lincoln used the expression in controversy comes from Lewis Campbell, one of the best-known pioneer citizens of De Witt County. Mr. Campbell remembers distinctly when Lincoln used this expression. It was on September 8, 1858, and in a speech delivered in the evening after Douglas had finished his speech.

'He says that Douglas reached Clinton in a private car, sumptuously fitted up for those days. Lincoln came unheralded and alone. While Douglas spoke Lincoln sat twenty feet distant. Douglas did not recognize Lincoln during the speech nor after it. In the evening when Lincoln spoke, he stood upon a dry goods box, placed against the north side of the old courthouse by Mr. Campbell and his friends. Mr. Campbell says that Lincoln used this form: "Judge Douglas cannot fool the people: you may fool people for a time; you can fool a part of the people all the time; but you can't fool all the people all the time."

'Then further along, in replying to Douglas' egotistical speeches, he said that Douglas put him in mind of a passage of Scripture. He thought it could be found in the Mormon bible, and read something like this: "Blessed be he that bloweth his own horn and cursed be he that bloweth not his own horn." The Bloomington *Pantagraph* devoted but a column to this speech referred to by Mr. Campbell, and in this column no mention is made of the expression. The editor apologizes in a footnote for the limited report, stating that the foreman had declared that there was no more room in the forms for a longer report.

'Judge Lawrence Weldon, of Bloomington, a member of the national Court of Claims, is also confident that Lincoln used the expression. Few men now living knew Lincoln intimately as Judge Weldon.

'E. E. Pierson.'

The reference to Judge Weldon is interesting. He did indeed know Lincoln well, and in his opinion the speech was authentic. But with Judge Weldon it was a matter of opinion; he did not hear the speech. We come to the evidence of Mr. Campbell, a man of repute.

In the first place he is slightly incorrect in his date. The address was not delivered September 8, but six days earlier. On September 8 Douglas was speaking in Carlinville and Lincoln in Paris. They were nowhere near Clinton. Lincoln spoke in Clinton on Thursday, September 2. That in itself is immaterial; the dates are not unimportant.

In the next place Douglas did not speak in Clinton on the day that Lincoln spoke there. Mr. Campbell is incorrect in his recollection that Douglas had arrived in a private car and spoken in the afternoon and that Lincoln followed him in the evening. That had occurred at certain places early in the campaign, but it ended with the agreement for the joint debates.

Lincoln had been assiduously following Douglas up to that time, and was much criticized by the friends of Douglas who said that he could not get a crowd himself but followed Douglas and got not only the crowd but the last word. Lincoln was, indeed, very fond of the last word, and got it whenever he could. But he agreed with Douglas not to attend any more of Douglas' own meetings.

This, too, is not in itself material. A witness may be wrong in a hundred unimportant details and correct in his testimony concerning the really vital fact. But, when we are forming a judgment on the reliability of a man's memory, we must take into account his accuracy in the details of which we have assured knowledge, that thereby we may estimate his accuracy in the matters which we do not know.

E. B. Bentley, then editor of the *Public*, undertook in 1905 to obtain the testimony of men living in Clinton, and found some who professed to have heard Lincoln use the words, and others who were present and could not remember them. That is not strange. Political speeches were very long in those days. Most of the men who in 1905 had heard Lincoln in 1858 were boys when he delivered the address, and if they sat or stood through it all—for the address was delivered out-of-doors—they grew weary, and they did not know at the time that Lincoln was saying something immortal.

THE testimony of one man who is sure he heard it outweighs the testimony of several men who were present and do not remember it. Still, if there are many who did not hear it, and very few who did, the fact that the large majority do not remember must have weight in the judgment we form.

One of those who heard Lincoln and was sure he used the words under consideration was a reputable man, J. J. Robinson, but he also remembered it as a joint debate:

'In 1858, Lincoln and Douglas spoke in the city at the north side of the courthouse. I was present at the meeting and remember distinctly some of the remarks that each of the men made. Douglas spoke first and Lincoln followed. During the latter's address he made use of the oft-quoted expression: "You can fool all the people some of the time, and some of the people all the time, but you cannot fool all the people all the time."

'In the course of Douglas' address he was sarcastic. He charged Lincoln with being nothing more than a saloon-keeper. Lincoln evidently forgot to answer that part until he closed, for he was no sooner seated than he rose, saying that he had forgotten to make reply to a portion of his friend's address. "Mr. Douglas has accused me of conducting a saloon at Springfield. That charge is true, but while I was delivering the goods from behind the counter my friend Douglas was receiving them on the other side." '

THAT last sentence gives away the case for Mr. Robinson. In the very first debate, at Ottawa, Douglas spoke of Lincoln as having kept 'a grocery' which at that time meant a saloon. Lincoln denied it, and I do not think Douglas ever repeated the charge. But I have been told the story by numerous men who profess to have heard it in places where the stenographic reports are silent concerning any such dialog. Certainly nothing of the sort occurred at Clinton.

Moreover, the statement of Mr. Robinson brought out reply from other elderly men who professed to have been present. Lincoln did not speak from the north side of the courthouse, they said, but in some other part of the square.

It is an interesting fact that when the seven towns where the Lincoln-Douglas debates took place undertook to mark the site of the discussions, old people who were undeniably present disagreed in almost every city as to just where the debates had occurred.

But what about these men who profess to have heard both Lincoln and Douglas in Clinton?

They are probably correct. Douglas spoke in Clinton on Tuesday, July 27, and Lincoln followed him more than a month later, and probably spoke in the same spot. Years went by, and the old men who as boys heard both speakers quite generally thought that both had spoken on the same day.

But perhaps the clearest testimony came from J. L. Hill, of Fletcher, Ohio, who wrote that as a boy he heard the speech, and was confident that Lincoln used those very words or words to the same effect.

Another explanation has been offered, which is that the words are not Lincoln's at all, but were brought out by P. T. Barnum, who declared that the people wanted to be humbugged, and who frankly set out to give them what they wanted. But this is quite another sentiment than that of Lincoln, who was not advocating humbug but protesting against it.

To my mind, the strongest negative argument is not that so few people remember hearing Lincoln say those words, but that, if he really said them at Clinton when Douglas was not present, he did not repeat so apt a phrase in one or more of the five remaining joint debates. He missed five excellent opportunities to use effectively an undeniably pat expression.

Nevertheless, I incline to the belief that Lincoln actually used those words and at Clinton. The evidence is far from conclusive, but it is not lacking in probability. It sounds like Lincoln, and the occasion alleged is one in which the words might appropriately have been used.

But if Lincoln never spoke this clever apothegm, then it would almost seem possible to fool all the people all the time; for all the people, virtually, believe these words to have been Lincoln's.

# The Evolution of the White House

By TOM EVERRITT

THE White House is an edifice whose historic associations give it uncommon interest.

Major Pierre Charles L'Enfant, a French army engineer who served in the American Revolutionary Army, selected the site of what he termed the 'Presidial Palace' in a report he made to President Washington on June 22, 1791. In that report he said: 'That where I determine the seat of the presidial palace, in its difference of nature may be view of advantageous to the object of adding (see footnote) to the sumptuousness of a palace, the convenience of a house, and the agreeableness of a country seat . . .'

The designation, 'Presidial Palace,' however, apparently was not to the liking of George Washington, Thomas Jefferson, and others who had to do with the selection of the location of the capital of the United States, for in all their correspondence and other writings upon the subject of the residence of the Chief Executive, the term, 'President's Home,' was invariably used.

When the District of Columbia was created as a distinct entity, entirely beyond the governmental jurisdiction of any state, two commissioners were appointed by the President for the actual carrying out of the local governmental necessities.

The records show that an interminable amount of quarreling and wrangling took place between the two commissioners of the District of Columbia, on the one hand, and Major L'Enfant on the other, in which contentions President Washington became involved, before a start was made upon the actual construction of the President's House. These bickerings had to do with the exact dimensions, the proposed architectural plans, and such other things as are involved in an undertaking of the kind.

Finally, on March 14, 1792, shortly after a preliminary survey of Washington had been made, the first active step, which gave any promise of accomplishment, was taken when an advertisement was directed to be published in several of the towns in the United States, informing that $500 in gold, or a gold medal of that value, according to the choice of the individual, would be awarded for the plan submitted and accepted before July 15, following, for the President's House.

At a series of conferences on July 16 and 17, 1792, President Washington and the District Commissioners analyzed the plans that had been received.

A young architect, James Hoban, of Charleston, South Carolina, was awarded the first prize, and chosen to accept a gold medal of the value of $60 and the remainder of the $500 in money.

The selecting of the precise location of the building created considerable difficulties. Major L'Enfant previously had staked out the dimensions of the building upon a considerably larger scale than the plans of Hoban provided for. This controversy

caused President Washington considerable annoyance; but finally he effected a compromise between the two plans.

One difficulty after another surmounted and one problem after another courageously met and solved, President George Washington, Grand Master of the Alexandria, Virginia, Lodge of Freemasons, on October 13, 1792, laid the first corner stone of the President's House. Of this, the records of that date recite that 'the Commissioners of the District of Columbia, accompanied by a numerous collection of Freemasons, architects and inhabitants of Washington and Georgetown, went in procession and laid the first corner stone of the President's House.'

The process of carrying to completion the extensive building program embarked upon by the District Commissioners was delayed from time to time by their inability to procure the funds necessary to the expeditious carrying on of the work.

The Government was removed to Washington from Philadelphia in 1800, and in November of that year, President and Mrs. Adams moved into the uncompleted President's House.

It appears that nothing of extraordinary interest occurred in and around the President's House until August 24, 1814, when the British Army captured Washington, entering the Capitol grounds about six o'clock in the evening. The President's House, the Capitol, the Treasury, the State and Navy buildings, and many private homes were burned that night by the British.

The walls of the President's House remained standing, so that all that was necessary to restore it to its original design was to reproduce the interior, which required more than four years.

Upon completion, the exterior of the entire structure was painted white completely to efface the smoke stains which resulted from the fire. The President's House then became the White House.

The White House was thrown open on January 1, 1818. The beautiful south portico was added in 1823, and the north portico about 1829. Gas lighting was installed in 1848, and a heating and ventilating system was put in during 1853.

On June 20, 1902, the Congress decided completely to renovate and restore the building, and on that day appropriated money for that purpose, which included the wings on the east and west sides. The work was completed within a few months.

*(The above is the literal translation of L'Enfant's report to President Washington.)*

# From the Ground Up

*(Concluded from page 2)*

*power* is the best plane, but to add horsepower in an airplane to get increased performance is only kidding oneself.

There are many ways in which the future plane will be improved, aside from the engine itself. The first will be by better wing curves, giving greater lift per square foot than at present. This will enable the planes to be built lighter, and every pound saved in the weight of the plane means a pound more load or fuel that can be carried. This lightness will be obtained with even greater strength by the use of metal construction instead of wood, although in a small plane these ships may still be cloth covered.

After better wing curves and lighter structure will come lessened resistance by the elimination of parasite resistance by the streamlining of all parts and the bringing of all structural members inside the wings. This will make a tremendous difference in performance.

No one knows today what the future publicly owned airplane will look like, but the eventual plane will be capable of a great variety of uses, on land or water, or as a car on the road. This is not within the vision of the airplane engineer today, but is bound to come. The public has the picture in its mind and is going to be able to pay for it when the time comes.

There is a difference, however, in giving the public what it wants, as against what it thinks it wants. Most of it thinks it wants the helicopter which will go straight up; but if it knew the liabilities involved from such a design, from the standpoint of safety alone, to say nothing of operating costs, it would quickly change its mind.

What really is wanted is a plane that will take off out of an ordinary vacant lot with at least fifty per cent power to spare, and which can land in half the space in which it can take off.

The amount of power required to lift a load also depends on the slant of the inclined plane up which you drag the load. If you are content to climb at a 30-degree angle from the ground, you are well within the range of complete safety and normal economy as far as horsepower is concerned.

If that same load had to be lifted straight off the ground with our present type of equipment, at least 1,000 horsepower would be necessary to lift one man, and if his engine stopped, there would be no means of letting him down safely.

The present-day airplane has become almost completely safe in that regard, for when the engine stops, one merely picks a field and lands. Even over the Sierras in the West, with planes that land at 55 miles an hour, the Air Mail has not had a fatality in six years of almost daily mountain flying.

Aside from the small privately owned planes, will come transatlantic and transpacific monsters. These will be boats fitted with three or more engines and with staterooms and the like, as in a modern yacht. Most of the passengers and load will be carried inside the wing itself, rather than out in any exposed body section.

The heavy-lift type of machines will, for the most part, be monoplanes at the one extreme, or multiplanes having a lot of wings like a Venetian blind; the one for speed, and the other for load capacity.

# Prohibition in Mr. Mellon's Own State

(Concluded from page 7)

idea which has gained wide credence that the Federal Government is impotent to enforce prohibition, a state law enforcement officer submitted the following memorandum to Governor Pinchot, of Pennsylvania, bearing on this point:

'For over fifty years the federal statutes have placed in the Treasury Department (specifically upon the Internal Revenue Commissioner and his subordinates) the duty of collecting taxes upon manufactured liquors and alcohol, and preventing their illegal manufacture. During this period, and principally after the breaking up in 1876 of the "whisky ring" which had practically controlled the Government for some years, a wonderful system was worked out by statute and regulations for supervising and controlling the manufacture of all kinds of alcohol and alcoholic liquors and for the collection of taxes on these products. A system of supervision and control so efficient that liquor tax evasions were almost impossible, but, if going on, certain of detection which would result in punishment of those responsible for them.

'For years before the adoption of the 18th Amendment, the law enforcement officers in the Internal Revenue Bureau were out of politics and its morale so high that the thought of having revenue agents on his trail struck terror into the lawbreaker and kept all but the most foolhardy from even thinking of operating in their field.

'By that act, which could of course be greatly strengthened, Congress gave the Internal Revenue Commissioner ample powers for enforcing the 18th Amendment, closing the great supply of illegal poison drink, and preventing any appreciable quantity of such liquor from reaching the retail trade.

'By that I mean that soon after the National Prohibition Act was enacted, the provisions for stopping liquor lawbreakers became dead letters and unused; politics crept into the Revenue Bureau group; its traditions were swept away; old tried agents were allowed to resign or were dismissed and its morale was gone. The liquor criminals saw this and quickly came to have no fear of federal law or its enforcement which for generations before, as was never better shown than during the Great War, had proved destructive to such lawbreakers.

'Congress since 1868 had by specific statutes, which are still in force, clothed the Internal Revenue Commissioner and Secretary of the Treasury with almost unlimited powers to prevent liquor tax dodging; and in the National Prohibition Act gave additional power to the Internal Revenue Commissioner to adopt regulations, if approved by the secretary, for preventing, through the permit system, violations of the 18th Amendment. But these powers also the Internal Revenue Commissioner and his assistants have wholly failed to use as they should to prevent violations of the National Prohibition Act and enforce the 18th Amendment.'

The rule of politics in prohibition enforcement is complete and undisputed. When state enforcement officers who know and have reported to Washington the alleged illegal character of business being transacted by persons and companies which they name, see these supposed lawbreakers continue to bask in the favor of the Washington authorities, and federal authority for their activities extended rather than curtailed, the adverse effect on the morale of the whole enforcement system is apparent.

THE Internal Revenue Commissioner's report for the year ending June 30, 1925, shows the ever-increasing rise in this flow of poison and illicit beverage producing alcohol. Since the end of the fiscal year 1921 the production of denatured alcohol in the country has risen from less than 22,390,000 gallons a year to a grand total, in the year ending last June, of more than 81,800,000 gallons. And during this time specially denatured alcohol production has gone up from less than 17,153,000 gallons to more than 34,820,000 gallons; but completely denatured alcohol has leaped from less than 16,194,000 gallons to the enormous production last year of more than 46,983,000 gallons. And to sell and use this completely denatured alcohol *no permit is required after it is manufactured,* which has afforded and does afford today an unparalleled opportunity for alcohol diversion to the bootleg trade.

For example, the Consolidated Ethyl Solvents Company, indicted in 1925, and with an assessment of more than $458,000 levied against it for diverting alcohol, was alleged (prior to 1925) to have sold in less than five months more than 590,000 gallons of completely denatured alcohol to two small so-called 'supply' concerns with no evidence of doing much of any business.

Quoting further from Governor Pinchot's Department of Justice report on the Pennsylvania situation:

'When lawbreakers hold federal permits, the illegal ring results; distillers furnish alcohol to denaturers and wholesalers; and they in turn supply manufacturers of alleged hair tonics, tobacco and disinfecting sprays and toilet waters, and also fake supply houses. And these last named manufacturers and fake houses are even furnished directly by the original producer of alcohol without his working through the denaturer or wholesaler. Thus the crooked alcohol rings are found operating, as the grand jury report stated.

'And finally, the permittee manufacturer of toilet waters or tonics or sprays completes the vicious circle by using a "cover-up house" to conceal his diversion of alcohol in the bootleg trade and retail customer. A "cover-up house"—of which there are many notorious ones in Philadelphia well known to the Internal Revenue Agents—is an alleged buyer of manufactured alcoholic preparations whom Government agents during days and days of shadowing find never to receive any of the alcohol products claimed to have been sold it.

'The bold way in which these violators operate is shown by the following statement in the United States grand jury report referring to a "cover-up house" in New York, to which a large permit holder claimed to ship most of his alcohol:

> We had the manager of the New York 'cover-up' house before us. He testified that in turn he ships it (the preparation) to Cuba and it is there used to disinfect the theaters and streets.

'These "cover-up houses" generally do business with only desk room or small office space. Each of these alcohol rings under the cloak of the federal permit makes a vicious circle in which the bootlegger coöperates to put poison drink into the consumer's hands.'

Take this example from Philadelphia, where more denatured alcohol was produced and withdrawn for use the last year, ending June 30, than in any entire state of the nation except Maryland, Louisiana and Illinois:

The Publicker Commercial Alcohol Company, of Philadelphia, under a federal permit produced more than 8,750,000 gallons of alcohol in 1924, and in 1925 more than 10,849,000; itself denatured over 75 per cent of this alcohol, sold most of the balance to others for denaturing, and in 1924 paid a tax to the Government *on less than 800,000 gallons.* In 1925, out of the nearly 11,000,000 gallons produced, it *paid a tax on less than 743,000 gallons.* In less than five months of 1924, the Publicker Company sold over $210,000 worth of pure alcohol for denaturing purposes to the Consolidated Ethyl Solvents Company, indicted last summer for violating the law. The latter company is said to have been caught shipping pure alcohol, and an assessment was made against it last spring to collect over $458,000 for evading Government taxes.

THIS same Publicker Company (state officers assert) had sold during ten months to Henry J. Trainer, a bonded dealer, with a federal permit in Chester, Pennsylvania, more than 296,000 gallons of specially denatured alcohol, and all except two of Trainer's forty-three customers with federal permits, during those ten months, were alleged by federal agents of the Internal Revenue Commissioner or state officers to have violated the federal law, some being later indicted. It was also charged by the state officers that shipments of alcohol by barrel to H. J. Trainer often never left the wharf of the Chester Shipping Company which carried them from Philadelphia; but on that company's wharf at Chester, Trainer's clerks relabeled full barrels and then shipped them back to Philadelphia, at times by the same boat which brought them.

Though thirty-six of Trainer's customers were alleged to be violating the law and permits of eleven of them have since been revoked, yet he and the Publicker Alcohol Company still go on. The records show that the latter concern produced more than 10,849,000 gallons of alcohol this past year and more than 1,099,000 gallons in December, while the Swanson Chemical Company (of which Trainer is president) was granted in October, 1924, a basic permit to denature alcohol. The Trainer family has long been prominent in politics in Philadelphia and for more than forty years in the liquor business there.

# More People Ride on Goodyear Tubes

The job of the tube is to hold the air. Goodyear Tubes are built and tested to do that job better than other tubes you can buy.

Goodyear Tubes are built up layer upon layer, of pure gum. And they are water cured—the latest and best method ever devised for curing tubes. It insures absolute uniformity throughout.

And, to still further guard against any porosity, leaks, or "pinholes," Goodyear Tubes are subjected to an unusually severe water test—inflated under water until the strain put on the tube is fully equal to that in actual service.

There is a Goodyear Tube to fit every tire and every pocketbook. Goodyear "Heavy Tourist" Tubes represent the highest standard of tube quality. Also of Goodyear quality, but costing a little less than the Heavy Tourist, is the "Regular." And for those who want big tube value at a popular price there is the Goodyear-made "Pathfinder."

In any grade, at any price, there is more trouble-free, economical mileage in a Goodyear Tube. That is the reason why more people ride on Goodyear Tubes than on any other kind.

HEAVY TOURIST TUBES

# A Man Who Lives by What He Sees

(*Concluded from page 17*)

impression on the copying sheet from that actually produced. It was obvious that the carbon copy in evidence could have been made only through a sheet of the thinner, second-page paper. Presumably, the man used such a sheet to avoid wasting a piece of his expensively engraved paper. His thrift on this point proved his undoing. The evidence against him was so scientifically exact that he was forced to acknowledge his original letter and live up to its promises.

This document student once solved a queer little riddle by noticing a man's number habits. Heirs of a well-to-do man had received a long statement, containing hundreds of figures, from a storekeeper for goods declared to have been bought by the head of the family shortly before he died. The heirs had a strong suspicion that the bill was fraudulent. When the expert received the ledger account for inspection, he noticed that the many charges showed frequently recurring figures in the same groups:

| | |
|---|---|
| $ 37.64 | $764.82 |
| $113.76 | $198.37 |
| $ 95.21 | $ 80.53 |

'The bill is probably bogus,' the expert declared. 'It is highly probable that no such goods as mentioned here were bought. If fictitious, the items had to come out of somebody's head. If you'll bring me a telephone directory of the town where this storekeeper lives, I think I can show you the key.'

He then pointed out the conspicuous recurrence and sequence of certain figures. Three was invariably followed by seven, seven by six, and six by four.

'You might find,' he suggested, 'that this man's telephone number, or perhaps his house number, contains figures in the order found so frequently in the ledger. At any rate, that order of figures seems to have been so firmly fixed in his mind that he uses them much more than would be accounted for by mere chance.'

The guess proved to be not far from correct. The storekeeper's home phone was 764-J. He had unconsciously prefixed this number with a favorite figure—three. In due course he was sentenced to a prison term for his attempt to obtain money by fraud.

This keen observer long ago noticed that in books printed in England a period and a decimal point are not the same. The period is placed on the line, but the decimal point above the line. He had also observed that English accountants frequently use a decimal point for either purpose, and put their periods higher than the average person does. Having noticed all this, he tucked it away in the back of his head. Years later he was able to tell, after a two-minute examination, that an anonymous letter probably had been written by an English accountant. He knew this just from the periods! They were too high for American periods.

Likewise, this man once identified the writer of a forged letter by first learning that the author was probably an Italian. He thought this because, though the man wrote a good hand, he made a terrible botch of the job every time he undertook to form a 'k.' There is no letter 'k' in modern Italian.

# Where Early Christians Worshiped

(*Concluded from page 15*)

part of the Fourth Century, probably before the year 375. Whether an earlier church or other ruins lie farther down will be shown by future excavation.

If the vicinity was formerly occupied by private residences, the metropolitan church reasonably represents the oldest and strongest ecclesiastical organization of the region, in all likelihood that founded by the preachings of the Apostles Paul and Barnabas.

The two Apostles, spreading the gospel in Asia Minor, arrived at Pisidian Antioch, as described in the thirteenth chapter of the Book of Acts. Here they were at first cordially welcomed by the Jews, but shortly thereafter the Jews rejected their teachings and incited persecution against them. Paul then made the decision that laid the foundations of the church as it is known today; he turned from the Jews and addressed himself to the Gentiles.

*One of the numerous well-preserved architectural fragments unearthed by the expedition.*

The hostility of the Jews would have denied converts a public meeting place, forcing them to take recourse to some private dwelling. Such a location may have been later supplanted by a church, to be in turn replaced by the splendid Fourth Century edifice when the congregation grew stronger. Still later, the basilica was erected above the church on the consecrated ground.

The mosaic floor was left exposed only a short time, with a guard, but natives caused irreparable damage by attempting to destroy it. It has been recovered pending further excavation.

Our digging has not yet located the earlier Greek Antioch, though a few Greek inscriptions and a Greek 'Victory' statue of that period have been discovered. The latter in delicacy of conception and workmanship will undoubtedly take a high place among statues of its type. The greater part of our finds have been of the Roman and Byzantine periods, particularly of the time of Augustus (27 B. C.—A. D. 14). The other most important piece of sculpture discovered was a beautiful head of the Emperor Augustus in white marble. Although the nose is missing, it ranks among the most important portrait busts hitherto brought to light.

Our excavations furthermore disclosed the arrangement of Antioch as a city. On the very summit of the hill on which Antioch lies was what might be called a civic center. First was a large paved area surrounded by shops which an inscription names the *Tiberia Platea* or Square of Tiberius (A. D. 14-37). At the east end of the square a stairway of a dozen steps, some seventy feet long, led to another paved square, that of Augustus.

On the stairs and the square below great masses of sculptural and architectural pieces were piled together. Enormous cornices, architraves, voussoirs, and slabs of sculptured reliefs lay about in confusion. Several reliefs represented winged genii holding festoons; others depicted Pisidian chiefs, cuirasses, shields of various forms, quivers, swords, spears, and even war galleys. Drums of engaged Corinthian columns and magnificent Corinthian capitals have been unearthed. Even the bases of the arch piers have been indisputably located. The facade of the three arches was decorated with four engaged columns. On the blocks in front of these were incised the famous 'deeds of Augustus,' of which more than two hundred fragments were found, and in front was a fountain.

Water pipes in ancient Antioch were found so well made that today, after nearly 2,000 years, they are still capable of holding water. Indeed, the drainage and water supply of Antioch was better than that of many modern cities. The aqueduct carried water over arches and through tunnels from the mountain side six miles distant.

Behind the Square of Augustus rises naked rock into a flat summit, where we found the Romans had chiseled a huge semicircle, hiding the rough surface with a beautiful two-storied colonnade. With its cellar wall on the front axis of the semicircle, we found the most imposing edifice yet uncovered at Antioch—a temple to Augustus.

A searching investigation of the almost complete number of blocks found enabled the expedition's architect to reconstruct the design in detail. Parts of the four Corinthian columns of the portico were found. There were long architraves with a delicately carved astragal at the top of each band; a frieze of extraordinary bulls' heads, bound together by garlands of leaves and fruits; scrolls and floral ornaments between the pilaster capitals; and other parts.

This temple was of a richness and refinement rarely achieved by Roman architecture. The massiveness of Rome was combined with the delicacy of Greece to produce a dazzling masterpiece. Mason's marks in Greek prove that the workmanship was Greek.

Of coins, lamps, pieces of pottery and household utensils, we found a great number, in addition to several more inscriptions. We also discovered another, and still later, Byzantine church.

To say that our expedition was successful is conservative; any one of the important monuments would have been ample reward.

Ancient Antioch still holds an infinite number of valuable finds, which will be the objective of another expedition already being formed.

Those who have the interests of art and archeology at heart cannot afford to overlook such a rich treasure house.

# James Russell Lowell

(*Concluded from page 13*)

of nun, vowed to no less a bridegroom than Christ. So I got a shock when her betrothal to the young farmer was announced: I would as little have expected Miranda to marry Caliban. But Lowell appeared to be not only acquiescent but delighted with the match; and the young farmer became prosperous, and the brand of sausages that he sold all over the country was immensely profitable. Was it another case of the Biglow Papers—a vicarious consolation to Lowell for the sterilization wrought in him by Cambridge culture? So far as I ever knew, Mabel was very happy with her husband, and I'm sure he was the best of good fellows in the intervals of his sausage-making.

Lowell had visited Europe for a couple of years, previous to taking the chair of belles-lettres at Harvard, in succession to Longfellow. That was in 1855; from 1857 to 1858 he edited the *Atlantic Monthly*, and afterward the *North American Review*. Then the Government appointed him minister to Spain, and afterward to England. So his long and honorable services to literature and learning had their reward; he had realized whatever success and happiness were possible for such a man, and when he was superseded in 1880, he returned to the old house at Cambridge, a vigorous man of sixty-one, broad-shouldered and active, his full beard only a little grizzled. He lived about ten years longer, content among his books, writing a little, cordial to his surviving friends. Women were fascinated by his appearance and his chivalrous manners. He was poor in money, but rich in spite of it.

I HAD renewed my contact with him during his official residence in London, and witnessed his complete conquest of the British: there have been many 'best' after-dinner speakers, but Lowell was enchanting; his aspect, his voice, his wit, point and skill, his warm friendliness, made him incomparable. He represented his country with full manliness and sincerity, but he was loved on his personal account as much as he was respected as an ambassador.

He told us once how, invited to an important dinner, and delayed by a cab accident, he had hurried up the steps of the Mayfair mansion, and hardly waited to be announced before entering the dining room. The twenty guests were already seated; when the host rose to greet him, Lowell realized that they were strangers to each other: the entire assemblage was unknown to him. What a predicament! But they all knew the distinguished American: the host laughed at his apologies, and insisted that he remain; the guests rose and cheered him; and, 'Speech! Speech!' I should like to have heard him on that occasion; he himself could not recall what he had said; but he observed with a smile, 'I find, in looking back, that my best epigrams have usually been confided to the back of the cabby who was driving me home afterward.'

I like most to recall, however, the hours I was privileged to spend alone with him, before the log fire in his spacious library at Elmwood. My mother had suggested, in view of our anticipated removal to Dresden, that he give me some insight into the German language and literature. He consented so to honor the son of Hawthorne; but I can hardly imagine that my mother really expected me to acquire any practical familiarity with German from those interviews; and as a fact, what I did learn was Lowell himself—as much of him as a boy could comprehend; and he gave me generously whatever he thought I could assimilate. Ostensibly, we read Goethe's *Faust* together. In reality, he read and I listened; but after an hour with the book, he would close it, and fall into conversation. It was like being led through a land rich with beauty and wonder; he understood boyhood, and treated it with candor and gentleness.

I WAS, at that time, more devoted to athletics—walking, running, and rowing in the Harvard crew—than to the college curriculum; and he, far from chiding me for remissness, entered heartily into discussion of physical culture, and, since there was not much to be said about my brains, cordially admired my brawn and muscle. Then he would tell me tales of the world into which I was about to enter, and now and then, as by inadvertence, something of the philosophy of human life. He would lead me to express my opinions and outline my experience, and then, without commenting upon them directly, would say things which I was afterward to recall for their critical significance.

Sometimes, as we sat in the firelight, he would bring forth strange objects of art and interest, brought perhaps from foreign parts by forbears of his—by the traveler and connoisseur John, perhaps: a concentric sphere of ivory from China, five or six, one within the other, and all carved miraculously with figures and designs, the slow work of a lifetime. He had a marvelous set of chessmen, too, tall figures of men and animals in ivory, tinted after life, refined to an eyelash; two little armies to face each other in endless conflict. They were ancient, made for some monarch of a date older than Europe. Books he showed me, too, though he was no book-collector in the professional sense. These were volumes of the personal sort, not to be bought nor replaced by money, which spoke to him not more through their printed contents than by the friends and associations which they recalled.

AS far as his library was general, record of it may be found in his own writings; and some of his finest work has been in the way of literary criticism. He had the faculty of conveying perceptions which do not commonly lend themselves to words; it is a rare gift, enriching the reader he knows not how. The room itself in which we sat was eloquent, shadowy and mellow with the musings of many years, when, as he says in one of his meditative verses, reviewing the events of his life shortly before his country called him to her service, and when he could show, in place of the grand argosy that his youthful hopes had imagined, only 'a fleet of paper ships,'

'Well, maybe more love with the less gift goes
I growl, as, half moody, I toast my toes!'

But the argosy came to port, full-sailed, before the end.

# The West Has More Cowboys Than Ever

(Concluded from page 5)

changed the entire character of the West. The people of the East discovered that they owned the public lands in the West just as much as the cattlemen did, and through the Forest Service they took them over and began to administer them. A code of rules was drawn up for the use of the public range. Each rancher was given a permit to run his stock on the land, and he was allotted a certain general district as his range.

Thus a new kind of West, as far as ranching was concerned, was built up. The result is that today it is an empire of small ranchers, a republic instead of the old monarchy of the big operators. Each of these ranches must have cowboys, and they always will have cowboys; and the work of the cowboys has, so far, remained virtually the same. Sometimes they are the sons of the ranchers; again the size of the herd necessitates the hiring of outsiders.

THERE is nothing particularly romantic or adventurous about their work. During the summer, some of them go into the hills with the herds. The best beef comes from contented steers, and it is the job of these cowboys, who really are cowherds, to keep the steers together, to move them as gently as possible from one good place to another, to see that they do not have to travel far for water, to keep salt on hand, and in every way to conserve the strength of their charges so that they may wax fat instead of becoming lean and stringy.

Others must keep the corrals in repair, must take care of the horses. When colts are to be broken, they do it. If the ranch owns hay lands, these must be irrigated, the hay must be cut and stacked. On the big ranches the breaking in of the bronchos used to be an event of importance, and competition among the cowboys for riding honors ran high. This affair was called a rodeo. It was natural that the cowboys of neighboring ranches should hold their rodeos together, and that each would try to outdo the other. From this has come the modern rodeo.

The rodeo of today is almost entirely synthetic. Most of the horses are not actually broken at the rodeo, but are trained to buck: many a favorite bucker at the rodeo does prosaic work the rest of the year; others are kept by the cowboys just for this event.

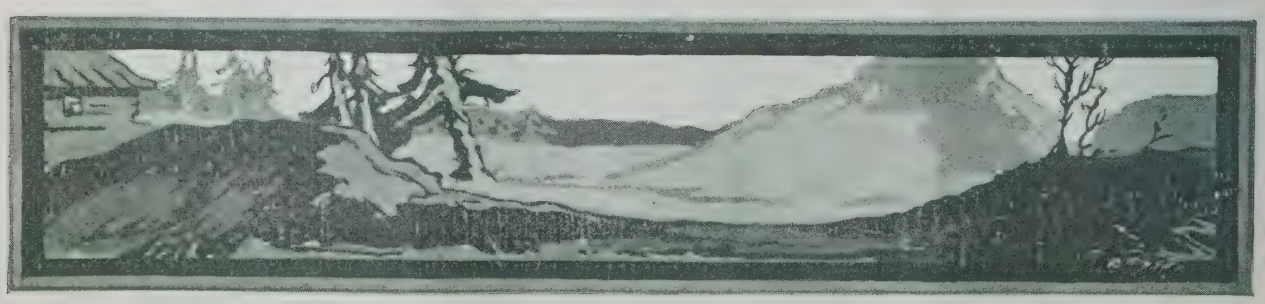
The dress of the cowboy has changed little since the early days. The reason for this is that all of the trappings familiar to patrons of the motion pictures are not only practical but necessary. I am informed by cynical individuals that the cowboys wear such things as chaps and high-heeled boots only at the tourist centers. While it is true that the cowboys are beginning to become self-conscious, they can hardly afford to be self-conscious at the current prices of such trappings. While none of these things need be fancy, they are expensive in their plainest forms and since the cowboy is proud of his equipment and takes excellent care of it, it is natural to add a few extra trimmings at a small additional cost.

The average cowboy, no matter how poor he is, will never pay less than seventy-five dollars for a saddle, and the average is closer to ninety. Chaps run from twenty dollars to a hundred.

Chaps are of two general styles: the 'stovepipe,' which is simply a barrel of leather like the leg of a pair of pants, and the bat-wing, which snaps around the leg and has a wing which extends far to the rear on the outside. The material may be heavy leather, or it may be leather covered with the skin of the Angora goat with its long, silky wool. This wool, which is strikingly beautiful, usually is left in its natural white, but some is dyed black or in such popular colors as orange, red, yellow, and combinations. The leather chaps may be plain or trimmed with tooled or white designs on black. Some are finished with silver or nickel trimmings.

All cowboys wear chaps, and since these things are expensive and most cowboys are poor, there must be a good reason for them. In the cactus, sagebrush and buck-brush regions of the Southwest, breeches or pants are torn to tatters in a few days without the protection of heavy chaps. Last summer I rode for a month in this type of territory in Arizona, and as steep, rough trails required some dismounting and walking, I wore very heavy breeches. But at the end of the first day they were so badly ripped that I had to wear chaps thereafter. Later I met a Forest Service man who had been riding in breeches for several days, and the breeches were in ribbons and the rider in ill-humor.

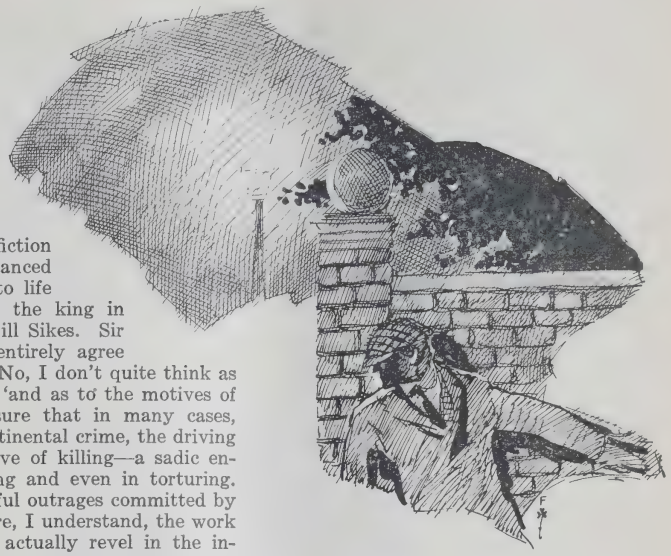
CHAPS make riding possible in such regions. The riders do not follow paths or trails; they ride at top speed through the worst kind of brush. In the northern Rockies there is not so much brush interference, but chaps are necessary there as well. They are warm in cold weather and cool in hot, and their economical side recommends them.



Any kind of pants may be worn under chaps. The constant friction against the stirrup leathers would ruin them, even in the absence of outside interference. Furthermore, the chaps take up much of the motion of the horse, thus greatly assisting the rider. Obviously, the plain leather chaps are more popular in the South, the wool ones in the North.

High-heeled boots are as much a part of the cowboy's outfit as his saddle is. These boots are narrow toed, the instep is highly arched, and the heels, powerful at the base, taper abruptly from the rear to the size of a half-dollar. The Westerner rides his horse hard. He uses ring stirrups and he rides the stirrup in his arch, not on the ball of his foot. He must have a powerful grip on the stirrups, for he does all of his work—riding brush, crossing ravines at full speed, roping animals—standing up. Thus he wears boots that fit his job.

COWBOYS wear blue denim trousers—not overalls—and these are made of the stoutest material and are copper-riveted at all points of tension. Oddly enough, one of the striking characteristics of the cowboy's dress is seen only in motion pictures and on the covers of magazines. That is the colored neckerchief. The cowboy is not given to fancy additions that serve no purpose. Visitors from the East, 'all dressed up' in cowboy clothes, can be spotted a mile away by these glorious bits of silk.

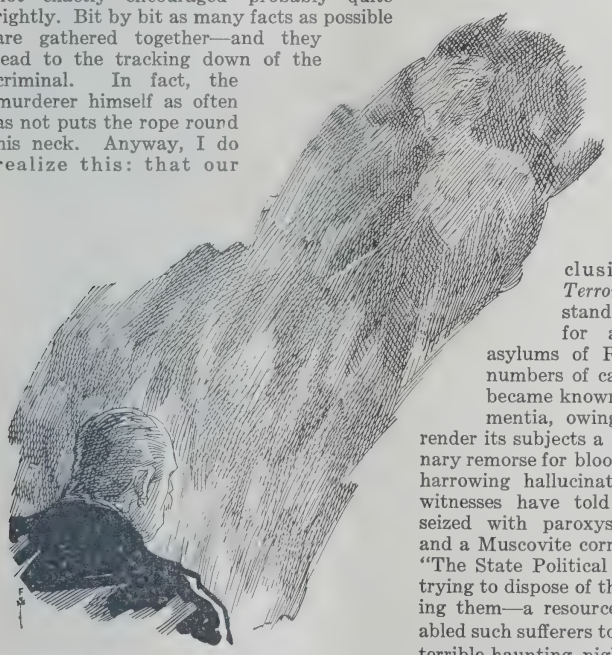


Although the cowboy has changed little in appearance since the early days, and his job is much the same now as it was then, the growing civilization of the West, the standardization of the American small town by radio, the motion picture, the cheap magazine and the palace of sweets, has had its effect on him. He no longer 'rolls his own' with one hand, for he prefers the factory-made cigaret of a cheap and popular brand. He does not blow into town and shoot up the main street by way of diversion, any more than does the Iowa farm-hand dash through town on a plow and throw hunks of sod at the store windows.

When the cow-hand comes to town he usually comes in the ranch flivver and he wears a white collar and a suit of clothes of popular and standardized cut. If he wears any of his working clothes it is his boots, or his big hat if it is new and clean and presentable. But ordinarily you couldn't distinguish between these cowboys and the usual Saturday evening visitors to any small town in America.

# The Psychic Side of Crime

(*Concluded from page 3*)



Jonathan Wild, for example? He was much that type of offender; and there must be others.

'. . . Where does the idea of a story come from? I can't say. An idea—a crude idea—bobs up from the unconscious; then perhaps the reminiscence of something read somewhere, or a memory of something heard from somebody; and gradually, spontaneously, the rough notion weaves itself—weaves *itself*—into a story.

'As I've told you, in several of the Sherlock Holmes stories, the crimes are no crimes at all!

'By the way, it may interest you to know that several times I've been "called in" on mystery cases, and I've applied the methods of Sherlock Holmes with some success.

'I don't know much in detail about the ways of our Criminal Investigation Department, but I gather that imagination is not exactly encouraged—probably quite rightly. Bit by bit as many facts as possible are gathered together—and they lead to the tracking down of the criminal. In fact, the murderer himself as often as not puts the rope round his neck. Anyway, I do realize this: that our police methods are most efficient.

'Have any of my tales got me into trouble? No, no, why should they? But I did get into boiling hot water because I sent Sherlock to his death over that precipice. I had many letters absolutely abusing me for killing him, one from a lady I remember bluntly began: "You brute!" And now and then I've had criticism from experts. There was the case of the story—a racing tale—about "Silver Blase," a turf expert reviewed it in one of the sporting papers; he said that I'd made all my characters behave in such a way that they'd have all been either in jail or "warned off" !'

We talked about the callousness of murderers as distinct from the remorse with which they are almost always endowed in fiction and drama. I instanced as quite untrue to life the characters of the king in Hamlet and of Bill Sikes. Sir Arthur did not entirely agree with this view: 'No, I don't quite think as you do,' he said, 'and as to the motives of murderers, I'm sure that in many cases, especially in Continental crime, the driving power is sheer love of killing—a sadic enjoyment in slaying and even in torturing. Many of the fearful outrages committed by the Bolshevists are, I understand, the work of wretches who actually revel in the infliction of pain. These brutes delight in torturing men and women to death, *but* many of them are themselves tortured with remorse. They die mad, raving, unable to sleep, haunted by the apparitions of those they have killed.

'The last revenge of the helpless, outraged human is the psychic revenge. The evidence on this seems to me to be conclusive. In *The Red Terror* Melgonnov says: "It stands beyond a doubt that for a while the lunatic asylums of Russia registered large numbers of cases of a disease which became known as Executioners' Dementia, owing to its tendency to render its subjects a prey to real or imaginary remorse for bloodshed and to the most harrowing hallucinations." Similarly eyewitnesses have told of these men being seized with paroxysms in public places; and a Muscovite correspondent once wrote: "The State Political Department has been trying to dispose of these madmen by shooting them—a resource which alone has enabled such sufferers to find release from their terrible haunting nightmares." In another place one of the Cheka officials is described as crying out: "All night the dead men keep torturing me" . . . You see,' Sir Arthur concluded, 'I keep chapter and verse for all psychic things.

'My views upon capital punishment,' he said 'are due to my psychic beliefs. They arise from those beliefs. When we hang a murderer, or other scoundrel, we send an evil spirit to the next world, the other world; and that spirit can communicate with us—can suggest to us, or to some of us, the commission of sins, can prompt us to evil deeds. We may really be enlarging his field of activities. Don't you think that here we may have the explanation of the repetition of crimes, which is so frequent and striking? One murder is often followed after no long interval by another of like character. *Think*—'

I have thought, and am still thinking. This suggestion is at least worthy of sincere consideration and strict examination. If it is accepted that there is another world and that the spirits of the departed can and do communicate with us who still live here—and if Sir Arthur's suggestion should be proved to be fact—should we not have a rational explanation of all the many forms of belief in good and evil angels, the ministers from 'beyond' who prompt men and women to good and evil? Would not a bright light be shed into many dark places?

In addition to the psychic point of view, Sir Arthur pointed out that to familiarize the public mind with violence on the part of the law is scarcely the way to discourage violence in their own thoughts. He remarked that capital punishment was in practical or actual abeyance in half the countries of Europe and that the murder rates in these countries was not higher than in our own.

'The great thing,' he said, 'is that the law should be rigidly enforced, with no possibility of relaxation or escape. That is what is wrong with America—there are far too many loopholes of escape. Death on the scaffold has something dramatic, which appeals to certain minds; "I'll swing for you!" he says. But a life in a drab, dingy atmosphere, away from all life's pleasures and vanities, is very different. I think the *certainty* of that would be more appalling.'

Yes, indeed, I came away with much food for thought—and, on certain points, for disagreement.

# Are Soldiers' Rights Safeguarded?

(*Continued from page 6*)

That was why he inquired for instructions. There, without being given any opportunity to explain his case at all, he was placed under arrest almost before he knew it and accused of being absent without leave. I am saying accused, because they were put through all their ensuing torture without having any charges preferred against them, nor being allowed to explain their cases and proceed to their organizations.

'Prisoners were usually detained at the Ste. Anne's Hotel about one day, when they were transported in trucks to the Bastile. However, on one occasion nine men were forced to stand on the roof of this hotel two days and two nights. If they faltered or fell from exhaustion, they were beaten up by the military police under officers' orders.

—*Press Illustrating.*

*Yankee displaying five of his German trophies.*

'The prison used by the American Expeditionary Forces at Paris is a big stone building, inclosed by a strong wall about 15 feet high. It contains many tiers of stone cells, each cell with a padlocked iron door. The cells are small holes in walls strung along dark halls. Each cell has only a single cot.

'Two men and often three were forced into a single cell. Four men have been confined in a single one of these cells. In one instance the fourth was compelled to sleep on the floor without a blanket. The men were herded to their cells by a general prisoner by the name of Cohen, who shouted, "Get in your holes, you rats, or you're out of luck."

'The guards were a hard lot. One night three of them were playing a game of cards. They got into an argument and one of the guards accused another of something and said he had a good mind to shoot him. The fellow dared him to shoot, and the guard then pulled out his gun and killed the other two. This shows the type of men that were chosen to confine men who were some of America's noblest fighting heroes. The military police were apparently under the influence of liquor most of the time.

'When the soldiers entered this prison, they were listed as prisoners and subjected to prison regulations. They were compelled to surrender their leggings and all personal belongings, including their money. All during the procedure the soldiers were roughly handled, sworn at and reviled with unprintable language.

'One night when a bunch of soldiers were brought there and were waiting in the guard room to be assigned to cells, a soldier did a trivial thing. A noncommissioned officer ordered a sergeant to hit the man. The sergeant in the most casual manner reached over and hit him on the head with a club. It was a common thing at night to hear men groaning. When anyone inquired what was the matter, he was told that the men were being beaten by prison guards.

'One man, charged with a theft of something like 80,000 francs, about $15,000, escaped from the prison. The first night of the day of his capture he was beaten into unconsciousness and then revived with cold water and beaten again. This treatment was kept up for three days. The man went about the Bastile with his face all bandaged up and looked like a human wreck.

'One night about ten o'clock a negro was beaten all the way down the hall to his cell and one of the men beating him was heard to say, "You will try to kill a white man, you black ———." "The cries of the negro were frightful," reads a report.

'Men were ordinarily kept here only one day. However, on one occasion about five or six men taken to the prison in a "detachment" of prisoners were held there for sixteen days because their papers had been lost by the military police. During the entire sixteen days of their confinement in the prison, these men tried every way they could to have an interview with an officer, but were refused. At last, in a general check-up of the number of prisoners, it was found that there were five or six more than were accounted for. There were in the neighborhood of a thousand soldiers in the place. It was thus that these men were discovered and sent to Farm No. 2.

'In the case of one man who had been in France only a week before his arrest, I understand that while changing trains at Paris, during a necessary wait of a few hours, he became slightly affected with drink, was noticed by an American military policeman, picked up and sent to Ste. Anne's Hotel. He was held in the prison for sixteen days, then sent to Farm No. 2 for sixteen days, and finally spent six days at the stockade. This made a total of 38 days. He had arrived in France, November 12, 1918, the day after the Armistice was signed, and on the twentieth he was a prisoner. Sent to France to fight for the world's liberty and democracy, in the two months he had been there, he had been free only eight days! The rest of the time he was a prisoner with no charge brought up against him.

'Farm No. 2 was then run by Company K, One Hundred and Fifty-Eighth Infantry—of the Fortieth Division. Lieutenant Smith was the officer in charge. This lieutenant was known as "Hard Boiled Smith"; in fact, he boasted of it before the men when giving exhibitions of his criminal brutality. Farm No. 2 was a French farm outside of Paris used by the American Army as a prison camp. There were many stables, three-quarters of which were used by the men of Company K, which numbered about 250 men. The other quarter of the stables was used for the prisoners, who sometimes numbered as high as 1,200 men. These men were quartered in something like ten stalls, each about the size of a two-horse stall, and a loft just above these stalls. Those who remained in the overflow were put in pup tents in a small yard. About sixteen men slept in a single stall. For the 1,200 men there was but one latrine about twelve feet long and two feet wide. It was situated close to where the men slept. The unsanitary conditions were frightful.

—*Press Illustrating.*

*One of the vocational classes conducted in the army camps overseas. These men are studying methods of utilizing tin cans.*

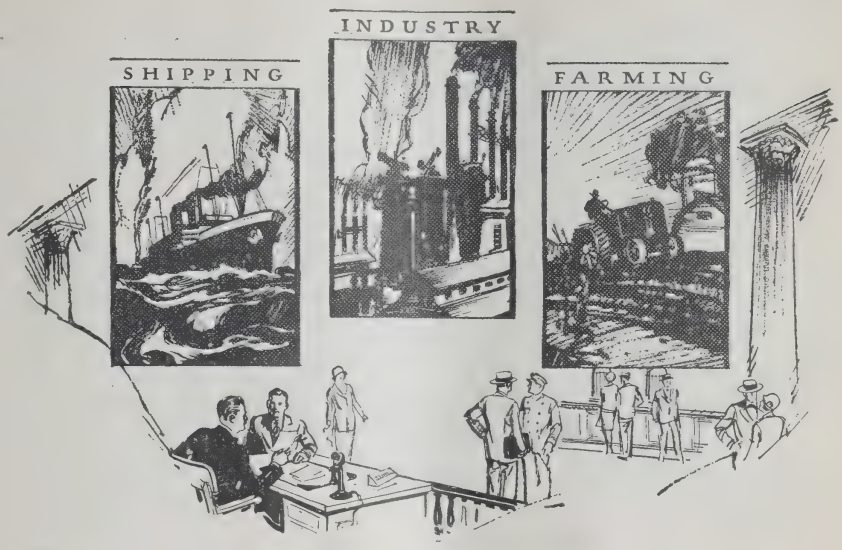
'When soldiers arrived at this farm from the Paris prison they were taken, two at a time, to an upper floor of the building used by the company commander as his headquarters. Here they were thoroughly searched by two sergeants in the presence of an officer. If the personal belongings or money of the men had been returned to them before they left the Paris prison, they were taken away from them here. A big box was

placed in the center of the room. As the men's belongings were taken from them they were tossed into this box. Lieutenant Helphenstein sat beside the box and immediately took possession of anything that was valuable. Money was thrown into this box; in some cases the men were given receipts for their money; in others they were not.

'It was a common thing to see a sergeant knock a man down or beat him up on the slightest provocation. One morning as the men fell in line for breakfast, one man was slightly out of line. Sergeant Ball went up to him and punched him in the face six times.

'One morning about nine o'clock four men were taken into one of the stalls in the stable and beaten with blackjacks for twenty minutes. When they came out the blood was streaming from their faces and they were in a horrible condition. Lieutenant Helphenstein, Sergeant Ball, and a duty sergeant of Company K, One Hundred and Fifty-Eighth Infantry, together with three general prisoners, entered the stall with these four men who were beaten up. A guard with a rifle on his shoulder stood at the door. After the men came out, Lieutenant Helphenstein and another stood in the door examining their fists. The men were taken over to wash off the blood, and one man, a little weaker than the other three, lingered behind. Sergeant Ball punched him in the ear from behind and kicked him into line with the other three. These men were put on bread and water. A prisoner who carried the water to them said the guard inquired at the kitchen for their bread, but the mess sergeant told him there was no bread, so the men had to go without it . . .

'Some of the men were kept as long as three weeks at this farm and then they were sent to the stockade just outside of Chelles. This stockade was a regular military prison with a big iron fence around it and lookout posts about twenty feet high. The stockade was even worse than Farm No. 2. The men received the same criminal treatment and the living conditions were worse, if possible, than those at Farm No. 2, because the stockade was simply an inclosure of mud with no shelter of any kind except tents.



'Two of the prisoners at Farm No. 2, after the Armistice was signed, said they had been prisoners of war in Germany and that the treatment they received in the German prison camps had been far better than that which they received in the Paris prison. at Farm No. 2, and in the stockade.

'THE incidents I have related in this letter I can substantiate, and are contained in an official report from the inspector general of the Second Army Corps to General Headquarters, American Expeditionary Forces, and represent only a few of the atrocities committed at these places.

'Newly returned soldiers, whom I know personally, inform me that conditions such as I have described still exist.

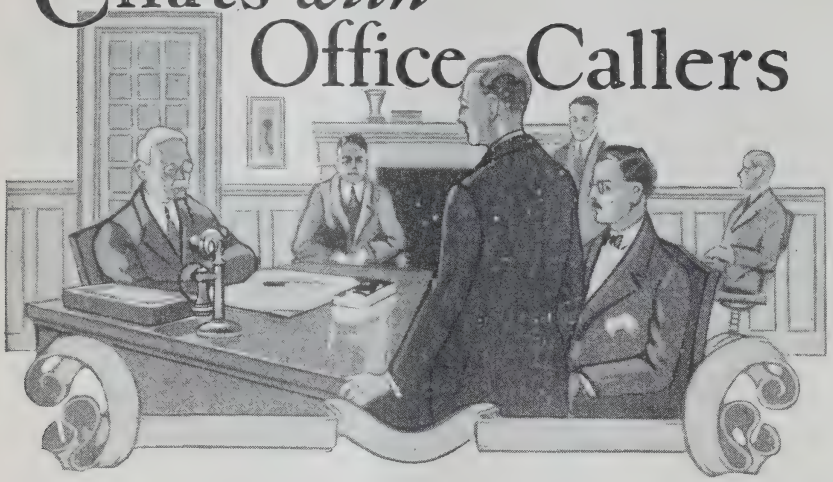
'Lieutenant Colonel Ansell has told us what happens to the soldier for the slightest infraction of Army Regulations. I wonder what sort of punishment has been or will be meted out to those responsible for cruelties and tortures worse than ever experienced at Andersonville.'

*(The third and concluding installment of this series on the court-martial system will appear in an early issue.)*

*Helping to Develop the Nation's Business*

The CANAL BANK, for ninety-five years, has satisfactorily served the general banking needs of a commercial clientele.

This Bank offers a business banking service which reaches from the original source to the very end of the transaction.



Exporters and importers, merchants, railroads, manufacturers, and a host of other concerns in almost every line of business have learned to depend on the CANAL BANK for accurate trade and credit information; for immediate contact with principal world-centers; for complete banking facilities and accommodations.

*"Through Ninety-Five Years," an interesting booklet on the South's industrial development, will gladly be mailed executives on request.*

# Chats *with* Office Callers

'Say,' said ***the Customs Officer,*** 'your man in Office Chat was wrong about customs officers speaking in broken English and asking impertinent questions. It was *immigration officers* he meant. It does seem strange that men of obvious recent alien origin should represent this Government at the front doors of the country. But all I am asking you and others to do is not to say "customs officer" when you mean "immigration officer." '

❦ ❦ ❦

'And now another great British tradition has been shattered,' said ***the Traveler.*** 'The English, during the hot summer days, have discarded their waistcoats! This is almost revolutionary. For generations the sturdy Britons have clung to their waistcoats, winter and summer, with that bulldog tenacity for which their race is noted. They have faced sweltering heat and blazing sun uncomplainingly; they have disregarded advice; they have ignored ridicule.

'Many Americans thought the wearing of the waistcoat (we call it vest) was with the British a principle, like reverence for their Constitution or handclapping at cricket matches. But it wasn't. They wore waistcoats solely to conceal their braces—or, in American, suspenders. Now braces *are* a principle, and any true Englishman would as soon discard his King as he would these—but he realizes that in spite of their utility they are not objects of great beauty. And so with rare esthetic sense he has insisted that they be covered.

'The adoption of double-breasted coats has at last solved the difficulty, and the Englishman can now appear in public minus his waistcoat and with his braces decently concealed. But to those who love British traditions the change is somewhat of a shock. It seems, somehow, as though the sturdy old British character is weakening.'

❦ ❦ ❦

***The Artist*** had just visited a modern industrial plant, watching with much interest the various operations of the men at their machines. 'All this,' he said, 'reminds me that beauty has law and order for its foundation. One of the fundamental laws in nature is that of subordination. There is no beauty without it. The beautiful is not dependent upon size, form and color for its charm. One thing in nature may be subordinate to another, but it is not less lovely, even though it be the smallest flower as compared with the fullest rose.

'Can you imagine the monotony without this law? There wouldn't be much happiness if everything in nature, the flowers, the trees and the plants, were the same in size, in form and in color. We need the spice that variety gives. The diversity of it produces broader mentalities. A man, whether he be a sweeper or an expert engineer, must recognize that he is just serving a purpose. The sweeper, though menial in position and in that sense subordinate to the expert, is helping toward the complete working out of the natural law. In painting it is the juxtaposition, the shades and subordination of colors that make the masterpiece.'

❦ ❦ ❦

'Who is Dorothy Ellingson?' demanded ***the former Newspaperman*** as he strode into the office. Several men were grouped about.

'Isn't she one of the newer English writers?' ventured one.

'She's one of the Broadway characters,' opined another. 'One of the so-called butterflies.'

'Way wrong, both of you,' the former Newspaperman said. 'And a year and a half ago Dorothy Ellingson's name was on the front page of nearly every newspaper in the country. There were stories about her and stories by her, stories about what she had done and what she hadn't done, about what she had thought and what she hadn't thought. Her picture was flashed around the world. She was shown smiling, she was shown weeping and she was shown doing both and doing neither. Her name was as familiar to newspaper readers as Aimee McPherson's is today. The headline writers familiarly called her Dorothy and more familiarly called her Dot—and the newspaper readers were supposed to know who "Dot" was. Special writers were sent to interview her and write sob stories about her; psychologists were sent to interpret her to the palpitating public. She couldn't be dislodged from the front page for a month and a half. Yet here, scarcely eighteen months later, she has been forgotten. I have asked nine persons this morning who Dorothy Ellingson is—and only one could tell me.

'Dorothy Ellingson is the San Francisco girl who killed her mother.

'You remember now, of course. The association of name and facts brings the case back. The point I want to make is this: In spite of all the ballyhoo and flubdub printed, the newspaper stories did not make a sufficient impression on your minds for you to remember Dorothy Ellingson's name for even eighteen months.

'And that explodes one of the choicest of newspaper myths. Newspaper editors claim that they print all this scandal stuff because you—the reading public—demand it. Don't you suppose that if you had demanded all the intimate details the papers printed about Dorothy Ellingson, you would at least have remembered her name?'

❦ ❦ ❦

'In former times,' said ***the Southerner,*** 'every nation worthy of the name raised and trained her sons to take their part in the public life of the community and the nation. To hold public office was an honor, to be accepted even at private sacrifice, and to be discharged creditably and with the utmost conscientiousness. National greatness has been achieved always at the expense of private sacrifice. Now all this—in America, at least—seems changed. We treat politics either as a joke or as a means for gain, particularly in the larger cities. We must return to the practices of our forefathers if we are to preserve for the nation its fundamental ideals and traditions.

'This sounds well in the abstract, but it must be translated into the concrete to remedy the state of affairs to which we have come. Children must be prepared to accept public duties and offices; voters must be awakened to their responsibilities, and a new spirit of unselfish devotion to public welfare must replace the too prevalent spirit of selfish interest.'

❦ ❦ ❦

'Many people ask me why I feed these sparrows,' ***the Gateman*** said as he tossed a bit of bread crust to a black-throated sparrow at the foot of an elm. 'When I first came on out here bugs were everywhere. They ate the leaves of the shrubbery and at night fluttered around the watchhouse—a regular nuisance. One day I noticed the English sparrows eating some. I began feeding the birds part of my lunch. By feeding the birds they came to watch for me and, while waiting, ate more bugs. Now my wife puts bread crusts and cake crumbs in my lunch box and the birds and I dine together. And the insects have disappeared. I know English sparrows are considered a nuisance but they've made life bearable out here by their war on the moths and beetles.'

# Can You Tell Me?

QUESTION: Has the Government changed the quota immigration law?

ANSWER: Not basically. It has been amended to admit ex-soldiers (their wives and children) who served with the American Expeditionary Forces and were mustered out on the other side so their wives could have an opportunity to visit their old homes before coming to America. It has also been amended to admit Spanish subjects who are bona fide residents of Porto Rico but elected to retain their Spanish nationality.

QUESTION: Can we still get Government seeds from our Congressmen?

ANSWER: No. The practice was discontinued about June 30, 1923, when Congress failed to grant the usual appropriation for the purchase of the seeds.

QUESTION: Is there still Government land to be allotted to home seekers?

ANSWER: Yes. None, of course, in the original thirteen states, but a great deal in many of the other states. Special provisions for ex-service men. Homestead Bureau, of General Land Office, Interior Department, Washington, D. C., will gladly furnish detailed information. Their circular No. 1022 gives all vacant public lands as of July 1, 1925, by states and counties. Circular No. 302 relates to Soldiers' and Sailors' Homestead Rights. Those interested in the Stock-Raising Homestead Act ask for Circular No. 523.

QUESTION: Who is now using the power generated at Muscle Shoals?

ANSWER: The Alabama Power Company under what is said to be a contract subject to revocation.

QUESTION: Does Eugene Meyer, Jr., continue to be managing director of the War Finance Corporation?

ANSWER: Yes.

QUESTION: What is gun elevation?

ANSWER: The elevation of a naval gun is the angle which the axis of the bore of the gun makes with the horizontal plane at the instant of firing. It is correctly spoken of as the 'angle of elevation'; the greater this angle, between the limits zero to 45 degrees, the greater the resultant range.

QUESTION: Is there any similarity between the modern trade associations and the guilds of two hundred years ago in England?

ANSWER: Yes, some. The Guilds started out honorably to improve the conditions of their members, and some of them wound up by price-fixing. Some modern trade associations have been very helpful to their members, but some of them have a decided inclination toward price-fixing.

QUESTION: On the ledges of the three windows above the white stairway in the American Red Cross Building in Washington are the busts representing 'Faith,' 'Hope' and 'Charity.' Who are they by?

ANSWER: Hiram Powers.

QUESTION: What, in naval terms, is a 'bulge'?

ANSWER: A bulge, or 'blister' is an extra compartment built around the underwater portion of a ship to act as an extra defense against torpedo attack or airplane bombs exploding under water. The same protection is afforded by dividing compartments inside the ship into a 'honeycomb.'

*In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.*

QUESTION: Is it a fact that the Philippine Islands are wet? If so, why?

ANSWER: The Enforcement Division of the Prohibition Unit of the Treasury Department states that the statutory act establishing the Philippine government provides that no laws thereafter passed shall affect the government of the Philippines unless special provision is made therefor in the act itself. The Volstead Act does not make such provision. Residents of the Philippines are morally bound by the 18th Amendment, but the Volstead Act is the agency by which the 18th Amendment is enforced, and without the act to enforce the provisions of the amendment, it is ineffective.

QUESTION: Is the house in which Lincoln died in Washington still standing? If so, where is it located and for what is it used?

ANSWER: It is still standing, and located at 516—10th Street, Northwest. It is occupied by the O. H. Oldroyd Collection of Lincolniana, and Captain Oldroyd himself lives on the top floor. The collection has recently been sold to the Government.

QUESTION: When was the United States first called America?

ANSWER: It is said to have been so called for the first time about 400 years ago by a druggist named Serre, at the little town of Saint Die, in France.

QUESTION: When was the cornerstone of our National Capitol laid?

ANSWER: September 18, 1793.

QUESTION: When did the Congress move into the new wings of the Capitol?

ANSWER: The House met in their new hall for the first time December 16, 1857. It was some time later before the Senate chamber was ready. It was ready for occupancy January 4, 1859.

QUESTION: When was the battle between the Monitor and the Merrimac fought?

ANSWER: March 9, 1862.

QUESTION: How much did it cost to build the dome of the Capitol?

ANSWER: $1,047,291.89.

QUESTION: What was the first building erected in the United States for public use under the authority of the Federal Government?

ANSWER: The United States mint in Philadelphia.

QUESTION: What is meant by 'franked' mail? 'Penalty' mail?

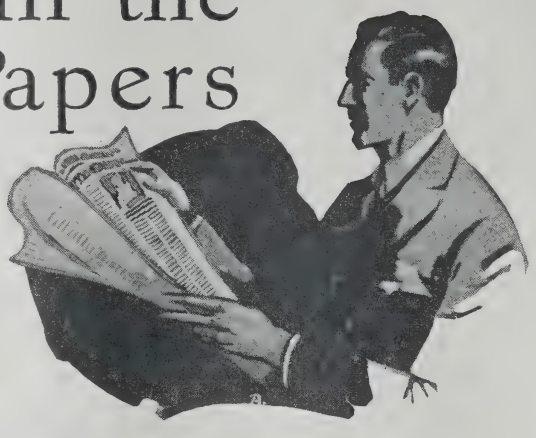
ANSWER: 'Franked' mail is such mail as is sent free by members of Congress, while such mail as the various officers of the Government and the departments send on official business is called 'penalty' mail. 'Franked' mail usually carries the facsimile signature of the Congressman or Senator, while 'penalty' mail bears the stamp 'Official Business, Penalty for Private Use $300.'

QUESTION: When was the Capitol in Washington burned by the British?

ANSWER: August 24, 1814.

QUESTION: Is trachoma prevalent among the American Indians?

ANSWER: Yes, the Government recently put on a campaign to eradicate this dreaded eye disease from among their Indian wards. Among the 136,551 Indians examined, 27,943 were found to be suffering with trachoma. Eye operations were performed on 8,457, while more than 19,000 were given treatment, operations being considered unnecessary.



QUESTION: How much has the national debt been reduced during the past year?

ANSWER: From March 31, 1925, to March 31, 1926, it was reduced $845,677,858.64.

QUESTION: When, if ever, was authority granted the Treasury Department to pay interest to taxpayers on refunds which were erroneously or illegally assessed and collected?

ANSWER: Section 1324 of the revenue act of 1921, approved November 23, 1921, was the first provision of law granting such authority.

# I *Read* in the Papers

'It is surprising to learn that in 1924 every person in the United Kingdom, on an average, consumed one hundred apples, seventy oranges and thirty bananas. Of the apples, thirty-eight were supplied by the United States, twenty-five were grown in the United Kingdom, nineteen were imported from Canada and eight obtained from Australia and New Zealand.'

*International Friendship and Oranges*

So says the *Times* of London, commenting on the Imperial Economic Committee Report, and continues, 'Of the seventy oranges, fifty-seven were supplied by Spain, seven by Palestine, three by South Africa and one by the United States.' A Carlyle, no doubt, could take such dry-as-dust material and make a great picture of it. The average man, if he is an American, cannot fail to be interested in that one orange. Once a year, every man, woman and child in the United Kingdom eats an orange which comes from the United States. All protagonists of international amity must hope that it is a good one.

❦ ❦ ❦

*The Amazing Structure of the Earth*

The structure of this amazing universe is in a sense simple. All the 'elements' are made up of atoms that have differing electronic combinations. Thus the hydrogen atom has one electron and one proton which exist as single particles of equal but opposite electric charges. The oxygen atom has sixteen electrons and sixteen protons. The electron is so small that 50,000,000,000 would be required to form the diameter of a printed full stop. The vast heat of the interior of the stars transforms mass into energy, that is to say, into radiation. The emission and absorption of energy can only take place by whole units, which are called quanta. The universe would instantly dissolve if this were not the case. The quantum law prohibits emission of radiation except in cases, such as the sun and stars, when there are vast stores of energy. But the new physics and the new mathematics have not yet shown the internal working of the atom. Yet this we can say, that the unspeakable vastness of the universe is easier to comprehend than what Dr. Abbot calls 'the infinitesimalness of the atomic structure.' Yet there seem no limits to the discoveries that are opening for man in the essential nature of things and in his knowledge of the universe. There seems a tendency to a simplicity that peers forth after and as the result of amazing intellectual efforts. The thought that lies behind the infinitely great and the infinitely little is beginning to appear as something as simple as it is majestic and all-pervasive. The whole tendency of modern discoveries in physics and astrophysics is to emphasize a Creative and Protective Mind.

Are thinking minds limited to this little earth, a speck in the Milky Way, in the oyster-shell that holds the sun and other stars? Dr. Abbot says on this point that we may believe that 'there is great probability that there are indeed many worlds like ours, and that there is no reason either to affirm or to doubt that they contain as intelligent beings as ourselves.' This view was long ago controverted by a great thinker, but if it is true, if we may reasonably not be surprised by the existence of thinking beings in other parts of the universe, then we may also conceive that they have reached higher stages of intellectual and observational advance than we have. It would indeed not be absurd to say that some day workers observing the universe from regions far apart may observe, or rather may become conscious of, the existence of each other. Great surprises may come in the thousand years of astronomical research which Dr. Abbot thinks may be required 'to fill out the noble outlines of the structure, and reveal in its full beauty the grand system of the celestial hosts.' At the rate at which men and women are now working an even less estimate may seem appropriate. —*The Contemporary Review.*

❦ ❦ ❦

*How Society Came to the Sea*

It was the adventurous little Duchesse de Berry, the mother of the Comte de Chambord, who really led the fashionable world of France to the seaside. She came to Dieppe in 1824 and 1825 and bathed every day. And, which seemed very marvelous in those days, she was able to swim. Not, of course, that she dispensed with the services of a 'bather,' a valiant and experienced salt named Courseaux. When her Royal Highness went to bathe, she was escorted by the Director of the Baths, an elegant person clad in evening dress and white gloves, who took her by the finger and walked with her a little way into the water!

At that moment a gun announced that her Royal Highness was really in!

The Royal Duchess's example seemed so far likely to find imitators that the Parisian fashion journal *Le Journal des Dames et des Modes* thought fit to give its readers some practical hints on the subject:

'In sea-bathing you sit or stand on the shore, taking care that someone holds you from behind by the hands, lest the wave in receding carry you with it. If you dress too hastily, a certain moisture will be perceived on the skin; for sea water moistens you twice over, and you must dry yourself twice. Another excellent precaution is to wear a woollen shift. This will not reveal the form, and with it on you can take a sea bath in presence of seamen and other curious observers.'

What would this prudish *arbiter elegantiarum* have thought of the all-revealing costumes worn by the beautiful bathing nymphs depicted in our illustrated journals today!—Edmund B. d'Auvergne in *The English Review.*

❦ ❦ ❦

*Explaining the Girl of Today*

The girl of today absorbs a freedom-loving and egocentric conception of life almost from the time she is able to walk. The books that she reads, her social *milieu*, her companions, her school, often the home itself, all conspire to impress upon her a view of life which leaves out of account the social and functional aspects of womanhood. Most important of all is the influence of the school. Girls' schools are staffed to a very large extent by teachers themselves deeply impregnated with feminist ideas, and whose typical life-outlook is that of the independent bachelor woman who understands little or nothing of the problems of sex and marriage. At the most plastic period of development girls spend years subject to this kind of influence.—Meyrick Booth in *The Nineteenth Century and After.*

❦ ❦ ❦

*Breton Tale Accounts for Sea Salt*

Once upon a time, according to a Breton folktale, a fisherman fell in love with a siren who, leading him to a rock by the seashore, gave him in a magic cup a draught, nectar to the taste, which would make him follow her forever. The fisherman put the draught to his lips and was about to drink it when, of a sudden, he remembered the sweetheart he had left behind in his own village. He dashed the cup, therefore, into the sea; and the love potion, spreading over the waves, turned them to the salt waters we know today.

It is a suggestive tale to those who are interested in human nature because it convicts out of their own mouth, as it were, that large proportion of Bretons who live by the sea and by the fruits thereof. It convicts them of being, unconsciously no doubt but none the less painfully, on the horns of a dilemma. They love the sea: they fear it. God, they say, created the earth: the Devil created the sea in order to drown the earth. When it is remembered that about half the fishers and sailors of France are Bretons, this dilemma might seem to suggest disquieting cowardice of spirit, were it not also borne in mind that racially the Bretons are not as the rest of France and that he only is brave who advances in the face of fear.—W. Branch Johnston in *The Contemporary Review.*

# Briefly Told

AN ANIMAL STRONG as a mule, possessing as great intelligence and able to withstand terrific heat, has been produced on a Kansas farm. It has been christened a 'zebroid,' being a cross between a zebra and a Percheron.

THURLOW LIEURANCE, composer of 'By the Waters of Minnetonka,' recently made his first visit to Lake Minnetonka. On an Indian reservation in Montana Lieurance received his inspiration from the song of a Sioux Indian.

CATNIP IS BEING grown by the United States Biological Survey. The oil obtained from the plant is to be used in trapping mountain lions. Catnip is a lure for all members of the cat tribe, save the cheetah, or hunting leopard, of India.

FRENCH FLIERS HAVE adopted as their patron saint Father Carnus, whose name will soon be entered for canonization. He made a memorable balloon ascension August 6, 1784

MUNICIPAL guards in full uniforms, with bayonets at their sides, saw to it that there was no cheating at the matriculation examination of Sorbonne University.

CHARLES II was probably the first king ever to use the classified columns of a newspaper. The *Mercurius Politicus*, published in 1660, regularly carried the king's advertisements for the return of lost dogs, hawks and falcons.

TORNADOES IN THE United States during 1925 numbered 115, and caused aggregate damage of $25,000,000.

THE HEAD OF A London art school has evolved a plan for the relief of young artists unable to sell their pictures by having them rent their works. A charge of $5 a year is made for a picture valued at $250.

IN VARIOUS English schools pupils are sent in groups to historical places of Europe to study history first-hand. The groups are in charge of teachers and children pay their own expenses.

AN OIL COATING IN THE barrel of a gun affects the elevation of the shot, recent Government tests show.

WHEN NO HUMANS OR ANIMALS are handy, the mosquito lives largely on plant juices.

A SPEECHLESS GOLF tournament was held by fifteen women members of a Nebraska golf club.

A WASHINGTON WOMAN was recently arrested and fined for driving an automobile with one arm around a pet poodle.

EARLY SAXON PENNIES had four grooves in them so that they could be easily broken. Each section was called a fourthing, the word later being corrupted to farthing.

AN EXPLORER in Africa tells of a beauty show held in the heart of the jungle. Five hundred young women entered, and the winner was judged by the perfection of her feet.

HOLIDAYS BY AIR have become a recognized feature now in London and special tourist tickets have proved a great incentive to travelers.

THE SULTAN OF MOROCCO was shocked at the exhibition of the Charleston he witnessed in Paris. He declared: 'It is very curious. I don't understand how men can allow their wives and daughters to join in it.'

AN APPARATUS FOR DISPERSING fog is being developed at the Philadelphia Naval Aircraft Factory. A simple charging screen, a transformer with rectifying device, an airplane propeller, and a meter, all mounted on a truck, will electrify 700,000 cubic feet of air a minute and cut a path 2,000 feet wide and 1,000 feet high through a fog.

IN THE BELIEF that outside radio aërials were drawing thunderstorms, irate Hungarian farmers tried to wreck them. They were stopped only by arrival of the police.

'PSYCHOLOGICAL demobilization' of the Italian people has been ordered by Premier Mussolini. Newspapers are forbidden to print incendiary material tending to keep alive the 'bellicose terminology and spirit.'

OF THE 3,000,000 MILES of highway in the United States, approximately 500,000 are reported as improved roads.

A GIANT CAULIFLOWER in Australia grows four feet high. Pegs are driven into the stems to retard growth which, when too rapid, leads to rankness.

BOBBED HAIR HAS BEEN the fashion among Albanian women for 2,000 years.

TUESDAY HAS REPLACED Monday as the general American washday.

THE WHITE HOUSE has had telephone communication for forty-five years, the first instrument being installed by order of President Grant.

ANIMAL SHRINES IN JAPAN have been ordered destroyed as a detriment to progress. Thousands of the shrines, relics of former worship of foxes, snakes and other animals, exist.

AT LEAST THREE VESSELS have been known to go over Niagara Falls.

A KNIFE FROM which peas would not roll, invented by an Englishman, is now preserved in the British museum. It has a spoon-shaped depression at the end of the blade.

B-A-G-D-A-D HAS BEEN designated by the United States Geographic Board as the correct spelling for the famous Arabian Nights city, rather than Baghdad.

THE EAST COAST OF ENGLAND is rapidly being eaten away by the sea. The town of Dunwich lies beneath the waves, and Holderness is fighting a losing battle.

A HALF-MILLION PEOPLE live on the desert lands of the Sahara.

BIG GAME ANIMALS ARE increasing in the National Parks. Elk have multiplied to such an extent as to make necessary a special open season in some of the parks, during which a limited number may be killed.

THE JAIL AT YELLOWSTONE National Park, not having had a prisoner in the thirty-two years of its existence, has been torn down.

HORSES OF THE LONDON police department are being experimentally shod with rubber shoes

# NOTES · COMMENTS CRITICISMS

Mr. Ford's Page this week discusses facts and their relation to life.

ɤ ɤ ɤ

The airplane of tomorrow is being developed today. Hazards are rapidly being eliminated. Aviation is taking its place beside the other modes of transportation. William B. Stout is recognized as one of the foremost experts in the country. This article describes the planes that will soon be dotting the skies—the small, privately owned machines and the great trans-ocean liners. (p. 1)

ɤ ɤ ɤ

*'You can fool all the people some of the time and some of the people all the time, but you can't fool all the people all the time.'—Did Lincoln say it? And where? History has long attributed the phrase to him, but history often errs. And the phrase can be found in none of his writings. William E. Barton believes that Lincoln did say it. He bases his belief on evidence found during an exhaustive research in Illinois.* (p. 8)

William E. Barton.

ɤ ɤ ɤ

No man living, probably, excels Dr. Barton as an authority on Lincoln. His *Life of Lincoln* is accepted as standard, and he is the author of several supplementary works on the Great Emancipator. Dr. Barton's story, 'The Truth About the Bixby Letter,' which appeared in THE DEARBORN INDEPENDENT last February, has just been republished in brochure form. The present article also forms an important contribution to the nation's Lincolniana. (p. 8)

ɤ ɤ ɤ

The cowboy has not followed the buffalo to extinction. On the contrary, he is more numerous than ever. But the ranch-hand of the present differs vastly from the fictionized cowpuncher of the past. Donald Hough, who knows the West as do few other writers, paints a vivid picture of this cowboy of today. (p. 4)

ɤ ɤ ɤ

Pennsylvania—home of Secretary Mellon, generalissimo of prohibition—has the reputation of being one of the wettest states in the Union. It has been helped to that reputation by its numerous distilleries which manufacture alcohol, *under Government permit*, supposedly for legitimate purposes. John D. Erwin, Washington correspondent for a New York newspaper, describes the activities of some of these distilleries—and tells how alcohol is withdrawn. (p. 7)

ɤ ɤ ɤ

From Harry McDevitt, editor, Durango, Colorado: 'I get considerable food for thought from your paper, and am very glad to receive it. I am by no means in complete harmony with views expressed, but approve of many of them, and always appreciate an opportunity to look at the landscape through the other fellow's glasses.'

ɤ ɤ ɤ

From R. L. Moore, president, Mars Hill College, North Carolina: 'I want to thank you for THE DEARBORN INDEPENDENT. It discusses vital themes in vigorous style, seems truer to the old ideals than is common nowadays, and fills a unique place.'

ɤ ɤ ɤ

From L. C. Lowrey, Oklahoma City, Oklahoma: 'After reading THE DEARBORN INDEPENDENT for six months I find I cannot be without it.'

ɤ ɤ ɤ

From Herman J. Brown, Hollywood, California: 'Your Puritan article is certainly a farce . . . Too bad the Plymouth Rock didn't land on the Pilgrims.'

ɤ ɤ ɤ

From L. E. Cowly, Wichita Falls, Texas: 'I have been reading THE DEARBORN INDEPENDENT for several years and have read every issue, and I want to say to you that your July 24th issue is the best I have ever read. Everything in this issue is good, but I want to commend you especially for the article on limelighters.'

*A half-century ago a young college student sat before a log fire in a spacious Cambridge home and listened, entranced, while an older man talked. The boy was Julian Hawthorne, son of Nathaniel Hawthorne. The man was James Russell Lowell, one of the best loved of New England's great coterie. This week Julian tells of that talk and others, tells of Lowell's vivid life and charming personality—tells of the man himself as no one else now living can.* (p. 12)

Julian Hawthorne.

ɤ ɤ ɤ

London has many bizarre and interesting clubs. Among them is 'Our Society,' a group of noted authors and criminologists. And among its members are Sir Arthur Conan Doyle, famous as creator of Sherlock Holmes and equally famous as a believer in spiritism, and W. Teignmouth Shore, noted British journalist. Here's a story about Sir Arthur by Mr. Shore. (p. 3)

ɤ ɤ ɤ

*Do the spirits of criminals suggest, from another world, crimes for humans to perpetrate?* Conan Doyle believes they do; and he points to the known fact that one crime is often followed by a series of similar crimes. Whatever your views on spiritism, you will want to read of his theory. It is an amazing blend of Sherlock Holmes logic and psychic postulation. (p. 3)

ɤ ɤ ɤ

There lives in New York a detective who might have been conjured into fiction as Sherlock Holmes. He has reached preëminence in his profession through his ability to observe minute details which others overlook. Fred C. Kelly is well equipped to describe him. Besides his wide experience as magazine writer, Mr. Kelly served during the World War as special agent of the Department of Justice. (p. 16)

ɤ ɤ ɤ

James W. Beckman, sergeant major in the A. E. F., who forced a Congressional investigation into the court-martial system, continues his story of the abuse of power by certain American officers. (p. 6) . . . Easton T. Kelsey writes of the remarkable discoveries of the Second University of Michigan Expedition at Antioch. (p. 15) . . .Tom Everritt tells of the changes that have come in the White House in the past hundred years or so. (p. 19)

# SPITE

CROMWELL and some other wights who lived in England long ago, grew tired of battling for their rights, grew tired of governmental woe. King Charles, a most wrong-headed man, was reigning with his scepter there; it seemed to be his misfit plan to ball things up beyond repair. It was a sin the way he reigned, he'd prove his power at any cost; people murmured and complained and said the monarch was a frost.

John Hampden to O. Cromwell cried, 'The limit's reached, I'll stand no more; I'll board a moral ship and slide from England to a foreign shore. America looks good to me, there tyrants do not scourge one's back, and so I'll journey o'er the sea, and make my home in Hackensack.'

'I'm with you, John,' O. Cromwell said, 'I'm weary of this British isle; the king, he keeps me seeing red, who used to dance and sing and smile. I'll leave my breweries and farms, I'll cross the ocean with my aunt; Hoboken surely has its charms, and there I'll start a bottling plant.'

They wound up then their home affairs and reached a vessel in the bay, and hoped that sweet and gentle airs would blow them softly on their way. King Charles, he sat upon his throne, and fiddled with his costly crown; his gossip told, in eager tone, the news he'd gathered in the town. He told how Cromwell and his crowd were even then upon a ship which was arranging sail and shroud to make a transatlantic trip. Charles smiled in triumph; 'Now,' quoth he, 'I'll circumvent that bunch of bores; I'll issue straightway my decree, so not a ship shall leave these shores.' The which he did, and from their ship emerged the Cromwell delegates, with burning words that well might rip the hides of foolish royal skates. They did not come to this fair land, they did not cross the stormy sea, to join our bright Kiwanis band, or make a splash in Rotary. They stayed at home to plan and fight that freedom might be widely spread, to show the king how childish spite could make a monarch lose his head.

## The Doctor Looks at

# *The* Cause *of* Nervous Breakdown

By JOSEPH COLLINS
*Illustrated by* W. W. CLARKE

IN MY early days of the practice of medicine the ailment that I heard mentioned most frequently by patients and their friends was 'a kind of malaria.' The one I hear now is 'nervous breakdown.' The former meant little, the latter means less.

There is a disease neurasthenia, first described by a New York physician, Doctor Beard, fifty years ago, and called by Europeans 'the American disease,' which might be entitled to the designation; but that is not the one that is meant when my friends and acquaintances use the term. When they want to convey that they or one of their relatives have or have had neurasthenia, they speak of it as nervous prostration. I have no quarrel with that name, though neurasthenia is a better one. It means weakness or loss of tone of the nervous system. In the beginning of the present century it was thought to be a very common disease. That was before we knew much about the nervous system, and practically nothing about the part of it that is connected up with the organs of secretions that we hear so much of these days, the 'glands.'

The sympathetic nervous system runs the glands and, year by year, we are learning something about them despite the activities of the endocrinologist. It was also before we knew much about mental disorders and less about psychology. It was a time when I frequently heard doctors say: 'I know nothing about nervous diseases, nor does anyone else for that matter.' Today we know more about them than we do of most diseases save those due to specific organisms like pneumonia and diphtheria. The physician who does not know about nervous diseases should have his license revoked. It would be a hopeful sign were the laity to get a grasp of them too, particularly of those that are included under 'nervous breakdowns.'

Before they can accomplish it, they must get the right attitude toward the whole question.

The vast majority of so-called 'nervous breakdowns' are mental disorders. It is difficult for the laity to believe that those who suffer mental disorder are not usually insane. Insanity, conventionally, is a matter of conduct. One may be as full of insane ideas as a bank is of money, and still be sane in the light of the law and in the eye of his neighbor, if his conduct does not express these insane ideas. On the other hand, the possessor of such ideas is 'insane' from the physician's standpoint, for at any moment the ideas may condition conduct prejudicial to his welfare and to the safety of the community.

The majority of people visualize an insane person as a raving lunatic, but for one who raves there are ten who do not and the most deeply dyed of all lunatics, the paranoiac is far too foreseeing and determined either to rave or ramble. He plans and plots with great discernment and always with tremendous energy; he surmounts obstacles and overcomes difficulties that baffle, impede and discourage the average sane person; and he has self-confidence and self-belief that transcend understanding.

It is difficult also for the layman to believe that there are many varieties of mental disorder which are different in their origin, in their display, course and termination, and he positively refuses to believe that an individual may be insane one moment, one hour, one day, and not the next moment, hour or day. He is loath also to accept the fact that persons with mental disorders do not display their symptoms with anything like uniformity, yet should they stop to think about it and reflect upon their own moods and reactions they would realize that the persons whose intellects and emotions are disordered must necessarily have greater variability of 'feelings,' and expression of them, than the person whose psychic equilibrium is on a fairly

*In my early days of the practice of medicine the ailment that I heard mentioned most frequently by patients and their friends was 'a kind of malaria.'*

*We begin to throw fear into children as soon as they betray the first glimmer of intelligence, and keep it up until they escape from parental influence.*

even keel. And he is adamant to the suggestion that mental disorder, whether it constitutes insanity or not, is disease, and should be treated accordingly.

No one needs to be told that many of us like to talk about the bodily illnesses we have, and boast about those we have surmounted. It is equally true that we shrink from acknowledging that our minds have ever been other than in the very best order.

The reason mental disorders are called 'nervous breakdowns' is that it is considered disgraceful to admit their existence, either in one's person, or in one's ascendants or descendants. It is a patency of good form to have gout, and especially to have had a gouty parent, but it is a blot on the escutcheon to have experienced an attack of exaltation, to have a father who was subject to tricks of thought or action, an aunt who was afraid to go near an open window lest she should throw herself from it, or a cousin who was morbidly shy. In reality the person who has gout should beat his breast while saying '*mea culpa*,' for that disorder in nine cases out of ten is an admission of presumptuous sin, and gouty ancestors should be denied.

On the other hand, mental disorder is something for which one is rarely personally responsible. Like original sin, it is thrust upon one. There are thousands of persons in this country who believe that disease is a sin. I am willing to admit that it is both a sin and a crime, but the roadway leading to many sins is so yielding underfoot and so banked with alluring flowers that most of us find it difficult to take the stony one flanked with thorns.

So long as religion, convention and society insist that we treat our instincts, and particularly the genesic instinct, not only as the chief source of sin, but as something to be ashamed of instead of looking upon it as a fountain of love, light and life and our noblest and most godlike possession, we are going to have nervous and mental diseases, for the exciting cause of most of them is repressing, or improperly and indiscreetly indulging that instinct.

Save the comparatively few mental diseases that flow from syphilis and alcoholism, the predisposing causes of most burdening and incapacitating mental disorders are rooted in hereditary and acquired influences wholly beyond the victim's control. They are not, however, in a measure, beyond parental control. In other words, the chief causes of mental disorder aside from the hereditary predisposition is improper bringing up. To enumerate and describe the hiatuses of parental enlightenment would require discussion of relation of hirelings to infants and children, moral education, character building, habit formation, sex instruction and the theory and practice of modern education; its aims, accomplishments and failures. That would be a large order.

In a general way, it may be said that heredity is the taproot of mental disorder, fear is the root-fibrils, ignorance or, better said, misinformation about our whence, and wrong direction about our whither, the soil. Until recently, fear was believed to be instinctive in human beings, but today it is the concensus of experimental psychologists and observant parents that most fears are acquired: the creation of grown-ups, and chance.

Fear of the Lord is doubtless as Solomon said a fountain of life, but all other fear is a life extinguisher.

There are as many varieties of fears as there are of ferns, and more. Some of them are concrete and specific: fear of disease, death, disasters; others are so vague and indefinite that they constitute what may be called apprehension, and awareness of impending calamity. Fear is so closely interwoven into man that it forms an integral part of his make-up. The time the weaving is done is infancy and early childhood; the weavers are parents, servants, educators and ecclesiastics; the result, misery, inadequacy, disease. Once it is in, it can never be wholly eradicated.

There is one justifiable fear: the one that we are assured is the beginning of wisdom. All others are anathema.

We purged the world of yellow fever and malaria; we are on the way to purge it of the white (*Concluded on page 22*)

*Socialism*

# Through the Eyes *of the* Churchman

By G. A. STUDDERT KENNEDY

('WOODBINE WILLIE')

WHITHER goest thou? That is the question which Life is always asking of men and nations, and on the answer to it their fate depends. It is for all of us the riddle of the Sphinx. If we answer rightly we may be crowned kings; if we answer wrongly we go back to the beasts of the field.

The best and truest answer man can give is, 'God alone knows.' That might seem to some to be the answer of despair, but in reality it is the answer of hope enthroned with power. God alone knows, but He *does know*, and it is by reference to Him that we can find out. It is precisely and exactly because we have left God out that we are, as so many of us are, in such a state of mental muddle and confusion. If God is left out, if the infinite principle of righteousness and right thinking is left out, all our ideas about property and the rights of property are plunged into confusion.

That is what has happened. The Socialist is right in his feeling that the root of the evil lies somewhere in or about the laws and customs regulating the rights of private property.

This was perceived years ago, and exactly stated by one who was by no means a Socialist. James Madison, one of the authors of the American Constitution, put the truth exactly when he wrote in the *Federalist*:

'The diversity in the faculties and powers of men, from whom the rights of property originate, is not less an insuperable barrier to a uniformity of interests. The protection and development of these faculties and powers is the first object of government. A landed interest, a manufacturing interest, a mercantile interest, a moneyed interest grow up of necessity in civilized nations, and divide them into different classes, actuated by different sentiments and views. The regulation of these various interfering interests forms the principal task of modern legislation, and involves the spirit of party and faction in the necessary and ordinary operations of the government.'

That could not be more carefully and exactly stated. It is as true today as it was a hundred years ago.

'Quite so,' says my friend, the Socialist. 'The unequal distribution of property is the root cause of faction and class war, therefore abolish private property, and the trick is done; faction and class war go, too.'

But Old Man Madison was no hasty, shallow thinker; he was deeper than that. Look at that first sentence again: 'The diversity in the faculties and powers of men, from which the rights of property originate, is not less an insuperable barrier to a uniformity of interests. The protection and development of these faculties and powers are the first objects of government.'

He says that the different and unequal powers of men are the roots of the matter, and that these natural inequalities must not be abolished but protected and developed under proper regulation.

When you face that fact you get down to it properly. It takes all sorts to make a world, especially a modern world, and each sort must be free to make his contribution if the world is to grow. It is commonly assumed that any fool can own property, but if he is a fool he doesn't own it long. A fool and his money soon part.

Now, it is a disaster to the community if the bulk of its property owners are fools and knaves, because if that is so the property will be badly administered and wastefully used. The truth is that property owning is a difficult and responsible job, and that we need above all things wise and honest men to do it.

The Socialist believes that popular election by ballot will secure infallibly the wisest and most honest men to administer the property of the community. He is a man of great faith. Such faith is beyond me; I cannot attain unto it. To put the capital aggregations of the community within the reach and under the pressure of popular clamor and party scheming seems to me to be the surest road out of the frying pan into the fire.

If the property owners had to manage their property with one eye on the facts and figures and the other on the ballot box, efficient management would become impossible. If popularly (*Concluded on page 27*)

*(C) Keystone View Company.*

*One of the agitations occasionally heard in our day is for the equal division of property. It sounds easy to take from one and give to another, yet the question is far more intricate than that. The Reverend G. A. Studdert Kennedy ('Woodbine Willie'), well-known padre of the war forces in France and now chaplain to King George, presents a new viewpoint.*

## Thomas L. Masson Asks and Answers the Question:

# *What* Books Are *Worth While*—and *Why?*

RIGHT information on the subject of books is very rare. Almost all persons who, familiar with the subject, furnish lists of books, overplay their part. For instance, a recent list of books for children, furnished by an undoubtedly competent woman librarian, ran into the hundreds. To get through only a small part of it would require a lifetime, and any child who attempted it would be a centenarian before he finished. There is another thing about modern books which is apt to mislead innocent people, and that is the almost supernatural skill displayed in playing them up, so that one gets the impression that: Here is a world-beater; here is the best thing ever printed; here is an epoch-maker. A little later on this book vanishes out of sight, and persons who have bought it, and leave it on their tables, smile sheepishly when you ask them if they really got anything out of it.

One of the best sellers of the present moment is a case in point. The manuscript for this book was sold to a leading periodical for $380. It lay around for a year and there was indeed some doubt as to whether it would be published at all. However, it finally came out, attracting no attention. The author had sold the copyright to the periodical, but, having friends among the publicity experts and book reviewers, she persuaded the periodical to turn over the copyright to her. She induced one or two leading authors to read the book and help her out with notices. The book—which was what we call a book of the moment—'caught on' and she has already made perhaps $100,000 out of it. Yet in a year or more from now it will be completely forgotten.

When Edith Wharton's *The House of Mirth* came out, leasing authors pronounced it a masterpiece. A prominent book reviewer was so carried away by it that he pronounced it not only 'the great American novel' but the best novel of all time. As I now recall it, Richard Watson Gilder, then editor of the *Century Magazine*, stated about the same thing.

Similarly, George du Maurier's *Trilby* was hailed by critics on both sides of the Atlantic as a masterpiece, and we all remember how Svengali was advertised and how so many articles were *trilbyized* in advertising.

As a matter of fact, both *The House of Mirth* and *Trilby* are excellent books, and can be read now with pleasure.

*A man writes a successful book and thereupon writes a succession, more or less duplicating the first. There is one book in any one man, but rarely more.*

A prominent American writer produced last year a biography, and the week it was issued she called on every literary editor in New York and in several instances selected the man who wrote the review of her book. These reviews appeared almost simultaneously, so that the combined effect was not unlike that which P. T. Barnum produced when he came to town. The book was hailed far and wide as a masterpiece. When it got to England, however, the British critics, who secretly despise American scholarship, roasted the book, and even to this day refer to it in terms of contempt.

On the other hand, Theodore Dreiser wrote his books for many years, refusing to compromise with anyone, and while he was declared by a few insiders to be one of the best writers America has produced, his books did not sell until this year, when his *American Tragedy* was issued. It is reported that movie rights for this book were sold for $90,000. But these estimates are usually open to suspicion. Undoubtedly, however, Dreiser has made a lot of money out of his book, and is now on Easy Street. Probably from this time his work will deteriorate, as few modern writers can resist the lure of the lucre. In my opinion, he is a first-rate writer in his fidelity to what he believes to be true. He doesn't dodge anything, and this is high merit.

With reference to the question, What is a Liberal Education? and to be of some service to those dead-in-earnest persons throughout the country who really want to know what are the best books, the following observations may be of value.

First, it must be remembered that, while it is undoubtedly true that our recent increased material prosperity has given the great mass of people more leisure than ever, or at least more freedom in the use of their time, it is also true that our time is very much more taken up with a greater variety of things to do—foolish and footless as many of these are.

Many business men during the past few years have discovered that they can get more real recreation and benefit out of reading solid books than in any other way. One man particularly, a member of a large accounting firm, goes about the country dealing with the heads of large corporations. During the past year he has read biographies of Washington, Lincoln, *Pepys' Diary* (in part, of course), Greek history, Gamaliel Bradford's biographies (nearly all), and Russian history. The other day he was going on a vacation and cast about for a book. A large list of modern novels was suggested to him. 'They make me sick,' was his comment. He finally decided on Bassett's *History of the United States* and later he reported that he had sat up nights at a seaside resort reading. This man plays

golf and makes a score of 80 frequently. He is 'a regular guy.'

The fine art of conversation has recently been lambasted more or less by many writers, including Chris Morley and Albert Nock. But the fact is, in this country it is improving rapidly, and especially among business men.

In this respect the war was a great help because it gave a large number of Americans, who had hitherto but scant knowledge of anything but their own small communities, a vision of the world at large.

Also, the whole standard of business intercourse has been raised. Practically every advertisement which appears in a leading periodical or paper is a true statement, based on accurate information. So it is that men have discovered that to sell goods it is not necessary to lie, but only to produce goods that are useful to others. The result of all this—so briefly indicated here—is that everywhere, all over this country, men are seeking a wider culture.

Thus we come back to our second proposition, which is that a fair, working knowledge of the essentials of history and literature is necessary, not because of its direct value but because it really saves our time in keeping us from being fooled by so much modern stuff, which, under the cheap guise of the moment, offers us, in the superficial vocabulary of the day, the old thoughts which have been so much better expressed.

For instance, a quiet perusal of Emerson's *Essays*, which might take a few weeks, would dispose entirely of the necessity for reading anything by Frank Crane. It is only fair to Dr. Crane, however, to say that while he has undoubtedly derived much of his raw material from Emerson and la Rochefoucauld, he has managed to mingle with this some homely wisdom of his own, and is undoubtedly a genius at the rare art of 'putting things.'

Still, we must conserve our forces. And when it becomes known that the constant reading of half a dozen books, long since written, will give us all that has ever been known or doubtless ever will be known about certain fundamental things, many modern writers will have to seek other means of support.

This does not mean, of course, that modern writers are not useful and in many cases necessary. But it does mean that we shall learn to discriminate more and more keenly among them. That we are now beginning to do this is indicated in the improvement of our talk. Business men no longer pass their time in telling risqué stories or relating their doubtful adventures, but they are more concerned with the fundamental principles of conduct, world in and world out.

*Pambo's friend began with the first verse of the 39th Psalm.*

*First find out what writers are worth while and then read the one thing they have written which is worth while; the books about philosophy would fill a library, yet it is all comprehended in a little volume; as for religious information, it also is contained in a little volume.*

*Illustrated by* AUSTIN EUGENE BRIGGS

As for the merits and defects of modern books, one may be cited, namely, Spengler's *Decline of the West*, the first volume of which has recently been published. This book is full of big ideas. It is a great corrective to so much that in past history has been wrongly conceived. In fact, for one who has the patience to read it, it furnishes a fine kick. But it is so long and so involved, and presupposes so much intricate learning on the part of the reader himself, that to read it is almost like having a fit of sickness. One needs to hire a room in a hospital, where one can be undisturbed for several weeks, to get through with it.

Here I must repeat the story told of S. Pambo, a famous old ascetic who lived toward the end of the Fourth Century, as related by S. Baring-Gould:

> Not being learned in letters, Pambo sought a man who could read, to teach him the Psalter. His friend began with the first verse of the 39th Psalm: 'I said, I will take heed to my ways, that I offend not with my tongue.'
>
> 'That will do for to-day,' said Pambo, and went his way. He did not return for six months, and was chidden.
>
> 'It is hard to learn that one verse,' answered Pambo; 'I have not mastered it yet.'

Many years after someone asked him about that verse. 'It has taken me nineteen years to learn it, and I am not perfect in it yet,' he replied.

In an age where such uncanny skill is revealed in meeting demand, it has been inevitable that publishers should respond generally to (*Concluded on page 18*)

## The Scientist Is the Most Effectual

# Agent *for* Democracy

## *Says Edwin E. Slosson*

By FRANK M. CHASE

THROUGH their journals and societies the scientific men of America have long kept one another informed of their discoveries and achievements —the raw material out of which far-reaching industrial and sociological advances are made. The general public, however, for which research is undertaken and by which its expense is ultimately borne, has been woefully slow in getting the results of the scientist's work. Too many years have elapsed between the new reaction in the test tube and the new manufacturing process.

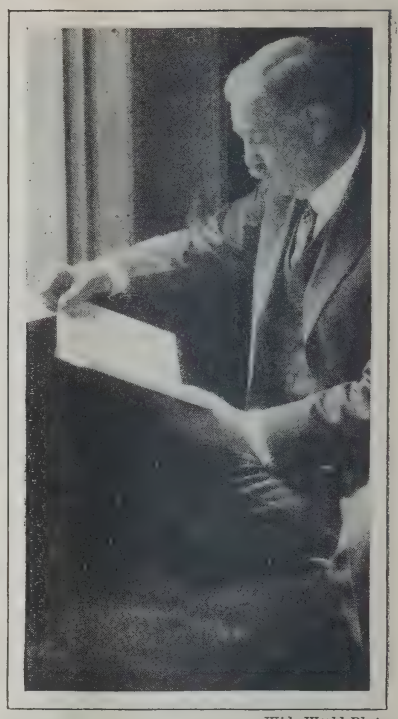
The explanation is simple. It is not the scientist's business to promulgate and exploit his findings. His work is with fundamentals. On the other hand the newspaper reporter, should he find the scientists' convention among his assignments, ordinarily is not familiar enough with the particular science involved to understand and appreciate its message, let alone having the time to put it into an accurate and readable form for the man in the street.

The liaison between the scientific worker and those for whom he is working is weak. As a result, the utilization of his findings is left much to chance, save where research is undertaken privately and for specific manufacturing ends. Obviously here is one place where another middleman is needed.

In Edwin E. Slosson the world has such a middleman. Ever since the appearance of *Creative Chemistry* his name has been almost synonymous with popularized science. But he is more than a translator, an interpreter of scientific language. He is acquainting the people with the great place of science in modern life and awakening them to its cultural value. In short, he is putting science into their everyday lives.

'The period of the extension of civilization is approaching its end,' he says, 'and henceforth progress must take the form of intensification of civilization. People must cease to expand and begin to construct. There are no more continents to discover; no more worlds to conquer. The new era will require new methods and here the constructive powers of the scientist will come into play. The world will more and more come to depend upon him.

'The scientist is a manager of mankind. His discoveries and inventions, his economies and creations, often transform the conditions of life. He is the most effectual agency for democracy, since he accomplishes among material things that equality which legislation aims to bring about in the political sphere. Luxuries, formerly the monopoly of the privileged classes, become, through applied science, the common property of the masses.'



That science is not more interesting to the general public, Doctor Slosson holds, is largely due to the conscientious extraction from it of every vestige of the human element. While this is favorable to the development of abstract science, it has the unfortunate effect of eliminating the human interest.

'Science teachers in the secondary schools occupy a strategic position for influencing the thought of the nation,' he recently explained. 'They give all the instruction in science that most of the people ever get, and they have the first chance at those who go on to the university. Upon such science teachers therefore rests the responsibility of presenting science in the beginning in its integral and humanistic aspects. I venture to say that such a presentation gives the best foundation for future specialization and abstraction.'

Both writer and scientist, Doctor Slosson himself is admirably equipped for making science intelligible to the people. He was educated at the University of Kansas, from which he was graduated in 1890, being granted his Master's Degree two years later. His first position was with the University of Wyoming, which he served as professor of chemistry and chemist of the agricultural experiment station for eleven years. The summers he spent in research, either in his own laboratory or at the University of Chicago, from which in 1902 he received the degree of Doctor of Philosophy for his work in organic chemistry.

To amuse himself while in Wyoming he began to write for *The Independent*, published in New York. His contributions appeared with increasing frequency, and in 1903 he became literary editor of the magazine. On going to New York and making writing his chief occupation, he reversed his former program, giving courses in journalism and sociology in Columbia University as a side line.

'This is an age of specialization,' he observed, looking back on his radical change in occupation. 'I saw

—Wide World Photos.
Dr. E. E. Slosson.

I must specialize too. Looking about I found that chemists had first divided into organic and inorganic chemists; then the former differentiated into three classes—fatty chemists, alcoholic chemists and aromatic chemists. I determined not to fritter away my time on any such broad field but to concentrate my attention upon one single reaction and then perhaps I might accomplish something. After due deliberation I chose the *precipitation of a dilute aqueous solution of ferric tennate upon thin sheets of cellulose.* To this I have devoted the last twenty years and feel that I am only just beginning to understand it.'

Early in 1921, Doctor Slosson came to his present position as director of Science Service. This institution, which he has built up from the beginning, is a non-profit-making corporation established for the specific purpose of disseminating scientific information. Through it Doctor Slosson is giving practical expression to his ideas on the popularization of science, and with gratifying success.

In his chosen task of taking science to the people, Doctor Slosson has written a new chapter in journalism—has pointed out a new field of service. As he said recently in addressing one of the schools of journalism:

'It is the journalist who must be the interpreter of the secret languages with which members of the scientific guilds talk to each other in order that outsiders may not understand and interrupt. It is his business to build bridges across the chasms which divide humanity.'

## Certain Fundamental Safeguards Are Still Needed in

# Our Court-Martial System

*Third of a Series*

## *Says a Former Sergeant Major of the American Expeditionary Forces*

By JAMES W. BECKMAN

THAT the American court-martial system was not always used for justice was stated with frankness by Major General John F. O'Ryan, Commanding General of the 27th Division in the World War, in his testimony before the Senate Sub-Committee on Military Affairs in September, 1919, when he said, describing the attitude of the officers who presided in court-martial:

'They made up their minds that when an offense was committed they would send the man before a board that would impose a sentence that would terrorize the rest of the force.

'I use the word terrorize advisedly.

'No officer in the army expected these sentences to be carried out. When severe sentences were imposed they had a very beneficial effect, except where they gave the impression that they were unjust or inhuman.'

(C) Underwood & Underwood.

*The expressions on these American soldiers' faces are sufficient evidence of their joy when getting first view of their own country upon returning from overseas aboard the 'George Washington.'*

While Congress in 1919 enacted the most sweeping changes in our court-martial system, making it impossible in the future to deny that the system is designed for justice and not for tyranny, and has inculcated some of the mechanism of fairness, it failed in one very fundamental respect to provide machinery to insure that the spirit of justice would prevail and not be defeated again under conditions similar to those that existed in the World War.

For the first time in any manual for court-martial of the United States Army, there appeared a reference to justice in the frontispiece of the newly revised Court-Martial Manual of 1920 that followed the belated elimination of the military laws of King George III from the government of our armed forces. And this quotation from *The Art of War*, by Louis de Gaya, in 1678, is the first statement that appears in our present Manual for Court-Martial:

'Justice ought to bear rule every where, and especially in armies; it is the only means to settle order there and there it ought to be executed with as much exactness as in the best governed cities of the kingdom, if it be intended that the soldiers should be kept in their duty and obedience.'

Congress practically rewrote the court-martial laws, in many instances going into the most specific detail so that justice should never again be miscarried.

The case of Colonel William Mitchell, formerly chief of the air service of the United States, was the first case of prominence under which the new court-martial laws were tested. Regardless of the merits of the case of Colonel Mitchell, this court-martial showed that the new regulations failed in a most important particular, preventing the miscarriage of justice that Congress intended to guard against.

Congress took away the authority of military commanders to use the court-martial system as a means of discipline without a fair and just trial for the accused; but it failed to create the machinery which would prevent those in power from defeating its purpose.

Granting that Mitchell was guilty of the charges against him, his whole trial was irregular because the charges were brought, not by his immediate commander, as required by law, but were inspired and prompted by higher authorities in Washington.

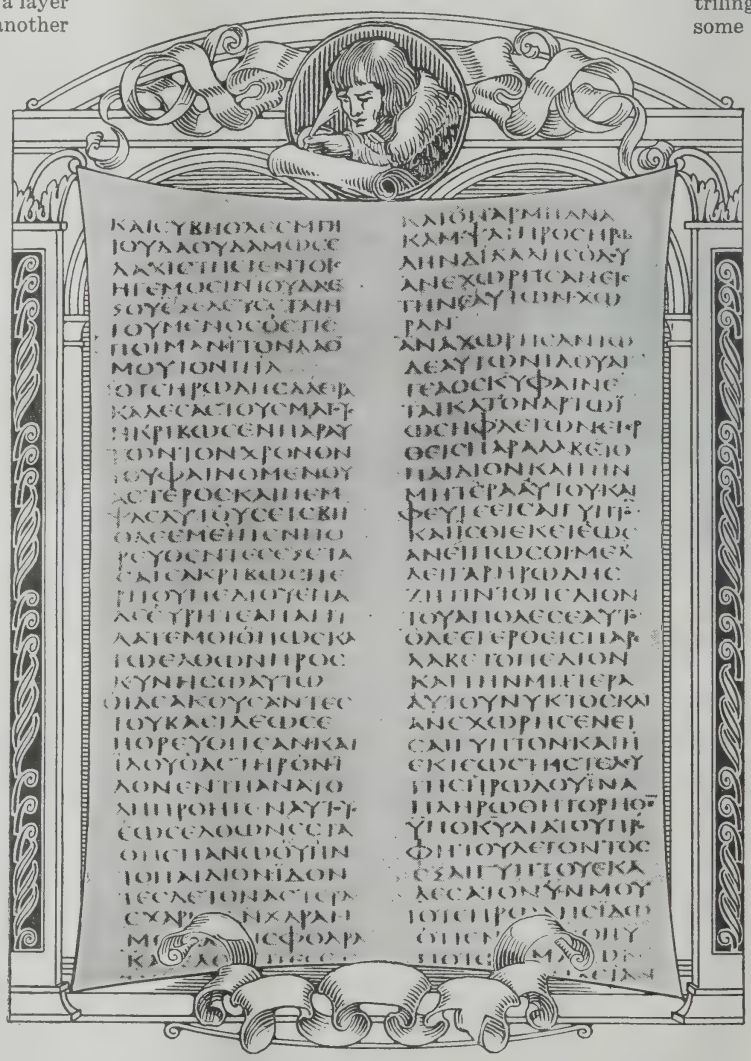
General Mitchell was tried by a court-martial that, under the circumstances, was bound to convict him because the officers composing it might themselves be subjects for retaliation from those higher up.

Instead of trying Mitchell under a specific article of war, which it would have been difficult to prove he had violated, he was tried under the 96th Article of War, which specifies no particular offense, but vaguely mentions without definite specification any conduct that tended to bring discredit upon the military service. Thus was it possible for Mitchell's political superiors, instead of his military superiors, to try him.

The discredit to the military service that resulted from Mitchell's charges was not caused by their being made, but by the incompetence which Mitchell exposed. Mitchell merely pointed out that the laws of nature, of aëronautics, are not amenable to military commands; that while incompetent military officers could order capable aëronautical officers to obey them, these military officers could not control the elements that proved so disastrous to many of the best men in the service.

If Colonel Mitchell had been charged with insubordination, he could have been tried under the 63d and 64th Articles of War, which provide death or such other penalty as the court-martial may direct. *(Concluded on page 23)*

## The Scholar Analyzes The Different



# Versions *of the* New Testament

By HENRY A. SANDERS

IT SEEMS certain that the different books of the New Testament were written at first on papyrus, which was the common writing material of the time. Sheets of this material were made by cutting thin strips of the cellular pith of the papyrus reed, which were then laid side by side to form a layer or sheet. Across this another layer of shorter strips was laid at right angles. The whole was then stuck together with some form of glue in water and the pasted mass hammered into a firm, thin sheet and dried in the sun. These sheets were usually from nine inches to a foot in height and twenty or more were pasted together to make a roll eighteen to twenty feet in length. Such a roll, written on but one side, could have contained a whole Gospel or a collection of letters. Thus eight or ten rolls would have been needed to contain the entire New Testament.

The material was light colored and easy to write on, but it wore out quickly, especially if subjected to hard usage. As the Bible was used in the church service from early times, it is evident that the rolls wore out rapidly and that new copies had to be made. Yet even the most practised copyist could not avoid a certain percentage of errors. Therefore the oftener the books had to be copied, the larger the number of errors. These called for comparison with other copies, attempted corrections, and finally editions based on the study and comparison of many copies.

By the Third Century the desire for a more durable material and the need for a book form in which the texts for the service could be easily found caused the parchment book or codex to begin to supplant the papyrus roll. In the case of the Bible the victory of the new book form seems to have been complete early in the Fourth Century. Yet the need for recopying did not materially lessen. Christianity was expanding rapidly and new copies were continually needed for new churches. Constantine, the first Christian emperor, ordered fifty copies to be made at one time for the churches of his new capital, Constantinople. Also the Bible was being translated into all the other languages of the time. The more important of these translations were made in the Second and Third Centuries. Bilingual, or even trilingual, copies were made in some cases, probably for missionary uses. Manuscripts still exist with the Greek and Latin texts in parallel columns, either on the same page or on opposite pages. Likewise many of the people, especially in the eastern provinces of the Roman Empire, spoke two or more languages with almost equal readiness. Thus the Bible came to be quoted indifferently in various languages and the reader or scribe often used his knowledge of a second language, or the Bible text in that language, to correct the text he was reading or copying.

*Part of the second chapter of Matthew, as recorded on the Sinaitic manuscript discovered by Tischendorf on Mt. Sinai in 1858. The Revised Version of the New Testament is based on the agreement of this manuscript with the Vatican manuscript, both of which were written in the Fourth Century.*

The period of the most frequent and striking variations in the text of the Bible lies before A. D. 200. The Third Century shows more of a tendency to correct, and this culminated near the end of the century in at least two important editions, the one made at Alexandria and the other at Antioch. The Alexandrian edition, in its Greek form, never gained a strong foothold outside of Egypt, but the Antioch edition was taken over by the churches of the capital city of the Eastern Empire and eventually became the Constantinople edition, which even today is alone used in the Greek Catholic Church.

It was from a manuscript of this class that Erasmus made his copy for the first printed Greek Bible in 1516, and a similar text (Continued on page 24)

# MR. FORD'S PAGE

ONE of the instincts of humanity to which little attention has been given is the common urge to help people up, to lift them to the plane one has reached oneself. To judge from much that is said, the existence of this natural human characteristic has not been much observed. There is a view of human nature which would represent it to be inclined to the opposite, namely, to a tendency to keep others down that by comparison their low estate should exalt the better estate of others. However true this may seem to be in single mean particulars, it cannot be described as a general characteristic of humanity.

In the first place, there is nothing that any man can do the benefits of which he can restrict to himself alone. Society is so constructed that any good produced overflows its original limits and benefits the adjacent people. The supreme folly of selfish intention is that it cannot be achieved. The intention may be present and the selfishness may be unlimited, but natural law frustrates the intended consequences. The surgeon may practise for fame and wealth alone, but his very fame and wealth depends upon his giving benefit. The baker may bake in the utmost selfishness, caring only for the money his craft will bring him, but nevertheless his bread feeds others. Whether we like it or not, no benefit is ever produced for oneself alone; its very nature of good is distributiveness. No fortune was ever accumulated without increasing the means of wealth to a multitude. Vast possessions of every sort have always demanded and obtained the privilege of supporting as many persons as if they were owned by many. Indeed, it would be true to say that vast possessions have always supported more people than if the ownership were divided, for there is a magic in consolidated management. That statement may be applied to nations or to individuals.

In the second place, besides this which we call a law of nature, there is also a law of human nature which makes sharing an instinct. Private ownership, considered in the absolute, extends only a little way. About the only thing a man can own absolutely privately is his experience. Our theory of the private ownership of property, in the right of every man to full security in what he has earned, is based on this privacy of experience; life experience is inevitably attached to material property, and what belongs to a man is his.

*WE LIVE in a world where nothing has value if it is selfishly used. The value increases in proportion to the number of people who share it. Creative power is inseparable from the desire to give others the benefit. The very attempt to conceal a value implies that it may not be a value at all. When value brings prosperity it means that the families in the next street, or at the other end of the world, are happy and their wants supplied. Prosperity is only a unit when it is limited to individuals. Not until the last family enjoys it can we say that it has completely arrived and done its work.*

It is really impressive to consider how commonly owned are all the elements of experience, and how mankind instinctively shares these elements among its members. Every mode of communication is an indication of man's desire to share and of the great antiquity of his habit of sharing. On the caves of prehistoric times man carved his observations of the world about him, his recollection of great events, in form and color and with crude craftsmanship—and for what purpose? Only that he might share with others the thing he knew.

Science exists because of this instinct for sharing. It is only the unnatural thing, like misunderstood money, that makes men misers; the great natural things they instinctively share. No one hoards a great discovery—they are all at once made public. It is part of the religion of science to have all things in common, that is, for the common good.

The fact is, we live in a world where nothing has value until it is shared. The value rises in proportion to the number of people who possess it. The most surpassing sculpture would be as nothing, hidden away; indeed, if it were surpassing it could not be hidden away, because the very power to conceive and execute would of necessity carry with it the desire to give it to the world. Creative power does not exist except in company with the desire to share. The very attempt to hide away a value casts doubt on its being a value. All this talk we hear, all this print we see, all these symbols displayed everywhere, these mountains of goods daily produced, these conferences and congresses and churches and colleges—what are they but evidence of the human desire to share? And the thing which helps bring men nearest together is their fellowship of discovery, their feeling of intimacy because they have discovered and appreciated the same things.

It was said long ago: 'No man liveth to himself alone.' Because no man wants to and no man can. Prosperity means to us that the families in the next street, at the other end of the country, at the other end of the world, are happy and supplied. We never feel prosperity complete with ourself alone. Not until the last family has it do we feel that it has fully come. It is the human instinct for sharing. So too this feeling for reform that sometimes draws our ridicule or scorn: after all, is it not the desire of people on a clean, free, wholesome plane to have all the others enjoy it too?

# EDITORIALS

## *Painting the Pennsylvania Lily*

REPUBLICAN apologists in Pennsylvania are having a difficult time painting Senate-nominee William S. Vare the white of the proverbial lily. Party loyalty is heavily drawn upon as the principal ingredient in the whitewash. But party loyalty is an ingredient of uncertain volatility, and Mr. Vare is an uncertain subject. Furthermore, the action of Republican Senators Norris, LaFollette and Nye in offering to campaign for William B. Wilson, the Democratic nominee, adds a great gob of mud to the paint bucket.

The western Senators' offer sends Mr. Vare's chances for a comfortable Senate chair farther afield than ever. It presages not only a difficult time at the polls but an even more unpleasant one in the Senate, should Mr. Vare be named. And his hope of being named is by no means established. His own political machine is functioning well, and he has made ostensible peace with the powerful Mellon interests in Pittsburgh, but he has estranged thousands of Republican voters who owe allegiance to no political boss. It is to these that the plaintive plea of party loyalty is made most urgently. It is no specious plea; it is a desperate one. Mr. Wilson, Secretary of Labor for eight years in President Wilson's Cabinet, is developing surprising strength. He is a man of undoubted integrity and recognized ability—a dangerous opponent for a man of Mr. Vare's caliber.

The Republican majority in the Senate is woefully small. It needs the bolstering of a regular party man like Vare, even though he come in under somewhat of a cloud. Therefore loyal Republican newspapers and party leaders who heretofore have gazed upon Mr. Vare's ambitions with a stony stare have suddenly developed keen interest in electing him. The Republicans in Pennsylvania are faced with a disagreeable alternative: they must either sanction Mr. Vare's political methods by electing him; or they must reduce the Republican senatorial strength by defeating him and thus rejecting what he stands for.

It should be remembered that if Mr. Wilson is elected he will be elected by Republican voters, as a rebuke to Mr. Vare. Pennsylvania is a state overwhelmingly Republican, and it is only in crises such as this that a Democratic nominee has a ghost of a show. Tom W. Cunningham, local politician who gained passing national notice through his reluctance to testify before Senator Reed's investigating committee, once came into local fame in Philadelphia through voicing a choice phrase. It sprang from his lips, full-born, at a peacefest following a vigorous factional fight in Philadelphia. 'We must all,' he said in effect, 'be a band of brothers in our common cause.' Mr. Vare's henchmen are fervently hoping that this band of brotherhood will extend over the entire state by November.

## *The Dollar Sign of Sportdom*

NO ONE desires to take away from Gertrude Ederle any of the credit that is hers for being the first woman ever to swim the English Channel. Nor does anyone deny that her pluck and skill are worthy of reward. Whether they are worth the $1,000,000 in swimming, movie and vaudeville contracts reported offered her is largely a matter of opinion. But in giving fair and judicious consideration to her achievement, this monetary element as well as others must enter in.

Miss Ederle said she swam for the glory of America. Mrs. Corson, who duplicated her feat a few days later, said quite frankly that she swam 'to make some money for my kids.' Both are highly laudable aims. Miss Ederle got both glory and money, and it is to be hoped that Mrs. Corson will be equally fortunate. As individual cases there can be no quibbling over this. The dictum of the street—They earned the money; let them have it—finds ready response. But when the cases are considered in the larger phase of their bearing on the future of American sport, they assume a different tinge.

Miss Ederle was a professional when she undertook her successful swim; she had discarded her amateur status some months before. But it was as an amateur that she earned her first honors and won her first fame. Her million-dollar triumph came close upon the precipitate plunge of Mlle. Lenglen into professionalism, a plunge which has worried followers of sport to a marked degree. Americans do not take kindly to the professionalization of sports long held sacred to the amateur ranks. Nothing better illustrates this than the open glee of leading newspapers at the defeat of Elizabeth Ryan for the American woman's

tennis championship, a glee which was generated solely by the rumor that Miss Ryan would turn professional if she won. The fall in esteem of 'Red' Grange, erstwhile gridiron hero, is so well known as not to need mention.

America has gained preëminence in sport through the development of amateurs, not professionals. The game has been played for the sake of the game, not for the hope of material gain. Baseball to the contrary, professional sport is alien to the spirit of the nation. Baseball owes its success to the false inflation of publicity, and the commercialization of other sports is being accomplished by the same medium. Those who go to see an amateur champion, turned professional, go to see a ten-day wonder, not an excellent sportsman. Amateur sport 'for the sake of the game' has proved a tremendous asset in American life. Amateur sport as a stepping-stone to profitable professionalism is stripped of most of its value.

## *Peace With Victory*

STARVING the British miners into submission is not going to provide any permanent solution for England's coal problem. It is merely furnishing sharp fuel for the conflict that is bound to come in the future. And the unrelenting attitude of the mine-owners throws both support and public sympathy to the miners, where otherwise they might have had neither.

One of the saddest features of the present situation is the rapid decline in prestige of Premier Baldwin. Immediately after the great strike he was the idol of his nation. His influence was greater than that of any Englishman of a generation. He could have led the way to an equitable settlement, forcing the miners and mine-owners to accept conditions most favorable for the country. But instead he was content to drift; and now the impression is abroad that his Ministry has actually espoused the cause of the mine-owners, and is not averse to seeing the miners beaten into surrender. The probable truth is that Baldwin has been grievously hampered by his die-hard associates, but this does not save him from public censure. His opportunity for leadership has passed.

The miners and the mine-owners are about equally to blame for the present impossible situation. The miners have alienated many people through their acceptance of Bolshevist gold. But this seems more than offset by the mine-owners' stubborn refusal to accept reorganization of the mines. The British *Review of Reviews* tells of one mine where an enormous saving was effected through proper transport facilities underground. Formerly the miners had to tramp for an hour from the bottom of the pit to the coal face, thus reducing the seven-hour day to an actual five-hour one. Installation of electrical transport resulted in saving an hour and a half of labor for each man—a tremendous item in the operation of the mine. The case was cited by the British magazine, not for its exceptional qualities, but as an instance of what can be accomplished through reform in management. The same principle of modern management applied to the whole industry would not only save the necessity of a cut in the miners' wages, but would give the coal to the public at a reduced rate.

The English workers have gained the feeling that the mine-owners, backed by the Ministry, are attacking the miners' standard of living. They believe that this attack, once successful, will be extended to other industries. Warranted or not, such a feeling is dangerous for a nation. It is deplorable that the Baldwin Ministry has allowed it to gain headway. British officialdom seems to have acquired American officialdom's knack at blundering.

---

## *Mexico*

THERE are those who see money-making if we interfere in Mexican affairs. There are editorials well calculated to awaken prejudice, passion and strife. There is secret pressure being put upon those in high places. There is the usual talk about the 'will of the people.' So the field is open for mischief. But the great body of the people are not to be swept off their feet by such tactics.

The disagreement in Mexico between Church and State is deplorable just as a difference of opinion in the house next door is deplorable; but it is a wise man who concentrates on setting his own house in order.

Mexico, like other countries, must work out her own destiny. Her economic doctrines, her religious creeds and her ecclesiastical conditions are her own business. On the anvil of experience she must shape her own character. The thing to remember is that her quarrel is not ours. As for armed interference, just now the popular opinion is very much like that expressed by that sage and philosopher, Mr. Dooley, who said: 'I'll niver go down again to see sojers off to th' war. But ye'll see me at th' depot with a brass band whin th' men that causes wars starts f'r th' scene iv carnage.'

# *The* OLD-TIME REVIVAL

## *Is It Good Enough For Us?*

By WILLIAM E. BARTON

*Illustrated by* GEORGE HARPER

THERE are a few questions the calm discussion of which will be likely to awaken more violent dissent than this. Whatever the evangelistic movements of recent years have done or failed to do, they have not failed to excite prolonged and acrimonious debate. The history of revivals in the Christian Church and the development of recent evangelism offer material for discussion and no fear of dissenting opinion ought to prevent a consideration of this important theme.

There can be little difference of opinion about the value of revivals in centuries gone by. The Christian Church was born in a revival. The preaching of Peter on the Day of Pentecost was characterized by all that we now know under the general term of a revival. The Protestant Reformation, whatever else it was, was a revival of personal religion. The Puritan movement was a religious revival. The rise of Methodism, which I, not being a Methodist, may be at liberty to mention with high honor and reverence, was unmistakably a revival.

The great awakening of the middle of the 18th Century, in spite of all the unfortunate backwash of that movement, must be regarded as having accomplished great and permanent good. In a sense it was the spiritual preparation for the political freedom which came with the Revolutionary War. The revival in the beginning of the 19th Century was a double movement, starting simultaneously in the colleges and the backwoods, and in each place its benefits outweighed its disadvantages I think a hundred to one. It consecrated learning anew at the shrine of righteousness, and rescued the wilderness from godlessness.

The revivals of 1857 and 1873, each following as it did a financial panic, were movements of tremendous significance. Speaking for the past, I think we must admit the very great value of the revival in church history and in the history of America.

The theory of a revival of religion is entirely logical. Human nature is seasonal. It has never proved possible to hold the interest of a great body of people steadily focused upon any one object, no matter how high or holy. The world is too much with us, the flesh is in constant evidence, and the devil is busy. The theory of a revival of religion is based on the conviction that the claims of religion are so reasonable that men will yield their lives to it if they can be induced to give it consecutive attention.

Still further, there is a word to be said concerning the professional evangelist. The minister's vocation, like every other, tends to specialties. Among lawyers, there will be one who excels in writing briefs, and another whose special forte is the presentation of cases to the jury. In the medical profession, one man will develop skill in diagnosis and another in surgery. So there are some ministers who develop a special power of appeal which should be utilized in the special work of evangelism. These men need not, of necessity, be the most learned, or the most eloquent men of their vocation, but if they succeed in doing this one thing better than the average pastor can do it while he still carries on the varied responsibilities of the pastorate they should be released for this particular service and no one should complain if their rewards are rather large, considering the strain under which of necessity they work, and the seasonal nature of their vocation.

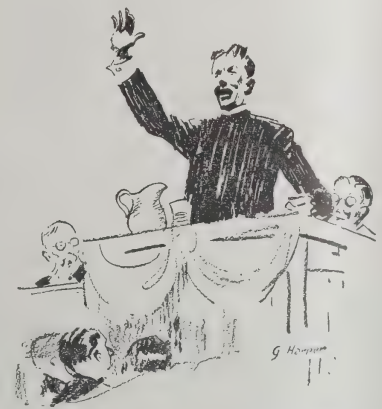
Having said all this in favor of the old-time revival and of the old-time revivalist, I turn to other and less pleasing aspects of the subject.

The first is that whatever the merits of the modern revival, it has pretty nearly ceased to perform its primary function of converting men in any considerable numbers to sustained Christian faith and established Christian life.

I am prepared to be confronted with statistics showing how many 'trail hitters' there are at the end of a revival in one city and how many 'card signers' there are in another. I do not alter my statement, and I have very definitely in mind some of these same figures when I make it. I shall refer to this later.

Let me go back and run rapidly over my memories of the evangelists of the last forty or fifty years.

THE first eminent evangelist I heard was Dwight L. Moody. I regard him as one of the great men of his generation. He was a layman and had the good sense to remain a layman. No foolish ecclesiastical body laid any ineffectual hands upon his head to make him a minister of the gospel. That was not necessary. He was far better off without it. I regard the work which he did in many American cities as of incalculable value, and so I also think was his work across the sea. The schools which he founded in rare unselfishness bear testimony to the abiding influence of his work for education. He kept himself clean from suspicion of covetousness. For these and many other reasons I hold Mr. Moody in honor.



Before he died Mr. Moody found his method subject to the law of diminishing returns. I am aware that men who knew him far better than I have denied that he felt at all discouraged or in doubt about the permanent values of his methods. Notwithstanding all this, I know that there were times when Moody felt a very deep depression over the fact that his methods were not yielding the same and proportionate results as in former years. I know it because he said it to me and also because he said it to a large group of ministers in my presence. He may not have felt so all the time, but he certainly felt so at some times, and I think not without reason.

My ministry goes back to the time when Sam Jones was emerging from local into national eminence. He was a rising figure in the neighborhood of Atlanta when I was there in the spring of 1885. He emerged into wider celebrity in Cincinnati and I heard him there and elsewhere in Ohio about five years later. I sat on the platform with him when he came to Boston for the first time and was with him again on the platform in Chicago. His message, 'Quit Your Meanness,' was a very practical gospel and had a real value. His oddities of expression, his free use of slang, his use of abusive language free from malice, were elements of strength, and so far as I am able to judge from what I saw and learned of his work as a whole, there was much more good than bad to be said regarding him.

For twenty-five years I was pastor of a large suburban church in the city of Chicago, and there I saw four notable evangelistic campaigns. The first, which I think was the best advertised movement I had ever known anything about, was a series of revival meetings conducted in the auditorium under the leadership of the Reverend R. A. Torrey. His was an earnest and sincere message. If it made any appeal to any considerable group of people, I saw no evidence of it.

I remember coming in late, at one meeting, and hearing his voice before I got inside. Long before I could distinguish a single word, I felt repelled by the harsh, rasping dogmatism of his voice. His homiletic method in no wise relieved this unfavorable impression. He was an educated man and knew the rules of proper sermon construction. His method was a merciless dialectic. For myself, I earnestly desired the success of his work, and strove to put myself into mental accord with it, but I found myself invariably throwing a protective shell about my mind in rebellion against the harshness and dogmatism of his method. I suppose he did some good—I hope so, but I did not see any of it.

The second of those campaigns was held by Gipsy Smith, who preached each day at noon in one of the theaters and in the afternoon in the churches in or about the city. Whatever results there were, were good. There was no dogmatism, there was nothing harsh or repellent, and excepting for the little bit of artificiality and posing in his frequently reminding his audience that he was a gipsy (a pose which I am sorry to know his son has inherited), his methods seemed to me as free from criticism and as fully to be commended as any I had ever known in an evangelist. At infrequent intervals, I have heard and met him since and I always have the same distinctly favorable impression. He did not, however, make a profound impression on the city.

*The evangelist has a trinity of pet sins against which he habitually declaims. They are dancing, theater going, and card playing. The worst card game I know of is the one played by the evangelist. It is that of securing cards signed by supposed converts, these cards being distributed among local pastors to be followed up with a view to prospective church membership. I have followed these cards through a good many campaigns, wearing out shoe leather and wasting time that might have been better employed. I shall not say the results were meager; I shall say that I have yet to add one hopeful member to my church through the following up of hundreds of these cards.*

THE next city-wide campaign in which I had a share was conducted by Chapman and Alexander. It was excellently planned. It brought to Chicago for a good many weeks in succession a group of accredited evangelists from all over the country, and stationed them in various centers, moving them from time to time by definitely arranged schedule. In three centers on the north, south, and west sides of Chicago, church meetings were arranged and to each of these in turn Chapman and Alexander themselves came and spent one-third of their time in each. No better piece of religious generalship has ever come under my observation. I remember nothing I should care to criticize. The meetings did not, however, produce the results which it was hoped they would produce.

The fourth and largest of these meetings was conducted by Billy Sunday. I went to Paterson, New Jersey, with a committee to invite him to Chicago, and was on the reception committee when he arrived, and on the executive committee throughout the meetings. We erected an enormous tabernacle and had a vast choir and other facilities, as large I suppose as he had in any city. I heard a great many of his sermons. In the main they were good sermons. I heard the one that was most criticized on the score of its bad taste. It certainly contained some sentences which I could have wished omitted, yet in the main I think it was a wholesome sermon. He was preaching, in his way, the same kind of sermon that Mr. Moody used to preach from the text, 'Whatsoever a man soweth, that shall he reap.'

Nearly fifty thousand persons 'hit the trail' in Chicago as a result of Billy Sunday's meetings and about one-third of them got away without signing cards. I do not care to go into a detailed discussion of the matter beyond saying that the executive committee, after the whole thing was over, decided by a small majority not to publish the results in church membership.

The excuse which those gave who voted for the affirmative was that their figures were incomplete. Of course they were incomplete, but all the churches had reported that had anything of importance to report. The incompleteness of the returns would not have prevented their publication but for the fact that they showed an appalling disparity between the apparent and the real results so far as this could be told in figures. *(Concluded on page 25)*

# The Cry of the Crippled Children

## Is Greater Than That About Which a Barrett Browning Wrote

By FORREST LORD

AUTHORITIES agree that the deformities of two-thirds of the 300,000 crippled children in the United States could have been prevented. Why weren't they? Because, in most cases, parents and family physicians did not know what to do. What a colossal tribute ignorance exacts!

It is likewise agreed that fully ninety per cent of the deformities occurring in children under twenty-one can be either wholly corrected or greatly improved.

Various coöperating agencies have brought relief to about a third of these children. The rest, nearly a fifth of a million, are growing to adulthood sadly handicapped and, in cases, altogether incapacitated for earning a living, many of them doomed to end their days in the almshouse.

Disease is the prolific parent of most physical defects, and the malady that takes first rank as a deformer of children is infantile paralysis. Not a year passes but that this disease makes its appearance in some quarter of the country. In 1916 an epidemic swept the eastern and central sections of the United States, taking an enormous toll of life and limb. In New York State alone its victims numbered more than 7,000. Medical science stands helpless before the stealthy approach of this disease. Its germ is as elusive as the mist of the morning. Its carrying agent is conjectured but not known. Unlike diphtheria, it cannot be readily diagnosed. Unlike smallpox, it cannot be vaccinated against, and unlike tuberculosis, it cannot, so far as our present knowledge goes, be prevented. About all that science has learned of this disease is that it is communicable, occurs more frequently in summer than winter, and is probably more prevalent in rural than city districts.

It is encouraging to know, however, that while the disease itself cannot be prevented, the deformities which commonly follow its attack can always be. To understand the theory of preventive measures we must hark back to our knowledge of the nature and functions of the muscles which suffer most from the ravages of the disease.

Next only to that of the heart and brain is the vulnerability of the spinal cord. The germ of infantile paralysis has a marked affinity for the gray matter of which this cord is composed and makes its lodgings there as soon as it enters the body. Never was guest more unwelcome! It attacks those tiny cables we call nerves, which permeate the muscles of the lower limbs, severing communication with the brain and thus depriving the muscles of their normal power to move the limbs.

*Occupational therapy to restore strength to fingers which have suffered an attack of paralysis.*

Nature has no remedy for such a condition, but science has. Science comes forward, clamps on a brace and thus restrains the bone from yielding to the insistent demands of the functioning muscle. Or from the healthy muscle modern surgery may pluck one of the tendons, with which nature has generously endowed all muscles, almost, it would seem, to superfluity, and transplant it in the injured muscle, thereby restoring a modicum of its lost strength.

A second important source of deformities in children is tuberculosis of the bones and joints. This is contracted either by too close association with other persons afflicted with the disease or by the consumption of the meat or milk products of tuberculous cattle. Owing to the superior legislation of the states against the sale of uninspected or untreated milk, tuberculosis is not so common in the United States as it is in European countries. In Great Britain it is blamed for more than one-third of all deformities.

Both the disease and deformities of tuberculosis can be prevented—the first by avoiding contact with tuberculous persons and shunning the milk, meat, butter or cheese from infected bovines; the second by early hospital treatment. The sputum of tuberculous persons is deadly to children susceptible to the disease. Out of forty-eight guinea pigs given food containing the sweepings of rooms occupied by tuberculous persons, forty-seven contracted the disease. Examination of samples taken at random from untreated milk in various American cities usually reveals eight to fifteen per cent containing the bovine tubercle bacilli.

The orthopedic surgeon comes to the rescue of crippled children with curative operations that fifty years ago would have been hailed as miraculous. He is the master carpenter of the human framework. When disease, like the rot that crumbles the timbers of a house, twists and enfeebles the supports of the human frame, he is the craftsman who comes forward with saw and scalpel to repair the damage. He cuts and straightens bones, transplants tendons, lengthens muscles, makes new joints and cartilage for them to work on, and effects other astonishing adjustments to overcome the deformity. The story of the orthopedist's triumph over the malformations of the human body is a fascinating one.

In practically every county of the United States may be found deformity cases of varying gravity. While only a few types of deformity tend to complete helplessness, the large majority do present serious obstacles to satisfactory education and self-support. Illiteracy and beggarism are the price which crippled children are paying every day for someone's neglect.

In our programs of conservation of natural resources, is there no room for the conservation of the cripple?

Ensenada, one of the larger towns of Lower California.

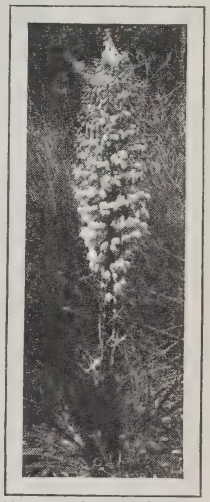
# Lower California, Land *of* Mystery



## Where American Filibusters Once Sought *to* Establish *a* Republic

By H. H. DUNN

LOWER California is remarkable in that down its whole length runs a range of extremely inaccessible mountains, with few traversable canyons leading back into them, and only four fairly good passes through them. Mammal and bird life is there in abundance, and one recent expedition is reported to have found three new species of birds, and two new species of mammals in a brief exploration trip. River beds are many, flowing down both sides of the mountain wall, but rivers containing water are few, with none at all during midsummer. There are deer in the forests of pine and oak; mountain sheep in the bare upper ranges, and a few antelope are reported as still existing on the higher mesas. The smaller variety of wild turkey is reported in the manzanita-covered lower slopes, while there are quail at every water hole and the rare California condor, rivaling the Andean condor in size, is making its last fight against extermination in the caves of the Lower California Sierra. On the Guadalupe Islands are the remnants of what was once a large herd of sea elephants, or elephant seals. The waters of the Gulf of California and of the Pacific Ocean along the coasts of California teem with edible fish, while there are valuable pearl fisheries at La Paz, on the eastern shore and near the lower end of the peninsula. Yet the fisheries are undeveloped, and the pearl concessions are neither thoroughly nor competently worked.

Wherever prospecting has been done in the mountains, traces have been found of pre-Spanish placer and free-gold mining, but the Indians now in Lower California have neither ideas nor legends of these ancient miners, who appear to have been Indians of more advanced civilization than the present inhabitants of either the mainland of Mexico or the peninsula. The entire population of this nearly 40,000,000 acres of land is probably less than 30,000, and the interior is virtually uninhabited, nine-tenths of the people being gathered in ten or twelve towns and villages, with La Paz the capital of the southern district, and Mexicali, opposite the California town of Calexico, the seat of government in the northern half of the state.

The most prosperous period which this interesting peninsula has had was from the landing of Father Salvatierra in 1697 to the explusion of the Society of Jesus (Jesuits) from California in 1767. Within this seventy years, the fathers of the Society of Jesus, undertaking to colonize and develop the peninsula where the Spanish Government had made a signal failure, had founded twenty-three missions, of which fourteen had proved permanent and successful; charted much of the eastern coast, mapped some of the interior, erected mission buildings, taught the Indians to work in agriculture and in useful arts.

Yucca, or Spanish dagger, sweet desert flower.

With the sudden and unexpected expulsion of the Jesuits from Lower California, the Dominicans came in, followed by the Franciscans. Neither of these orders accomplished much for the development of the peninsula, and neither carried on the work so arduously and so auspiciously begun by the Jesuits. Neither the Spanish Government nor the Mexican Government ever has been able to develop this rich province at all; far from the degree to which the score or less of Jesuit padres carried it.

The first mission station was established at San Juan, some twelve miles north of Loreto, and not more than a mile from the shore of San Bruno Bay. Farther inland than this, however, the most historic of all the Lower California missions, and the one generally credited with being the first, was set up. This was Loreto, founded in 1698, and destined to be-

One of the mountain lakes in the interior of Lower California. Wild life abounds here.

# *The* TRUTH *About* FRANCE

## Lesson *of* Touraine *and the* Woolen Stocking

FROM THE *MORNING POST*, LONDON

*Drawings by* GERALD VAN DER HEYDEN

WHO has not pictured the French peasant counting his month's earnings by candle-light before hiding the bank notes in a stocking under his bed? What does he do with his bank notes now that the franc is rushing down a precipice? I have put this question point-blank to farmers all over Touraine, and watched the look of pained surprise that came over their faces at my curiosity. I need not have wasted my breath in most cases, however, for it is not the first time I have wandered by the side of their cornfields and their vineyards, and the change that has come about should have been sufficient answer to my question.

I must say that my farmer when first I knew him after the war lived in a very meager home. When I suggested that it needed repairs he would give me a little lecture on economy and go on his way unperturbed. What was my surprise therefore to find him living in a house rebuilt from top to bottom. The furniture was new and the paint shone in the sunlight. The bedrooms were airy, and behind the house a garage had sprung up like a mushroom, while a new two-seater car was waiting to take him to the village.

'What on earth has happened?' I asked him. 'You must be earning a lot of money.' 'Yes,' he answered, 'I am earning money—quite a lot.' 'And your economies?' I asked.

The farmer growled: 'What is the use of economies?' he asked. 'I have taken out the money I had in the bank. In a few years my savings would have been worth nothing, whereas now—now, I have a house that will fetch a good price any day, and after all a car is always a car. I can sell it when I want to.'

That is precisely what the farmer is doing with his savings. He is buying up everything he can round him, for he has faith only in what he can see.

The farmer does not think of the franc as losing value as the sterling rises. One hundred francs six months ago is still one hundred francs. Moreover, he could sell a pig for twenty francs in 1914, and with the twenty francs he could buy a pair of shoes. Today he sells his pig for 130 or more, and still buys the pair of shoes with the proceeds of the pig.

But where the peasant does find a difference is with his Rentes, which five years ago he might have bought for 100fcs. and which today he finds only worth perhaps 70fcs. As a matter of fact he has lost a great deal more than the difference between 70 and 100fcs., but he would be incapable of seeing as far as that.

The peasant, therefore, sells his Rentes and keeps his money in a drawer for a few days. During that time he keeps his eyes open for the first piece of vacant land round his farm, and as soon as his neighbor is willing to sell, he rushes to buy it. Now this rush to buy up the neighbor's land is so common all over France today that one begins to wonder where the land comes from. Who is the seller?

One of the secrets lies in the death dues. You cannot go twenty miles out of Paris now without seeing some château put up to auction in lots. A rich man dies leaving ten million francs' worth of land. Supposing he has no son, and the land passes to a cousin, the cousin must immediately pay to the state a sum of nearly eighty per cent of the value of the property he inherits. It is very unlikely that any young man would have a million and a quarter francs in cash, so the land is nearly always sold in small lots of three or four hectares each.

A hectare of vineland here has, roughly, augmented by nine times in value since the war, but it is almost impossible to suggest even roughly what a hectare is sold for. First, it depends on the grape, and, secondly, as it is impossible to buy a single inch of land from a peasant, any figure would have to be more or less a guess.

Now here in Tours the peasant is, for the most part, well off. He buys a motor car to take him into town, he has acquired the latest American farm tools, and fights at auction sales for every piece of land near his own. When he finds that he still has a few bank notes at his disposal he buys real estate in Tours, and I could actually cite cases where small peasants have bought town houses in Tours where they come to spend the week-end.

# *IF* Shakespeare Came *to* London

## Would He Be Able *to* Search Out *and* Identify Many *of* His Old Haunts?

By W. TEIGNMOUTH SHORE

*Drawings by* L. PERN BIRD

IF HE could come back, what would the Bard of Avon think of the London of today? There would be things of which he would know neither the names nor the uses. He would be staggered at the huge size of this over-bloated city, at the cleanliness of the streets, at the absence of abominable smells, at the motorbuses, at the short skirts of the girls, at—oh, innumerable things! He would be a stranger in a strange city.

The Great Fire of London in 1666 swept away very much of medieval London, but here and there are many buildings which he must have seen and in some of which we know he has been. Many of my American friends have been surprised that there is so much of Elizabethan London still to be seen.

We shall start on our ramble from Holborn, one of the busiest streets, a name well known to Will Shakespeare. Start there, because there still stands an ancient dwelling place, looking very tired and as though ready to tumble down upon the slightest provocation; its quaint gables, chimneys and timbered walls askew; but in reality sturdy enough still to last many a day longer. Its front gives a very good idea of the appearance of an average street in the London of Queen Bess.

*Staple Inn, Holborn.*

This is Staple Inn at which we are looking; once upon a long time ago a hostel of the wool-staplers; later an Inn of Chancery, where resided men of the law in Shakespeare's time; now inhabited by all sorts and conditions of men.

Nearly opposite Staple Inn is Furnival's Inn, rebuilded in 1879, where Dickens occupied 'chambers' and wrote there the early chapters of *Pickwick*.

Not far away is Ely Place. In the tragedy of *King Richard III*, the Duke of Gloucester says to the Bishop of Ely:

> 'My Lord of Ely, when I was last in Holborn,
> I saw good strawberries in your garden there.'

You see them there now only in the fruit stores!

We will walk on, and in Chancery Lane pause a moment before the gatehouse of Lincoln's Inn, another rookery of the black-robed gents. Shakespeare must often have passed this by, or gone through it, for in the immediate neighborhood was the house of his friend the Earl of Southampton, to whom he dedicated his poem of *Venus and Adonis*, also *The Rape of Lucrece*.

Then down Chancery Lane into Fleet Street, so named because it led down to the Fleet River, once quite a vigorous and busy stream but long since degraded into a sewer; across and into The Temple, once occupied by the Knights Templars, 'Poor Knights of Christ and of the Temple of Solomon'; who ceased to be poor, became haughty, became rich and powerful, and, so their envious enemies said, unworthy. The Order was dissolved in 1312, and after various vicissitudes The Temple became an Inn of Court and the abiding place of legal lights, dim and bright; so to remain to this day.

We are concerned with one spot only, Middle Temple Hall. It is a glorious example of a Tudor Hall, such as there are many of in Oxford and Cambridge colleges and in noblemen's houses in the country. It was built in the period 1562 to 1572 so far as the interior is concerned; the exterior proves the truth of the bitter saying: 'Restoration, a falsification of history.' The walls within are ornate with coats of arms of Temple worthies, hung with portraits, and the stately windows richly decked with armorial bearings.

In the gardens here the red and the white rose were chosen to be the badges of the Yorkists and the Lancastrians through the bloody civil wars of the Roses. The Temple gardens overlook the Thames. Shall we go up or down? Go downstream to the Tower of London? I think we will not. There is a far fairer, far happier spot upstream—Westminster Abbey. Shakespeare must—I will not admit that it can have been otherwise—*must* often have walked through the shadowy cloisters; possibly stopping a while to chat with some of the boys of

*Middle Temple Hall (showing part of the screen).*

Westminster School. Appropriately we will go into the Abbey to Poets' Corner. There, see, the tombs of Dan Chaucer and Edmund Spenser; here lies Francis Beaumont, fellow dramatist and doubtless friend of Shakespeare; tombs and memorials of many another poet whose verses echo down the corridors of time. A monument none too worthy to Shakespeare himself. Here lie David Garrick and Sir Henry Irving, two of the greatest actors in Shakespeare's plays. And—but it would be wearisome to record the names of all the great dead here enshrined.

William Shakespeare must have been here oftentimes; in this famed temple of the God of Battles and of Peace.

Westminster Hall, part of the old royal palace, is but across the way; first built as long ago as 1097 by William II and magnificently added to by Richard II, in 1399; by the irony of tragedy it was in this place that he was deposed from his throne, the year after he had kept a very merry Christmas there. As you may read in the tragedy of *King Richard II*.

We will betake ourselves to the Church of Saint Saviour. Beyond doubt Shakespeare has been there also! 'Here upon Thursday, December 31, in the year 1607, was buried Edmund Shakespeare, brother of William; a player; aged twenty eight,' with a 'forenoone knell of the great bell.' Several of Shakespeare's comrades were laid to rest here. For Americans there are other interests in this church: a monument to William Emerson, probably an ancestor of Ralph Waldo; the Harvard Chapel, restored in memory of John Harvard, who was born in this parish.

So—farewell to the London of William Shakespeare, of which we have seen but a part. There are many other churches that escaped the Great Fire; there is the Charterhouse, once the home of a famous Elizabethan nobleman; some scant remnants of the old city walls, which were standing when Shakespeare came to town; and so on . .

Go to Stratford-on-Avon; it is a charming, old-world town; see there the room in which Shakespeare may have been born; the school to which he probably went; the cottage in which dwelt the woman whom he loved and married; the few fragments of the house in which he died. But come to London if you wish to see the town in which he lived, worked, achieved his great name—there is much of it to see, and to see it helps to the enjoyment and the understanding of Shakespeare's plays.

*A PERMANENT FILE*

*For Your Copies of*
*THE DEARBORN INDEPENDENT*

TO THOSE readers who desire to save their copies, we can furnish a specially made binder which holds 26 copies.

This binder permits of ready reference to or the removal of any particular issue without disarranging other copies.

Durably constructed, with stiff covers, cloth covered, this binder solves the problem of keeping all copies neat and instantly available.

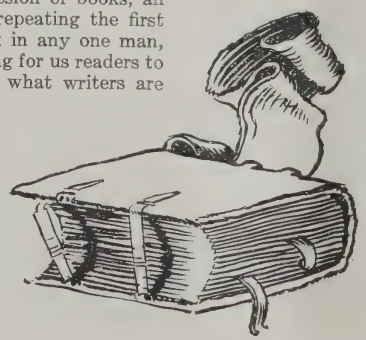
# What Books Are Worth While

(*Concluded from page 5*)

this demand on the part of so many persons for compressed knowledge. We have therefore an increasing number of pocket-editions, and what may be termed bird's-eye-view books. Notable among these are the Today and Tomorrow Series, issued by Dutton, a series of small books which cover fairly well the fields of science and philosophy.

Everyman's Library is of course a standard, reproducing in small space some of the world's best books. Also, the Oxford Press has succeeded in publishing a similar series in pocket editions, and the Nelson editions of Dickens and other standard authors are fine examples of practical book-making. But books like *The Shorter Bible*, or, in fact, any emasculated books, are to be shunned. A Bible can be purchased for as low as a dime. The other day one came to notice which can be read only with a magnifying glass, and can easily be put into a vest pocket. The price was about a dollar and a quarter.

A liberal education does not consist in knowing the contents of a large number of books, or even in book learning as a whole. It consists in knowing those books which corroborate and clarify one's own life experience. Their great and indeed necessary service lies in the fact that they act as true levers to our faith. For instance, if one works hard and long and the return seems slow, it is a lever to one's faith to read in Emerson:



'If you love and serve men, you cannot by any hiding or stratagem escape the remuneration.'

This was known before, but to have it corroborated by a great mind is an enormous help.

That is about all there is to reading, but it is enough, and reflection shows that it is comprehensive.

Suppose we consider English fiction. It is interesting, as a kind of game, to watch the rise of new writers, to observe the temporary reputation of Miss Kennedy's *Constant Nymph*, to see Virginia Woolf gradually gain her American audience. But certainly one cannot read all that is written, and if one reads John Galsworthy's *Saga* he has got about all there is in the atmosphere of Modern England. Furthermore, this book, written by an artist who writes true to his British life, corroborates all that one feels in his own life, plus the racial differences.

Naturally, the tendency of all modern authors is to repeat. A man writes a successful book and secures an audience. He thereupon writes a succession of books, all of them—more or less—repeating the first book. There is one book in any one man, but rarely more. The thing for us readers to learn is first to find out what writers are worth while and then to read the one thing they have written which is most worth while. Bertrand Russell, one of the ablest scientific writers in England, has written a succession of books, but a very small one of his entitled *What I Believe* contains practically all we know that he knows. Similarly, Albert Einstein, the projector of the modern theory of relativity, has written a number of books about it and heaven save us from reading all the books on relativity written by others. Yet much of what he knows is comprehended in a little essay of his called *Sidelights on Relativity* which is simply two addresses he gave, combined.

The books published about modern philosophy would fill a whole library, yet it is all comprehended in a little volume entitled, *Introduction to Modern Philosophy*, by C. E. M. Joad.

As for religion, words fail in defining the extent of the books published. Yet if you wish to know what religions there are and all the information necessary, it is contained in a little volume by Robert Ernest Hume, entitled *The World's Living Religions*.

Herbert Hoover, not so long ago, stated that an educated man was merely one who knew where to go for his facts, and that is a superb definition. There is, however, something more than facts; there are atmospheres. The question is: Where shall we go for our real culture, for that indefinable thing which gives to life its chief charm?

And in this sense, there are long books one must absorb. I spent a good part of my last vacation in reading Plato's *Phaedo* (Jowett's translation). Read there what Socrates says of madmen, and possibly revise your opinion of some of your queer friends. Also, realize that in this dialog practically the whole philosophy of life is comprehended.

American writers seem to excel in works on philosophy, science and history. Anything which requires research, condensation, practicality, terseness or inventiveness lies within the scope of our genius. Most of our fiction, however, is impossible. But Gamaliel Bradford's biographies, Mark Sullivan's recent *History of Our Own Times*, Will Durant's book on philosophy (too long, but quite remarkable), Professor Smith's *Life of Garfield*, Nock's *Jefferson*, Dorsey's *Why We Behave Like Human Beings* and a number of others like them, are fine examples of high intelligence endowed with the genius for 'putting things.'

I am conceited enough to believe that my own opinion about books is of importance, but only because it happens that I am in close touch with many, if not all leading publishers, and because I have seen the effects of book reading over long periods on so many young people.

I have received more than five hundred letters, from practically all the states east of the Mississippi, asking me for further lists of books.

(EDITOR'S NOTE): Those readers who wish special lists can address Mr. Masson care of this magazine or WEAF, New York City.)

# *The* LURE *of* LOFTY PLACES

## *There Are* Thrills *on the* Mountain Tops *and* Fascination *in* Finding Them

*By* A MOUNTAINEER

AHEAD of me, past Alta Vista and the cairn of stones marking the danger line, ran a shrub-lined trail, steaming under the hot midsummer sun. Just an arm's length away, so close that I could reach out and touch it with my hand, was majestic Rainier. Down below me, at the bottom of the cliff, was the dirty crevassed ice of Nisqually Glacier.

The mountain seemed to be sleeping in the midday heat. Its eternal snows dazzled the eyes and its three crests lay immobile under a fleecy cloud which rested gently on the summit.

It was a good time and place to stop. We spread ourselves on the bank, and I idly pointed out to my companion where an avalanche lily bloomed beside the crust of ice.

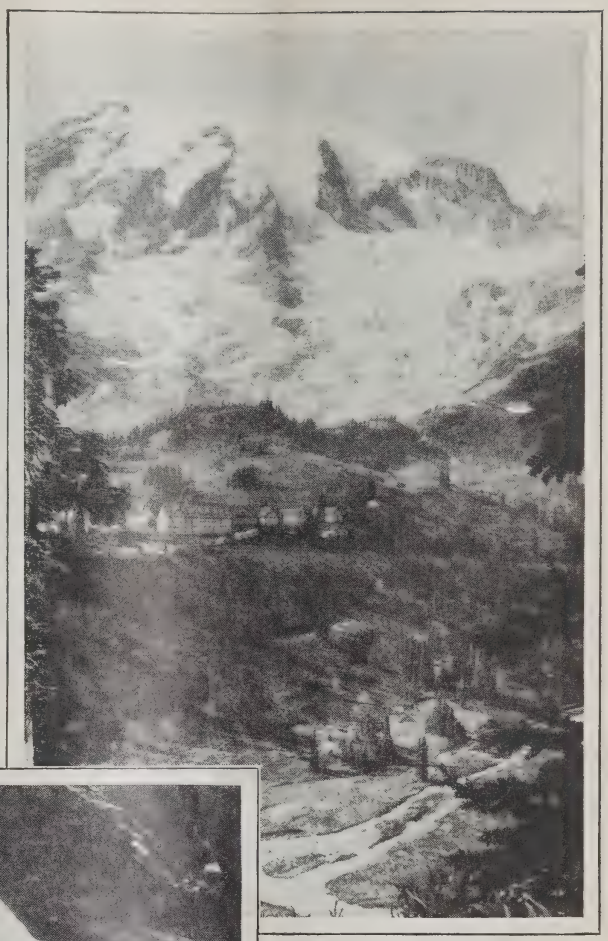
For perhaps fifteen minutes or so we lay there, looking over the side of the bluff at the sluggish stream below, watching the melted water slip from its snout and amble away in a chattering rivulet. Occasionally we heard the boom of falling rock and the queer rumbles of the mountain side.

It was my companion who at length broke the spell.

'Tell me,' she said, 'why do people like to climb mountains?'

The question may have been asked many times before, but it was the first time I had ever given it thought.

'Why—' I hesitated, 'because they like the exercise. Because it is a keen sport. Because of the thrill of adventure. Because of the thrill of the dangers, and the unexpected. Because of the desire to explore and see new things. Because of the desire to look upon spots where man has never stood before. Because—'



'You've given me enough reasons,' she interrupted. 'But which is the important one?'

That was several years ago, and I haven't yet found the answer.

The late Le Roy Jeffers, Fellow of the Royal Geographical Society, whose untimely death in California this summer saddened mountain-lovers everywhere, seemed to have as his principal reason, the intimate fellowship which he established with the peaks he scaled.

As he once said: 'Like the call of the sea, forever potent to him who has wandered amid its vast spaces, the call of the mountains is heard by the true mountaineer, and he returns again and again to their inmost sanctuaries.'

In other words, the mountaineer and the mariner have that much in common. Perhaps it is what the sourdoughs try to explain when they tell why they are returning to the reaches of the Yukon. Properly, it is not a wanderlust. Neither is it a form of nature-worship.

*Photo, E. M. Newman.*

*The great Rainier, rising 14,408 feet above sea level. There are twenty-eight glaciers, a number of which are 'live' or moving. Nisqually Glacier shows plainly in this view.*

*Left—Mountain climbers high up on the side of Mt. Rainier, negotiating a dangerous formation of the perpetual snow.*

Jeffers was one of the great exponents of mountaineering. The impossible had a lure for him and, hand in hand with that rugged determination, he carried an absolute trust in Divine Providence. Thus armed, he ventured alone into terrifying spaces where the slightest mishap would have meant disaster.

A notable example of this fearlessness was his ascent of Mount Moran on August 11, 1919. It will be recalled that more than a year previously, in March, 1918, the *Scientific American* stated that the summit of that peak would probably never be attained. One of the massive Tetons (shown on our front cover this week) forming the western rampart of the Jackson-Hole country in Wyoming, it had turned back more than one seeker ahead of Jeffers.

As is well known to all mountain lovers, the Teton range, while small, offers many unclimbed summits to the hardy traveler. Mount Moran itself is 12,000 feet in height

and the last 3,000 feet are sheer perpendicular walls of rock. To place it still more closely in the layman's geography, it may be said to stand just below the southern border of the Yellowstone National Park and will some day be included in that playground. Its region formed the setting for many of the stirring events in Owen Wister's *The Virginian*.

This peak beckoned Jeffers from the day he learned that it was unclimbable. The loftier Grand Teton, 13,747 feet in height, did not intrigue him because it had already been conquered. Into this miniature replica of the Himalayas, Jeffers penetrated one hot August day with his wife, and between daybreak and daybreak, ascended to its lofty crest and stood where no man had placed foot before.

To me, the interesting thing about his climb was the fact that the final stages were completed in the dark. He mounted the unknown dangers without even the ability to see clearly what was before him. It was in fact nine o'clock at night when he emerged on the little surface comprising the top. Instead of the moonlight he had expected, he was, as he said, 'exposed to the unbroken fury of a gale in the darkness.' This, in addition to the sweeping sleet and the imminent electrical storm, would have struck terror to many a stout heart. But Jeffers made the return without a slip.

In fact, he traveled over the mountain side for practically the entire remainder of the night, having missed his wife at the original camping place, and immediately starting in search of her. During all that climb he was experiencing vigorous exercise for a continuous period of thirty hours, during which he scaled the equivalent of 7,000 vertical feet.

Exercise? Yes, thank you. Keen sport? Jeffers went back and did it again in August, 1922. Adventure? Try climbing down a mountain peak some dark, stormy night. Dangerous? 'The hand-holds were meager and the slant of the rocks so alarming that, if I had started, friction would not have saved me from the abyss.' Desire to see new things? To stand where man had never stood before? Yes, that must be included. Jeffers admitted it.

Few of us have forgotten the summer of 1921, when another stalwart mountain-climber, Dr. W. E. Stone, president of Purdue University, conquered Mount Eon in the Canadian Rockies, and paid for it with his life. Accompanied by Mrs. Stone, he surmounted the 10,860 feet of rock and gazed about long enough to recognize the very summit—then he fell.

Mrs. Stone, missing the way back, finally became stranded on a narrow ledge, 7,500 feet above the valley, where she was forced to remain for five days and nights. Without food except moss, without sufficient warm clothing, knowing that her husband had plunged to his death and that his body lay exposed somewhere on the mountain side, she waited until rescuers finally came.

Few of us, likewise, have forgotten the many thrilling events which marked the recent attempt to scale Mount Everest, the world's highest peak, in the course of which the intrepid adventurers reached altitudes never before attained by human beings. Some day—

Today we find the popularity of mountain-climbing increasing year by year.

# 'Barefoot Dave,' *Son of Nature*

## Mute Thoreau of the North Woods

By M. S. RICE

IT IS all too seldom in these days that an individual can really sound a note of distinction and live a separated type of life in the untrammeled liberties of his own choice. If he tries such a life amid the crowd, we call him a 'nut.' If he goes off alone in patient pursuit of his desires, we call him a hermit. However, for both 'nut' and hermit we have an inquiring interest. We cannot but admire the individuality that will persist in its individualism. The crowd that so completely conceals most of us menaces us like the huge walls of a great prison.

It not infrequently happens that unique geographical situations attract to their confines peculiarly responsive characters, whose lives, as if by a designing providence, seem to fit into the environment. There was Thoreau in his cabined wilderness, and Joaquin Miller in the Sierras, and John Burroughs in the Catskills, and many another such fine type of genius that has sought compatible surroundings, only to reflect them in eloquent interpretation.

But there are other characters as unique, though without literary expression, who have lived their genuine lives in close contact with some characteristic spot; and it is of such a one that I write.

The Les Cheneaux Islands are a most unusual and attractive group, clustering in wild loveliness along the north shore of Lake Huron. Many islands constitute the group, ranging from mere rocks to great Marquette, with its spreading area of green forest fastnesses. Winding waterways have made it a favored place for fishermen from the days of the earliest Indians to the motor-drawn troll of today. Flanked on all shores by a persistent wilderness that has not even now surrendered, the setting is unique in all the attractions of the great American outdoors.

'Barefoot Dave' is an inseparable part of Les Cheneaux. I do not know how they ever got along before he came.

His name is David Sugden, though that is often spelled by his friends Sudgen, all however agreeing on the name that no interchange of letters can confuse—'Barefoot Dave.'

Canadian-born, he wearied of working on an Ontario farm for twenty-five cents a day, and at fourteen years of age he found a job in an Arkansas logging camp where he spent seven years. But hearing the call of the North, and with no ticket other than the right of way along the great open roads, he made his unhurried return via Rose City, and Biscuit River, and St. Ignace, arriving at Cedarville in the very midst of the Les Cheneaux Islands. He looked like a guide, and at once began piloting summer tourists. Tiring of the repetitive nature of such a life, he settled himself in a crude little cabin on the shores of Duck Bay, where in prized seclusion he could allow himself free expression, and work out in leisure his own life's philosophy.

There is in a little New England cemetery an old gravestone which has carried for many years an eloquently significant description of a rich man, a sentence in biography that should attract attention in this strenuous day of ours. The inscription reads, 'Here lies a man whose riches consisted in the fewness of his wants.' 'Barefoot Dave' is rich. Computed in such terms, Dave too is a millionaire, I am sure. He has carried the fewness of his wants out where they can be enjoyed without embarrassment by their fewness. He is happy with little, because he does not want much, and that is an available form of riches in reach of all. Dave's little tar-papered shanty is a palace, because it is what he wants. The multiplication of our wants has almost wrecked our happiness today. Luring advertisements, pictured luxuries, blazing show-windows, have made paupers of many who actually have more than kings of old could buy, but who want more and more.

'Barefoot Dave' achieved his descriptive name for the very good reason that he goes without shoes almost the entire year. Only the more severe seasons of that cold region, where the mercury is in almost constant humility, drive him into protective footwear. Not infrequently he is seen about his always scant woodpile in the snow, stamping about in the tough comfort he possesses because he has weathered his feet.

It was a genuine sensation with one of my boys one day, as he stood wondering at this unique character the first time he had ever seen him. Dave was diligently,

but vainly, sucking at an old pipe, whose fire had either gone out or had burned away for lack of fuel. In a matter-of-fact manner, he pulled out a match, turned up the tough red sole of his plump bare foot, and struck that match to a flame as lightly as though he had struck it across a stone. My boy was not long in effectively convincing himself of the difference that exists in feet.

Had Dave the literary genius of Thoreau the world would be enriched by the treasures of his knowledge of nature. He is a simple lover and companion of trees and flowers, birds and butterflies, land and water, clouds and winds. He talks to them. Most of the talking he does himself, but the conversation never wearies out. His loves are legion. His hatreds are few.

His cabin is a gathering place for his many friends. His society is not in ordinary. His callers sometimes dispute with him the possession of the place. Squirrels, chipmunks, groundhogs, deer, and even skunks, claim an unafraid right around there. He talks to them, laughs with them, and scolds them sharply. Sometimes when the bold and greedy squirrels take liberties with his prepared food, he has a genuine dispute. One day he stumbled in his kindliness a moment because a mouse had boldly climbed upon his table as he was eating, and with a badly aimed bullet he put a telltale hole through a perfectly good coffeepot to remain a protest ever before him at losing temper over so small a matter as a mouse.

He has one pet of which he is especially fond. His fondness for her is based upon that safe foundation of interest—sympathy. A three-legged deer stays close by his cabin. Some hunter with a bad shot struck one leg from the little forest creature. She did not die, and by her fine native strength her wound was healed. She found a welcome at Dave's cabin. Today she is the privileged one there. She browses without fear in his much cherished garden. He talks to her as he would to a child.

He cultivates likewise a fine friendship with the birds. A lovely pair of cedar waxwings built their nest near his door. He was as much interested as were they in the task. He watched them with increasing interest, as they brought the strange bits of straw and bark and twigs and built them in. One day the little female bird failed to appear. It was a strange absence that witnessed to either a misguided interest, or a tragedy in birddom. Several days later Dave found the dead little worker caught in an old fish net he had hung in a tree. She had doubtless sought to pull out some coveted strings for her nest, and died at her home-building. It was a tender-hearted old friend who found her there, and with genuine affection untangled the little foot, and buried her tenderly, as a true mourner.

Dave is not in a hurry. He has no strenuous schedule to keep. He is not concerned with clock or calendar. He has all the time there is, and that is all he has. Without a sign of slacking interest, he will spend half a day watching a humming bird build the wonderful little nest of lichens. If the nest is not finished then, Dave has the rest of the day available. There is real satisfaction in that. Edgar Guest said to me the other day as we were comparing strenuous schedules wondering how we could get somewhere, 'I have to spend so much time getting from where I am to where I don't want to be that I never get to go where I want to or do what I really care to do.' Not so Dave. He is out there where he wants to be and eagerly spends his time in his own time-privileged way.

A few years ago, as winter came on, some men who were going to do logging persuaded Dave to move over into the woods near them and work in their camp. There was a little shack where he could live in his own way, and after careful consideration he got his old boat loaded with his worldly essentials, an old stove, a coffeepot, a frying pan, and a kettle. It was almost dark on one of the short winter days as he began taking aboard his livestock. He had a pig, two cats, and two dogs. The boat went well until almost to the destined shore. Without notice its old age crumpled and sank. The cats and dogs swam to shore, the stove went straight to the bottom, and the pig, in its crate, came triumphantly out on Dave's shoulder. It was pitch dark and raining hard, and they were a long way from their destination. A bed was made of balsam boughs and the whole collection went to bed.

When spring came, Dave alone of the strange little group survived and moved back again to his little cabin beside Duck Bay.

There is a genuine and rich vein of affectionate interest in him. During the long winter months, when he is largely shut in, his nearest neighbors have been an old man and a little girl. They stay as caretakers at one of the camps far-flung from the world in winter. The life of a little girl is surely dreary there. They have but little to eat, and that little has to be prepared by the lonesome lassie. Largely owing to the lack of nourishing food, she was taken sick one winter when she was ten years old. She became seriously ill. Dave learned of it. He selected his daintiest food, and he is a good cook, having won several prizes from an American outdoor magazine for recipes for outdoor cooking. He always puts up for his own use some choice fruit, making delicious jams and jellies of the wild raspberries and strawberries and blueberries that abound. He selected the very best he had, and with some wholesome bread, tracked through the winter-bound forests to the bedside of the little sick girl. With tender interest and genuine helpfulness yonder in the isolated winter-locked wilderness he brought health and cheer to the lonely little life again. Her gratitude to him was unbounded, and she always counts it a privilege to sit at Dave's table and enjoy the vegetable dinners he prepares from his treasured garden.

*Dave's cabin is his castle because it is what he wants.*

# The Cause of Nervous Breakdown

(*Concluded from page 2*)

and black plague, tuberculosis and syphilis, and we strive to find the cause of cancer, but the gorgon fear is allowed to entwine itself about our suprarenals, and no one raises a protesting voice or an opposing hand. The consequence is that many, burdened with original sin and fear, find the pathway of life so rough and studded with thorns that they become partially or wholly disabled before they have gone far on it. Either the truth of this is not admitted, or we are averse to taking the drastic measures that are necessary to make the pathway treadable.

The fact that fear has been identified as the devil is one of the most hopeful signs that day by day the world is getting better and better. Until we gave concretion and specificity to the devil it was most difficult to tackle him. Now one of his horns has been knocked off: we have got rid of hell, or nearly so. With time, we shall rid ourselves of the fear of death, and then if we can succeed in making ourselves to the image of God, and not Him to our image, the millennium will be in sight.

We are loath to do this because our hereditary plasm and our acquired belief have been steeped in the conviction that these would be subversive of morality, destructive of organized religion.

The conviction that has been forced upon me by a lifetime devoted to invalids is that if the world were purged of fear, practising physicians would be comparatively idle, and medical fakers would be distressingly lonesome. When it shall be realized that we throw fear into children as a stoker throws coal into a locomotive firebox, and that we begin to do it as soon as they betray the first glimmer of intelligence, and keep it up until they escape from parental influence, we see how tremendous are the difficulties attending the prevention of fear.

The marriage-contract should be amended to contain the following words 'and we individually and collectively swear that should children be vouchsafed us, we shall tell them the truth in amount proportionate to their understanding; we shall never threaten them with punishment that we dare not carry out; and we shall safeguard them, so far as it be in our power, from knowledge of fear.' Parental responsibility will then take on a deeper significance and 'nervous breakdowns' will eventually go the way of the dodo.

Potential parents should take three books with them on their wedding trip: Edmund Gosse's *Father and Son*, Warwick Deeping's *Sorrell and Son* and Miguel Cervantes' *Don Quixote*. From the first, they would learn of the destructiveness of fear, from the second the constructiveness of fearlessness, and from the last they would get a comprehensive notion of things that sweeten life: courage, humor and ideals.

'Then, have nervous breakdowns no relation to worry and strain, to grief and yearning, to responsibilities and deprivations, to unwise eating and intemperate drinking, to disease and disaster?'

'They have indeed, but the fearless person avoids them or surmounts them, the fearful invites them or succumbs.'

Again it will be asked:

'Is there no acquired factor or influence that is so malign and potent as fear, and shame that flows from sex ignorance?' And the answer is emphatically and dogmatically, 'none.' There are others, to be sure, and important ones, but all of them together do not outweigh these.

Persons to whom fear is a stranger sometimes have 'nervous breakdowns' but in those instances it is an inheritance, not an acquisition.

In view of the fact that fear is such an important cause of disease, such a potent solvent of happiness, it transcends understanding that we are not keener and more determined to prevent it from contaminating children. In reality, children are brought up in fear. They must be good, prudent, truthful, kindly; if not, they will be punished now; they must be moral and put their neighbors' welfare above their own, else they will be punished in the Beyond. The customary way of making children 'good' is to 'throw a scare' into them. The classic one is the bogey-man, but he is not so popular as he was a generation or more ago. The fear highwayman has been succeeded by the sneak. He seeks to avoid detection by dressing, appearing and acting like honest people and he operates stealthily, not openly.

Curiosity is the dominant urge of the child, and the parent of knowledge. Children are peepers, investigators, wonderers, inquirers. They find their own bodies and functions, the bodies of others and their potentialities the world of their orbit, and its contents of engrossing interest. They are restless and relentless in their pursuit of them. But such pursuit is 'naughty' or 'nasty' or not done by 'nice' children, and invariably results in something called punishment, which, of course, being painful, is a thing to avoid. There are two ways of avoiding it: not do it, and not be found out.

In some respect, children are like mules: they are obstinate and they take the easiest way. Thus is engendered the basis of the most prolific and devastating fear: that of having done something wrong, the fear of self-injury: thus is created the first batch of pharisaical leaven, hypocrisy.

Man's craving for pleasure is insatiate; the appetite comes with the first breath. Children often find that their own body mediates it. They are threatened with amputation of the hand if they do not desist; the body and the external display of its functions intrigue them, but they are threatened with sore eyes from peeping and peering; closets and cupboards, fences and trees were made for certain purposes, no doubt, but it entails climbing to find out.

If he climbs, he is likely to break bones and probably a very essential one,called the neck, and as for paddling a puddle or investigating a newly formed brooklet, they are delectable pleasures, but they lead to 'death of cold' or, worse yet, to castor oil, so what is a child to do? Be good. But being good begins to be pleasurable only after one has lived a long time, twelve or thirteen years. What is one to do meanwhile? Be bored? That is one of the things a child cannot tolerate. He is never bored when his curiosity is being appeased.

Once we begin to tell children the truth about their whence and whither, so far as we know it, and cease to tell them lies about punishment here and hereafter, we shall have crippled fear. Once we begin to admit to children and to ourselves that emotions are vouchsafed us that we may externalize them and revel in them, to realize that by sorrow of the heart the spirit is broken, we shall have taken the first steps to destroy the psychoneuroses, those mysterious disorders of the soul and body that so long resisted interpretation, and are still rebellious to treatment.

(*This is the first of two articles by Dr. Collins. The next will appear in an early issue.*)

*Once we begin to tell children the truth, and cease to tell them lies, we shall have crippled fear.*

# Our Court-Martial System

(*Concluded from page 7*)

Then, if he had been guilty of insubordination or disrespect toward the President or Secretary of War, he could have been tried under the 62nd Article of War and punished as the court-martial may have directed, which article permits a court-martial to impose the death penalty.

That Colonel Mitchell could not be so charged and the charges proved in a regularly constituted court-martial, was demonstrated by the fact that his accusers did not charge him with a violation of those Articles of War, and if he was guilty of anything and should have been punished for anything, it was these Articles of War that he should have been charged with violating.

—U. S. Official Photo.

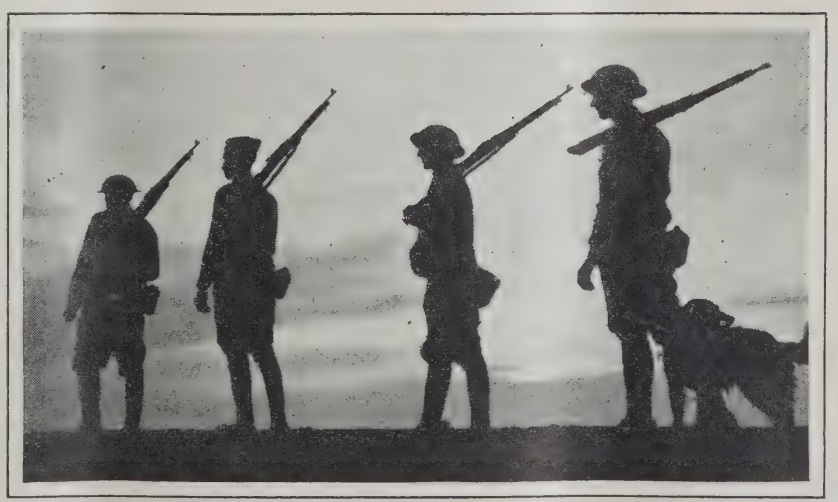
*Doughboys didn't forget their spirit of fun in the grim business overseas. This bugler at Cochem elated the Bachelets with his tunes.*

A soldier or officer is obliged to obey the commands of his superiors, only, however, when these commands are lawful. Article 1 of Army Regulations specifies this, and so does Article 64 of the Articles of War. Neither a soldier nor an officer is obliged to obey an unlawful command and if any soldier should commit a crime from one of the simplest nature to treason or murder in obedience to the command of a superior officer, that soldier would be punishable just as if he had committed the offense of his own volition.

No soldier is required to obey a command to surrender to the enemy or to be guilty of conduct that is against the good of the country. In fact, a private soldier is not only empowered with authority to place any officer under arrest, if that officer is inciting or participating in quarrels, frays, disorders, mutiny or sedition; but the soldier is punishable with death or such other punishment as a court-martial may direct if he fails to do so. In other words, the law of the land and the welfare of the nation are superior to the authority of any military commander.

Mitchell was never charged with having violated any lawful command. He was merely charged under a very indefinite Article of War, that should be repealed because of its very indefiniteness, of casting reflections upon the military service. Under such an accusation Mitchell could have been tried by the same court-martial if he had accused his superiors of traitorous conduct, regardless of how guilty they might be. Hence the injustice and the absolute lack of reason for Article 96 of the Articles of War to be on the statute books.

By charging Colonel Mitchell with a violation of the 96th Article of War, it was possible to try him for a purely political offense and no military offense at all. Mitchell would never have been brought to trial if it had not been understood in advance by his accusers that he would be convicted. It was the will of his superiors, as well as those whom he had accused of incompetence, that Mitchell should be punished. Therefore, if any member of the court-martial that tried him had voted to acquit him, he would have been guilty of the same offense with which Mitchell was charged, and while no official would likely have had the temerity to have brought such a member of the court-martial to trial, he would have been marked for retaliation, and would have been subject to transfer, demotion, refusal of promotion. His only recourse, then, would be to resign, just as Colonel Mitchell, Colonel Ansell, and other officers who have incurred the displeasure of the military authorities have had to do.



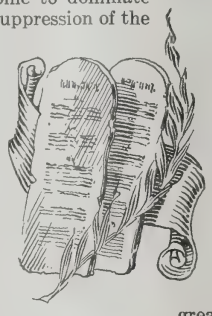
This trial of Colonel Mitchell could never have taken place nor have been successfully prosecuted if the provision for military justice specified in Congressman Dallinger's bill had been carried out. This plan would have prevented a military commander, a Cabinet officer, or even a President, from penalizing a man without fair trial.

The bill proposed by Congressman Dallinger simply prevented the possibility of a military commander dominating a court-martial or ever penalizing in any way any member of a court-martial who might vote for an acquittal where a conviction was desired. Congressman Dallinger's plan did nothing new. It simply placed military courts on the same plane as civil courts, and required that they be conducted by men qualified by education and character to preside over them.

The members of such military courts would be amenable to the same laws controlling their conduct and the faithful performance of their official duties as are federal judges. There can be no honest objection to applying the same rules to military courts as apply to civil courts.

There is always ample time for a court-martial. There is no exigency that demands haste at the sacrifice of justice. Therefore, when a man is brought to trial he should be tried by men competent in legal matters instead of by men utterly ignorant of law. That is what the Dallinger bill provides. And there is no more reason that justice in the army should be administered by men ignorant of law than that men ignorant of the law should be appointed to judgeships in our civil courts. Legal matters in the army should be under the administration of men of legal training, just as medical matters in the army are under the administration of men of medical training.

Additional safeguards that exist in the present law should be retained, such as requiring the approval of the President of all sentences of death before they are executed, and the prohibiting of any higher court to increase any sentence imposed by a lower court. Love of country and loyalty to the flag are the two things that have made American success in wars that in some instances were very unequal and apparently hopeless.



It was the inspiration born of a fight for justice against tyranny that enabled a poorly disciplined, poorly equipped, poorly trained and poorly fed straggling army of Continentals to defeat the highly disciplined, well-equipped, well-paid and well-trained army of the greatest power on earth. Any army that does not fight for love and loyalty is a defeated army.

# Versions of the New Testament

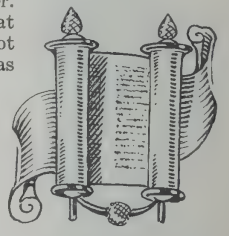
(*Continued from page 8*)

was used by the English translators of the King James Version in 1611. This has been the dominant Greek text for nearly 1,500 years and most Greek manuscripts give it either in a pure form or mixed with a residue of readings from other texts.

The Latin Vulgate, which has been the common text of Western Europe and especially of the Roman Catholic Church, since it was translated by St. Jerome late in the Fourth Century, follows the Alexandrian text in the New Testament. Thus two great editions have come to dominate the Christian world to the suppression of the less corrected but earlier texts, which circulated in manuscripts of the Second and Third Centuries.

The history of the study of the New Testament text in modern times has been mostly a record of the struggle between the adherents of these two editions, whether both sides appreciated that fact or not. The Westcott and Hort edition of 1881, on which was based the English 'Revised Version' of 1885, was confidently claimed at the time as the restoration of the original Greek text of the New Testament, but it was also bitterly attacked. The English scholars, Burgon, Scrivener, and Miller, led the fight in defense of the traditional text. It was in a way an early example of the contest between 'liberals' and 'fundamentalists.' For a time Westcott and Hort seemed to win, and it will always stand to their credit that they conclusively demonstrated the secondary character of the Antioch text and hence still more of the Constantinople text, which was dependent upon it.

All the so-called erratic manuscripts, having exceptional variants or errors, were classified by Westcott and Hort as Western manuscripts, and in general disregarded, except in so far as they supported either the Antioch or the Neutral text. Thus Westcott and Hort practically reproduced the text of the Vatican manuscript in their edition. Variants in the Sinaitic even were often overlooked or disregarded. And for this there was a good deal of justification. The text of the Vatican manuscript was a good text, easily intelligible, and particularly free from all words and phrases that were easily shown to be later additions. It almost always furnished the shortest form of the text, so that scholars under its influence came to view all additional words and phrases of other manuscripts as interpolations. Yet this wonderful text, so confidently defended by its editors, really rested on an unstable foundation. It was not in accord with the majority of the quotations from the Church Fathers of the Second and Third Centuries, and it varied most decidedly from the text of the early translations, especially the Old Syriac of the Curetonian manuscript and all the Old Latin manuscripts, which contained a text antedating that of St. Jerome. Against this array of evidence, all of which could confidently be referred to the Second Century, Westcott and Hort had to rely primarily on the agreement of the two Greek manuscripts of the Fourth Century.



For a time the battle seemed won for the Westcott and Hort text, but the following years kept bringing new evidence and it was generally against the Vatican text. In spite of the almost accepted view that all later manuscripts were worthless, adventurous scholars continued to investigate. Gradually certain groups began to differentiate themselves, small, to be sure, and generally somewhat corrected with Antioch readings, but still they brought to light a text that was plainly old and interesting. Such were the Ferrar Group and the Family 1. The text of these groups was often related to the so-called Western text, but in general was less erratic. Individual later manuscripts also came to the support of these on many readings, so that it became evident that a number of separate, older texts must have been buried under the orthodox expansion of the Antioch and Constantinople texts. These served to bridge the great gaps between the erratic Western text and the Antioch and Vatican texts.

At this auspicious moment the Fourth Century Sinaitic Syriac manuscript was found on Mt. Sinai by Mrs. Lewis. It is related to the Curetonian Syriac mentioned above, but older and better. The two restore for us the main features of the first Syriac translation. In most of the important variations this was found to be in agreement with the Old Latin. Thus the idea that the Old Latin manuscripts represented an erratic Western text had to be given up. The agreement of Old Latin and Old Syriac with the citations of the Church Fathers of the Second and Third Centuries, especially Irenaeus of the Second, showed that this erratic text was the common text of the Second Century, and the one from which the early translations were made. The presence of many errors in this old text was apparent and no two manuscripts of it agreed exactly. Unanimity in the acceptance or rejection even of notable readings had not been attained, perhaps not even sought. The New Testament had not yet been canonized. It was merely the story of the life and sayings of Christ, together with the most important writings of the early leaders. These were still considered capable of improvement, grammatically, stylistically, and even by the incorporation of additional facts, whenever found.

The text controversy was in this stage, when in 1906 Charles L. Freer, of Detroit, found and bought in Egypt the now famous Freer manuscripts. One of them contained the Four Gospels entire, written in a hand which I announced as of the Fourth Century in my first publication. But the text was in some portions erratic. It had close affiliations with the Western text. It became immediately famous because it contained the following extra verses after Mark xvi, 14: 'But they defended themselves saying that this age of lawlessness and unbelief is under the power of Satan, who does not permit those made impure by evil spirits to comprehend the truth and power of God. Therefore reveal now thy righteousness, they said to Christ. And Christ replied to them, that the limit of the years of the power of Satan has been made full, but other dread events are near at hand, and in behalf of those who had sinned I was delivered unto death, in order that they may return to the truth and no longer sin, to the end that they may inherit the spiritual and imperishable glory of righteousness, which is in Heaven.'

These verses are found in no other manuscript of the Bible, but it is plainly a so-called Western or Second Century characteristic. Also the manuscript had a decidedly Western character in all of Mark, though less so in the other Gospels. If it were really a Fourth Century manuscript, the case began to look worse for the originality of the Vatican text, for the Freer manuscript was supported by Old Latin, Early Syriac, and the earlier Church Fathers, while the Vatican manuscript had found little additional support. So the former 'liberals,' now turned 'fundamentalists,' attacked the age and thus the authority of the Freer Gospels. By some it was even placed as late as the Seventh Century. But as the years went on and the manuscript was published in full, these extreme views yielded. It was plainly one of the oldest manuscripts of the Greek Bible, if not indeed the oldest of them all. It is now dated in the Fourth Century by all the best students of early Greek writing.

This wonderful old manuscript has brought us further light on the text question of the New Testament. While in Mark and to a less extent in John its affiliations are with the Second Century or Western text, in Matthew and in the last two-thirds of Luke it has an Antioch text, though showing traces of Western influence. Furthermore, in the first eight chapters of Luke the text is surprisingly like that of the Vatican manuscript. Indeed in one point it is shorter and simpler than the Vatican manuscript, for it omits the genealogy at the end of the third chapter.

It is probable that the Freer manuscript of the Gospels was made up of such remnants of earlier manuscripts as had escaped destruction in some great persecution.

One can see that originally the text of all parts of the manuscript was Western, or Second Century, in type, and that this had been but little corrected in Mark. In John the corrections, which belonged to the Vatican type of text, were quite extensive, except in the first few chapters, while the first eight chapters of Luke were an almost perfect example of that type, as we have just noted. In the rest of Luke and in Matthew, the text had been corrected to the Antioch type, but here with a goodly remnant of Western readings still unchanged. This one manuscript thus seems to give an almost perfect picture of what was happening to all manuscripts of the New Testament at

that time. The basic text was of the Second Century type with the irregularities and inconsistencies which that designation implies.

But corrected editions had appeared at the end of the Third Century and were spreading rapidly through the churches of the East. In the community where the Freer manuscript arose, they had access to two corrected editions and parts from each were used to get a complete manuscript of the Gospels, while Mark had to come from an uncorrected text.

As one of these corrected texts was the Antioch edition, we might assume that the other was the Alexandrian, and this assumption is well supported by the fact that this corrected text had to be accessible in Egypt in the Fourth Century, when the Freer manuscript was written.

This view has continued to gain ground, and von Soden, in his huge text edition of the New Testament, openly claims the Vatican manuscript and all its allies as representatives of the Alexandrian edition. He further shows that the Church Fathers, whose quotations of the New Testament agree with this text, were all from Alexandria or were associated with the Alexandrian leaders of the Church.

On the basis of this explanation the Vatican text is much easier to understand and that, too, without denying its many excellent features. It is a text made up about A. D. 300 by a good Alexandrian scholar, probably Hesychius, who drew his material from a collection of earlier manuscripts. He probably had the rule to omit all words and phrases, which seemed doubtful, and he may have gone further in that direction than a critic would today, but he produced a conservative, readable text, which has served the Church well for many centuries, especially in its Latin form.

With these two editions established, which represent, as it were, the extremes in the text controversy of the New Testament, the problem for future scholars is well defined. The Second Century text with all its variations and irregularities, must be restored as far as possible. For this not only all Greek manuscripts, even the latest, must be studied but those which show variations from the Antioch text must be fully collated. Then the Greek text thus tentatively restored must be enriched and corrected by a thorough study of all the early translations, especially those into Latin, Syriac, Armenian, and the various Coptic dialects of Egypt.

When that information is well in hand, and it may well be another generation before it is completed, scholars will be in a position to renew the discussion of the opposing editions of Antioch and Alexandria, and having before them much of the text of the Second Century type, on selected manuscripts of which the two editions were made, it will be possible to restore the original text with a high degree of probability. It is not impossible also that other editions, as those by Eusebius or by Origen, which are now too shadowy to be reckoned with, may be better known in the future. It is of the utmost importance that scholars of the present overlook none of the work of the past, for final results can be attained only by using all the material available, and that will include all past editions as well as all manuscripts and early translations.

Yet even now the text of the New Testament is not in such a corrupt state as is often implied. It is stated that two English scholars of the past century counted all the variations in manuscripts and versions of the New Testament and found that one word in every five showed variation in some manuscripts. Today we might find an even larger percentage, for more manuscripts have been studied, but such a count would be entirely misleading, for the great mass of variations find support in comparatively few manuscripts and are immediately recognized as errors. In hardly more than one word in a thousand is there real doubt as to what was the original text, and in many of these cases the manuscript evidence has already been gathered, which will enable scholars to determine the true text.

And finally the real teachings of the New Testament are so clear and so often repeated, that they are never brought into doubt by these minor variations. We have already a better established text of the New Testament than of most other literary works of like age, but so great is the importance of this foundation work of our religion, that scholars will continue the study until the original text has been restored in absolute entirety.

---

# The Old-Time Revival

*(Concluded from page 13)*

Whatever good any one of these four city-wide movements did, no one of them gripped the city and no one of them produced any notable result in the way of church membership.

The old-time revival was good enough for the old time because it succeeded in doing the main thing it was intended to do. It brought men face to face with the opportunity for decision and it caused them to decide in considerable numbers to live the Christian life. The modern revival does not do this. It produces spectacular 'trail hitters,' a very large proportion of whom are already church members and who take that opportunity to shake the evangelist's hand just for the sake of doing it. As for the others, large numbers give false addresses, and of those who are found, the number is extremely small who are beyond the reach of the local pastor, and who offer any evidence of changed lives and firm faith.

The modern revival does not get the consecutive attention of impenitent persons. So many seats are assigned one night to the employes of the Metropole Rubber Company, and the same seats set aside the next night for the Lumber Pilers Union. For each of these groups, or at least for a considerable proportion of the individuals in each, that is the one night they are to be there, and when the opportunity is given to go up and shake hands with the evangelist, a number from each crowd go forward, led probably by some earnest spirit in the group itself. But it does not mean that any profound impression has been made upon either group.

There is a poor outlook at the present hour for professional evangelism. What have we that can take its place? Has it served its day, and is it gone for good, or is it capable of readjustment?

I leave the question in the large for the readers to answer. What has become of the old-time revival?

# Keeping Up the Star of the Old West

POSSIBLY the most famous of the annual reunions of range life is the round-up held in September in Pendleton, Oregon. This is one of the old towns of the state, once the center of the cattle industry and the home of many of the heroes of the trails and ranges of fifty years ago. To its annual round-up come riders and horses from a circle with a radius of more than 200 miles. In the celebration participate thousands of Indians, descendants of those who fought the fathers of these cowboys but now as eager as the white men to keep the star of the Old West above the horizon as long as possible. More than 65,000 men and women see this round-up during the three days of its existence, and more than a thousand white men and women take part in it. Here are shown the finest riding and the most expert range and trick roping to be seen in the world.

For fifteen years the large sum of money which these cowboys and cowgirls have earned for the round-up has gone to the development of the city.

From the Umatilla Indian Reservation come the thousand braves and their families. And here are brought the most vicious horses—the outlaws collected during the year from all the ranges of Montana, Idaho, Washington and Oregon—as well as the wildest cattle the ranges produce, all to conquer, or be conquered, by the last of the knights and ladies of the saddle.

Presently, from the huge megaphone hung in a tower at one end of the field, a voice roars, 'Let'er buck!' and the annual round-up is on. A six-gun ripples, scarcely heard above the hum of voices, and the first event, the cowpony race, is off. No dwarfed jockeys are these, riding on the necks of dope-filled 'thoroughbreds,' but men of full size, sitting the straight seat in huge range saddles.

This race finished, the forty-five smokes again, and a band of mounted Indians, guiltless of all dress save breech-clouts and such paint as their squaws may have smeared on them, dash out, sweeping around the oval with a disregard for life and limb. Then comes a quick-change race, in which a score of cowboys, fully accoutered for the range, leap to their horses, ride a hundred yards or so, dismount, change saddles, change equipment, mount and ride back again.

There is a rainbow race of Umatilla Indian girls, clad in all the hues of the spectrum, their heavy black braids flying like birds in the wind. Three real stagecoaches, which once served their time on the Oregon Trail, take part in the stagecoach race, each drawn by four horses, and driven by men who actually drove such coaches in the latter days of their use.

Then comes a roping contest, in which a wild longhorn is roped, thrown and hogtied in two minutes.

And so the round-up goes, a living, thrilling picture of the Old West, until the War Dance and the Love Dance of the Indians through the arena and around the track bring to an end one of the few remaining exhibitions presenting an actual cross-section of real American life.

# Lower California

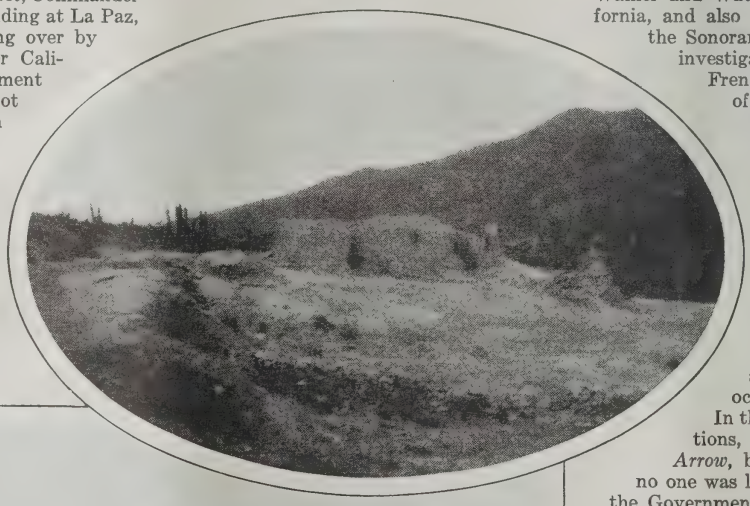
(*Continued from page 15*)

come not only the chief center of civilization in Lower California, but, temporarily, the capital of the Californias.

Toward the end of the 18th Century the Indians, usually tranquil, rose in arms and attacked the missions, and in 1822, or thereabout, pirates plundered the sacred shrine of Loreto of all its jewels and gold or gilded vessels of worship. For nearly a century and a half Loreto had been queen of the mysterious Californias, and one of the lesser queens of the New World. Today it is a ruin.

In 1826, Lieutenant Hardy, who later gave his name to one of the mouths of the Colorado River, sailed up the 'Sea of Cortez' and on up the Colorado itself. In 1828 came the historic party of adventurers headed by Sylvester Pattie and James O. Pattie, and it is a matter of record that the Hudson's Bay Company's trappers and traders trafficked in Lower California, at least as far south as the Mission of Santa Catarina. Then, down from the North in armed array, in 1847, came a company of United States soldiers occupying Todos Santos (All Saints) Bay on the Pacific Coast, while two other companies landed at La Paz on the Gulf of California.

At the latter point, Colonel H. S. Burton, U. S. A., raised the Stars and Stripes, and, for a few weeks at least, Lower California was ruled by the Gringo, in fact, Commander T. O. Selfridge, U. S. N., landing at La Paz, announced the formal taking over by the United States of Lower California, with the added statement that 'this possession shall not be relinquished.' It has been probably the greatest misfortune in the history of Lower California that this intention—if intention it was—was not carried out by Uncle Sam. Many of the leading residents of the peninsula sought the protection of the American flag, and, when that flag was withdrawn, were compelled to abandon all their worldly possessions and flee to the United States.



The Gadsden Purchase fixing the southwestern boundary of the United States, followed, in the making of which by some mysterious means the Mexican commissioners saved to their country the mouth of the Colorado River and the upper part of Lower California. Mexico once more resumed control of the peninsula, and put a complete end to mission life there definitely in 1854 and 1855. In between, however, came one of the most romantic bits of Lower Californian history—the filibustering expedition of William Walker. The exploits in Nicaragua of this 'gray-eyed man of destiny,' as his friends called him, are so well known that they have dimmed his previous adventure in Lower California.

There came to San Francisco, California, in 1852, the report that one Raousset de Boulbon, a French adventurer, was on his way across Sonora, with the approval of the Mexican Government, to acquire a strip of territory lying directly on the United States boundary, and extending southward some leagues into Lower California, including the mouth of the Colorado River and the head of the Gulf of California. At this time there lived in Marysville an editor, lawyer, physician and politician, by name William Walker, a native of Nashville, Tennessee. Walker and Henry P. Watkins organized and led a movement to prevent the French, either governmentally or privately, from acquiring territory along the border of the United States. Without discussing the matter with the Washington Government, Walker and Watkins went to Lower California, and also to Guaymas, the port on the Sonoran mainland, and made an investigation of conditions. The Frenchman, Boulbon, drops out of sight at this point, but the two Upper Californians discovered much that they believed needed remedying in Lower California and Sonora, so they opened an office in San Francisco. There they issued bonds of a prospective Republic of Lower California, and also recruited soldiers for an army of invasion and occupation.

In the process of their preparations, they chartered the brig *Arrow*, but one dark night, when no one was looking, the commander of the Government troops at San Francisco, General Hitchcock, took possession of the boat, being removed as commander for his work, due to the influence of Jeff Davis and other Southern powers. Walker, now uninterrupted, sailed with a number of men, variously recorded at from forty-five to seventy, in the brig *Caroline*. This filibustering force landed at La Paz, took possession of that port, and issued a proclamation declaring the Louisiana Code to be the law of the land. This meant the introduction of slavery, and in it lay the prime reason for the support given Walker by Southern influences at Washington. The 'Republic of Lower California' was proclaimed, with William Walker, then twenty-nine years old, as president, and a flag, consisting of a white stripe between two red stripes, and with two stars, representing Sonora

*This is the 'meson,' or hotel, at Las Cabras, a 'town' in Lower California.*

*San Telmo, one of the historic towns of Lower California, Mexico, whose records have never been written. Oval—Forsaken mission of San Fernando, about 350 miles south of the American border. It was one of the first strongholds of Christianity in the New World.*

and Lower California, was hoisted over La Paz.

In the winter of the same year, Walker, leaving a small garrison in La Paz, sailed around Cape San Lucas, at the tip of Lower California, and up the Pacific Coast to Todos Santos Bay, barely 100 miles south of San Diego. There Walker constructed a headquarters post which he called 'Fort McKibben,' and there he was joined by 250 recruits who sailed down the coast from San Francisco. In quick succession the filibusterers defeated the Mexicans at Santo Tomás, La Grulla and San Vicenti, also beating them off when they attacked Fort McKibben. Walker organized a government, and, early in 1854, set out to conquer the Mexican mainland state of Sonora. Their route across Lower California is not well known, but it appears that they crossed the Colorado River some six or seven miles above its mouth, and, shortly after crossing it, turned abruptly southward. As they moved further into Mexico, however, Walker's men, never closely bound together, began to desert, returning to the American border.

When these desertions became numerous, Walker turned about, recrossed the Colorado River, and moved his remaining men up to the international boundary just south of San Diego, somewhere near the present location of Tia Juana. There he fought off the Mexican soldiery until he could surrender to the American army post, under command of Major McKinstry. The three leaders—Walker, Watkins and a man named Emory, who had been secretary of state to the 'Republic of Lower California'—were tried in San Francisco, and Walker was acquitted, while Watkins and Emory were fined $1,500 each, and the fines allowed to go uncollected. Lower California has been the football of political parties in Mexico since that time.

## Socialism Through the Eyes of the Churchman

(*Concluded from page 3*)

elected officials had to decide how much we should save and how much we should spend, and their tenure of office depended upon how much they were willing to spend, as it would do, we should have a new set of property administrators every week, and each one would be more wasteful than the last.

The truth is that the problem of property is really the problem of natural inequality of power and ability among men and that the strong and able men will somehow always secure the power that the administration of capital necessarily involves. The only thing that cuts to the root of the matter is the truth that nobody owns anything absolutely, or can own anything absolutely, not even his own legs. They, like all other forms of property—brains, brawn, brass or beauty—are trusts given by God to be used in the service of the Family.

We may evolve, and are slowly evolving better systems of legal tenure of property, but those can evolve only as that truth becomes more and more deeply stamped on men's minds. The mere transference of property power from the self-seeking few, even if so they really are, to the self-seeking many would not lead to the Kingdom of God, but to chaos and confusion.

# Child Welfare and Conscience

By FRANKLIN CHASE HOYT

ONLY an optimist, it seems to me, has the right to engage in the work of child welfare. Any man or woman who believes that conditions are growing worse or that the spirit of our people is degenerating is not going to make much of a contribution to a cause which calls for devoted service and an abiding faith in the gradual improvement of the human race, especially as regards the protection and care of its children.

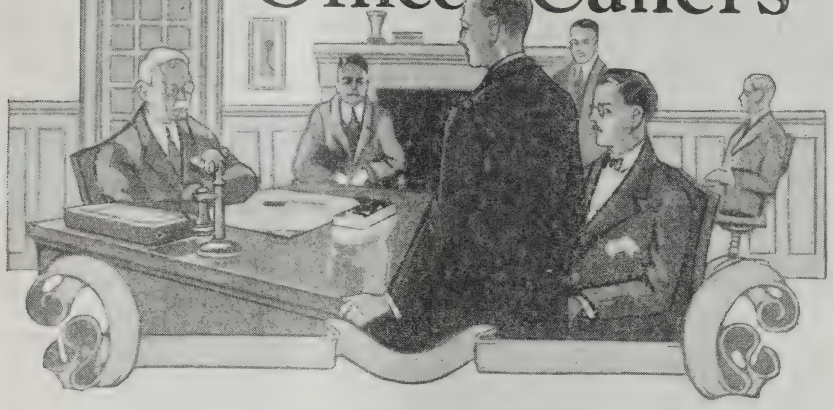
Pessimism has never contributed in any appreciable degree to the advancement of civilization and it certainly will never prove of great assistance in the work of safeguarding and improving the youth of our community.

*Judge Hoyt sits in the world's largest juvenile court. During the past fifteen years he has passed judgment on more children than any other judge in the world's history. He is known widely as a friend of underprivileged children.*

Look back through the ages and consider what revolutionary changes have taken place in the status of the child as a member of the state. From a chattel which might be sacrificed to the gods; which might be killed by its parents or exposed to death or starvation by the state itself; which might be sold into slavery by a spendthrift father or seized for his debts; which might be scarred and deformed by an unscrupulous mountebank; which might be forced to labor eighteen to twenty hours a day at the ages of seven and eight years by a hypocritical mill-owner; which might be herded into jails, almshouses, reformatories and schools, there to suffer a living death, the child has gradually won its age-long fight for recognition as a human being and has come to be regarded as a privileged member of the body politic, for whose protection the law is more solicitous in many respects than for that of older persons.

It was only three hundred years ago that St. Vincent de Paul, chancing to discover a little boy being maltreated and scarred by a miscreant for the purpose of making him an appealing and effective object of charity, seized the child and placing him on his shoulder marched through the streets of Paris, calling upon the people to save their offspring from the horrors of infanticide and torture. It was less than a hundred years ago that the Parliament of Great Britain learned to its shame that English children were being delivered to mill-owners in herds like cattle and that after they had been kept huddled by the hundreds on canal boats, in cellars and other temporary prisons, the survivors were 'apprenticed' out to lives of slavery from which, happily for them, they usually found release in death after several years.

Can anyone deny, after studying the history of the child from the dawn of civilization to the present time, that the cause of child protection and child welfare is not advancing with more rapid momentum with each successive age?



Even during our own day and generation, the gain has been almost unbelievable. Such innovations, organizations, or developments as children's courts, probation, mothers' pension systems, clinics for the examination of mental defectives, vocational guidance bureaus, visiting teachers in the public schools, Boy and Girl Scouts, Big Brother and Big Sister societies, parents' leagues, community centers and many others, have all been organized and established within the past twenty-five years and some of them within the past fifteen or ten.

Today there are many great philanthropies or foundations making intensive studies of the various phases of child life, especially in relation to health, a field in which the most extraordinary advances have been made, yet twenty-five years ago these organizations did not exist. Then again, during the same period the work carried on by the churches, the schools, the clubs and settlements and the children's societies has been in many instances revolutionized and developed in far more effective fashion than in former days.

In our own special and limited field I can give some figures which should impress the doubter. In the Children's Court of the City of New York the total arraignments of children for all causes have fallen from 15,000 in 1911 to 10,000 (in round figures) in 1924—a reduction of 5,000 in thirteen years, in spite of the increase of the city's population. And, better still, our commitments of children to institutions, for all causes including that of neglect, have been reduced from 3,682 in 1911 to 2,016 in 1924, a reduction of 1,666.

That the future holds out unlimited opportunity for progress and achievement goes without saying. Much remains to be done, and possibly a hundred or two hundred years from now, men will look upon the accomplishments of the present day as mere beginnings—mere scratches on the surface of things. But one thing is sure, and that is that the world is progressing. No one who has faith in the destiny of mankind ought to believe otherwise.

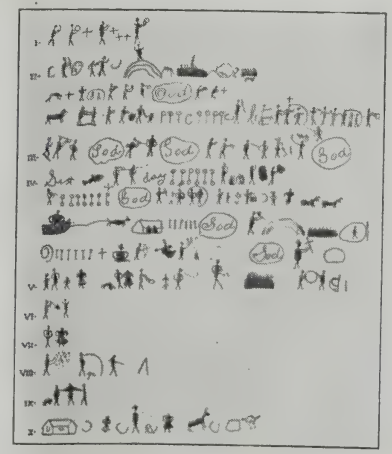
# Chats *with* Office Callers

'Montreal is a great city,' said ***the American,*** just returned from a vacation there. 'Lots of business. But Americans who yell for "light wines and beer" ought to go there and see how the "Quebec system" really works. Along the docks, around the markets, on every corner in the industrial and downtown sections are "taverns," which differ in no way from our old-time saloons, with their gangs of woozy individuals hanging around the doors. The wets may say what they like about their being more drinking under prohibition than before, but in two days I saw more drunks in daylight on the best streets of Montreal than I have seen during the past ten years in Detroit.'

❦ ❦ ❦

'Teaching,' explained ***the Superintendent of Public Schools,*** 'is a tough job. Whatever good you do cannot be measured. You never know just where you stand. It is only a belief in yourself and the system you follow that carries you along. Results help very little, and while you see a certain response in the immediate work of the students the big benefits you want to confer remain in the shadow. Grief is plentiful. It has come now to the place where the schools are expected to take the child, rear him, cultivate him and do all but clothe him and provide for his lodging. Parents in many instances are anxious to shift every burden of responsibility they can to the schools. We have always been willing to do our share, but there isn't any institution in existence that can take the place of the home in the life of a child. If the home does not fulfill its purpose, nothing else can.

'Then there are the school boards who settle on the general policies to be followed. In the majority of cases we find men of vision and judgment on these boards; but it is hard to work with a progressive board for five or six years and then be thrown with one of opposite ideals. After building up a school from a low scholastic standing, after installing modern school methods, meeting requirements as to teachers and teaching standards, putting athletics on a par with the schools in our locality, having our schools placed on the accredited list at the state university, to have a new board whose knowledge of school matters is negligible come in and deal disparagingly with all these cherished accomplishments is enough to discourage anyone. But this is part of the game. We have to accept it with a smile and have faith that what we have tried to do has not all been without purpose.'



❦ ❦ ❦

' "There's never a law of God or man runs north of sixty-three."

'The next time somebody hurls that quotation at you to indicate the turbulence of men in the frozen wastes up around the Arctic Circle,' ***the Writer declared,*** 'show him this illustration and refer him to Dr. George Byron Gordon, F. R. G. S., explorer, archeologist, author and director of the University Museum in Philadelphia.

'In a hitherto unexplored region of Western Alaska along the headwaters of the Kuskokwim River, where no white man had ever set foot before, Dr. Gordon found on a slab of wood in one of the Indian villages—well "north of sixty-three"—the newest translation of the Decalogue in the most ancient form of recording thought—the Ten Commandments in picture writing.

'A restless brave of the Kuskwogamiut tribe of Indians had come in his travels to a mission somewhere in the endless snows. Remaining to listen, he had "got religion"

and one day he mushed back to his native village with the story of the white man's God thundering His commands from the mountain top. The Indian and his fellows had not learned the paleface trick of making speaking pages, but they were adept in the primitive art of picture writing.

'Dr. Gordon tells me that the author of this document afterward discovered that he needed a more rapid method of writing to keep up with the spirit of the times, and, relying entirely on his own resources, he gradually developed a system of shorthand, using the picture writing as a basis. By means of this discovery he could take down all the lessons and sermons that he heard and recite them afterward without missing anything.'

❦ ❦ ❦

'I hear a great deal of complaint about the weakness of preaching today,' said ***the Clergyman,*** when he found a minute to look in at the office. 'I suppose that preaching has always been criticized, in every age of the Church, but I could wish that some of the sermons of today were deeper and stronger. However, I cannot believe the fault is entirely with the preachers. It is rather with the modern church organization, and the modern social and civic organization. These demand so much aid and effort from the ministers, that there is no time left for reflection such as our fathers had. Jonathan Edwards wrote his *Freedom of the Will* while serving a lonely mission station among Indians, and his other great works in the conscientious but wholly spiritual labors of a village pastorate. We preachers of today read the passage in the Bible, "Be still, and know that I am God," but we never have time to be still.'

❦ ❦ ❦

'Do you remember that old melodrama—"The Streets of New York"?' asked ***the New Yorker.*** 'It was a hot one. But it wasn't a marker to the scenes I've been witnessing on the streets of New York in the last few weeks. I'm referring to the crowded streets in the Thirties, where the shops and workrooms of the clothing and fur districts are located. One day I saw more than 600 men form in a solid wedge, four abreast, and march along sidewalks, elbowing everybody off into the streets, pedestrians, women shoppers, children, just everybody who came along in the crowded luncheon hour. There was a fur- or garment-makers' strike on, and these people were "picketing," they said.

'Another day I saw a lot of women going through the district with hammers wrapped in newspapers, rapping the heads of their recalcitrant employers. When the weather wasn't so good the pickets wedged themselves into the entrances of garment shops to prevent anybody from working there. When arrested they told the judges they were only seeking shelter from the rain. There's scarcely a day passes that small mobs don't rush into the loft buildings, force themselves into the workrooms, pour acids on rolls of cloth and steal suits, and incidentally beat the factory owners unconscious. All this seems to be taken as matter of fact by the newspapers and the public. These people aren't Americans, of course. Or if they are, they are Americans by recent acquirement. But they are typical of the new New York.'

# Can You Tell Me?

QUESTION: When was the act passed establishing the United States mint?

ANSWER: Approved by President Washington April 2, 1792.

ꕥ ꕥ ꕥ

QUESTION: Who built Mount Vernon?

ANSWER: Lawrence, half-brother of George Washington, built it in 1743. George Washington inherited it on the death of Lawrence and his only daughter, and it was his home from 1747 until his death in 1799.

ꕥ ꕥ ꕥ

QUESTION: How and when were the early records of the United States moved from Philadelphia to the new Capitol in Washington?

ANSWER: They were shipped in a little vessel called a 'packet sloop' during October, 1800.

ꕥ ꕥ ꕥ

QUESTION: How much wheat do we export? Import?

ANSWER: Preliminary figures for the fiscal year give the exports to June 26, 1926, as 61,178,000 bushels, and imports to the same date as 16,953,000 bushels.

ꕥ ꕥ ꕥ

QUESTION: What amount of money has been refunded to taxpayers during the past year by the Federal Government, and the interest thereon, for taxes which were erroneously or illegally assessed and collected?

ANSWER: For the first ten months of the fiscal year 1926 the refund of taxes amounted to $135,828,088.23, plus interest allowed amounting to $33,773,855.13.

ꕥ ꕥ ꕥ

QUESTION: Is Washington considered a northern or southern city?

ANSWER: Geographically, it is southern, being about fifty miles south of the famous Mason and Dixon's line. Theoretically and legally it is neither, but national. The preponderance of its old inhabitants lend to it a distinct southern atmosphere.

ꕥ ꕥ ꕥ

QUESTION: Is there any religious qualification attached to the Presidency?

ANSWER: None. Even his oath of office omits the usual 'so help me God.' Art. 2, Sec. 1, Clause 8, of the Constitution gives his oath: 'I do solemnly swear (or affirm) that I will faithfully execute the office of President of the United States and will to the best of my ability, preserve, protect, and defend the Constitution of the United States.' Further, the first amendment to the Constitution provides that 'Congress shall make no law respecting an establishment of religion . . .'

ꕥ ꕥ ꕥ

QUESTION: What are the qualifications for burial at Arlington National Cemetery?

ANSWER: All officers, cadets, and enlisted men of the Army, Navy, Marine Corps, United States Coast Guard, and Army and Navy Paymasters' Clerks, dying in the service of the United States, or dying in a destitute condition after having been mustered out or honorably discharged from the service, or who served, or hereafter shall have served, during any war in which the United States has been or may hereafter be engaged, are entitled to burial in any National Cemetery free of cost. Army nurses are also entitled to this privilege as well as any American citizen who served with any Allied Army during the late World War. Wives and minor children of persons in the military service of the United States are entitled to be buried in such cemeteries, and widows of any persons buried in such cemeteries are entitled to be buried alongside their husbands.

*In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.*

ꕥ ꕥ ꕥ

QUESTION: How many American soldiers were killed in the war? How many were wounded and survived?

ANSWER: The War Department furnishes the following table:

BATTLE CASUALTIES

| | Killed in action | Died of wounds rec'd in action | Wounded | Total |
|---|---|---|---|---|
| Officers | 1,600 | 593 | 6,678 | 8,871 |
| Enl. Men | 35,331 | 13,080 | 191,378 | 239,789 |
| Nurses | | | 3 | 3 |
| Total | 36,931 | 13,673 | 198,059 | 248,663 |

This does not, of course, include those who died from disease, by accident, drowned, suicide, murder or homicide, executed, or other causes.

ꕥ ꕥ ꕥ

QUESTION: How many Representatives and Senators come up for election this year?

ANSWER: Article 1, Section 2, of the Constitution provides that all members of the House of Representatives shall be chosen every second year by the people of the several states. Therefore, all representatives will be elected this year.

Article 1, Sec. 3, of the Constitution provides that the full term of a Senator shall be six years. They are divided into three classes, so that one-third—or 32—may be chosen every second year. Therefore, the following Senators—or those who are to take their places in the Senate—come up for reëlection this fall.

Underwood, of Alabama
Cameron, of Arizona
Caraway, of Arkansas
Shortridge, of California
Means, of Colorado
Bingham, of Connecticut
Fletcher, of Florida
George, of Georgia
McKinley, of Illinois (Defeated in primaries for renomination)
Watson, of Indiana
Cummins, of Iowa (Defeated in primaries for renomination)
Curtis, of Kansas
Pepper, of Pennsylvania (Defeated in primaries for renomination)
Smith, of South Carolina
Norbeck, of South Dakota
Smoot, of Utah
Dale, of Vermont
Jones, of Washington
Lenroot, of Wisconsin
Ernst, of Kentucky
Broussard, of Louisiana
Weller, of Maryland
Butler, of Massachusetts
Williams, of Missouri
Oddie, of Nevada
Moses, of New Hampshire
Wadsworth, of New York
Overman, of North Carolina
Nye, of North Dakcta
Willis, of Ohio
Harreld, of Oklahoma
Stanfield, of Oregon (Defeated in primaries for renomination)

The House of Representatives also has a territorial delegate from Alaska and one from Hawaii, two resident commissioners from the Philippine Islands and one from Porto Rico. They have the privilege of the floor but no vote.

# I Read in the Papers

Britain is laboring in her industrial distress like a waterlogged craft in a heavy sea. Her national revenue declined by more than $100,000,000 during the first quarter of the present financial year, as compared with the corresponding period a year ago, her foreign trade has dropped nearly $700,000,000 within six months, and upward of 2,500,000 of her workers are now in idleness. The country is becoming increasingly dependent upon imported coal for maintaining its essential services. Even industries less affected by the coal strike feel the pinch. The shares of more than sixty textile corporations in the Manchester district are at a discount, and many of them report heavy losses for the current year. Meanwhile the striking miners are holding out with grim determination, although there is said to be actual hunger in their ranks. In a word, the bitterest industrial conflict in England's recent history has come as a climax to one of the worst industrial depressions recorded in her annals.—*Living Age.*

*Great Britain's Financial Difficulties*

ɤ ɤ ɤ

Vendors of soft drinks have discovered what is claimed to be an entirely new scheme for producing an unquenchable thirst among their patrons. Citrate acid is placed in the drinking glasses or used in the manufacture of the drink. Anyone taking a drink of the product treated in this way discovers shortly afterward that thirst has again developed. A second drink makes matters even worse, and a half-dozen drinks on a warm day produce an almost unquenchable thirst.

*New Ways to Create a Thirst*

There is nothing new in the idea of using artificial means to produce thirst. At the lunch counters in some of the public houses in England salt fish and highly seasoned foods of various kinds are freely offered to patrons. This, in its turn, is but the survival of a very ancient custom which found an outlet at baronial banquets and revels of various kinds.

ɤ ɤ ɤ

Collectors and booksellers in England and America have been greatly concerned for some time about the large number of manuscripts now being offered which their owners claim to be original works by eminent authors, especially Shelley, Anatole France, Rudyard Kipling, and W. H. Hudson. These documents seem to come from a common source which evidence locates somewhere in Paris, and there is no doubt that most of them are forgeries. In several cases examples have at first been accepted as genuine by experts. Signatures are also counterfeited in this way. A copy of, say, the first edition of an 18th Century poem is procured, and the signature of George Washington, or some equally celebrated American, is forged on the title-page or flyleaf and faked to a resemblance of age. Then the volume with its new mark of association is shipped across the Atlantic and sold for an exhorbitant sum.

*Manuscript Forgeries Increasing*

Nor do the forgers confine their skill to penmanship. With the same ease they will imitate type that no longer exists. Given a piece of paper they will counterfeit a page of a Restoration play or with equal skill a pamphlet of some great writer. The extravagant prices paid for rare old and modern books and manuscripts embolden the forgers to run risks that would frighten the timid. It is difficult to detect these forgeries or trap the forgers, who depend largely on the fact that the expert who has been deceived is even more afraid of exposure.

ɤ ɤ ɤ

It was before the time of killing women in war. Napoleon could murder the Duc D'Enghien in a ditch at Vincennes—but he could not kill a woman. With all his faults, Napoleon could never have slain Nurse Cavell. We must always remember that to his credit. Just as he refused to use poison gas, so he shrank from killing Madame de Stael. Perhaps Napoleon knew that exile was worse than death to this daughter of Paris. She was not happy at Coppet, and she flooded Napoleon and her friends with appeals to allow her to return to Paris. Sometimes she set out on her travels and crept as near as possible to the great city—pathetically haunting the suburbs as if to catch a whiff of the Paris odors. But whenever Napoleon caught the rumor of her approach, swiftly he threw his thunderbolt of expulsion. Wherever she lodged she was tracked down. There would come a rap at the door and a letter would be carried to the great lady while she was dining. She would tear open the folded message and her face would grow pale. Early next dawn her horses and chariot would be waiting at the door and she would be departing swiftly back to Geneva and Coppet.

*Exile Proved Secret Blessing*

But what France lost, letters gained. For Madame de Stael was so voluble a talker that she would probably have written little if she had remained in Paris. Tied down to her *chateau* at Coppet, she could find only one way of relieving her *ennui*, and that was by writing. So it was that, with the resolution that marks the true maker of books, Madame de Stael would settle down at Coppet to the long strain and labor of composition, and in that way she would while away the hours and days spent by the Lake.—Harold Spender in *The Contemporary Review.*

Interesting observations on Chicago civic conditions are made by Chief of Police Collins of that city in commenting on the fact that more than 200 gangsters have been killed as the result of feuds during the past four years, and 160 have been killed by police.

*Gang Killings Viewed by a Police Chief*

'The police can do nothing to stop gang killings,' he said. 'They are beyond protection by the police. The gangsters have an organization of their own. There was a time when they had the city divided into territories and each faction respected territorial rights. That was before the days of hi-jacking.

'Nowadays they are all over the city, and when they want something they take it. When their demands are refused they back them up with revolvers or shotguns. If gangsters kill each other, we don't care very much. Of course, we make an honest and sincere effort to find the guilty parties, and when arrested we try and hang them. But the task is hard.'

# NOTES COMMENTS CRITICISMS

MR. FORD'S PAGE this week discusses the fact that prosperity is without value unless it is shared with others.

'Nervous breakdown' is a polite phrase become popular in this country only in the past few years. It would not be so popular—declares Dr. Joseph Collins—if it were generally known that 'nervous breakdown' is usually a camouflage term for mental disorder. (p. 1)

*A few years ago a book by a comparatively unknown author met instantaneous and phenomenal success. That book was The Doctor Looks at Literature. It was followed by other works in the same clear, incisive style. Dr. Collins became famous almost overnight as a critic and writer. But he was already famous as a neurologist. He draws upon both talents to produce this remarkable article on nervous diseases.* (p. 1)

*Dr. Joseph E. Collins.*

Mental disorder does not necessarily connote insanity. Conventionally, insanity is a matter of conduct. Many a man who is filled with insane ideas is not regarded as insane by the law or his neighbors. And mental disorder can be almost entirely eliminated from life. In his trenchant way, Dr. Collins tells of the cause of nervous breakdown—and the prevention. (p. 1)

THE supreme test of a religious revival is not its momentary excitation but its permanent results. How many of those who 'hit the trail' retain their religious fervor after the evangelist has departed? How many remain in the church? In former days the religious revival played an important rôle in America. What is its rôle today? (p. 12)

Dr. William E. Barton brings a ministerial experience of forty years to the discussion. In early manhood he was a circuit-riding preacher in Tennessee. Later he held the pastorate of one of Chicago's largest suburban churches. He served as Moderator of the National Council of the Congregational Church in the United States for two years. He has participated in many revivals—and his analysis of them is one that churchmen and laymen together will want to read. (p. 12)

George S. Roberts, of Montgomery, Massachusetts, writes: In THE DEARBORN INDEPENDENT of August 21, Charles D. Cameron says: 'It is not a *grammatical error.*' How on earth could a man who is competent to write on the subject of the English language commit so inexcusable a solecism? Like a Roman Catholic Protestant a grammatical error is a paradox.

Sherwin Cody, recognized stylistic authority, in *The Art of Writing and Speaking the English Language* (G. P. Putnam and Sons), says: Grammar is the science of the relationship of words in a sentence, and there is as much bad grammar as bad chemistry or logic. 'Grammatical errors' are 'errors of grammar,' not 'in grammar.'

Many more freak laws have been brought to light through the interview with Arthur Train, printed in a recent issue, in which the noted novelist scored the American propensity for law-making. One reader writes of an Illinois law (since repealed) which provided a fine of $500 for any woman convicted of reading her husband's mail. In Indiana a performing chimpanzee was fined five dollars for smoking.

Among the bills introduced in the latest sessions of legislatures were an act requiring hotels to furnish bed sheets nine feet long, an act requiring husbands to cook breakfast on Sundays, and an act requiring railroad companies to remove the last car from each train to prevent rear-end collisions.

Shakespeare's London still exists in little nooks and corners of the vast city of today. Some of the inns were he stayed, some of the churches were he worshiped, remain almost as he knew them. (p. 17)

*W. Teignmouth Shore, who contributes the delightful article on Shakespeare's London, is listed in the British* **Who's Who** *as journalist, lecturer and business expert. He did editorial work for the* **Encyclopedia Britannica** *for a number of years. He is well known in England and America as a writer. But he is more than this. 'I am,' he writes, 'an expert in criminology, cookery, American literature, the theater and Charles Dickens. And an awful nice young feller.'* (p. 17)

*W. Teignmouth Shore.*

Thomas L. Masson, the noted editor and critic, places a measuring rod to literature and tells us what books he likes, and why. (p. 4)

Some months ago we published Mr. Masson's story, 'Leading the Simple Book Life.' Following this he was invited to deliver a series of book talks from one of the leading broadcasting stations. Since then he has been literally swamped with requests for additional information and advice. This article is his response. (p. 4)

DURING the war the name of 'Woodbine Willie' became almost a household word. 'Woodbine Willie' was one of the best known of war chaplains. Today he is chaplain to King George, and an aggressive leader of the younger English clergy. He writes vigorously on socialism as viewed by the churchman. (p. 3)

And among the other authors in this issue are Harry A. Sanders, philologist, archeologist and curator of the famous Freer Collection at the University of Michigan, who writes on the different versions of the New Testament . . . Harry H. Dunn, who spent many years in Mexico and the Orient as press correspondent . . . Forrest Lord, who has made a special investigation of the condition of crippled children, at the request of various civic organizations . . . James W. Beckman, once secretary to Elbert Hubbard, who concludes his series on the Army court-martial system.

When a native of Trinidad wants to wreak disaster on an enemy, he drives a nail into this tree, supposed to be the home of the dread Jambie bird.

*Your painter will tell you that Valspar is unequalled for beauty and durability.*

# The Economy of Valspar

A Valsparred surface is absolutely waterproof and accident-proof. It can be washed with hot soapy water or ammonia as often as necessary without the slightest injury. Even acids and alkalies can not make ugly spots or dim its luster.

The great economy of Valspar lies in the fact that it lasts twice as long as ordinary varnishes, it gives better protection and looks better—on floors, furniture, woodwork and metal.

**45c** *Forty-five cents worth of Valspar will make a shabby Front Door look new!*

*A New Car for about $2.30 worth of Valspar-Enamel!* **$2.30**

**55c** *is about the amount of Valspar Varnish-Stain needed to renew an old chiffonier.*

*The necessary Valspar-Enamel or Stain for refinishing the average bed, in any color, will cost about* **65c**

## Valspar—Clear and in Colors

Valspar meets every household need. *Clear Valspar Varnish* gives a lustrous finish, without changing the color of the woodwork; *Valspar Varnish-Stains* produce a transparent, natural wood color with Valspar's brilliant luster and durability—Light or Dark Oak, Walnut, Mahogany, Cherry and Moss Green. *Valspar-Enamels* cover the surface with a solid coat of beautiful color—Red—*light and deep*, Blue—*light, medium and deep*, Green—*medium and deep*, Vermilion, Ivory, Orange, Bright Yellow, Gray and Brown. Also in Black, White, Gold, Bronze, Aluminum and Flat Black.

Valspar in Colors is just as waterproof, durable and beautiful as the Clear Valspar Varnish. One coat is often sufficient, but of course, greater protection and beauty is secured by each additional coat.

*Send the coupon for samples, and prove for yourself the economy of Valspar.*

*Valspar-Enamel will make your refrigerator bright, sanitary and easy-to-clean for* **70c**

**1½ cents** *per square foot to renew your old linoleum with Valspar.*

# Taxes, Taxes, Taxes!

## They Are Always With Us But Often We Do Not Know It

By SAMUEL CROWTHER

THE country has consistently refused to be frightened by the amount of taxes which it pays or the indebtedness—the public mortgage—which is being steadily piled up. The people are for low taxes. That is a matter of course.

The number of voters who do not pay taxes directly and who never expect to pay any is so small as to be negligible. All the efforts to work up a class-conscious proletariat have fallen flat—both to be poor and to be proud of it is not in the American nature. And neither is that nature any more scared by public debts than it is by the number of automobiles per capita. We refuse to believe that we are going to the bowwows just because we are what we are.

And the public, as usual, is instinctively right. This whole business of taxes and debts is one of proportion. We have a way of making ourselves afford what we think we can afford. The point in taxes is not what we are paying. The point is, 'Do we know what we are paying?' People get into the hands of loan sharks mostly because they do not at the beginning know what they are letting themselves in for. Look at debts and taxes from that angle.

If your income is under ten thousand dollars a year and you own a house, the taxes which you do not know you pay will exceed those for which you write checks.

If your income is under five thousand dollars a year, you will pay more for taxes than you do for clothing.

If your income is twenty-five hundred dollars a year or less and you are a married man with a family, you will pay, whether you own your home or rent it, more for taxes than you do for food, although you may think you are tax-free.

The rich man pays the bulk of his taxes by check. The poor man—the man over whom the politicians weep and who may never get a tax bill—bears the heaviest tax in the nation.

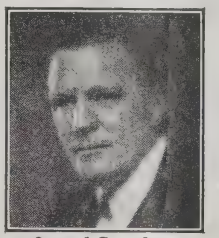
The matter of the taxes levied by the Federal Government, although highly important, is not all-important, for Congress has had a measure of taxing sense beaten into it by the voters. What Congress does about taxes and what the President does with the budget are front-page news—Washington is under the spotlight. But the debts and the taxes which will make or break us do not in their entirety get into the newspapers at all. They do not come out of Washington. They come out of state capitals and city councils, highway districts, school districts—out of something like a thousand political bodies which have the right to incur debts in this country and few of which have even the most elementary knowledge of finance. The expenses of the Federal Government are being reduced. Whether they will stay reduced is another matter. The expenses of state and local government are rising.

Perhaps you have not thought much about taxes. Possibly you directly pay only a few or none at all. But whoever or whatever you are, just try this little exercise. Select a cold, gloomy morning—a day that starts spoiled. For it will be spoiled anyway when you have finished the test. Do not try to do the thing too quickly and do not attempt any mental arithmetic as you go along. If taken slowly and carefully, the exercise is guaranteed harmless.

Let us assume you are a commuter with a job in a city. It does not make any difference whether you are an employer or an employe. If, instead of being a commuter, you live in a city or town, you can omit whatever exercises do not apply to you. Ditto if you are a farmer. No matter who you are, you will find plenty of exercises that exactly fit you. Try this:

No. 1. Rise and yawn. As you get out of bed, reflect that you have just worked out one night's real estate taxes on your home. You may be paying those taxes directly or through a landlord.

No. 2. Turn on an electric light. Reflect that you are helping to pay the taxes of the electric light company.



No. 3. After shaving, put some tax on your face—witch hazel, bay rum, or any lotion. They all contain alcohol, and the most expensive ingredient of alcohol is the excise tax.

No. 4. At breakfast, reflect that all the food on the table, all the dishes, everything you own or use is full of taxes. Every article has paid a number of property taxes and probably in several states. If made or handled by a corporation, it has paid, in addition, two or more taxes a corporation. The article has been carried on motor cars or railroads and part of the charge for each division of transport is tax.

No. 5. If you take a taxi to the station, reflect on the federal excise taxes on the car, tires, and so on, and the various state (Concluded on page 23)

*THE only fine feature of national statistics is their flexibility. If I am an Anti-Saloon Leaguer, I can get the exact figures on how much Prohibition has saved the nation. If I am a Saloon Leaguer, I can get equally accurate figures on how much Prohibition has cost the nation. I have before me a bulletin which seeks to prove that we are not spending too much for public education. It compares the national wealth of 1922—which is only a guess—with the income of 1919 and the cost of education in 1922. The resulting chart looks as though it ought to mean something. Actually it means nothing at all, for the figures are not comparable. By the same method I could estimate the cost of King Tut's funeral, compare the result with what Henry VIII spent for wives, reduce the whole to 1913 dollars, and prove that after all it wouldn't cost much to run an automobile in 1930.*

*But what follows on the expenses of government and on the debts incurred by government is reasonably accurate.*

Samuel Crowther.

# Cashing in on the 'Blue Sky'

## *A Study of the* Methods *Used by* Wily 'Aviation' *and* Real Estate Promoters *in Separating the* Sucker *From His* Dollar

*By* RALPH W. BUDD *and* J. OLIN HOWE

*Illustrated by* W. W. CLARKE

'BLUE SKY' has been placed in the dictionary as the term for that horde of pseudo-scientific, pseudo-industrial, quasi-legal, always visionary, get-rich-quick schemes whose stocks and other 'securities' are annually foisted on the American public to the total of One Billion Dollars!

Numerous American cities might be named as first-class 'Blue Sky' territory which is intensively worked; but the majority of these sheer gambles, or worse, originate in New York.

Though the average New Yorker professes himself a hard-boiled sophisticate, the truth is that within a radius of ten miles of Times Square are more suckers to the acre than in any other place on earth. 'Sucker' is also in the dictionary as descriptive of him who parts with cash hard come by for worthless stocks and the like. Of course he doesn't *think* they're worthless! But how much does he *know* about what he is buying?

Such make New York the ideal laboratory it is for the 'Blue Sky boys.' To the 'high-pressure birds' and the 'reloaders,' who exchange for lifetime savings sheets of richly engraved paper without even the wish to know whether what they are selling is worth a dollar or not—New York is home.

Here they can plan unbelievably audacious schemes and be sure of plenty of human material on which to try them out before scattering to reap the harvest. There is one office building in New York jokingly known as 'The Den of the Forty Thieves.'

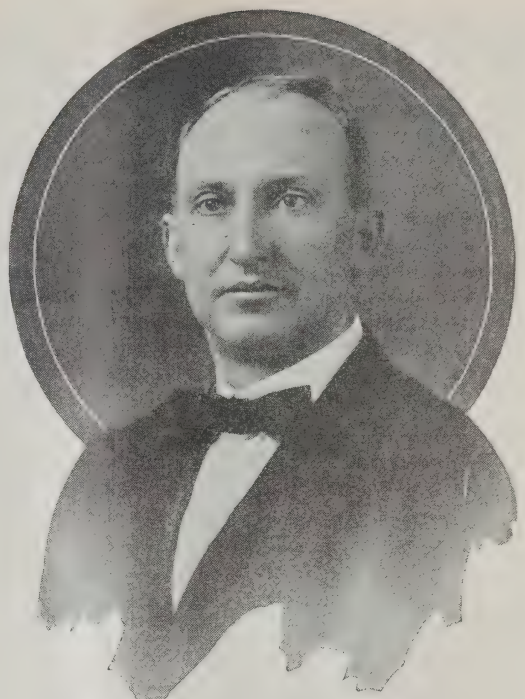
Immigrant and outlander may more readily buy the Woolworth Building from chance acquaintances, but it is the out-and-out New Yorker—who has been one long enough to really belong, say, a couple of years—who brings prematurely gray hair to the temples of local and federal district attorneys, and Post Office inspectors.

For example, at the extreme northern end of New York City, where it merges into Yonkers, a fabulous 'mine' lately closed its career at the behest of the authorities, whose promoters had absolutely guaranteed the presence there of gold, silver and platinum, and other precious metals in paying quantities. In fact, they were ready to name about any metal one would ask for.

Those fellows had a secondhand trench-digger at work, saying they need not sink a deep shaft because of the favorable lay of the land. There was no difficulty about selling their stock.

In New York, too, the famous 'cat and rat ranch' promotion came into being. In a spirit of fun a witty writer wrote a burlesque prospectus describing the efficient and profitable operation of a plan by which rats would be raised to feed to cats, the cats killed for their fur—whence came the profits—and their carcasses fed to the rats which would be fed to cats—and round the endless chain again.

A financial house (Concluded on page 19)



*'Mother, we've struck it rich this time! I'm going to take a full square mile.'*

## The Motives That Guided Me in

# Exercising the Pardoning Power

By GEORGE W. HAYS
*Formerly* GOVERNOR of ARKANSAS

*George W. Hays was elected governor of Arkansas at a special election held in July, 1913, to fill the unexpired term of Governor Joe T. Robinson, who was elected to the United States Senate. Mr. Hays was inaugurated January 1, 1914, serving five months as governor and was reelected for two more years. During his term of office he pardoned about 400 criminals.*

THE highest gift which the state can bestow on its chief executive is the pardoning power. In the entire scheme of social existence and political life, there is nothing of which I am more convinced, nothing to which I so strongly adhere than the belief that the principle of granting relief to life's wayward and unfortunate is truly God-given.

While I was governor of the State of Arkansas from 1913 to 1917, I pardoned almost four hundred criminals. Considering the population of the state at that time, this record may seem remarkable. And yet, of all that number only three, less than one per cent, have been returned to the penitentiary.

It is a source of satisfaction to me to know that practically all those who received clemency from me once more entered society and did not fall back into a life of crime. Think of what this means not only to the individual but to his friends.

Pardon movements arise from a wide variety of sources. In many instances the applications that I received were recommended by the very judges that tried and sentenced the convicted persons, from the juries that found them guilty and even from the prosecuting attorneys. Other officers of the counties in which the trials took place together with many other citizens, from practically every calling, augmented the list of petitioners.

While this method was frequently used for arousing interest in the pardon-seeker there were many exceptions to the rule. Thousands of letters poured through my office from mothers, wives and children as well as from many who had no personal concern in the prisoners.

In the latter class may be placed the vast numbers of newspaper readers whose sympathies are often aroused by accounts of mitigating circumstances in the lives of the condemned. Often these pleaders for clemency are from distant states.

I remember one instance where a young man was convicted and sentenced to a term of three years on a larcency charge. His wife, during his prison term, lost interest in him and when at last he left the penitentiary he was told by a mutual acquaintance that she had divorced him and had married again.

Completely disheartened the young man decided to leave Arkansas and make a fresh start in one of the big industrial centers of the North. Here he made good and a few years later had risen to the position of mechanical foreman in a large industrial plant. During this time he never heard from his former wife. Another love came into his life and he married again.

After a few years as a good husband and father he learned that his first wife had never divorced him and that he was a bigamist. He was brought back to Arkansas, tried, convicted and sent to the penitentiary to serve a term for bigamy. The broadcasting by newspapers over the country of this unusual story roused a veritable storm of protest from readers of all classes in the most remote places. The convict's domestic affairs were satisfactorily readjusted by his first wife securing a divorce and he was promptly granted a pardon.

IN some instances my attention would be directed to particular cases and after a personal investigation I would grant pardons on my own initiative. I shall never forget one such occasion when an old lady from one of the remote counties of the state, with a little barefoot grandson as her sole companion, walked all the way to the state capitol at Little Rock, a distance of more than one hundred and fifty miles, to beg for a pardon for her son who was serving a three-year sentence in the penitentiary for burglary.

This boy was her main dependence for a livelihood. The poor old soul was weeks in making the trip, as she stopped along the road to pick cotton for a day or two at a time to enable her to earn a little money to buy herself and her grandson sustenance until they reached their destination.

When she came into my office, presented her application and told her pathetic story I immediately inquired from the prison officials about the young man's record since he had been an inmate of the penitentiary. I learned that it was good and at once granted the pardon.

At the time this occurred there sat in my office a big generous-hearted Irishman, and when I handed the old lady the pardon he gave her a sum of money to pay her expenses down to the state farm, where she had to go to present the pardon and secure the liberation of her son.

It is no uncommon thing for a serious doubt to arise after a man has been convicted as to whether or not he was guilty of the charge. This is often offered as a plea for a pardon and at times public sentiment in the community from which the convict has been sentenced is so strong that a reinvestigation may be held resulting in the granting of a release.

Another of the common pleas for executive clemency which I received during my two terms of office, and one which at times proved irresistible, was the youth of the convict. For example, arguments were placed before me showing that the wayward boy had been deprived of proper training in early life. Possibly he had lost his mother or his father or both parents and had received none of the advantages that should have directed his mind along the path of right living.

Viewed in the light of such ex-

tenuating circumstances, together with the fact that the youthful offender had already served part of his term and had received sufficient punishment to teach him the lesson of discipline and self-control, I exercised the pardoning power, feeling that by doing so the boy would be given another chance.

The important matters of health and hygiene play their parts in the granting of pardons. Sometimes persons convicted and sentenced to the penitentiary are the victims of incurable contagious diseases. The protection of the health of other convicts actuate the granting of pardons in such cases.

One of the arguments frequently influencing the granting of a pardon was the fact that the convict was the sole support of a wife and small children. I recollect one case where a young farmer from the hill section of the state was convicted of making moonshine whisky and sentenced to one year and a day in prison. His explanation that he had not made the whisky to sell but merely to 'have a little cheer for Christmas' had no weight with judge and jury and he found himself, after due process of law, behind the walls of the penitentiary.

After he had served about six months of his term a letter made its way to the governor's office from his young wife in which she not only asked for a pardon for the mountaineer but advanced a most convincing reason why he should be permitted to return home—a picture of a fine-looking young son and daughter, twins, aged two weeks.

'They need their daddy, governor,' she wrote, and one could not but concur in the argument so cleverly yet simply expressed.

Often the fact that a convict is a member of a good family is advanced as an argument for freeing him before his full term has expired. In considering this type of plea it must be borne in mind that the disgrace and mental anguish suffered by this class of wrongdoer and the sorrow and suffering caused his relatives render his punishment more intense than that of the case-hardened criminal or the one from the lower walks of life.

I pardoned all white women convicted and sentenced to the penitentiary during my term of office. This may seem an astounding statement, but a realization of local conditions will throw considerable light on the matter. Arkansas, as a matter of fact, had no provision for the housing of white women convicts, while I was governor.

We men of Arkansas have a conviction that the penitentiary is no place for a woman and I, personally, believe that, as a rule, some low-down type of male is at the bottom of most crimes committed by women. This may seem a strange point of view to dwellers north of the Mason and Dixon's line but it is innate in the southern-born man.

I remember one striking instance where a poor, unfortunate creature, a pitiful caricature of her sex and race, was sent to the penitentiary for immoral conduct. This derelict bit of humanity had been reared in the hill country without advantages or opportunities. I went to see the woman, taking a pardon with me, and in company with a friend we put her in a waiting automobile, and brought her to a department store where some suitable clothes for traveling were purchased. We bought her a railroad ticket and sent her to her relatives who lived in a neighboring state.

Perhaps some explanation of the principles guiding me in the use of the pardoning power while governor would be timely and interesting. I would not want any of my readers to get the impression that I wielded this influence to turn loose on the community a class of dangerous criminals through foolishness and sentimentality.

Each pardon was granted only after a careful personal investigation into the case and the record made by the pardon-seeker before and after his commitment. The fact that less than one per cent of the large numbers granted executive clemency failed to reform bears out convincingly the wisdom of tempering justice with mercy in cases where it is deserved.

An important principle governing the pardoning power is the fact that a convict makes a better prisoner with the hope of a pardon in mind. People convicted of crimes are nevertheless human beings and regardless of the punishment fixed at the trial there remains in the breast of each and all a ray of hope. This ray, no matter how faint, never quite dies out.

Appealing to this inherent characteristic hope is a strong argument for reform and good conduct. During my seven years as circuit judge before I served as governor of the state I never failed in sentencing a convicted person to remind him or her of the fact that good behavior would mean the shortening of the penitentiary term.

Once let a prisoner understand that his own actions determine how much sooner he may win freedom and you have a potent influence for good conduct and obedience to prison regulations. The habits formed by convicts while serving their terms with this belief before them result in right thinking and the determination to go straight when they are released. The pardoning of this type of convict is a relief to the state as well as to the individual.

Only a few days ago there came to my office a man who at one time had been convicted and sentenced on a seri-

# The Genesis of the Constitution

## Reflections on What Washington and Thirty-Eight of His Countrymen Did One Summer

*It was suggested that the convention open each session with a plea to the Almighty. One delegate said he saw no reason to call upon the Creator.*

*By* ALLAN L. BENSON

*Illustrated by*
AUSTIN EUGENE BRIGGS

FROM the twenty-fifth of May until the seventeenth of September, 139 years ago, the most illustrious body of men who ever assembled upon the North American continent met day after day, behind closed doors, during a hot Philadelphia summer, to fashion a form of government for themselves and their posterity. Then thirty-nine of them signed what they had agreed upon and went their several ways, never to meet again.

Sixteen delegates did not sign. James Madison, in his Journal, says that all signed except three, but he meant that all but three who were present signed. Thirteen others were not present, some of whom opposed the Constitution. Lansing and Yates, of New York, together with Luther Martin, of Maryland, and a number of others, had long since become disgusted because events did not proceed to please them, and had gone home. Edmund Randolph, of Virginia, when pressed to add his signature, said that in refusing to do so he might be making the 'most terrible mistake of his life,' yet he felt compelled to hold aloof. A man who is known to fame only as 'Willie' Jones was appointed a delegate from North Carolina, but did not take the trouble to go to the convention at all, believing that it would not amount to much. Some men made mistakes then as some men make mistakes now.

All during the summer, Washington sat in his chair and said nothing except what his duties as presiding officer required him to say. Only once did he take part in the proceedings, and that was on the last day. He asked that the people be given a representative in Congress for each 30,000 of population instead of for each 40,000, and this was done.

Washington was the first to sign and the others followed in the geographical order of their states. Gouverneur Morris tried to get the objectors to sign by changing the paragraph at the close of the Constitution to read: 'Done by the unanimous consent of the *states* present.' With this phrasing, even an opponent could have signed, as his signature would have meant merely that all of the states approved without mentioning that sixteen delegates from the states did not, but the maneuver brought no additional signatures.

'Whilst the last members were signing,' says James Madison in his Journal, 'Dr. Franklin, looking toward the president's chair, at the back of which a rising sun happened to be painted, observed to a few members near him that painters had found it difficult to distinguish, in their art, a rising from a setting sun. "I have often," said he, "in the course of the session, and the vicissitudes of my hopes and fears as to its issue, looked at that behind the president without being able to tell whether it was rising or setting; but now at length I have the happiness to know that it is a rising and not a setting sun." '

This chair still stands in Independence Hall, where it stood when Washington sat in it, the sun that so long puzzled Franklin still visible on one of the panels of the back.

Today if a constitutional convention were in session the newspapers would be full of its proceedings. Then the newspapers printed nothing. There was nothing to print beyond the fact that the convention was in session, the members having voted to close the doors and say nothing to anybody outside. It was necessary to have a secretary, of course, and two candidates were named, Temple Franklin, son of Benjamin, and William Jackson.

Two states voted for Franklin and five for Jackson. Jackson's minutes of the proceedings were so meager that if we knew nothing today of the convention

## Bringing the Human Boat to Port

# Under Its Own Steam

By DR. JOSEPH COLLINS

*Illustrated by* W. W. CLARKE

THE first duty of a parent is to provide food and shelter for his child, the next to aid him to satisfy his curiosity. He should be fed with facts, not fictions. He should be told that the body is the soul's temple, that he should be proud of it and that it should not be defiled. He should be taught not threatened, shown not coerced, encouraged not suppressed. He should not be told that life is an adventure and that only the venturesome live it fully and fruitfully.

When we are taught to play golf, the 'pro' does not lift the ball when we drive it into a hazard. He shows us how to get it out. We soon learn where the pits and bunkers are and we strive to avoid them. Parents should warn children of pitfalls, instruct them how to avoid them and get out of them, teach them the rules of the game, show them how to play it, then let them make themselves proficient. The thing that should be forbidden them is to tell children there are venomous reptiles in the grass bordering the course where the game of life is to be played and that they are likely to be bitten should they go in the long grass.

There is more than one reason why the United States of America has been the breeding ground of the psychoneuroses, the technical name for 'nervous breakdowns.' An important one is that it has been dinned into us for generations that emotions were given us that we might repress them. Another is that atmospherically and climatically this country may not be favorable to the white race. A third is we are an admixture of nationalities, and that makes for nervous disequilibrium.

'The surest way to make misery is to mix stocks,' said Grandmother Savage to Dan Oliphant the Midlander, when he went to her to announce his engagement to one of those New York girls, 'who don't know anything in the world except French and soirées.'

Mr. Tarkington is not only a keen observer and trustworthy reporter of manners, he is a sage as well.

Whether we know how to live, to adapt ourselves to our environment that we can think right and feel right is open to discussion, but that as a nation we have put materialism above idealism, there is no debate.

Prosperity is something for which nearly every person and all nations strive, but the strife is often prejudicial to mental health and emotional balance, especially when it is not tempered with diversion, or the simple life. The widespread dissemination of the allegation that all men were born equal, and the universality of the education that seeks to support it has had something to do with the prevalence of nervous and mental disorders.

'Nervous breakdowns' occur in individuals who are handicapped by heredity, fettered by fear and burdened with disease or deprivation.

It depends upon the individual's 'pattern' and 'gait' what sort of breakdown he will develop, and upon them and his environment how completely it will overthrow him. The 'pattern' he gets from his ancestors, but the 'gait' is largely homemade.

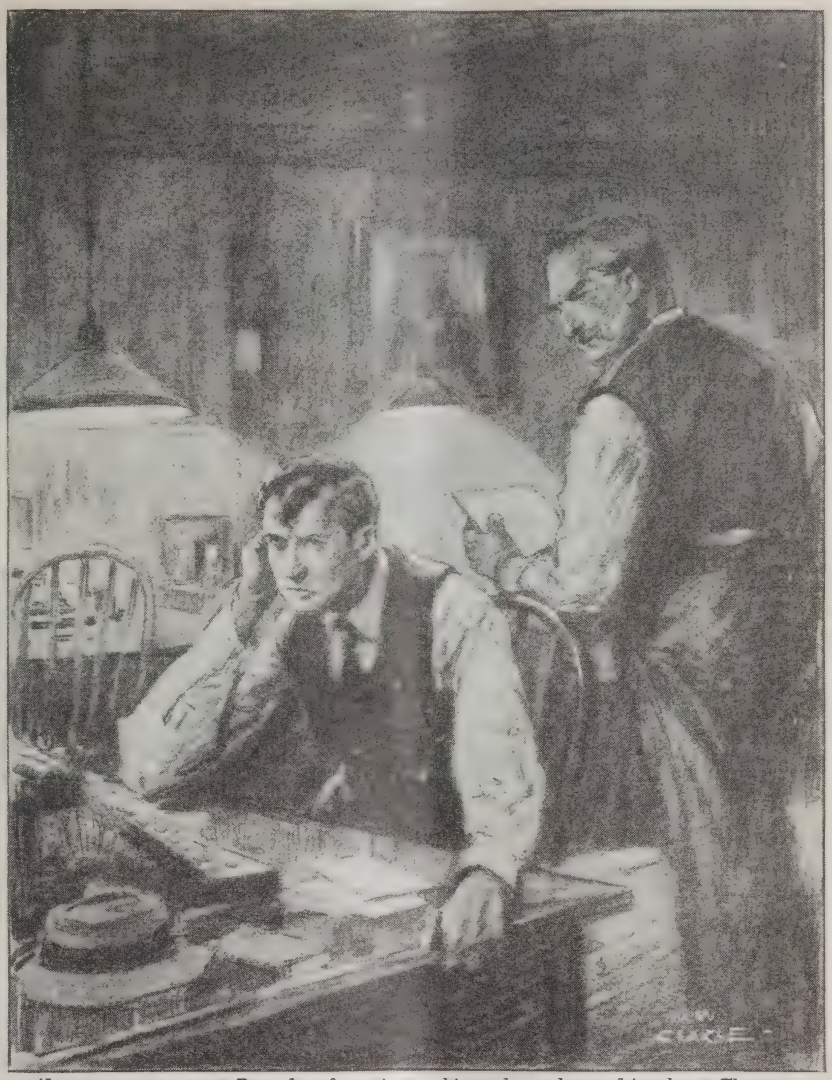
When character building, not passing into and from college, shall be the aim of education; when instruction in morality shall embrace moral hygiene;

*With the book in my hands I went to the window and soon found that my trouble was not due to a chemical disturbance.*

when open-mindedness, not money, shall be considered the patency of good breeding; when tolerance replaces bigotry, and hope, fear, our first resurrection will have begun. I am of the belief also that our last will be equally insured.

One of the great satisfactions of a physician's life is that he is able to steer many human boats threatened with foundering to a port of safety and to help their owners repair them.

Another is that it gives him opportunity to see many work out their own salvation, always a pleasing thing to witness in an individual or in a nation.



I have recently asked a man who had accomplished this masterfully to tell me how he did it, and this is what he said:

'AT THE age of sixteen, I was teller in a country-town bank. I had also the honor of being assistant cashier, bookkeeper, stenographer, errand boy and janitor of the building. The president of the bank was a physician, very successful and prominent in our part of the state. He was a kind friend to me and used to treat me for minor troubles without charge.

'My youngest brother went on a fishing trip, slept with a strange boy and came home with an itching infection. He slept with me, and I soon had it. At first I was more mortified than indisposed. My doctor friend examined the inflammation and gave me medicine to be taken internally. The trouble grew really severe. One day, sitting in his waiting room, I permitted to go ahead of me, out of courtesy to the fact that he did not charge me, those who had come in after me. The time seemed long. I looked over a bookcase and saw a green tome, *Skin Diseases*.

'With the book in my hands, I went to the window, looked up "Itch" in the index and soon found that my trouble was not due to a chemical disturbance to be righted with medicine taken internally, but to a small creature that burrowed under my skin, and that flowers of sulphur mixed in lard applied to the inflamed portions was the remedy. I replaced the book, left the office quietly, went home, threw away the bottles and presently cured myself with five or ten cents' worth of the yellow powder.

'How much significance this incident had in my young life, I cannot say. The experience probably suggested that I might put less confidence in the opinions of supposed authorities and rely more on my own faculties of observation and reason. It doubtless supported my growing conception that our kingdoms, even the technical and awesome ones of medicine, are man-made, that their rulers may be quite ignorant on matters in their own domain and that even an inquiring boy like myself might learn for himself in their own field.

*'I was on a newspaper. Part of my forgetting machinery dropped out of its place. The most inharmonious thoughts dominated my consciousness.'*

'Since then I have sought the services of a number of physicians, including able specialists, for rheumatism, eye trouble, and nervous breakdown. In each instance I have in the end done as in the case of my banker-doctor—used my own faculties of investigation, observation, experiment and check to understand the causes of my trouble and to overcome them, which up to the present I have done. I am not bitter against physicians. I number among them some of my warmest friends for whom and for whose work I have much respect.

'My first nervous trouble of consequence came at the age of twenty. I was a reporter on a New York morning newspaper. My work seemed satisfactory. I was made night hawk, working from seven at night until four in the morning. It was summer and frightfully hot. I could not sleep during the day on account of the heat and light. My stomach, which had been accustomed to wholesome home-cooking and plenty, was being fed in restaurants. Then a week of cooler weather came, and with it a strange phenomenon. My forgetting process was no longer working.

'I had always considered the process as natural as breathing. To be able to throw off the unpleasant thoughts one naturally encounters in even a small lifetime had been taken by me as a matter of course. Now, however, a part of my forgetting machinery had dropped out of its place. I could no longer forget. Instead, the most inharmonious thoughts of a youth's lifetime dominated my consciousness.

'I tried to dodge them, stave them off. They were always waiting for me. A day or two of this, and I had lived a lifetime in Hades. These painful thoughts were sitting on the bedpost when I went to sleep *(Continued on page 26)*

# What Would Izaak Walton Have Said?

## *The Author of* The Compleat Angler *in His* Wildest Dreams *Could Never Have Visualized* This Monster Fish—*A* 1,500-Pound Mackerel

By MAY B. WHITING

*Drawings by*
STANLEY W. WOODWARD

THE angling season is on in Southern California. Two fishermen in a specially constructed boat sit side by side, while behind them is the engineer who serves as gaffer and has the inglorious task of getting the fish into the boat. The anglers have bamboo poles and a reel of the most expensive make; also at least 300 feet of line baited with flying fish. Under the watchful eye of the Tuna Club of Santa Catalina they are endeavoring to win a medal in the angling tournament. They talk a good deal about pitting man's ingenuity and endurance against brute (meaning fish) cunning, and they are gratified that Providence, in its wisdom, has seen fit to put this most royal of sports within their power.

Down the steep bank I see clambering rather stiffly the Littlejohn brothers, Cap'n Wes and Still Homer (so called because of his habitual silence), old island dwellers off the coast of Maine, seasoned to every branch of fishing. One carries a lunch box and the other a water jug. Languidly I wonder where they can be going, for it is the wrong time of day for lobstering or trawling. Cap'n Wes, who is the elder, sits down on an overturned dory, while Still Homer slips the painter off the flat stone that serves as a mooring, drags the punt over the beach, and starts for the *Anna and Fern*, moored in the cove. He does not condescend to row, but stands in the back, sculling, a picturesque, vigorous figure, despite his more than sixty years. I watch him get over the side of the motor boat, throw out the bait left from yesterday's trip, and begin to take down the awning, for it had rained the night before.

While he was working a neighbor came in from hauling his traps and called cross the cove,

'Where're you bound for, Home?'

'Horsing,' was the laconic reply.

Instantly I threw down the magazine that told all about the tuna season at Santa Catalina, grabbed an old hat and sweater, thrust a bit of cracker and cheese into a paper bag which I concealed, and hurried down the bank. Cap'n Wes did not take his eyes from the horizon at my approach.

'It's a lovely morning,' I began.

'Tolerable, but it looks as if a fog might blow in.'

'I can't see the least sign of fog,' I objected.

'Didn't expect you could,' was the reply, 'but I've seen it fair in the morning and a living gale in the afternoon. Besides, I've got the twinges. Storm's coming.'

'Nonsense. You had them the day I went out to the trawls and it was a beautiful day and I enjoyed it very much.'

Cap'n Wes moved uneasily. 'Going further'n that today. Going horsing.'

'Oh, Cap'n,' I begged, 'I should love to see a horse mackerel caught.

Cap'n Wes grumbled, but finally yielded. I made many promises, that I would not mind a blow, that I would not be cold if it turned 'thick o' fog,' that I would not be hot if the breeze died down, that I would not mind if the boat tipped, and (Continued on page 20)

# MR. FORD'S PAGE

UNSEEN and almost unheard a great struggle is going forward in the world, a struggle upon whose issues depend the prosperity and therefore the future liberties of the people. It is a struggle between the industrial and the financial control of business, and business is the supply of necessity and the extension of progress. To put it briefly in question form: Shall finance be the master of industry, or shall it be the servant of industry? Which is more important to the welfare of the nations, that industry be made subservient to dividends, or finance be made subservient to industry?

And yet this overstates it a little, because on the side of industry it is not a question of mastery or control, but of the right to work out economic service on the logic of service alone. The desire for mastery, the conscious effort to maintain control exists on the side of finance. And by finance is not intended that gift of managing money so that it may accomplish public benefit, for that is a service against which there could be no antagonism, a service that would justify itself in the public judgment. Rather is meant that regard for money which elevates it to be the principal product and wealth, that peculiar fallacy which regards money-making as a primary industry in itself, that determination that it shall grow and increase out of itself and become the ruling hierarchy of all human activity.

*A GREAT struggle is going on in the world between the industrial and the financial control of business. Shall finance be the master of industry? A peculiar fallacy exists that money-making is a primary industry in itself which shall grow until it governs all human activities. On the other hand, industry is the subjection of natural forces to the uses of mankind. The right of industry to exist is conditional upon its service to humanity; and the right of finance to exist is conditional upon its service to industry. When money finds its profits in causing idleness or war, or obstruction, it misuses a power which cannot be left in its hands.*

The struggle on the part of industry is largely unconscious. Industry is essentially the subjection of natural forces, the manipulation of natural material, to the uses of mankind. It brings into action the worker, the engineer, the inventor, the type of mind that sees life alleviated by the accomplishment of certain things, and goes forward to that accomplishment with prophetic zest.

Industry is the struggle of man's physically puny forces against the forces of the universe which are set before him to be subdued; the struggle of his need against his ignorance; the struggle of his growing knowledge with the hidden values of the earth which yield up their good secrets only to the individual or the community which has won the right to those secrets by unresting and unselfish application to their sources.

Part of the struggle is within man himself. He must overcome his ignorance of the world in which he lives, his ignorance of the forces that surround him, his ignorance of the manifold combinations which are possible only to knowledge. And then he must overcome his repugnance to labor. Besides this he must overcome his clumsiness by a study of method, by the better management of his labor-motions and his time. All these he is on the high road to overcoming, and still he finds that a continuing obstacle in the way of his achievement is a thing called Money.

The nation itself, which is the creator of money, must halt upon the threshold of every work of vast public benefit and bind itself into debt, must beg its own money from private owners and brokers thereof, must bind itself to pay part of the public part of the benefit in the form of interest to those private owners and brokers, before works of great public benefit can proceed.

That is, money is now seen to be more unyielding than any natural force. It is only natural that men, having found the spirit of service respected, as it were, and assisted by the laws of nature, should turn their minds with new scrutiny upon this thing called Money. That is precisely what is occurring today.

Industry, having overcome all the obstacles found in the region of ideas and material and labor, finds this new obstacle, locked like a tollgate across the road of progress. It is not a question of some men having more money and some having less, it is a question of what burdens rightfully belong to man, in the nature of things, along the line of his quest for life as it may be and as it was meant to be. When this struggle turns upon possessions or personalities, no good results. The matter must be approached from another side.

Obviously this is a condition that cannot last forever. The right of industry to exist is conditioned upon its service to humanity; and the right of finance to exist is conditioned upon its service to industry. The justification of money is that it liberates energies, sets men to work, enables the opening of sources of supply. When it imprisons energies, finds its profits in causing idleness or war, and restricts the opening of sources, it misuses a power which cannot be left in its hands. When it constitutes an additional burden on industry, instead of a coöperative help, it evokes a challenge in whose terms the ultimate result may be read.

The question of the financial or industrial control of business has hardly as yet been put into words. But it is one of the problems which the scientific mind, and social mind, must grapple.

## *For Shame*

THE big-hearted European campaign to shame the United States into canceling the war debts has at last been extended to include the little children. England—declares Philip Snowden—is starving education and charity to pay America. This is an adroit thrust. Education is a fetish in this country, and children always come in for especial consideration. Americans listen respectfully whenever Mr. Snowden speaks. They realize that as former Chancellor of the British Exchequer he is well versed in the intricacies of finance. They realize that he is one of the brightest lights of the Labor Party. They realize that he probably has what he considers the best interests of his country at heart. Realizing all these things, they wonder why he does not continue his sad tale of the plight of England's children to its logical conclusion. They wonder why he fails to add that, while the British people can spend only $410,000,000 a year on education, on liquor they spend $1,580,000,000!

## *Your Dollars Are Needed*

THIS is typical of the current anti-prohibition propaganda. It is from a half-page newspaper advertisement of the Association Against the Prohibition Amendment:

> PROHIBITION HAS FAILED. When will the prohibitory laws be repealed? Don't be fooled by absurd statements that the Volstead Law cannot be repealed or modified. They are mere Anti-Saloon League propaganda. Just as soon as there is a liberal majority of ONE man in Congress, the Volstead Law will be repealed . . . Your dollars are bullets in this fight. We need them to organize the millions of voters who want to register their protest against the Anti-Saloon League politicians and elect liberal representatives and have the laws repealed.

The fact that prohibition can be repealed by one vote will be news to millions of citizens who believe in the Constitution of the United States. The Constitution declares: 'After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited.' Any bill which should attempt to legalize the sale of intoxicating liquors in America would promptly—and rightly—be declared unconstitutional by the Supreme Court. The Volstead Law is not prohibition. It is merely an enabling act to carry into effect a provision of the Constitution. The 'prohibitory laws' will be repealed only at such time as the 18th Amendment is revoked; and that can come about through a two-thirds majority in each house of Congress and a majority in three-fourths of the state legislatures.

*Your* dollars and thousands of others will be sorely needed if this ever comes to pass. A great many voters will have to be 'organized'—possibly as they were in Pennsylvania—before the wet Utopia is realized.

## *The County Fair*

THE harvest moon, yellow as a new cheese, rides high in the heavens. The sun sinks in shrouded majesty, lighting a canopy of clouds banked in the west. A haunting mist softens the lines of the high-board fence, the grand stand and the judge's stand at the race track. The twin lights of hundreds of automobiles are gently blurred like stars beneath a filmy cloud. The evening breeze wafts the scent of new-cut corn across the country. All is in readiness for tomorrow's county fair. For weeks the children and their parents have been looking forward to the event. The women folk have been canning fruit and making pickles for the exhibit. The men have fed and groomed the colt, the calf and the shorthorn. Tomorrow is the big day. In the households and in the fields and barns careful preparations have been made for the scheduled competitive events. Here, also, will be a great open forum for the discussion of the issues which interest the farmer folk. The astute campaigner for county office will be bustling about with the proverbial box of cigars under one arm, the other free to lift little Johnny Jones and his sister to his knee the while he praises them to their parents. Properly done this means two votes and maybe more. The displays in the agricultural hall are properly arranged, as well as the exhibits of new machinery and other mechanical devices. The county fair is a great institution. Long may it live.

## *Dictators and the Dictated*

OF ALL the dictators in the Old World, Mustapha Kemal Pasha is by all odds the most successful in suppressing members of the opposition. He orders them shot. His logic is unimpeachable, and his methods no doubt commend themselves to the other dictators. That the methods are not more generally adopted is to their credit, for Kemal's logic is the ultimate logic of all dictators. It is the logic of absoluteness.

A dictatorship is of itself absolute. It is the concentration of all power into the hands of one man. It is a reversion to the days of absolute monarchy. Dictators differ little in their methods of operation, and not at all in their attitude. They are supreme; and the will of the individual and the will of the people as a whole are to be ignored. The theory of their right to govern is the theory of might over right.

The rise of dictatorships in Europe has been heralded as evidence of the failure of democracy. It is, of course, nothing of the kind. The people now under dictators have been accustomed to the iron hand of an absolute ruler for centuries. It cannot be said that democracy has failed where it has been given no fair trial. Democracy has followed the sweep of the great Anglo-Saxon racial stream, and it is in the countries most affected by this stream that democracy is strongest today. The real significance of the present dictatorships—from the American standpoint—is that they exist in those countries whose quotas have been most sharply curtailed under our new immigration policy. The people now under dictatorships have only a vague conception of democracy as it exists in America. They are the ones who have proved least assimilable here, for they are the ones who least understand American institutions.

## *The Value of Vision*

GREAT accomplishments come only from great action; but great action comes only through the drive of a great vision. Not every man of vision can translate his dreams to action, nor can every man of action dream dreams. The visionary man may be a poet or a preacher; the other a contractor or a maker of the world's soap.

The great industries of this recent world have been builded by men of dreams who, by the drive of the dream, have taught themselves to become great executives and administrators of business, not as a means of getting gain or acquiring wealth but as a necessary pathway to making their dreams and visions come true. The man with a vision is the man to be watched and encouraged in your community, rather than your banker or greatest merchant. These can keep things as they are in your local business and build up in the ordinary way of things only.

The youngster who is now knocking at the gates of your town with a vision of some new thing is the one who can make things over, change a village to a world center, or a crossroads to a metropolis. The future of this our country lies in those men who now have visions and are already striving for their fulfillment.

## *School Again*

TOO many of us are inclined to look upon the opening of school as a welcome relief from responsibility in the care of children. There's danger in that point of view. We cannot depute the training of our children to strangers. Nor will anything take the place of home training. The school atmosphere is one thing, the home atmosphere, quite another. It is in the home, and by the parents, that character is formed. The old-fashioned virtues of truthfulness, perseverance, honesty, unselfishness—these cannot be inculcated alone in the classroom. Nor can the mere reading of books turn out upright men and women. Discipline makes the man, honor makes the gentleman. But it is in the home that habits of discipline are formed. And a sense of honor grows in the family circle. School is the agency by which learning is attained, but home is the place where character is made.

## *The Pathway Toward Truth*

THE time is past when one needs to design his future on opinions. We are living in days of facts. In the old days engineers built their pet ideas and tried them out; ran them and broke them, fixed them up and ran them again, until the old machine got so that it would keep going. This was the school of cut-and-try and lasted until some twenty years ago.

Now we have facts. We know steels, and can calculate diameters and wearing areas; we have heat-treating accuracy and can foretell strengths. We know of the flow of gases, and the action of electricity and we design by fact for fact. Cut-and-try is now necessary only in those new parts which vision ahead a little beyond the point where facts have gone, but even in these fields the paths are clear.

And so with one's future. The arts and sciences, the laws of living, these and more are available for those who would study the progress of science—the pathway of mankind toward truth and a knowledge that will set all men free.

## *Being the Story of a* Party *of* Young Men *from* Michigan *in* Their Search *for* Fortune *in* California *in* 1850-1851

SET DOWN FROM THEIR DIARY

*By* MARY PHELPS

IT WAS a rough looking party that rode into Hangtown, Placerville, Eldorado County, California, one hot day in August, 1850—very different from that which, freshly fitted out, had left our homes in Michigan the eighteenth of March. Looking down into the river beds between the ravines, we got our first glimpse of the 'diggings.' The distant camps on the hillsides or little open flats were comprised of tents or rough log and bark structures. Crossing Weaver's Creek we followed it down in the trail of the covered wagon.

Taking a narrow trail over which a wagon could not go, we had arrived some days earlier than others of our company. We had made the journey in less than the average time. One hundred days from the Missouri River was our record. But we were to be congratulated still more upon the fact that we had not fallen victims to disease. One man had deserted coming across the plains. One horse had died from eating 'crazy grass.'

Before crossing the steep Sierras, we had abandoned our wagon, using parts of it to make pack saddles for horses too poor to drag a vehicle. We had managed to hold on to the bulk of our outfit—even the little box-stove and the frying pan which had served us so well.

We were unshaven and dirty. But our appearance troubled us little; we found plenty more of the 'Great Unwashed.' What did give us some worry was the problem of food. The thought of bacon and jerked beef was repellent. Nature demanded fresh fruits and vegetables.

Having had a square meal, we turned our attention to our starved animals and found pasture for the four of them. (One had been stolen the night we unpacked. He returned to us three weeks later with stake attached and branded by a white man as we could see.) The first week, after providing the necessary implements, a rocker, picks and spades, we began to prospect around the immediate region. The pan we used had been brought from Michigan.

When a spot seemed rich, we would stake out our claims of sixteen feet square up and down the stream and reaching back to the ridge, with the restriction that holdings should not be made within fifteen feet of one another. Each camp, however, had its own laws. No person could hold more than one claim at a time.

The work at first was hard and disappointing. Wielding the pick and shovel in gravel and boulder streams, standing sometimes to the waist in the cold mountain water with the southern sun beating on the head was none too easy, even for men like ourselves inured to physical labor on

pioneer farms. Small wonder that those unaccustomed to hand labor early threw up the job in disgust, and went into business in the towns or returned home.

The hardiest remained to mine and universally they overworked.

We worked up our strength slowly. We knew what clearing a farm in the Middle West was—felling trees, burning stumps, picking up stones and plowing through roots—but we discovered that digging gold was quite as difficult. Conditions were trying and returns small at first. Working on an average of half a day, we made about five dollars a day each.

ON WEAVER'S Creek there were perhaps a dozen log houses plastered with mud. The majority of the miners lived in rough huts thrown together for temporary residence. The usual dress of a miner consisted of a red flannel shirt and deerskin trousers, with rubber boots. Early each morning we would start hopefully off up the creek, shouldering pick, shovel and bar, and at noon return for 'grub' with faces plastered with mud, carrying perhaps a third of an ounce of gold. (An ounce of gold dust was worth sixteen dollars.)

Ten days after we got to Hangtown, one of our party was sent to Sacramento for the mail and provisions. On the way, he picked up the horses we had put out to pasture. I never saw horses gain in so short a time as they did. He sold his mare for eighty dollars and brought back two loads of miners' supplies and food. We set up a trading post and made big profits. Business was so good that we did a regular route trucking which netted us about $100 a week. With the extra tips for mailing letters (twenty-five cents) and delivering (one dollar) we were well satisfied with our enterprise.

Prices were on a war-time scale. Life was happy-go-lucky. Every fellow for himself and the devil take the hindmost. California became a state a few days after we arrived, but there was little change in the wild and lawless régime of the Spanish rule. Public opinion was the great controlling force that kept a semblance of law and order. Infringement of the ethical standard brought quick punishment. The name of 'Hangtown' was fastened to this section of the gold fields by the fact that two men had been strung up to the same tree. The story of their trial gives a good illustration of the exercise of California justice in the middle of the 19th Century.

Lopez, a gambler, after retiring at night with his winnings, left, as was customary, the door unlocked. About midnight, five men rushed in. One put a pistol to Lopez' head, the others barred the door and rifled the trunk. There was a sudden alarm. The citizens rushed to the spot and arrested the robbers. A jury was quickly impaneled. The judge or alcalde, as he was called, was summoned. As the mob became more incensed, other charges were brought against the prisoners. The jury demanded that thirty-nine lashes be given each offender. Finally, the judge put the question whether they should be found guilty. The answer was a unanimous 'Aye.'

'What punishment?' he asked.

'Hang them,' was the reply.

Thereupon, the two men found to be the ringleaders of the gang were taken in a wagon to a nearby tree, nooses put about their necks, and they were left to hang. Such was the swift process of law in '49. With the influx of the Anglo-Saxon with his ideals of law and order, a new legal code was evolved from men's consciences.

The august 'court' occasionally presented a comedy piece. On one occasion, the honorable judge assumed an unconventional attitude in his swivel chair, feet on desk. For relaxation, he whittled a stick and now and then tested his skill in sending tobacco juice across the room. A lawyer in the case, evidently with some knowledge of Roman history, referred to the august alcalde as an 'oscillating Tarquin.' This unfamiliar but libelous-sounding accusation brought down the judge's chair with a thump.

'A what?' And without waiting for explanation he proceeded to pronounce anathema upon the head of the offending attorney. 'If this honorable court knows herself—and she thinks she do—that remark is an insult to this honorable court and you are fined two ounces.' To the expostulation against such extreme penalty, the judge replied, 'Silence, Sir! This honorable court won't tolerate cussings and she never goes back on her decisions.'

The sentence was executed without appeal.

Gold was hard digging on Weaver's Creek. The horde of miners coming in constantly made the output steadily less. A wagon road had been built from Hangtown along the Creek. Whenever a company heard of a ravine being opened up, they all swarmed to it and in a few days it was dug dry.

After about six weeks' tryout on Weaver's, we decided to go into winter quarters on Dry Creek, and struck camp below Fiddle Town. We had been told that by the middle of December the rainy season would set in, making the rivers and creeks rise and preventing any very successful mining. Many of the men then moved into towns, for amusement or to find other employment.

This was the harvest time for the towns. Every day was Sunday then. Sacramento presented a lively scene. Sports occupied the *(Continued on page 21)*

## Strange Scenes *on the* Banks *of the* Ganges, India's Sacred Stream

*By* WILLIAM E. BARTON

BENARES is so holy a place that even you, though a Christian, will go to heaven if you die while you are there. A million Hindu pilgrims annually visit this city. Besides visiting the many sacred spots within the city, the pilgrim must make the circuit of the Punch Cosi road, thirty-six and one-fourth miles around. This journey requires six days for the faithful, but the American pilgrim may do it in a fraction of the afternoon, and see the palace of the Maharajah and the Durga Temple, and Sarnath, where Buddha preached, all in an afternoon, and still have time to see the snake-charmers in the hot middle of the day before the tour starts, and yawn through the first four or five hours of a nautch dance in the evening, if he is foolish enough to stay so long.

The long cloisters of the hotel are a series of temporary bazaars, where one may buy brocade and brass work and very much besides. The snake-charmers afford brief interest, for one sees them everywhere in India. How they do it, I do not know, but they handle the deadly cobra and other wicked-looking serpents with impunity, playing their bulbed-pipes at intervals and never failing to beg for coin.

Five o'clock in the morning is the hour to rise if one wishes to be at the Ganges at sunrise. Any hour of the day will answer, but the early morning is preferable. The best way to see the bathing is to rent a boat, and view the river from the upper deck, while the boatmen slowly row along the sacred shore.

I do not know another city that presents so impressive a view from the waterfront as does Benares. It is solidly built up with temples and palaces, many of the latter having been erected by rich men as votive offerings, and they are occupied in part at least by persons who hope to die on the banks of the Ganges. The river has here and there undercut a temple, and there are several structures that have fallen down the bank, but in the main the buildings are imposing and create an unexpectedly pleasant impression.

The sacred side of the river is that on which the city is built. That is to say, while the river is everywhere sacred, and everything touching it is in some degree sanctified thereby, the city side of the stream is incomparably more sacred than the other. One of the guides attempted to put it into commercial form for our benefit. He said, 'On the other side of the Ganges one may buy for six rupees land which on the holy side he could not buy for six thousand rupees.' We could understand the difference, though with us it is not usually religion that makes the difference in price.

A ghat is a place of descent, a flight of steps. It is a landing place for your boat or a series of stairs down to anything. The bathing ghats at Benares are made necessary by the different levels of the Ganges in different seasons. I saw a registered high-water mark, and I should think it not less than sixty feet above the level of the river as I saw it. At whatever stage, the bather stands on a stone step for his ablutions. He must bathe daily in the river before he eats. He throws water upward thrice, takes water into his mouth, scrubs his teeth with his thumb, and vigorously washes his lips. Repeatedly he submerges his whole body. It is good, honest bathing. He washes his garments, also, and beats them against the stone steps, and spreads them out to dry in the hot sun.

A vast majority of the bathers are men, but there are many women, especially widows. Being responsible for the death of their husbands, and being forbidden to remarry, even though they were but little girls when the boys to whom they were betrothed died, they must bathe in the Ganges daily, and perform many humble tasks if they hope for immortality. The way they treat widows in India is lamentable, but having seen something of the conduct of some American widows on shipboard, I am of the opinion that there is something to be said for the method they employ in India.

'And his cheerful widow mourned him
Five lonely months at most,'

wrote Mr. Kipling. It happened in India, but it was not an Indian widow about whom he was talking.

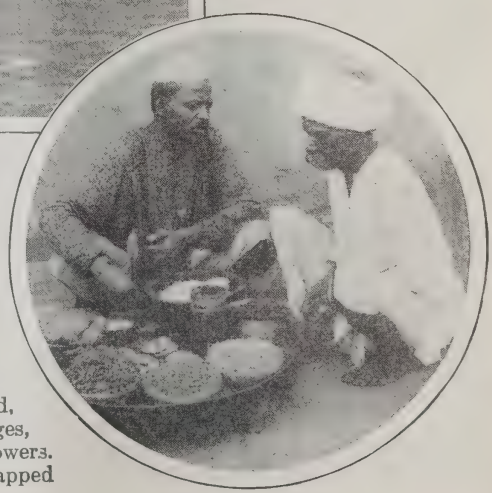
Except that the widows occupy specially designated floats, there appears little segregation of the sexes in the bathing at Benares. There were twenty men bathers to every woman, but the women did not keep strictly to quarters of their own. The bathing is most modestly done. The men who bathe are naked except for their loin cloths, but not more naked than thousands of men appear on the streets, and they can change their loin cloths after bathing, and put on dry ones if they care to do so, which few of them

do. As for a woman, who enters the water quite fully clad, she can change her dress, if she wishes, in the presence of all the world, and do it with a graceful modesty worthy of all commendation.

I have heard all my life how dirty the Ganges was, how full it was of dead bodies and of sewage. The people did not seem to mind the sewers, some of which empty close to the bathing ghats. I saw one dead human body, floating down the river into which it had been thrown. Dead cows, also, are thrown in. But the Ganges is not a dirty stream. I asked an intelligent native Indian, a Mohammedan, why it was that epidemics were not traceable to the use of Ganges water by the people of India. He said that the Ganges comes out of the hills heavily charged with lime, and that it flows through beds of sand, and is remarkably pure. The waterworks of Benares takes the water from the Ganges. The natives who at first rebelled against this prostitution of the holy stream have accommodated themselves to the situation and use it freely, for it still is Ganges water. But the military authorities and those who represent the civil government do not find it very bad water. It is filtered and used freely by the British cantonment. Boiled and filtered again at the hotel, as we suppose and hope, we used it freely and it was good. The Hindu use of the Ganges for daily bathing has much to commend it, and the sight of it is much more pleasant and impressive than I had supposed.

A Hindu can ask for nothing better than that he die on the banks of the Ganges. When a Hindu is about to die, he is sometimes removed to the bank of the river. Now and then he recovers, and I am told that he has some difficulty in making his peace with his family thereafter. He remains an outcast for several days, being ceremonially unclean, and he resumes his place in society apologetically for not having died when he had such a good chance.

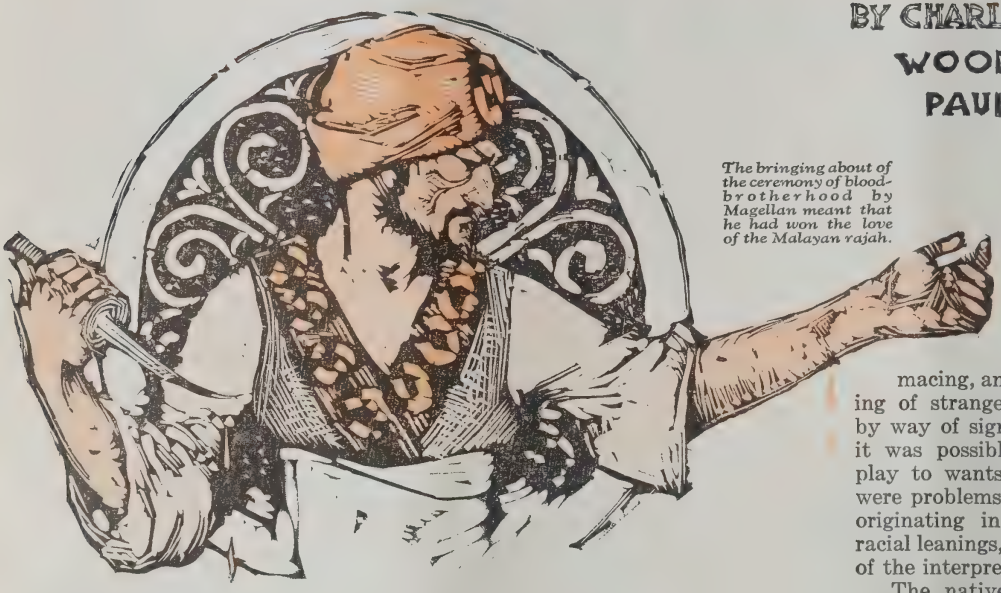
Mohammedans and Buddhists bury their dead, but the Hindu burns his deceased on the banks of the Ganges. As we approached the river we passed one or two dead bodies, each borne on a litter by two men and carried to the river. Arrived there, the body is laid down on the ground in any convenient place, whether in sun or shade, and left unguarded while wood is purchased. The dealers in wood do not hesitiate to demand of the mourners an extortionate price. The corpse may wait some time in the sun before a bargain is made. Seven or eight logs about five feet long and five or six inches thick at the larger end are necessary for complete incineration, with about as many pieces half as long to be laid across. If a man is rich, his funeral pyre is of sandalwood, and even the poor try to afford a little piece of it. In some cases the amount of wood is inadequate and the fire must not be rekindled. When the wood has been purchased, the body is dipped in the Ganges, and then it may be decked with flowers. If the deceased is a man, he is wrapped in white as he comes to the river; a woman is wrapped in red.



There is a last prayer by a Hindu priest; the friends, if present, are supposed to circle seven times around the body, and the fire is lighted by the professional cremators. One rather shocking piece of the ritual is the crushing of the skull. One of the undertakers, as the fire begins, thrusts with a long bamboo pole, shod at the end with iron, and breaks in the skull of the deceased. I asked many persons why this was done, and received three answers. The first was that the skull being the least combustible part of the body, and one which the friends would least like to have carried away, is thus more completely assured of combustion. The second, that by this breaking of the cranium the spirit is given release. The third was, 'It is an ancient custom.'

Not always is the wood sufficient, and there are persons waiting to explore the ashes for the coin which is supposed to have been put in the mouth of each person burned. The ashes, with any unconsumed parts of the body, are pushed into the river, and men are soon at work with sieves bringing up for sale and domestic use the coals that still have fuel value. The feet of the dead person are toward the river and extend out beyond the wood. Sometimes the combustion is far from being complete, but the Ganges takes whatever is given to it, and does not often cast it up on shore again. When the river does refuse a dead body, no one covets it, or willingly assumes the task of caring for it.

The temples of Benares are not attractive and there is sad ignorance and gross idolatry. Not a cheerful place.



*Dipping the dead body of a Hindu into the sacred waters of the Ganges, prior to burning on the pyre which may be seen in the background. Circle, above—Hindu fakir of Benares, handling one of the deadly cobra snakes. Circle, below—'Wallah,' or street vender, who sells a large variety of things to eat.*

# The Voyage of the Victoria

BY CHARLES J. FINGER
WOODCUTS BY PAUL HONORÉ

*The bringing about of the ceremony of blood-brotherhood by Magellan meant that he had won the love of the Malayan rajah.*

## DEATH *of* MAGELLAN

*Eleventh of a Series*

AT LAST, in spite of everything, trampling and pushing those who stood in the way, going through incredible difficulties, fighting secret operators, mastering those who were intriguing and plotting, meeting hostility, Magellan had brought his ships to the edge of that land of wonders and incredible richness. If Magellan's determination to reach the Spiceries, formed in 1507, came about through the hearing of Varthema's story, the least we can say of him, in spite of all his shortcomings and violences, is that he was of heroic mold.

And with his adventure on the eve of completion the conqueror suddenly became a servitor to his men, one deserving admiration and respect, doing what he could to bring strength and cheerfulness to those about him. We see him choosing an anchorage at Malhou, full of sympathy for those who had suffered on his account and for his ambition, treating his men as honored partners in his enterprise. For the island was uninhabited and it became a hospital and a resting place. In the same unflinching and steady manner in which he had kept his course, he set himself to work to tend his sick, the past thrust aside as a disagreeable incident. He was a Sir Launcelot proffering service, strangely lovable, gentle, sweet-tempered.

Before Magellan and his men had been many days on the island they had visitors, for a prau from the island of Sululand arrived. There were no confused purposes or ugly violences, and things went very well, with expressions of good will everywhere. The natives were presented with looking glasses and colored cloths and red caps, and gave in return fish, oranges, palm wine, 'figs a foot long and cocchi,' says Pigafetta, evidently meaning bananas and coconuts. If selfishness and covetousness were present at all, they were well hidden, so a kind of friendship was established, in spite of the fact that trade and exchange were carried on with very flexible notions of values. But the explorers dreamed dreams when another prau came, a few days later, for not only were there spices on board, but a chief wore bracelets and earrings of gold.

The fleet left Malhou, Monday, March 28, 1521, and the course was held past Leyte and to the island of Limassaus, and there a man of no particular importance became very central. It was Enrique of Malacca, Magellan's slave.* For some natives coming within hailing distance, Enrique found that he understood them and they understood him, so he immediately rose to importance as an interpreter. So things went smoother after that, men being no longer constrained to the waving of arms, and grimacing, and shouting, and the making of strange noises and contortions by way of sign language. But though it was possible to give less impeded play to wants and desires, still there were problems, some of them certainly originating in the eagerness, or the racial leanings, or the private ambitions of the interpreter, but of that later.

The natives had seen white men before, those who had come from the west, and they knew much of the wild ambitions of traders, so were timid and suspicious. Nor did the labored explanations of Enrique altogether satisfy them. However, overtures became possible presently, the white men loading a piece of timber with trifles calculated to please the savage soul, then turning it adrift. That was the thin end of the wedge and it resulted in a visit from the chief a little later, so that a conversation, with Enrique as interpreter, took place. The next day there was a kind of *entente cordiale*, when a rajah came on board and was dressed by Magellan in a gaudy red hat and robe, and the visit ended with a feast, at the close of which the ceremony of blood-brotherhood was gone through.

The bringing about of that ceremony was in one way a master-stroke on Magellan's part. It meant that he had won the love of the rajah, and, therefore, of the people the rajah ruled, for the Malayan rajah is held to possess something very like supernatural powers, and is supposed to be able to exercise some mysterious influence over the weather and the growing crops. Because of the transfusion of blood from the veins of Magellan to the veins of the rajah, and the other way about, a sympathetic nexus was established between the admiral and everyone in that particular tribe, and the enemies of that tribe became the enemies of Magellan.

Pigafetta, whose record we depend upon, missed tremendous things while

* Magellan had bought a man and a woman slave when in the Indian service, and had them with him when he appeared before the *Sasa de Contratacion* in Spain. As Enrique presently came to land he was familiar with, he, a Malayan, was actually the first individual to voyage round the world.

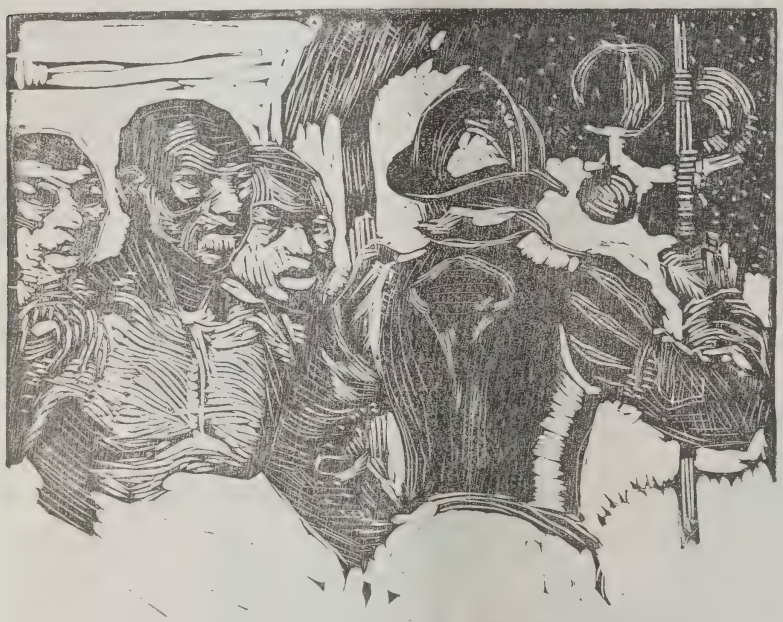
among those people. Of their wonderful folklore he was ignorant. Of their art he says nothing. He did not interest himself in their legends. But he gives a very full account of a feast at which he sat with two of the ships' officers, and how, on Good Friday, he ate very heartily of roast pork and fish and rice, with so much wine that the officers were intoxicated. He records with delight that he slept in the 'palace' which was 'like a hay loft or rick on four beams, covered with banana leaves.' So we figure the native feast with all there sitting on cane mats, 'cross-legged like tailors on a bench,' all eating tremendously, bridging vast silences with signs of admiration, making gestures, then at night, when the chief, tired of it all, put an end to things by 'making a sign that he desired to retire to rest.' Pigafetta admired the cane mats used by way of beds, the 'cushions stuffed with straw for pillows, and the candles made of the gum of a certain tree called anime wrapped in leaves of banana.'

Then on Easter Sunday, anniversary of that mad business in St. Julian, the rajahs and their friends were aboard the *Trinidad*, kissing the cross and following all the outward forms of worship just as Pigafetta the day before had imitated the gestures of his hosts. Magellan marched his soldier-sailors about the deck, fired off an iron cannon, dined and wined the natives, and, at the end, gave them a 'thorn-crowned cross' which they promised to set up on a hill.

All that civility and decency did not last long. The lust of conquest had to have effect. Military dominance became paramount and that mercy and gentleness and wholesome fellowship which the cross symbolized was thrust into the background. Magellan had accepted blood-brotherhood, and his alliance with the rajah's people necessarily involved enmity with the rajah's enemies. So Magellan put the questions. 'Were there difficulties? Was the rajah at war with other nations?' And 'the king made reply,' says Pigafetta, 'that there were two islands with which he was at war, but that it was not the best time to proceed against them.' And Magellan made the reply that 'he would return and bring enough men to conquer all these countries.' Meanwhile, to show good will, he placed at the rajah's disposal men of the fleet to gather in the rice harvest, and the conference ended with the 'kings' so 'intoxicated and ill because they had eaten and drunk so much, that they slept the whole of the next day and none were so bold as to disturb them.' When the fleet sailed, the rajah accompanied it, as pilot, in his prau.

So Magellan was plunged into local politics, and a few days later matters were made worse. At Sebu there were trading activities, but not without early friction. Magellan, like many another who enters new lands, overlooked the fact that while the savage mind may appear childish when confronted with the material things of another civilization, it produces leaders who are quite as superficially clever, quite as narrowly self-assertive, quite as able to proceed consciously and skilfully and deviously to a certain goal as those who would outwit them. So the sultan of Sebu, who pretended to a greater authority than he possessed, asked for tribute before trading commenced, nor would he budge in favor of the Europeans until a Siamese merchant who was on the island and who knew something of the habits of the white men, and of their hunger for spoil, advised conciliatory measures. Then the chief adopted other tactics, proposing a trade monopoly to the Spaniards in return for the support of arms against his enemies. That led to a second ceremony of blood-brotherhood and further involvement in tribal affairs.

But the rights of the de Haros and the Fuggers were not forgotten. A storehouse and trading station were built, articles of barter were displayed, and pikemen and swordsmen acted as storekeepers. Again there were peculiar and flexible notions of value. For fourteen pounds' weight of rusty iron, the equivalent of thirty-five dollars in gold was exacted, and much worthless trash was exchanged for necessities.



*Magellan gave the order to retreat; then a knot of men rushed at him.*

Meantime there was a certain amount of unauthorized fraternizing among sailors and natives. Jack was ashore, and that implied much. Duarte Barbosa, the captain, disappeared, and was absent for a few days living with the natives, an example not conducive to usefulness and activity among the men. He had been guilty of similar conduct while the ships were at anchor in Brazil. There were other irregular unions. But devoted workers in another cause were not wanting, and the priest, Pedro de Valderrama, was active, baptizing, it is said, some twenty-two hundred. To the rajah's wife he presented a carved figure of the Virgin and Child, which was found, fifty-five years later, by the explorer Miguel Lopez de Lagaspe, when it was regarded

by the natives as Bugaw, the perfect woman of the Ifuaga mythology.

Now the sultan of Sulu had professed mastery over a vast extent of country, and his claims were in extent of the facts. There was a kind of native George Washington who denied the overlordship claim of the Sulu king, who considered himself the superior and not the inferior of the monarch, and who was irreconcilibly set upon proclaiming his independence. Against that, the only crushing argument was force, so there was a punitive expedition, the Spaniards burning a village and killing a few natives who probably had not the slightest interest in the quarrels of their masters. Force begot force; intrigue bred intrigue.

*There were trading activities. Magellan overlooked the fact that the savage leaders were as able to proceed to a certain goal as those who would outwit them.*

A few days later there came to the fleet another chief bearing gifts, and through the interpreter he explained that while a more valuable token of esteem and homage was due, it was not forthcoming because of fear of Silapulapu, the revolted chief, whose village had been burned. But, he declared, he stood ready to deliver Silapulapu into the hands of the Spaniards and help to crush a pending revolt, if Magellan would send a small force ashore and take action.

There were those who protested vigorously against any such interference in native affairs. Serrao saw no reason why the white men should exhaust themselves in little skirmishes. He argued that men became more valuable every day because of the frequent deaths from disease, and pointed out the absurdity of risking lives, advocating abstention from participation in tribal entanglements. The Sulu king wanted to throw a thousand men into the fight, so that natives might bear the brunt of the affair.

But Magellan was obstinate. Perhaps it was a case of the lofty enthusiasm of a madman. At any rate he declared that he would lead the punitive expedition himself, and refused the help of his ally the Sulu king. That it was an adventure so ridiculous that no disciplined officer would think of it, did not occur to him. He was obviously at a point where he did not discriminate between that true valor which includes caution, and most reckless adventuring with the lives of those under him held lightly. Perhaps because he had enjoyed the sweets of victory but had never tasted the bitter of defeat he had come to think of himself as the favorite of Fate. Whatever the springs of action were, he was all for immediate action. He would, he said, take sixty men in three boats and make a test of strength.

Midnight of April 26, 1521, found the fleet anchored off the island of Mactan, and at gray dawn the boats were launched and manned for the attack. But not all the sixty landed. Twelve were detailed to stay with the boats, off-shore, and forty-eight, with Magellan, stepped over the sides and waded ashore. No sooner had they set foot on the beach than down from the jungle came a cloud of natives, a thousand or more strong, throwing their bone-tipped spears at the invaders. Then came stones in volleys, and in spite of their corselets, many of the men were wounded and bruised, and some lamed. So the bowmen fired a volley and seemed to win a little advantage, for the natives took to the jungle, though a few warriors stood a little way off, avoiding the arrows by leaping aside, sometimes indeed catching the almost spent shafts as I have seen natives of Tierra del Fuego do, and as Cunninghame Graham says some of the northern South American natives were accustomed to do.*

Soon Pigafetta was out of commission with a lance in his cheek; then the *Victoria's* gunner fell. Dividing the attacking party into two bodies, Magellan sent one of them up the beach to fire the village, a thing of dry reeds and leaves, and in a couple of minutes smoke and flame leaped against the sky and thirty of the huts were ablaze. At that, out of the jungle came a cloud of savages, and Magellan gave the order to retreat, but it was rather a huddled flight, men blundering into one another, each for himself. Here and there one or two made a stand, but half a dozen natives were at their throats in an instant. A savage thrust a spear in Magellan's face and he drove his lance through his attacker's chest. Then a knot of men rushed at him, and, as those in the boats saw it, he tried to unsheath his sword, but a second spear took him in the arm and he went down.

Pigafetta gives a more circumstantial account, though a wounded man flying for his life could hardly have been an impassioned spectator, and what he wrote was doubtless reconstructed long after. He says: 'The enemy rushed at him, one of them with a large *terzado*, like a scimitar, gave him a heavy blow on the left leg which caused him to fall forward on his face. Then the Indians threw themselves on him with iron-pointed bamboo spears and scimitars, and every weapon they had, and ran him through—our mirror, our light, our comforter, our true guide—until they killed him.'

Seven men died in that skirmish, which has been called the Battle of Mactan, but was a pitiful and needless squabble which could have accomplished nothing had the victory gone the other way. The whole affair was incredibly silly and meaningless. So Magellan's name stands neither as subject for eulogy nor for execration. He seems all through to have regarded the fleet and the men in the light of his own personal appanage. He was possessed of indomitable endurance, it is true, but as executive he was visibly flawed, and no sounding rhetoric can make us forget his unlovely aspects. We must set aside whimsical speculations as to what he intended to do and what was his aim. What we see is a man with a fixed idea, self-willed, regardless of the rights of others, a man of blood and iron who dared in a way to excite the admirations of men, and in daring depended upon brute force and strength of will. But he was without that admired quality of honor which wins without violence and meanness.

* To catch an arrow may seem an almost impossible feat, until one comes to think that a ball player will stop a ball speeding quite as swiftly. An arrow at the beginning of its flight is out of the question, of course.

# The Pardoning Power

(*Concluded from page 4*)

ous charge. This man proved to be one of the most exemplary convicts in the penitentiary.

In exercising the pardoning power I made it a point never to give publicity to the refusal on my part of any applications for pardons. In following this course I was actuated by the knowledge that such notoriety would react harmfully on the convict whose application had been denied, and on other convicts also.

By publishing only the pardons which were granted and withholding all information about those that had been denied, the spirit of hope was fostered and it became much easier for prison authorities to control the convicts who shared the view that if one man was granted a pardon another might be. Living up to this hope their prison records improved.

I was also guided by the principle that penalties are prescribed more as a deterrent than as a punishment. To place a person in prison makes him a slave of the state until he has paid the penalty

# Cashing in on the 'Blue Sky'

(*Continued from page 2*)

republished this as a joke—and as a warning. *Actually, several hundred dollars had to be returned to those who had sent it in good faith to purchase stock in this venture!*

This 'Blue Sky' business takes a billion dollars a year out of the hands of its rightful owners in this country.

DID you ever stop to think what happens to the community when John Jones puts even $1,000 into some 'Blue Sky' proposition and loses it?

The Joneses don't build the planned sleeping porch, or don't paint the house this year, or don't buy the new car, or they go without needed new plumbing or a new furnace or that extra bathroom—or do without the new vacuum cleaner or the new rug and new furniture for the living room—or father gets along another year with the old overcoat—or maybe has to drop some of his life insurance. Or, what is even worse, the family makes some unusual expenditures because of expected profits—which do not materialize.

Ours is a very complex social structure. There's no knowing how long a string of folks may be badly affected by this one loss, and, with the American credit system what it is, a number of them in one town have been known to cripple the whole community.

Big multi-engined airplanes are being built in different countries by responsible companies and here the high-pressure promoter figures by taking advantage of the publicity received in these legitimate enterprises. After being given the cold shoulder in several cities, one company finally located in an eastern town, leased a vacant factory and started a house-to-house canvass to sell its stock. *The factory held only the desks of stock salesmen.*

Investigators sought the head of the concern in New York to learn something of his company's history, plans and financial standing—and were met with the profane refusal to give any information. Despite this, his stock was actually being sold in the eastern town that day; and the chamber of commerce there was impelled to issue a statement to the effect that, though the inventor might be all that was claimed for him, this stock was a purely speculative proposition.

In their rather elaborate selling kit was an open letter to President Coolidge written by one of them detailing the accomplishments of the head of the company and urging that his remarkable talents be taken advantage of by the United States Government. This seems to have made quite an impression on some of the salesmen's prospects.

Unfortunately, there are many sincere folk who do not realize that such a letter means nothing—that the humblest of us is quite at liberty to address a communication to the President, couched in proper terms, on any subject under the sun which is suited to such an epistle—and give it to the newspapers as an open letter if we see fit, or print it for private distribution. More, we may even send it to him if we choose; that doesn't mean he will ever see it, or would heed it if he did.

It is highly advisable, then, that keenness of mind be not diverted by any such ruse. Anyone solicited to buy stock in any aëronautical project should insist on knowing who the officers of the company are and what they have done, where is its plant, how much actual work has been done there and what is its exact financial condition before signing a paper or making a promise. Further—ask your banker or some other competent authority whether there is a market for this stock if one wished to sell, and whether a bank would loan money on it.

Here is a typical 'Blue Sky' tale.

'Mother, we've struck it rich this time!' exclaimed Dr. John Jones—which is very far from his real name—to his aged wife in their comfortable home in the New Jersey town to which they had retired when Dr. Jones gave up his practice in Atlantic City.

The smooth young salesman of Florida land had just left.

The earliest dentist in the coast resort city, and proprietor of its first drug store, the doctor had given his adult lifetime to caring for others, and had acquired a competence upon which he and his wife could depend in their declining years.

'You know, dear,' the doctor continued, 'the Samuel L. Edwards Company'—which is a fictitious name—'pays $12,000 for that Boardwalk store for only three months. They're doing a tremendous business.

'THEY have 17,000 acres in one tract at Florentia Gardens, Florida, and 22,000 acres in another tract. Florentia Gardens is close to the town of Florentia and right on the Dixie Highway from the Gulf to the Coast. Then they also have 28,000 acres at Lake Homo.

'I was going into their Greenwood-by-the-Sea development, but now I'm going into Florentia Gardens. The land there is 61 to 67 feet above sea level; they have their town site drained already, and arrangements are under way for the drainage of the whole property. They've got three miles and a half of sidewalks down now, and a half-mile of hard-surfaced roadway. Quite a number of persons have built houses there so soon. And prices are going right up. Why, they're selling lots now for what they paid an acre for the property only a few months ago!

'It's a wonderful chance,' said the old dentist, growing more and more enthusiastic. 'It's the opportunity of a lifetime! I was going to take 137 acres, but it looks too good to me to be a piker, Mother. I'm going to take a full square mile, 740 acres. [They told him that, not 640 acres, as it should be.] It will cost me $118,400—'

'That's a lot of money, dear,' interposed Mrs. Jones.

'Of course it is—it takes about everything we've got—but look at the profit I get on it!' Dr. Jones went on. 'And they're going to resell the whole thing this coming winter so as to net me $190,000 more than what I pay for it. We'll be fixed for the rest of our lives!

'I don't have to pay for it all at once, anyway,' he urged. 'Probably I'll never have to pay more than the first installment of $39,500—in cash, I mean—I'll have to put up the deeds for this house and the other one to show good faith. Those stand for $42,000.

'But those chaps are going to pay me a salary of $750 a month during the life of my contract. We'll have that coming in. I agree to pay them $26,000 every six months after the first payment—but, heavens, they'll never call on me for that! Why, they're going to cut up this block into 3,700 lots that will average to sell for $125 apiece. Let me set the figures down.

'THIRTY-SEVEN hundred lots at $125 makes $462,500. They charge me 33⅓ per cent for selling them and that leaves $308,333, which I get. In other words, I get back my $118,400 and a net profit of $189,333—all within less than a year. I can hardly believe it myself.' Dr. Jones suddenly went tremulous at the magic of such figures.

So worked-up did Mrs. Jones become, in fact—so carried away by the glib talk of the high-pressure salesmen—that she decided on a little deal herself on the side. She had a cherished diamond bar pin worth $3,000 and this she traded with the Edwards Company for a lot priced at $1,500, which the salesman told her they would subdivide into three lots for her and sell at $1,500 each—or a profit for her of $3,000.

This Edwards Company brought on twenty-six high-pressure salesmen from Cleveland, added about as many more in Atlantic City and counted on making a clean-up by Labor Day. They might have succeeded but for the interference of the Atlantic City Chamber of Commerce, whose president is a leading hotel proprietor and the son of the proprietor of one of the resort's original hotels.

President Leeds watched the Edwards salesmen scouring the city for prospects and protested against the way they brazenly disregarded city ordinances all season long by soliciting on the Boardwalk. When this Jones case came to his attention he got busy.

For little of what these salesmen told Dr. Jones and his wife could be proved as true. The office rent was $750 a month instead of $4,000, and other misstatements were in proportion. The property the doctor had bought was not on the Dixie Highway from Gulf to Coast, but miles away and nearer to a section of early layout of this highway, long since abandoned.

The 740 acres supposed to lie in one solid block turned out to be in three pieces of land of indeterminate value. Improvements claimed had not been made and other sales talk was disproved. In Mrs. Jones' case the sales contract of July 17 and the agreement for deed of August 4 described different lots, a moth-eaten trick. According to competent authority, what Mrs. Jones actually got was a lot worth about forty dollars.

To rapidly sketch the happy ending unintended by the Edwards outfit, it was forced to disgorge, Dr. Jones got his money back, Mrs. Jones her bar pin, and all papers were torn up.

(*To be concluded in an early issue.*)

# What Would Izaak Walton Have Said?

(*Continued from page 8*)

above all, that I would not be in the way. In the meantime, Still Homer had the boat ready and he was heading her toward the little point of rocks. Cap'n Wes and I made our way out over the slippery seaweed and pools of water and I managed to tumble in over the side. Still Homer made no comments but I knew that he considered my presence no great addition.

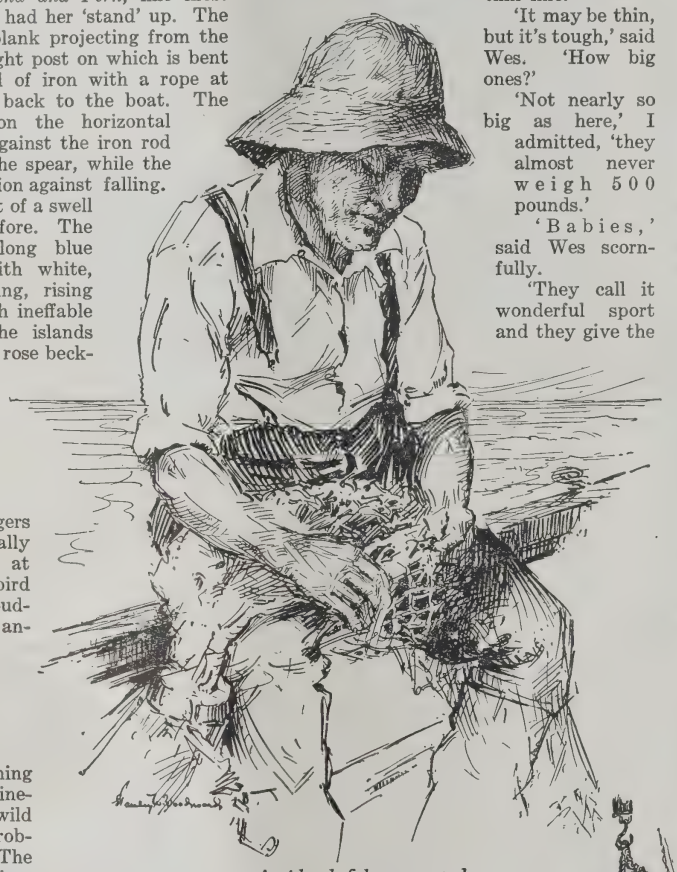
I was not able to take my place in the prow, for the *Anna and Fern*, like most boats in the cove, had her 'stand' up. The stand is a stout plank projecting from the bow with an upright post on which is bent a semicircular rod of iron with a rope at each end leading back to the boat. The 'striker' stands on the horizontal plank and leans against the iron rod when he throws the spear, while the ropes are a protection against falling.

There was a bit of a swell from the night before. The waves were in long blue ranges, tipped with white, changing, crumbling, rising anew, curving with ineffable grace. Slowly the islands passed us by, wild rose beckoned from the cliffs, and long brown reefs, edged with brown seaweed, flecked with white foam, stretched their fingers seaward. Occasionally a 'quawk' yelled at us. Probably the bird books give the loud-voiced creature another name, but to the island dwellers he is a 'quawk.' Along the bare rocks stood rows of gulls, still and shining in the sun, like ninepins. All seemed wild and free and throbbing with energy. The fishermen said nothing, but it was easy to note their deep satisfaction. On shore were cares of various kinds, but on the sea one forgot those things and lived.

Homer, who was of keener vision, kept an eye on the waters while Cap'n Wes attended to the helm. After a while I edged along where I would talk with him above the hum of the engine.

'Do you know they call them tuna in California?' I asked. 'That's the Italian name. Why don't you say tuna?'

'Because it ain't. It's horse mackerel. It's tuna after it's canned.' Then, after a pause. 'Funny why folks tell such lies about fishing. It's mostly folks ashore that tells them. They say that a swordfish will attack a boat and any one who knows anything at all knows that a swordfish is the biggest coward that swims, skeered of his own shadow. If he does fight it's because he's crazy with pain with the barb in him. Wouldn't you be with this here toggle in you?' and he picked up the dart, arrow-headed at both ends and weighted so that when it enters the flesh it turns at right angles to the line and cannot be withdrawn. Swordfish and horse mackerel are caught in very much the same manner on the coast of Maine. I admitted the probable wildness of my conduct under the unpleasant contingency he referred to; then continued,



'They catch them in California on just a thin line.'

'It may be thin, but it's tough,' said Wes. 'How big ones?'

'Not nearly so big as here,' I admitted, 'they almost never weigh 500 pounds.'

'Babies,' said Wes scornfully.

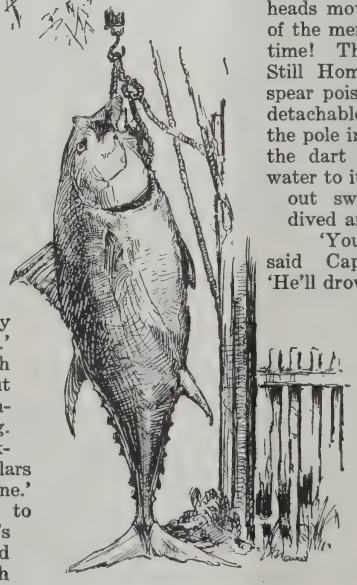
'They call it wonderful sport and they give the fish a chance for its life.'

*An island fisherman and a 'horse mackerel' or 'giant tuna.'*

'An even chance?' asked Wes suspiciously.

'Probably not exactly even,' I hedged, 'but it takes a great deal of skill. Sometimes they play the fish for five hours.'

'I reckon there ain't much play in it for the fish, but folks do like to fool themselves when they go fishing. Anyway, a good horse mackerel is worth eight or ten dollars to me and I hope we see one.'



We were getting down to Small's Point and Cundy's Harbor. A schooner passed us, sails set, dories piled high on deck, and men lolling about, the whole moving so swiftly and silently that it seemed a vision. She was inward bound for ice before setting out for the banks for swordfish.

But swordfish are paltry creatures in comparison with the game we were after, the giant tuna, the most beautiful, the most majestic creature of the deep, sometimes reaching, in our waters, a weight of 1,500 pounds and a length of 15 feet. It is of the mackerel family and built upon the same graceful, compact lines. It has great strength and courage and can swim as fast as the fastest liner. They believe it spawns about the far Galapagos and Marquesas Islands, migrating early in June, the smaller coming along the coast of California and the larger ones in the Atlantic, as far north as Cape Breton. On the coast of Africa and in the Mediterranean they are well known. In Sicily they catch them in an enormous net shaped like a cigar with an opening in the center and at one end the *camera del morte*, or death chamber, where the fish is led and killed.

But no horse mackerel appeared on the waters. I nibbled at my crackers and ate a banana. Off in the bay were other boats cruising as we were, their stands rising like stiff-necked swans, or, when they dipped on the waves, suggesting Cleopatra's barge. The breeze died down, we turned back, and the sea became dull, lifeless, molten. The exhilaration that comes of sailing into the wind passed, and there followed the weariness of one wave after another, forever slipping under the boat and away.

Then, of a sudden, Still Homer gave a sweep of his hand, Wes responded at the helm, and the boat veered outward. The two men became alert, tense, and although I strained my eyes, I could see only the expanse of waves. But soon, straight ahead, I saw four black tail fins, four dorsal fins, and in a few minutes we were alongside the school. How beautiful they were, their great bodies dark blue, radiant, their mighty heads moving all in unison—one of the memorable sights of a lifetime! The engine had stopped; Still Homer was on the stand, spear poised. He struck and the detachable head flew off, leaving the pole in his hand. With a hiss the dart went through air and water to its mark, the line payed out swiftly, and the school dived and disappeared.

'You struck him just right,' said Cap'n Wes, admiringly. 'He'll drown out soon.'

The line pulled taut, and our boat moved, towed by the stricken creature. I held tight to the side; it is so strange to move at the will of a fish. A blow from his tail, an unexpected turn, I had often heard of men getting overboard in the struggle with a dying horse mack-

erel! We were still, then moved again, shudderingly. The line slackened and was pulled taut, and then, after a few convulsive twitchings, everything was quiet.

'As good a strike as ever I see,' said Cap'n Wes. 'He's drowning out fast.'

'How wonderful to be able to aim so well from a moving boat to a mark under water,' I said.

'I used to be striker on a swordfisher. You have to be good then. There's twelve men watching you and if you fail it's their bread and butter.' That was a long speech for Still Homer and he shut his lips tight after it.

'HE's coming,' said Wes, as he pulled the line taut, and soon the monster, gasping, partly rolled on his side, came in view. The dark blue and greenish light shaded into creamy silver on the belly. In spite of myself I shivered, partly in contemplation of the death of so glorious a creature, partly in terror at the thoughts of the brothers trying to haul him into the boat. Leisurely they made the lines ready, leaning far out with the gaff as they slipped one rope over his head, another about the tail, while I struggled with the temptation to grasp the back of their sweaters. Then they tried to pull him overboard, but strain and brace as they would, the giant head would lift only a foot or so above the water, and then drop back.

'Wish we'd brought the dory,' said Wes. 'It would have been easier to roll him into that.'

While the brothers were vainly struggling, a boat had approached, unnoticed. In it were two men, one about forty-five, dark skinned and powerful, the other slight and boyish, with eyes wide open as if in perpetual wonder at the marvels of the deep.

'I'll come aboard and give you a hand,' called the stranger, and the brothers straightened up as if worked by the same spring.

'Wish you would,' said Cap'n Wes. 'He's too many for us old pods.'

The stranger stepped aboard, took hold of the forward rope, gave a mighty heave, and the great head wallowed in. 'All together now,' he called. Another heave, and the body came slithering aboard, not without a good deal of water. The stranger turned apologetically to me.

'Hope you don't mind the breakers. They *will* steal aboard.' With a long straddle he got into his own boat and the youngster started the engine.

'Much obleeged,' called Homer.

'There were three others in the school,' shouted Wes, 'they went to the north'ard.'

NONE of us could keep our eyes from the great fish in the bottom of the boat, blue and silver and metallic green, a brilliancy that is most resplendent at death.

'Handsome, ain't he?' said Wes slowly, 'and I suppose he had a good time swimming 'round. Fishing makes you think of lots of things.'

I was inexpressibly weary as I climbed the bank at sunset.

'It was a good strike,' I heard Wes tell a neighbor. 'Go out in your punt and look at him. Must weigh pretty nigh a thousand. Guess he'll be worth ten or twelve dollars.'

But in my mind were the far Galapagos that would not see their child return.

# The Gold Hunters

(*Continued from page 13*)

attention of the people both inside the buildings and on the streets. Phrenologists, fortune tellers and hawkers jostled one another. Drunken men staggered along. The 'lightning' artist sketched your portrait provided he could buy a piece of paper. The fiddler drew his bow for those who wished to dance. Sunday evenings were given up wholly to dancing, which was accompanied by 44-caliber whisky. If ladies were lacking, the men with patched pants took their place in the dance. The crowd was noisy and good-natured. All sorts of people were there, from the dandy who never had handled any instrument heavier than a whalebone walking stick, to the roughest laborer. All had come to make their fortunes in one way or another.

Sometimes, of a Sunday evening in our shack, we would talk about the folks back home and wonder what they would think of the way we kept the Sabbath, or rather broke it. The closest we came to having Sunday service was when we raised our voices in the familiar hymns, 'Greenland's Icy Mountains' being the favorite. We could now appreciate the allusion 'Roll down their golden sands.'

But to return to the practical. The first matter that had to be attended to was the building of a shack. On account of the heavy rainstorms of the winter, we had to have good material. We decided to use slabs or 'shakes,' as we called them. Plenty of trees could be utilized for this purpose. We built our cabin forty-two by sixteen feet, to make it serve also as a trading post. When it was finished within a week from beginning the work, we set out our supplies and were ready to receive customers.

WHILE we were putting up our cabin, a party of nine miners came along and camped near us. They lost their mules the first night out and stayed on to find them. We became good friends. They thought 'shakes' a queer name for our cabin lumber and we were the 'Shakes Boys' after that. Finally, they went on and we didn't see anything of them until some weeks later.

One day, a couple of them came to our cabin and took dinner with us. They told us they were camping seven miles up Dry Creek. They invited us to visit them, promising us venison. So the next Sunday we got on our horses and went over. They had a small shack without a window. Nine men slept on the floor. Outside the door hung four deer which they had shot. We had a good dinner of venison and carried some back with us.

Except for slight attacks of ague on the way over we had escaped sickness. Now two of our company were stricken with typhoid fever. The sameness of diet—meat and bread without fruit or vegetables—brought on scurvy.

We sent for a doctor in Fiddle Town and he came every day for six weeks. His regular charge was an ounce of gold a visit. He cut his price in half for us, but even at that the sickness was an expensive experience. One of us had to watch the sick men all the time.

We did no mining for two months. Our business at the trading post had been fairly good although the profits were falling off

steadily, a natural slump following the abnormal inflation since the discovery of gold. By February '51, prices were approaching the usual, after twenty-four months of profiteering. Storekeepers in general were variously called 'ogres,' 'demons of hell,' 'ravenous storks.' We had managed to hold our reputations as 'good fellows.' With our pioneer training we could not bring ourselves to extort 'blood-money' even from the 'Injuns.' And there was plenty of opportunity of charging two or three prices if we had been so inclined. White men and red were almost equally ignorant of the value of gold.

A SPANIARD would produce from the folds of his sash or handkerchief an old deerskin pouch, untie a coarse string and pour dust into our scales. If we reminded him that he was spilling it, he invariably refused to take it back saying, 'Plenty more where that comes from.'

The Indians learned slowly to be prudently suspicious of the white men at the post. At first, they had no conception of the value of gold and would exchange handfuls of the precious dust for any article of food or gaudy ornament that took their fancy. A party from Injun Creek way often came down to our camp. The leader, a fine-looking young brave, would come inside while ten or twelve would range in a circle outside and proceed to the counter in rotation. Each one would place on the palm of his hand a small leaf or piece of paper with a teaspoonful of gold dust. He would point to it and then to the article desired and give a grunt, 'Ugh!' If we shook our head he would retire and return with more dust.

While our relations with the Indians were as a rule friendly, we always kept our guns handy when they came around. However, in '51 they were not so numerous or dangerous as they had been the year before. They had been taught some severe lessons after several outrages. One of the most cruel was committed by a party that descended on a camp of five white men on North Fork and massacred them. John Greenwood, son of the famous mountaineer, mustered a large party and tracked the murderers to a ranch on Weaver's Creek, caught about twenty-five or thirty of the raiders, and, after a speedy trial, shot a half-dozen or more. 'No good Indians but dead Indians,' was the slogan with the miners in '49 and '50.

By the time our comrades were able to take care of themselves, our claims around Fiddle Town were not worth working. On Christmas Day, we started out to do some prospecting. We followed up Dry Creek east until we headed it. We were then close to Injun Creek where we knew the redman had his camp. After the first half-day's travel, we saw no more whites. As we were hunting 'Injun diggins' we kept on our way up the divide until the second night. By that time, we had come to the end of the trail.

A little before sundown we stopped and unpacked our horse and built a fire. I took the camp-kettle to go to find water. Springs were numerous. I put the water in the coffeepot and set it on the fire to boil and then began frying the bacon. The appetizing smells reached the keen-scented Indians, and soon our uninvited guests came filing along—between fifty and a hundred—to beg supper. We had none too much for ourselves and certainly not enough for an army. One old savage picked up a piece of bread and put it under his blanket. We told him to put it down. He replied in Indian gibberish that he wouldn't. When one of us picked up a gun and pointed it at the thief, he dropped the bread and all of the rest ran out to the path muttering and threatening to kill us.

We continued getting supper and then ate it. The Indians went into a grove of pines about a quarter of a mile away, built a rousing fire and had a war dance. We kept quiet, knowing that if we tried to get away they would waylay us. After finishing supper, we decided the safest thing for us would be to put out our fire. Warily, we caught our horse and tied him to a tree near the camping spot. Then we made our bed for the night by spreading our blankets on boughs. We lay down with our guns at our sides. Although very tired, we stayed awake the first half of the night without difficulty. The powwow prevented sleep. Finally, about one o'clock the woods became quiet and we fell into a sound repose until daylight and the sun's rays shot through the trees.

We jumped up quickly, packed the horse and without waiting for breakfast broke camp. We took the trail the redmen had followed the night before. About a mile down the hill we came to a large spring where we found a hundred or more Indians camped around their diggings. They were immediately on the alert when they saw us coming. One tall, stalwart fellow stood guard while the others got down into their diggings and started prospecting. We also followed suit and began to reconnoiter for signs of gold. Everything seemed quiet enough until more Indians came down from another camp. Then there was a general uproar with jabbering and gesticulating which worked itself into anger.

After a brief council of war, a young brave was delegated to speak to us. He asked us politely enough to go away. We recognized him as one who had been down to our camp a number of times to buy provisions. We told him 'No' and that we wouldn't go away until we got ready. He stood around some minutes telling us we had better go, and coaxing us. We could not be brought to acquiesce. Then he turned and went back to his camp.

We could immediately see the effect of his report. There was a commotion as though we had disturbed a swarm of bees. We proceeded with our prospecting until satisfied that the diggings were not very rich. Then we left. Traveling along southwest on Sutter Creek, we camped in the woods for three days and nights without sighting a white man. The Indians, however, gave us no further trouble.

ON our return from this trip, two of the boys announced they would leave us. One got a job in Sacramento and another started teaming fish. This was a wise move on their part, for they were not strong enough as yet to mine. Many an educated man resorted to driving wagons back and forth from the city to the camps. Good wages were paid.

A story was told of a lawyer from New York who was discovered managing a double span of mules. A friend rallied the professional man upon his social descent. The lawyer responded, 'What's the difference? Practising law is nothing more or less than trying to get something out of mules.'

By the last of January the wet season was drawing to a close. Water had been very low on Dry Creek for some time owing to scanty rainfall. We had depended upon it for washing our gold. So we mined mostly on Injun Creek and later moved our camp there.

Soon after this our comrades rejoined us, and we set out on another prospecting tour. Following the Stanislaus, we crossed to the Mocolomne River through a wild country to the Calavaras. We found plenty of creeks. Sheer cliffs between ravines made it almost impossible to cross the ridges. We would follow the divide awhile and then the creek, prospecting as we went.

IN April, we went on to Mocolomne Hill, a village with rich mines, the center of 'deep diggings.' Nigger Hill lay to the east. There was a great deal of mining going on here. French Hill lying to southwest had a few board houses but mostly tents occupied by 1,500 to 2,000 miners and gamblers. Three surrounding ravines centered in a spring.

One day, we started for Independence Flat up the river eighteen miles. There we found a trading post and pitched our tent a mile or so away and began to prospect on a little creek. We found a good mine and worked it for some time.

The Dry Diggings were a lottery. If we struck it rich, we would make our fortunes. So day after day, we kept on digging down into the rock. We had now gone down fifty-six feet.

One morning in May, we suddenly noticed that the soil had changed in appearance. We were satisfied that here was gold. Just before noon we went up to the hole with prospect pan and flour sack. Two of us went down where we had hollowed out a small place in the quartz rock. The two men sent up some lose dirt. I took it and washed it in the river a half-mile away. I found two or three dollars' worth of gold in this small sample of soil. I returned to the hole. The other two had dug more soil from the rock. I repeated the trip to the river and found six or seven dollars' worth of gold.

It was just before noon when I got back with the second bucket. I drew the boys up. Our spirits were high. We went to dinner but kept our success to ourselves. Then we all went to our claim together. One of us was lowered down the shaft. I went after him. He took an old crevice knife and began digging into the flinty rock. Soon he struck a fine nugget of gold. He rubbed it on his pants, held it up and then handed it to me.

We staked out two claims apiece and double what the miner's law allowed us.

All through the summer we mined our claims on Mocolomne. As autumn approached, we discussed plans for the future. Should we go home or should we stay? Many an evening was devoted to this question. Love of gold was considerable, but love of home was stronger and won out. One man was drawn back by a sweetheart; another by a mother who was ill.

We sailed for home around the Horn to New York. We had been in the gold fields thirteen months and carried back with us what was in that day a big fortune, seven thousand dollars apiece, which being minted in Philadelphia was rolled out before the wondering eyes of our families back home.

# Taxes, Taxes, Taxes!

(*Concluded from page 1*)

licence taxes. And also that the gasoline has in it a number of property taxes, several kinds of corporation taxes, some railroad and automobile taxes, and a direct gallon tax (possibly not in your state).

No. 6. As you ride in on the train, reflect that about one-tenth of your railroad fare is tax, and as you read your newspaper, further reflect that it also is a network of taxes. If you light a cigar or cigaret, reflect that you are smoking a mixture of tariff, excise tax, and tobacco.

No. 7. As you ride on the street car or subway, reflect that from one cent to half a cent of your fare goes to pay taxes.

No. 8. When you reach your office, look around and reflect as you did in No. 4. If you work for a corporation, reflect that the corporation is probably paying as much, if not more, in taxes as it is in dividends.

No. 9. At luncheon repeat the reflection of No. 4, and if you happen to get your hair cut, reflect on what wonderful things taxes can do in the way of growing hair, for tonics are largely compounded of taxes. The barber will be trying to sell you a tax.

No. 10. Go home and have dinner, reflecting as directed under No. 4.

No. 11. If you take out your motor in the evening, reflect on the taxes its operation is costing you, and if you go to the movies or to the theater, do likewise.

No. 12. Go to bed, and if you have had a good day, reflect on how much fodder you have provided for the federal and state income tax, or if you are not up enough to pay an income tax yourself, think how much you have helped someone else to pay an income tax. When you are through with this, you may, if you like, wonder if you will ever make enough money to leave an estate, and if so how much of it will go in taxes.

IF, AT the end of all this, you know how much you have paid in taxes that day, you will know more than anyone else does. But you will not know. There is no way you can possibly know. All the goods you have used that day have come to you through chains of producers, transporters, and handlers, each one of whom pays a series of taxes; from each radiates another series of producers, transporters, and handlers who pay taxes, and so on, from each of these. The thing is apparently endless.

And then, further to complicate matters, by no means all of this taxation is passed on, and there is no rule as to when it is passed on to you and when it is not—the circumstances often determine. An excise tax—as the tax on tobacco—is added to the price. So are the taxes on railroads and public utilities, because their charges are regulated by public service commissions and these commissions have to take taxes into account when fixing rates. We do not know how much of the tariff travels to you with the goods. Neither do we know the exact effect of the corporation taxes.

The truth is that no one actually knows anything about taxation because there are no figures on which to base anything that can be called knowledge. Legislators, social reformers, and many of those individuals who call themselves economists build theories and found arguments on data of less weight than one would need for making a dog house. One would at least need to know something about the size of the dog.

A man who knew neither his income nor his outgo would be bound to get into trouble. Taking the nation as a going concern, that is exactly our position. The Federal Government knows what it spends and what it takes in each year; also it knows what it owes. So do the states, and the municipalities, and the counties, and the townships. But there is no national balance sheet for December 31, 1925, or any date. There are no officially collected figures.

The tabulations of the Bureau of the Census do not go beyond 1922 and they cover only the states and the municipalities of thirty thousand or more. Washington collects all sorts of figures on all sorts of things. Most of them are founded on a large number of guesses gathered together and put through a calculating machine, but whatever the state of their accuracy or inaccuracy, they always come to hand too late to be of any use. Nothing is ever current.

We cannot, under any circumstances, know our national wealth or resources. Every piece of property has three valuations—first what the owner would like to get for it, second what a purchaser with money in his hand will pay for it, and third the value a real estate assessor would put on it. In the case of a factory, there is the value as a going concern, which is about two-thirds greater than the auction value of its bricks and machinery. What might be called our resources have only the value that our intelligence can take out of them.

The only reasoned estimate of our national income ever made was for the year 1919, which was a year of great inflation, and it does not help to convert 1919 dollars or 1920 dollars or any other dollars back into 1913 dollars. In the first place the conversions are not in the least accurate, and in the second place the comparisons would not be important even if they were accurate, for we happen to be living in the year 1926 and to a large part of our people the 1913 dollar is just about as far removed as the War of the Revolution.

Suppose you tried to run your business today on your sales of three years ago, your liabilities of last year, and your estimated assets of next year? Where would you be? You would be better employed trying to put salt on birds' tails.

In 1923 government—federal, state, and local—spent the stupendous sum of $10,000 million, of which about two-thirds was raised by taxation and the balance by borrowing.

Of this total, more than one-half was spent by local government. The Federal Government spent $3,459 million and the states $1,450 million.

THIS total spending is almost as great as the entire amount paid for wages in the same year. Progressive modern manufacturing companies can pay high wages only as a result of a plant investment of between five and ten thousand dollars an employed man. Every ten thousand dollars that is forcibly torn from production and put into nonproduction is therefore somewhere depriving some man of the potential opportunity to earn a good living.

The total taxes now being levied amount to about one-sixth of what we believe to be our national income, but probably they amount to more. Of these taxes about sixty per cent are being collected by state and local government and forty per cent by the United States.

These figures of themselves mean nothing. It may be worth our while to pay one-sixth or more of our income for community conveniences—for government means more today than just being governed. We want good schools, good roads, clean towns, and efficient police. All of these wants are legitimate enough. But are we a jump ahead of our pocketbooks? That is the real tax question.

No one can say with real authority what is a sound system of taxation and public finance. It is manifestly impossible for any community to pay entirely as it goes. Doubtless a great number of the public services which are now run at a loss could be put on a paying basis and thus a city could have some revenue other than what it derives from the taxpayers. But we have not yet reached the point where we can differentiate between the housekeeping of government in which politics ought to have no part and the policies of government in which politics must have a part. The city-manager plan is an effort in the direction of keeping politics out of the kitchen, but in most localities the distinction between public service and private service is rigidly kept. You need only go into a public office to know that.

*(This is the first of a series of articles by Mr. Crowther. The next will appear soon.)*

# The Genesis of the Constitution

(Continued from page 5)

except what he recorded we should know almost nothing, and the convention took care that this little should not become known. At the last session, it was voted that the secretary's records be turned over to Washington, 'subject to the order of Congress if ever formed under the Constitution.' The delegates were afraid that if the proceedings were at once published, unscrupulous use of them would be made by some of those who were determined to prevent the ratification of the Constitution by the states.

'It is a sure sign of the high respect in which this famous body of men was held,' says McMaster in his *With the Fathers*, that not one word was uttered by the people against their secret sessions.' Yet the lack of news gave rise to many rumors, one of which was that the convention was about to set up a monarchy and had already invited a second cousin of George III to come over and take the job of king. Delegates received many letters asking if this story were true. The answer always took this form: 'While we cannot affirmatively tell you what we are doing, we can negatively tell you what we are not doing. We have never once thought of a king.'

Not much was known about the details of the convention's proceedings until more than fifty years after it adjourned. Nothing would have been known then or ever if James Madison had not kept a journal. Before the convention was held Madison sought to make a deep study of the republics of antiquity, only to discover that nothing much was known about them because they left no records. When Madison was sent as a delegate to the Constitutional Convention, he determined that no future historian should have to work so hard to find out about the Constitution of the United States as he had had to work to learn about the ancient republics; so he resolved to keep a journal of the proceedings for himself—and for posterity.

'In pursuance of the task I had assumed,' he said, 'I chose a seat in front of the presiding member, with the other members on my right and left hands. In this favorable position for hearing all that passed I noted, in terms legible and in abbreviations and marks intelligible to myself, what was read from the chair or spoken by the members, and losing not a moment unnecessarily between the adjournment and the reassembling of the convention, I was enabled to write out my daily reports during the session, or within a few days after its close, in the extent and form preserved in my own hand on my files.'

Madison died June 28, 1836. After his death his Journal of the Constitutional Convention was published, which will always remain the great source document of the Constitution. He left his Journal to Congress, which published it more than fifty years after the Constitutional Convention adjourned.

Perhaps we should never have had a Constitution or a republic if it had not been for Franklin. At a certain point in the proceedings, four small states threatened to withdraw if the majority should not rescind their decision to give states representation in the Senate according to their population, which would have left the smaller states at a disadvantage. Franklin had voted with the majority and, to the last, said he saw nothing fair or just in giving the small states as many Senators as the large ones. But when the speaker representing the smaller states had made his threat, Franklin suggested a three days' adjournment to cool off. He urged that during this period those who thought alike should not confer exclusively with each other with a view to fortifying their position, but that they confer with their adversaries and seek, above all things, to cultivate a friendly feeling. In closing, he expressed the wish that the convention should straightway choose a chaplain who should open each session with a plea to the Almighty to show them a way to agree.

When Franklin finished, a delegate who will remain forever unknown said he saw no reason to call upon a 'foreigner'—that is the way he spoke of the Creator—to intervene in their behalf—that the convention was composed of able men who should be able to do their own thinking. Washington looked shocked, as did many others, but nobody paid any further attention to him. The convention appointed a chaplain and adjourned for three days. When it reassembled, Franklin moved that, in the interest of harmony, and to prevent the catastrophe of permitting the states to drift apart, the states be given equal representation in the Senate—and that is the way it is to this day.

*Washington so suffered from unscrupulous politcians that he said he would rather be in his grave than in office.*

Rhode Island sent no delegates to the convention and took no part in it. New York, by the way, failed to authorize its delegate in Congress to vote for the adoption of the Declaration of Independence, and ratified the Constitution by only a bare majority. Rhode Island took no part in the formation of the Constitution because its people preferred to remain by themselves. It seemed more profitable to do so. Rhode Island had seacoast and ports. Some other states had none. The Rhode Islanders believed they could do a profitable business by remaining out of the union and charging the inland states for the use of their seaports. The other states were tremendously indignant. Some persons advocated the use of force. Others urged that Rhode Island be treated with contempt and considered out of the union. On the Fourth of July, 1787, the governor of New Jersey ordered that only twelve cannon be fired in his state instead of thirteen. Rhode Island stood out until after the government was established, when she reluctantly yielded by ratifying.

The Constitution was ratified not by the votes of the people but by the votes of conventions. The people elected the delegates to the conventions, but most of the people were not permitted to vote. They were barred by property qualifications. It has been estimated that only about one-fifth of the male adults, or 160,000 men, voted for the delegates, a majority of whom voted in favor of the ratification.

Certain facts about the Constitution have never been clear to all the American people and are not clear to this day. It is assumed by some that the Declaration of Independence and the Constitution are but different expressions of the same thing. Such is not the fact. The Declaration was the exuberant, militant utterance of a young people, determined to be free, and was therefore intensely democratic. It was proclaimed at the beginning of the war when popular spirit was at its peak. The Articles of Confederation expressed the spirit of the Declaration. This, our first Constitution, vested all power in the people,

with no checks or balances. There was but one branch of congress and it was supreme, so far as any other branch of the government was concerned. Its members were elected for a year and were subject to recall even before the expiration of the year.

Our present Constitution was made in an entirely different atmosphere. The war had been won and its spirit had died away. Only six of the fifty-six men who made our present Constitution were signers of the Declaration of Independence. Thomas Jefferson, Thomas Paine, Patrick Henry, Samuel Adams and other leaders of the early revolutionary period did not sit in the Constitutional Convention, though Henry was elected, but refused to serve. Instead of making the legislature supreme, three coördinate departments were established, each one designed to be a check upon and a balance for the other two. This system of checks and balances came from England, not from the Declaration of Independence. In England they had to deal with the crown, the landed gentry and the common people, and a system of checks and balances was devised to enable all three to survive. We had no crown, and very few landed gentry, but the English system was nevertheless copied.

THE framers of the Constitution have been criticized from the first because they put so little democracy into our fundamental law. The more one understands, the less likely he is to take part in such criticism. It is true that the present Constitution sometimes makes the expression of the public will difficult. It is true that under this Constitution the people do not fully govern themselves. But something more is true.

To this day the people have never shown the ability fully to govern themselves. No people, either here or anywhere else, have fully governed themselves. Self-government is still rather a new experiment in this world. It was still newer when our Constitution was made. Washington wanted to give the people as much power as he believed they were capable of exercising, but was in great doubt as to how much of such power they would be able to handle. In this direction he and his associates went a great way, considering their day and generation. They went so far that the people have not caught up with them yet. They made a Constitution under which the people could fully govern themselves if they were determined to do so. But to rule one's self, one has to be interested; he has to study government, study politics, organize, and politically associate himself with his fellows. No Constitution is sufficient, in itself, to produce self-government.

The State of New York cast no vote for Washington as President the first time he was a candidate because the Clinton and the Hamilton forces in the state legislature could come to no agreement as to how the presidential electors were to be chosen. Each side preferred that the state should have no vote rather than see the other side have too much to say in the choosing of the electors. In New York in 1792 the friends of George Clinton stole for him from John Jay the governorship of the state by throwing out the votes of two counties that gave a majority for Jay. In the early days high officers in the government—members of Congress and others—did not regard it as wrong to have a financial interest in the legislation upon which they acted. This is still sometimes true, but it was somewhat rawer in the old days.

WASHINGTON so suffered from the unscrupulous politicians of his day that he said he would rather be in his grave than in office. In one instance Washington himself was so deceived that, unwittingly, he completed the ruin of an innocent man. That man was Edmund Randolph, Washington's own Secretary of State, earlier his Attorney-General, and still earlier, governor of Virginia, delegate to the convention that framed our present Constitution, and member of the Continental Congress.

Randolph, who was descended from a distinguished English family that emigrated to Virginia in 1674, is described as 'large, somewhat portly, but of impressive figure, massive head, handsome and intellectual countenance, trained and experienced as an orator, with exceptional command of language, musical voice and most engaging manners.' He succeeded Jefferson as Secretary of State at a time when our relations with England were not very good and our relations with France were bad and growing worse. It became Randolph's duty to conduct a diplomatic correspondence with M. Fauchet, the French minister, over the Jay Treaty with England, to which France vigorously objected. Randolph apparently framed his correspondence in such a manner as to keep the French minister a little in the dark as to what was going on. At any rate, he fell out with Fauchet, who wrote to his government that with a few thousand dollars he could influence American procedure, and intimated that Randolph could be bribed.

The British captured this letter at sea and, through the British minister, sent it to America, where it arrived while the Jay Treaty was before Washington and his Cabinet. Randolph continued to oppose the treaty unless the clause continuing the right of Britain to search neutral vessels were removed. Washington and his Cabinet differed from Randolph as to this and approved the treaty. Washington then handed Randolph Fauchet's letter, in which he intimated that Randolph could be bribed and asked for money with which to do it.

Randolph denied the charge but resigned from the Cabinet. The French minister afterward gave Randolph a clean bill of health, but it came too late. The damage had been done. In 1886, after both Washington and Randolph had been in their graves almost a century, a letter from Fauchet was found in the archives of the French Government in Paris completely exonerating Randolph.

Whoever believes the early days of this country were happier than the present ones is in need of more accurate information about the past. America is constantly improving, and it will be a great deal better in the future than it is now.

*In the early days high officers in the government did not regard it as wrong to have a financial interest in legislation.*

# Under Its Own Steam

(*Continued from page 7*)

and sitting there waiting for me when I awoke. Work, talk, acts of any kind were simply thin subterfuges to play that I was going to evade my tormentors for the moment. I never really evaded them. Their ghastly presence was always there in the background. The future became some inconceivable damnation. A year to be lived through seemed utterly incredible. The prospect of each hour ahead made me shudder.

'DURING this time, which was not more than a few weeks, I worked steadily, confiding to no one. I think no one guessed. At night, after the others had left the office, there was little to do save when an early morning story broke. These hours of waiting were horrible eternities. The night editor and I were not congenial. My only salvation was the telephone girl in the hall. Her name has faded, but not the grateful memory of her kind companionship with a youth who behind the eyes was desperate with suffering.

'Anyone who has not been through the experience can scarcely conceive the hopeless, eternal terror of it. In a few days a dragging pain had settled over my heart, a dull sinister ache which in the past doubtless gave rise to the expression, a broken heart. Once or twice relief came. I remember that one time I was sitting in Central Park when something wonderful happened. Suddenly my forgetting process was working. The missing parts had slipped smoothly into place. The awful thoughts dropped out of sight. I could relax. I had never before known such heavenly harmony. I would not have guessed it existed. It was like old times, only much more wonderful. I could think what I liked with deep content and peace. But the furlough was short. Before noon, the forgetting process had broken down again and I was as despairing as ever.

'Even now those days echo at times in my memory like the refrain of a forgotten song: the hot pavements, the weight of my chest, the jungle of my mind. Because walking gave me faint relief, I walked. I knew no better. Once when approaching the door of the newspaper building, what must have been a fainting spell came over me. I felt as though I were dying. My feeling was of gratitude and relief. No such luck. I had thought it all out and vastly preferred a death that ended everything. I doubted whether, if there were another world, there could be relief for me in it.

'The matter of seeing a doctor did not occur to me. I did not know what was the matter with me—certainly not that I was ill. I could walk as far as ever. My muscles felt strong. I could imagine a physician's queer looks if I should try to describe my ailments to him. I had no fever, no cough, no broken bones. Finally when I could stand it no longer, I went to the only place open to me—home. With rest, wholesome food, fresh air and the environment of the family fireside, I effected a blind recovery. I decided to abandon journalism to live a more tranquil life. My youthful experience in a bank aided me and I got a satisfactory position with a trust company in the Middle West. For two years I was happy; my services were appreciated by my employers and my health was good. Then came a bolt from the blue. The forgetting process failed again. Almost overnight I was reduced to the inner abject condition of my former breakdown. By this time, however, I had learned to suspect that I might be ill. I got the name of a distinguished neurologist in the town, and went to see him.

'He was kind. He gave me perhaps two hours of his time, listened to my story and then put me through an examination, physical and mental. At the end, he told me positively and cheerfully that there was nothing, absolutely nothing the matter with me. Were he an examining physician for insurance, and had I come to him for that purpose, he would have given me a perfect score. My trouble was purely imaginary.

'HE PROBABLY thought in his kind way that he had helped me. But I was blindly desperate when I left his office. If you have diphtheria, you know that it is a recognized experience. Thousands of others have had it and a large percentage have come through cured. But all this suffering that I was going through was apparently not a common experience. According to him, medicine did not recognize it, let alone know a cause or cure. By the time someone did study it and find out the barest rudiments, I would be gone. Had I not been able to keep on with my work as I had, I might have thought that I was crazy and the neurologist was too polite to tell me so.

'I found several volumes on the subject. No one ever read them with more eager hope than I. I found they might be roughly divided into two classes: inspirational and technical. The former dealt in generalities, pleasant suggestions and much encouragement. To this class of author it was an easy matter to be well. One had just to think one was cured, and so it was. They carried little conviction and were written as if the men behind them did not know their field or preferred not to get their hands dirty.

'The technical volumes were convincing enough. They coldly and specifically cited numbers of cases. I found my experience was not solitary. But a helpless youth got little else from them. According to this class of authors, it was almost impossible to be well. They seemed to have written the books largely to impress colleagues with their professional technique and experience, to point out triumphantly minor technical points for some obscure cause of satisfaction to the writer. One derived the impression that the idea of finding common causes and cure for the satisfaction of their patients would have been considered vulgar by those learned men. I understand now that this was not the case. In person, to patients, they were probably kind and helpful. But these books were not aimed at patients. They were propaganda, swank, aimed at colleagues with whom one might lose caste if he were simple and humane.

'I HAD bought a little black loose-leaf book, and now I began to make my own observations. They were crude, superficial, comprising what seemed to make me better from day to day and what seemed to make me worse. They suggested other experiments which I made and checked, then noted the results. I was young and presumptuous, a common foot soldier in the ranks. It was probably well I was no general secure in the rear of the lines. A position of immunity might have permitted me to be interested mainly in gaining an advantage for myself at the expense of others' suffering. My position on the firing line prohibited this. My only salvation lay in working to find the causes of suffering so it might be ended.

'I still carry my little black book, thanks to the integrity of its manufacturers. It has overflowed dozens of times. Together with the file that holds the notes that have sprung from it, it has comprised my laboratory for thirteen years. I have often envied psychologists blessed with elaborate facilities and felt ashamed of the meager equipment with which I had to get along as best I could. I have felt better since learning of Dr. Wollaston, chemist, physicist and president of the Royal Society. When a guest asked to see his laboratory, he replied,

"Certainly," and rang the bell. "John," he said to his man, "bring up my laboratory." John bowed and returned in a few moments with all of Wollaston's apparatus on a tea tray.

'After eight months I found that I had overcome my breakdown, and that's a matter of some twelve years. I was also in possession of a written record of my recovery, but I had not even dented the problem of the real causes of my harmony and inharmony.

'It varies endlessly not only in the individual, but in the same individual in the hour, place and stimulant. An ambitious principle to succeed must stand examination and check as the common agency of harmony in work, in love, in church, in play, in nature, in scientific research, in relief from illness, in all the thousands of ever-changing specific individual cases.

'INHARMONY from nervous trouble, from personal or material contacts or from no apparent contacts at all, means that there have been set off, inside the individual, expenditure groups that are spending energy faster than energy is released to them for their use. This deficit in the energy flow causes "missing" energy and irregularities in the releasing process, producing in the patient the strain known as inharmony. Harmony, roughly speaking, is the opposite. When there has been released enough energy to satisfy fully the rate of expenditure, there is not only an absence of strain but a smooth purring of the countless units of the expenditure groups. A good name for this purring is harmony.

'For a nervous sufferer to find harmony means that he must first bring down his expenditure within the limits of his daily refinement supply; he must secondly strive to increase the production of his daily supply to make up the deficit and for the reason that one always spends more than he anticipates, whether the currency be money or energy; he must thirdly strategically arrange his daily life according to an understanding of the process of releasing energy. He must understand that harmony is not having the energy on hand so much as releasing it to current expenditure.

'So many things enter into the making, saving and releasing of energy that a doctor cannot spend enough time with a patient to point out and advise on each detail of an individual's life. But the patient is always in his own company, and should have time for his own benefit. Consequently, it is the doctor's aim to teach a patient to understand the making, saving and releasing of energy as a conservative business man understands the job of running his business at a profit.

'Rest and relaxation are the best means of saving energy. One subject to nervous ailments should rest as much as possible. No long or hard walks are profitable. Ride, sit, lie down when possible. Quietness saves energy otherwise spent in action. Reclining saves energy that would be spent in pumping the blood against gravity and flows that are automatically set off when erect. Sleep saves the energy spent in higher rates of thought and in all the countless flows to various parts of the body which go on while we are awake.

'The patient should relax while at work. He should practise doing his work with the greatest possible relaxation in all parts of the body and brain not actively employed in the task. When one has non-full energy flow, many parts of the body are tensed for the appropriation of their energy content. Without full energy flow to relax these tensings, they gradually become chronic, adding to the general expenditure and depletion. Relieve these useless tensings gradually and individual consumption is reduced. No new tensings should be added.

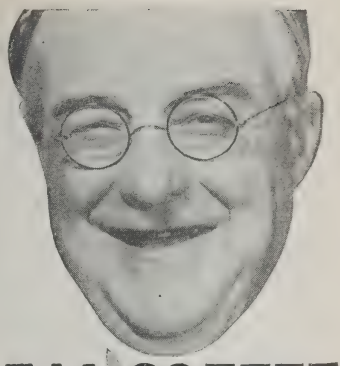
'The mind should be kept on the present moment. Looking ahead makes the mind travel faster than the accomplishment. It makes the latter feel behind, the individual tries to hurry and that spends energy fatally fast. Energy should be spent slowly, which is the way the organism makes it. The individual with luxurious energy does not proceed fast but leisurely. He lets his mind with keen enjoyment on each act as he does it. This is natural for him and easier than for the nervous sick. To relax, at first means that the latter must tense in order to release energy for relaxation. He will save more than he spends, just the same.

'Before one can save energy, though, it is sometimes necessary to go through a regular process of making it. Food, air and water are the great mediators of such achievement.

'Plenty of energy-making foods, preferably unpasteurized milk, whole-wheat bread, vegetables, eggs are beneficial. Some authorities condemn meat, and many do without it, though others find they are stronger and better with its use once a day. One may eat too much of it, another not enough. Whatever is eaten, a nervous sufferer with fair digestion needs plenty of it. It should be chewed well to save energy expense by the stomach and other organs, perhaps rather to expedite the refinement process. The heavy meal is preferable in the middle of the day. An easily digested supper such as bread, pudding and several glasses of milk partaken fairly early will allow easy digestion and as sound sleep and the energy available for relaxation permits. The sounder the sleep, the lower the general rate of expenditure during this time, the greater the saving of energy for the next day and for relaxing the inharmonies accumulated up to the night before.

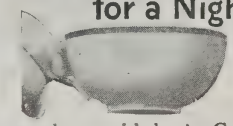
'MUCH increased supplies of energy result from deep breathing. Oxygen is not energy, and additional breathing does not mean that much additional energy. But deeper breathing does make for more energy. Tensing mechanically throttles breathing. This is in the popular domain, and every reader of "thrillers" knows that, in a tense situation, the author writes, "he scarcely breathed," of his hero. This is the popular way of describing a physical process. Yet one needs most to breathe in just such situations.

'Forced deep breathing in nervous moments will provide extra energy to relax more than could be done otherwise. If the patient is exhausted and can get no more air through the nose, he should open his mouth and draw in great draughts. The best thing to do is to make steady deep breathing an unconscious habit. It enables one to get the benefit of 20,000 deep breaths during twenty-four hours as compared with the twenty or thirty when one happens to think of it.



'Forcing a glass of water every waking hour will likewise help a critical period by increased elimination. The difference will be felt within several hours. Energy is saved.

'The tragic part of nervous sufferers is that no one offers them real understanding of their troubles. Even mothers, loving and sympathetic as they are, can do little more than listen kindly and with visible pain, and try to cheer up the victim of nervous prostration with other topics. To her, as to most everyone else, the trouble is one to shun and forget.



'Today, however, the situation is different. We know that those nervous pains and troubles are not caused by low mentality, God, the devil, or any abstruse, mysterious and incurable factor. The trouble is simply lack of energy to relax high rates. We do not know exactly what this energy is, but we know how to make it, save it and release it.'

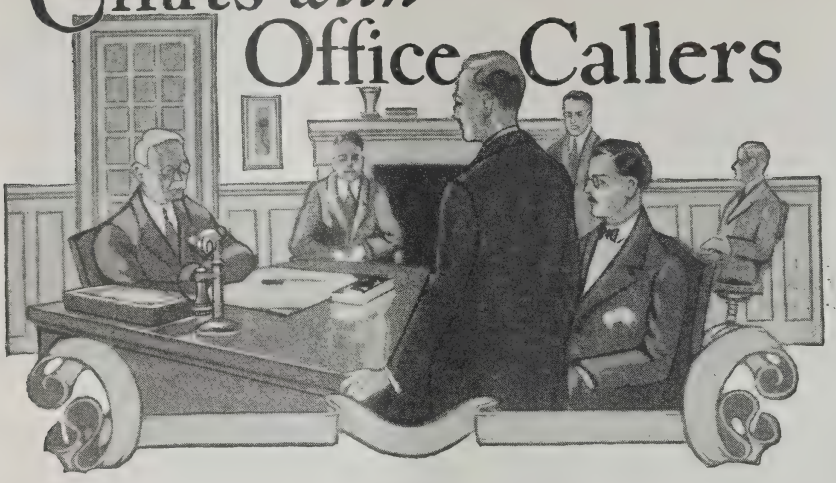
It is given to but few to tell their experience so vividly and to state the hypothesis of mental health so convincingly as this man has done. But he is a man of the best kind of education: self-education. He has a gift of the gods: a sense of mathematics. In addition, he has an unusual endowment: he is able to detach his mind from the concrete, or to concentrate it upon the concrete. He is intrigued with logic, and he has a heart!

Individuals so richly endowed are nearly always potential psychopaths. It is a tax the gods exact for talent.

REAL COFFEE
for a Nightcap!

Don't deny yourself the pleasure of coffee any longer. Or decline a second cup because it's late! Coffee can't keep you awake if it is the kind *without caffeine.*

Neither nerves, heart nor kidneys are in any way affected by this pure coffee—from which the caffeine has been extracted. And it is *real coffee,* full-flavored and full-bodied; nothing missing but the caffeine.



The day you try Kaffee Hag is the day you settle the coffee question. At the grocer's, or clip coupon now!

KAFFEE HAG 10¢
1532 Davenport Ave., Cleveland
Send me postpaid, enough Kaffee Hag to make ten cups of real coffee; I enclose 10 cents (dime or stamps).

'The film version of *Ben Hur* has at last arrived in our city,' said ***the Plain Citizen.*** 'I haven't seen it yet, but from the advertising it must be a great picture. With really generous abandon the producers have given credit to many people. Take this ad from last Sunday's newspapers: Credit is given the 150,000 actors who appear in the film. Credit is given the stars. Credit is given the producers. The advertisement informs us that *Ben Hur*, mightiest of dramatic spectacles, is "A Metro-Goldwyn-Mayer Production in Arrangement with A. L. Erlanger, C. B. Dillingham and F. Ziegfeld, Jr." The array of names really dazzles me; there are so many people to be thanked for the privilege of viewing the picture. There is only one name I failed to find. That's the name of General Lew Wallace. In the scramble to give credit to everybody else he was probably overlooked, or possibly there just wasn't space to mention him too. That's a small matter, though. All Lew Wallace did was write *Ben Hur*.'

ɾ ɾ ɾ

'The man from Porcupine is right,' remarked ***the Engineer.*** 'In excessively hot or cold weather you should throw your thermometer away. Its psychological effect is demoralizing.

'I traded upon this once and got by with it. We were doing some work in an office building. To get to it we had to take down a wall radiator. It was dead and had been for months. Its tubes were clogged with rust and débris. The big room was amply heated by smaller radiators which we did not disturb. But the radiator was not well out of the room before the occupants began to complain of the cold. I explained the situation but it did no good. They still kicked.

Figuring out that they were cold only because they thought so, there came the inspiration that if I could make them *think hot* the trouble—their incessant complainings were disturbing the work—would be over. I bought half a dozen cheap thermometers, cheap ones because I knew they varied. Fortunately four of them registered from two to three degrees too high. These I took apart carefully and slipped the tube up as high as the opening in the dial would allow the bulb to go. Thus they registered five or six degrees above the actual temperature.

'When the grumblers came to work next morning, one of these four thermometers was on each wall of the room. I said nothing, but came in occasionally and looked at one or the other of them. It was a raw day and the room was just healthily comfortable, but before noon more than one of the former kickers complained of the heat and after that we got along beautifully.'

ɾ ɾ ɾ

'Among other things that are passing,' said ***the Young Farmer,*** 'is the hired man. Time was when he was as much of an institution as the crossroad store; and he was a character, too, sturdy, honest, independent, a hard worker, given to much boasting, a good story-teller and usually generous to a fault. The hired man used to find a place in a certain family—sort of headquarters he would make it—and usually he was treated as one of the family. He drove a good rig and he wouldn't hire out unless he could get free board for his horse. You would always find him at the country dance and no community picnic or fair was a success without him. Often he was the spendthrift of the neighborhood. He was good-natured and kind and the youngsters always liked him. I spent a good many hours in the fields when I was a child, with our hired man.'

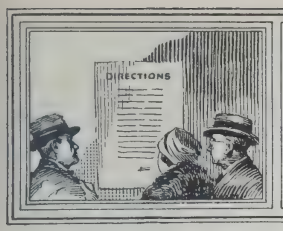
'Why is he passing? Where has he gone?'

'Modern machinery has replaced him to a certain extent. Industry has called him to the city. More than all that, he doesn't seem to fit in somehow with modern farm life. He is just another outgrown institution.'

ɾ ɾ ɾ

'For a number of years,' said ***the Englishman,*** 'I have watched the army of tourists which annually crosses to Europe from the United States. These visitors search most eagerly in London for anything of interest. They go at their sight-seeing with such zest and zeal that we Londoners are sometimes put to it to appear intelligent before the barrage of questions. Like everything you Americans do, your touring is done on the basis of volume and tourists do their sight-seeing on production schedule. The trips are mapped out ahead of time. There are so many cathedrals, so many museums, so many art galleries to be seen each day. The speed with which these tours are conducted allows for glimpses at buildings and monuments, but it does not give the opportunity of looking into the mind of the European. Only the surface is apparent. We are sorry for this, since many of the parties are from your colleges and universities and it is upon these young people that the future international relationships will rest.'

ɾ ɾ ɾ



'I see that the goose-bone man, after working on the crude anatomy of some old gander, predicts a hard winter and early spring,' ***the Naturalist*** said, 'while the hornet-nest man and the crawfish-tower man hold a directly opposite idea. The migratory-bird man is rather in a stew; some birds have gone south earlier and others have remained to defy the weather, contradicting each other by all previous signs. The hellgrammite and tree-moss man have not been definitely heard from, even as yet; they, too, probably have conflicting signs.

'Oh, the gullibility and lack of logic of a host of good folks! Will it never occur to them that the dumb creatures know even less about the coming seasons than does shortsighted mankind and that they act only in the present. Even the squirrel, pouched gopher and bee obey a blind instinct when they store up food. That this instinct is akin to man's simpler, nearly involuntary actions and is governed only by immediate conditions and needs there can be no doubt. Some goose bones grow thick, fat layers and some grow thinner ones every year. Some hornets build high and others hang their nests low each summer season and these nests are begun in spring so that these creatures must be the champion prognosticators to make a guess so far ahead.

'I well remember the winter of 1903-04 throughout the Middle States. There was a general prophecy from the believers in signs and, rather unusually, they all appeared to agree upon a mild winter, the goose-bone man being especially certain. Before Christmas the face of Nature was covered with ice and it remained that way pretty much until the end of February, with so much zero weather that water pipes were frozen three feet under the ground—a godsend to the plumbers. That ought to have been enough, but not so. The very next season the goose-bone man and his associates in absurdity were at it again. Perhaps once in a decade they hit it and then: "I told you so; it never fails."'

ɾ ɾ ɾ

***The Visitor from Poland*** told of driving through a typical American Main Street in a village of 4,000 population. He noted the well-kept lawns, the substantial and comfortable houses. 'This,' he observed, 'is the real America. Here live in comfort, I am told, your day laborers, your carpenters, your mechanics, your clerks and people of modest income. Happy will be that day in Poland when our common people can live in such houses. And this has been done in America, not by communism or socialism, but by economic processes. No revolution, no overturning of society, but rational application of economic laws explains this remarkable prosperity, this richness of life of your whole population.'

# Can You Tell Me?

QUESTION: How many nations have accepted the United States' reservations to the World Court?

ANSWER: To date, seven nations have accepted the reservations. These are: Cuba, Greece, Liberia, Uruguay, Albania, Dominican Republic and Luxemburg.

ǂ ǂ ǂ

QUESTION: What was the amount of the campaign expenditures for the Senate of Pepper, Pinchot, and Vare, in Pennsylvania this year?

ANSWER: The Senate Committee which investigated the campaign expenditures states that $1,804,979.25 was spent in Pepper's behalf, $800,114.60 for Vare, and $188,489.17 for Pinchot.

ǂ ǂ ǂ

QUESTION: How much money has Germany borrowed abroad since the adoption of the Dawes plan, and from whom?

ANSWER: Germany has borrowed approximately $950,000,000 since the adoption of the Dawes plan. Of this amount, $435,000,000 was borrowed in the United States, $58,000,000 from Holland, and the rest from Great Britain, Switzerland, and Sweden.

ǂ ǂ ǂ

QUESTION: Is the United States self-supporting?

ANSWER: In a recent statement, the Research Department of the Shipping Board says that we are not. Four-fifths of our sugar is imported, and our paper industry is dependent upon Canadian pulp wood. In addition, we import rubber, tea, coffee, silk, potash, nitrates, and great quantities of vegetables, as well as many other products.

ǂ ǂ ǂ

QUESTION: Who is the head of the Aviation Service of the Army?

ANSWER: F. Trubee Davison is Assistant Secretary of War in charge of Aviation.

ǂ ǂ ǂ

QUESTION: What is Trotsky's real name?

ANSWER: Trotsky's real name is Leon Bronstein.

ǂ ǂ ǂ

QUESTION: What is the fifth reservation to the World Court?

ANSWER: The fifth reservation to the World Court reads as follows: 'That the Court shall not render any advisory opinion except publicly after due notice to all States adhering to the Court and to all interested States and after public hearing or opportunity for hearing given to any State concerned; nor shall it, without the consent of the United States, entertain any request for an advisory opinion touching any dispute or question in which the United States has or claims an interest.'

QUESTION: Did exports from the United States last year exceed imports, and how much?

ANSWER: The excess of exports over imports for the fiscal year ended June 30, 1926, was $286,828,711.

ǂ ǂ ǂ

QUESTION: Since there are no quota limitations for South America, under the present law, may an alien by first coming to a South American country be admitted to the United States outside of quota restrictions?

ANSWER: Under the present law, aliens entering South America from other countries and proceeding from there to the United States must be entered under the quota of the country from which they originally came.

*In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.*

QUESTION: How much money is spent annually for admission to motion picture theaters.

ANSWER: Movie fans spend approximately one billion dollars in admission fees yearly.

ǂ ǂ ǂ

QUESTION: How much crude petroleum was produced in the United States last year?

ANSWER: The total produced was 763,743,000 barrels, according to the Bureau of Mines.

ǂ ǂ ǂ

QUESTION: What is the present status of the Child Labor Amendment?

ANSWER: The State Department advises that the Child Labor Amendment has been ratified by four states (no others have yet reported ratification to the Secretary of State), Arizona, Arkansas, Wisconsin, and California, according to official advice to the department to date. It must be ratified by two-thirds of the states before it can become law.

ǂ ǂ ǂ

QUESTION: How many immigrants are permitted to enter the United States this year?

ANSWER: 164,667.

QUESTION: How much vacant public land does the Federal Government now hold?

ANSWER: A recent statement from the Interior Department says that: 'At this time the Government has 142,109,401 acres of surveyed public domain vacant and unappropriated while 57,040,365 acres remain unsurveyed.'

ǂ ǂ ǂ

QUESTION: Have any of the German reparations been paid to the United States?

ANSWER: The United States was credited with its first payment of $5,904,771.40 in the last week of August, 1926.

ǂ ǂ ǂ

QUESTION: Has the Federal Trade Commission ever reported to Congress the results of its investigation of the effects of the future trading in grain?

ANSWER: Yes, the Commission has sent to Congress Vol. VII of its report on the grain trade, which is the final volume of the report and deals with the effects of future trading.

ǂ ǂ ǂ

QUESTION: Is there any book published that will explain all the involved and mystifying clauses in my fire insurance policies?

ANSWER: Address the Insurance Department of the Chamber of Commerce of the United States, Washington, D. C.; they have recently issued a bulletin regarding the subject.

ǂ ǂ ǂ

QUESTION: Are any Chinese admitted to the United States under the present immigration laws?

ANSWER: Under the 1926-27 quota, 100 Chinese may be admitted to the United States.

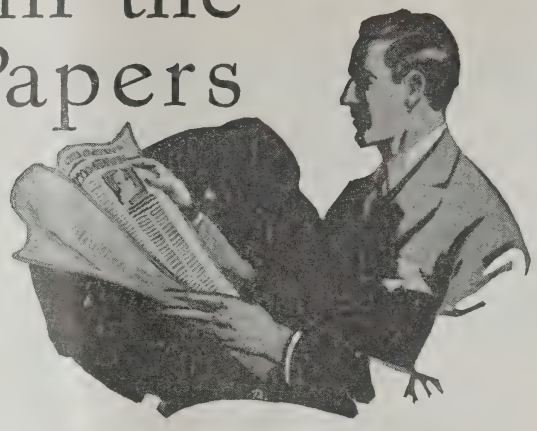
ǂ ǂ ǂ

QUESTION: How many cigarets are produced daily in the United States?

ANSWER: Nearly eight billion cigarets were produced in the United States in July of this year.

ǂ ǂ ǂ

QUESTION: What proportion of the average American's income goes to pay for purchases made on the installment plan?



ANSWER: The American people are said to be paying approximately one day's wages each week as principal and interest payments on articles bought on the installment plan.

ǂ ǂ ǂ

QUESTION: How much is spent annually on cosmetics in the United States?

ANSWER: About $141,488,000 last year. The cost of beauty is high.

# I Read in the Papers

There has been a suggestion that the next national encampment of the Grand Army of the Republic be held in Washington and that it be combined with that of the Confederate Veterans—the Blue and the Gray to march arm in arm down that historic highway that leads from the Capitol to the White House in one grand parade, as an evidence of our complete national unity and harmony.

*A Thought for the Last Parade*

Should this idea be worked out to a successful conclusion it will be the most thrilling demonstration this country has ever witnessed.

The ranks of the veterans of the Civil War are rapidly thinning out. Those who remain are feeling the weight of their years, and the days through which they may continue to 'carry on' are numbered.

Why not carry the idea a little further? Let this be the grand final parade of the united veterans of our civil conflict. At its conclusion, let them turn over, with appropriate ceremonies, the burden they have borne through all the years, to the American Legion. It is in this great organization that the sons and grandsons of our honored veterans are now serving, and it is fitting that the mantle should fall upon their shoulders.—*Army and Navy Register.*

Any poor, ignorant boy, as any poor, ignorant boy knows, has a chance to become President of the United States. But no boy is so ignorant as to believe that any poor boy may become a Pennsylvania Senator.—New York *World.*

ɤ ɤ ɤ

*The Boats of the Norsemen*

It was in large undecked boats that the voyages described in the Saga of Eric the Red were made, from Norway to Iceland, thence to Greenland, and later south to the American 'Vineland,' while for more than two centuries similar ships of the Danes spread terror through the coasts of Scotland and of England and penetrated even the estuaries of Ireland.

For propulsion the Norse ships relied mainly on oars, worked by their large crews of sixty or more men, but they carried one mast amidships, on which a square sail could be set athwartship when the wind was favorable. The same square sail is still used in the more remote parts of Norway, but in other lands it has given way to one or more lug sails, set fore and aft in the boat, which enable some progress to be made against a contrary wind.

An item of particular interest in these ancient vessels is the rudder, which was not hung from the sternpost as it is in modern craft, but was supported on the quarter, the starboard or steerboard quarter, in such a way that it could be rotated about its axis by means of a short handle or tiller which projected into the vessel, an arrangement which shows considerable affinities both to the steering paddles of the ancient Egyptians and to the quarter-rudders still used on the Ganges and the Irrawaddy. —*The Nineteenth Century and After.*

United States warships have been ordered to Nicaragua to protect the lives of American citizens. Funny the Government never sends a fleet to Chicago.—Portland *Oregonian.*

ɤ ɤ ɤ

*'It Is Me'— Is It Good English?*

The College Entrance Examination Board has decided, it appears, that 'it is me' is good English, making its decision on the ground that 'it is I' is affected. Barrett Wendell, long ago, we recall, arrived at the same conclusion from the slightly different premise that custom, by sanctioning the usage, had made it proper. Yet the weight of critical opinion still sets against it, or did until the academic decree caused a mild ripple in linguistic waters. Where, asks critical opinion, are we going to stop if we yield to the mistakes of the ignorant or the carelessness of the indifferent? Who is to say us nay if we prefer 'he don't' to 'he doesn't,' or 'different than' to 'different from'? Who are to be the arbiters of language, the masses or the scholars?

The old heralds gave Adam a coat of arms; modern genealogists give him a coat of fur and possibly a tail.—*Dean W. R. Inge.*

ɤ ɤ ɤ

*Change Comes in Prairie Landscape*

A gradual change in the general prairie landscape is taking place in Western Canada as a result of the coöperative tree-planting work being carried on by the Forestry Branch of the Canadian Department of the Interior. Thousands of shelter belts have been established from seedlings, cuttings and transplants distributed from the government nursery stations. During last spring more than 5,500,000 seedlings and cuttings of such varieties as maple, ash, caragana, poplar, and willow were sent out free to farmers. In addition to these more than 50,000 evergreen spruce and pine trees were distributed at nominal cost for general farm planting and about 60,000 for planting on forest reserves in Manitoba and Saskatchewan. The total distribution for a twenty-five year period has been 87,205,000 trees to 80,300 farmers scattered over the three prairie provinces. The effect of tree planting on the social and economic life of the provinces is considerable. Shelter belts have made the prairie homestead more homelike and comfortable, while by checking the high winds and conserving moisture the production of the farm is increased.

ɤ ɤ ɤ

*Japan Turns From Rice as Sole Diet*

Baron Masuda, of Japan, and other leaders have undertaken to alter the food customs of thousands of years, by trying to relieve the Japanese people of their helpless dependence upon rice as the staff of life. More than half the soil of the islands is taken up with rice culture, and still does not supply each individual with the five bushels he needs for his year's nourishment. Formerly Japan called for extra supplies from China and other mainland countries, but the Chinese wars have so diminished all agriculture that that country has barely enough for herself. Baron Masuda can see possibilities of calamity like that which has overtaken districts in India.

The remedy sought is in educating the Japanese to enjoy other cereals, many of which are really more nourishing, richer in gluten and fat than rice. Today the Japanese must have rice, no matter what other food has been served, while he may feel satisfied if he has rice alone. Westerners can hardly appreciate how this one grain can be so vital, for great civilizations rose and fell in Western Asia and Africa and Europe without even knowing that there was such a grain. But rice is the bread of Eastern Asia, and deprivation of this means deprivation of life to half the population of the world.

*Future Trade Will Be on Pacific*

The greatest trade development of the 20th Century will be on the Pacific, and will be directed toward China. The purchasing power of the Chinese is steadily growing and this, together with the increase in earning power of the Chinese laboring classes which constitute four-fifths of that country's population, point to a most optimistic commercial future. Only the fringe of China—the Treaty Ports and the territory adjoining these—has been penetrated by Europeans and Americans. The interior has scarcely been touched commercially, and the development of the Chinese hinterland will be the great commercial undertaking of the next fifty years. Vast grain elevators are being erected in the Treaty Ports to satisfy the increasing demands for wheat and flour which are being registered by the Chinese.

# Briefly Told

SEA BATHING WAS HELD scandalous in England until the beginning of the 19th Century, and persons who took a dip in the ocean were apt to be forcibly 'retrieved' by those who thought they had gone mad.

RADIO TESTS TO determine the permanency of the earth's crust will be conducted during October and November by the International Astronomical Union.

A MUMMIFIED HORSE, the first known to history, has been unearthed in Egypt. It is more than 16 hands tall and estimated to be about 3,500 years old.

'IF THE POLICE HAD a mind to enforce the law they could close every illegitimate drinking place in the land in fifteen minutes.'
—*Andrew W. Volstead.*

WHEN OPENED RECENTLY a 3,000-year-old jar of perfume found in an Egyptian tomb still retained its fragrance.

EVERY ENGLISHWOMAN IS a lawbreaker unless she wears flannel, ancient laws regulating wearing apparel having never been repealed. Under a decree of Henry VIII, wives who disobey their husbands may be whipped.

AN AMATEUR GARDENER declares that his plants draw energy from his radio aërial. Cucumbers and tomatoes, he says, are particularly susceptible, growing to enormous size.

ONE AMERICAN BOY IN every ten between the ages of twelve and eighteen is listed as a Boy Scout.

THE KING OF BULGARIA has two pet elephants which he has personally taught to carry lumber and do circus tricks.

LOBSTERS MAKE LOVE to their mates much as do humans, according to an English scientist.

OLD RECORDS OF THE MOBILE and Ohio Railroad show that slaves were hired out to the railroad by their masters. Their services were valued at $20 to $25 a month according to their physical abilities.

GREATER LONDON HAS 2,300 miles of streets and their upkeep costs about $15,000,000 a year.

TIPPING IN SPANISH hotels is now forbidden, the tipping charge being added to the regular hotel bill.

WITH THE MARRIAGE season nearing, the Straits Settlements have imported $125,000 in American gold coin. This is melted into ornaments for the brides.

IN KOREA WOMEN ARE taught that the greatest feminine virtues are silence, humility and timidity.

BARBER SHOPS IN PARIS have leased their ceiling space to advertising concerns. Patrons are thus forced to read the ads while the barber shaves them, unless they desire to close their eyes.

ARMY OFFICERS CONSIDER that next to his rifle the most important part of an infantryman's equipment is his shoes.

THE COST OF LIVING has declined 1.7 per cent during the past six months, according to the Department of Labor

FROCK COATS AND SILK hats are reckoned among the necessary habiliments of successful commercial travelers in South America.

A SYSTEM OF IDENTIFICATION by the teeth, said to be as accurate as the fingerprint method, is being worked out by the Navy Department

AMONG SURNAMES IN ENGLAND the commonest are Smith, Jones, Brown, Taylor, Davies, Wilson, Walker and Morris.

MEN MAY RIDE ON TEXAS trains in their stockinged feet with the full sanction of the railroad commission of that state. The decision comes as a result of a petition from a woman who demanded that men be prohibited from removing their shoes, boots or sandals while riding on trains.

METAL FURNITURE MANUFACTURED in the United States is finding a ready market in tropical countries, where it furnishes better resistance to white ants and other insects than the wooden type.

THE FIRST MUNICIPAL PUBLIC conveyance was used in Nantes, France, in 1825. A few years later the omnibus was introduced into London.

A SUPPLY OF SALVE which he used on the natives saved a missionary to the South Sea Islands from being cooked and eaten by cannibals.

NAPOLEON HOUSE IN NEW ORLEANS, to which friends of the Little Corporal planned to take him after effecting his rescue from St. Helena, is offered for sale. Napoleon died before the rescue could be accomplished.

ENGLISH IS BEING TAUGHT over the radio in Japan. Recently the instructor dwelt on expressions of politeness. The best way to learn them, he said, was to bump into English-speaking foreigners on the street, then bow smilingly, and remark, 'I beg your pardon.'

TRADING RIGHTS OF THE Moravian Church in Labrador have been sold to the Hudson's Bay Company. The church had maintained missions and posts in Labrador since 1771.

OUT OF THE 932 LONDON policemen accidentally injured while on duty during the year, 115 were bitten by dogs

SUBSIDIES WILL BE granted to heads of families in Spain who have eight or more children dependent upon them. There are in Italy 10,000 families with ten children or more each.

OFFICERS FROM FOURTEEN foreign countries will train at United States Army schools or with American troops during 1926-27.

A LIVE TURTLE ON whose shell was carved the date 1815 was found recently in Connecticut.

A MACHINE FOR CONVERTING corn into sugar in ten hours has been developed.

IT COSTS THE UNITED STATES approximately $2,000 a year to maintain one of its soldiers; Great Britain, $1,572; and France, $263.

THE OLDEST INHABITED castle in Scotland is that of Dunvegan in the Isle of Skye. After being lighted by tapers, torches and candles for nearly a thousand years, it has now been wired for electricity.

'I HAVE NEVER MET A person who could truthfully claim he had not made a mistake and I do not know as I would care to meet any such mortal.'—*Chauncey M. Depew.*

EXPERIMENTS SHOW THAT it is possible to produce flour from bulrushes. The flour is said to be high in nutriment.

THE NAME SING SING COMES from the Sin-Sinck Indians, original inhabitants of the region in which the prison now stands.

NO POISONOUS REPTILES and few wild animals are to be found in Japan.

A WEALTHY PARISIAN HAS left $10,000 to his cook because she was the only one who could make soup to satisfy him.

DOGS HAVE A WHOLESOME fear of fire. A delivery man recently saved himself from attack by two vicious dogs by tossing lighted matches at them as they lunged at him.

# NOTES COMMENTS CRITICISMS

MR. FORD'S page this week discusses the struggle between finance and industry for the control of business.

The living Constitution is as vital to the life of America today as it was at the time of its birth, 139 years ago. The nation has come to look upon the Constitution in the abstract. (p. 5)

*Allan L. Benson interprets the Constitution in a new way. He shows its human side. He tells of the problems that faced Washington and his fellows. The Constitution is a vividly human document, one reflecting the hopes and the ideals—and yes, even the weaknesses—of its framers. You will be better able to understand it after reading this article. A newspaper editor of wide experience, Mr. Benson has been devoting himself in recent years to magazine writing.* (p. 5)

Allan L. Benson.

Here's a good way to spoil your day: When you get up tomorrow morning decide to pass the day trying to determine how many taxes you pay *in one day alone*. Not just the open taxes, the *hidden* ones. Samuel Crowther outlines the necessary steps. (p. 1)

The poor man bears the heaviest tax burden in the nation, even though he may think he is tax-free. If your income is twenty-five hundred dollars a year or less and you are a married man with a family, you pay more for taxes than you do for food. If your income is less than five thousand dollars, you pay more for taxes than you do for clothing. (p. 1)

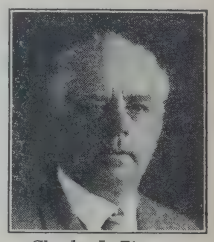
Few writers have the business acumen of Mr. Crowther. He is widely known as author and foreign correspondent, and he writes in a sharp, penetrating style that pierces to the very heart of his subject. If you think taxes a dull topic, read this article and see how interesting and important they really are. The article is first of a series. (p. 1)

Swindlers mulct the American people of a billion dollars a year. Many articles have dealt with the results of their frauds; this deals with the *prevention*. J. Olin Howe is a former New York newspaperman. Ralph W. Budd is manager of a detective agency. (p. 2)

From one of the greatest of American novelists comes this letter:

I am sympathetic with your purposes, and I have been enormously interested in the campaign of THE DEARBORN INDEPENDENT from the beginning. It is the only journal I know that is entirely free of the advertisers' club. I am particularly bitter when I see the stream of corrupting literature which certain publishers of foreign tastes and prejudices are pouring out. Anything I can do to keep in mind the sturdy virtues of our forbears I shall do.

From Victor L. Waters, Kim, Colorado: I would like to see the bugbear of taxation so minutely dissected that any ordinary person could see clear through without an X-ray and apply the solution to his own case. Give the man who wrote the 'Tragedy of the West' an assignment on the 'Tragedy of the East'—the floods, the worn-out lands, the stuffed cities—then drown him.



[EDITOR'S NOTE: Mr. Waters is respectfully referred to Page 1 of this issue.]

From W. A. Richardson, Kendrick, Colorado: Show up some of the high graft that is going on in this country. You know nowadays a grafter is looked upon as a high-toned gentleman and a poor man without graft is out of luck, no matter how honest.

[EDITOR'S NOTE: Mr. Richardson is respectfully referred to Page 2 of this issue.]

Success was near. Magellan had at last left unknown seas. He had rounded the world far enough to be close once more to the outstretched fingers of Western civilization. He had accomplished what no other man had. And then he was killed. (p. 16)

*There was tragedy in his death—the tragedy of frustrated purpose. But there was not nobleness. Charles J. Finger paints a brilliant picture of the man. Mr. Finger is on a familiar topic when he writes of the sea, for he has 'sailed before the mast,' and has retraced much of Magellan's journey. He has also hunted gold in Africa, explored in Mexico, visited remote parts of South America, collected cowboy ballads in Texas, and has been a student of music, a railway manager and an editor.* (p. 16)

Charles J. Finger.

GOVERNORS are often severely criticized for freeing criminals from prison. Here is a human story by a humane governor—George W. Hays, former chief executive of Arkansas. (p. 3)

Governor Hays' story suggests a number of questions about our whole punitive system. In how far does prison repair the damage done by the criminal to society and to himself? In connection with the article it should be borne in mind that Arkansas has a foreign-born population of only one per cent, while in a large eastern state such as New York it constitutes thirty-seven per cent. (p. 3)

Dr. Joseph Collins last week told of the cause of nervousness; this week he tells of the cure. The article is a rare one, for it combines not only the knowledge of the specialist but the facility at expression of the trained author. In addition to his reputation as a literary critic, Dr. Collins is famed as one of the nation's outstanding neurologists. (p. 6)

There's a story on gold hunting in California in the early days. It's transcribed into narrative form from the diary of one of the pioneers by his daughter. (p. 12) . . . And May B. Whiting, a frequent contributor, writes in her delightful way about Casco Bay where fish abound that would have astounded Izaak Walton. (p. 8)

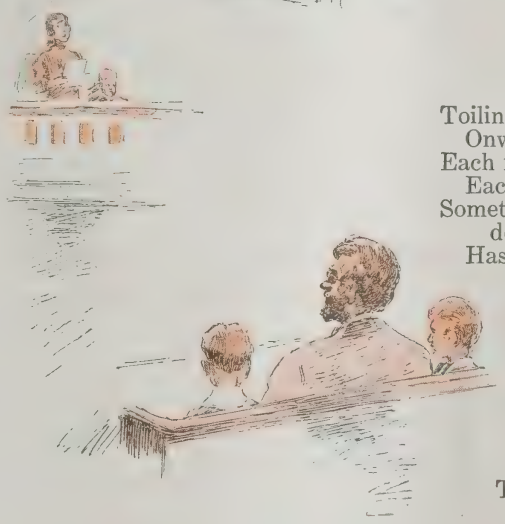
# The Village Blacksmith



by
~Henry Wadsworth Longfellow

*From* McGUFFEY'S FIFTH ECLECTIC READER *Edition of 1853*

Under a spreading chestnut tree
The village smithy stands,
The smith, a mighty man is he,
With large and sinewy hands;
And the muscles of his brawny arms
Are strong as iron bands.

His hair is crisp, and black, and long;
His face is like the tan;
His brow is wet with honest sweat;
He earns whate'er he can,
And looks the whole world in the face,
For he owes not any man.

Week in, week out, from morn till night
You can hear his bellows blow;
You can hear him swing his heavy sledge
With measured beat and slow,
Like a sexton ringing the village bell,
When the evening sun is low.

And children coming home from school
Look in at the open door;
They love to see the flaming forge,
And hear the bellows roar,
And catch the burning sparks that fly
Like chaff from a threshing-floor.

He goes, on Sunday, to the church,
And sits among his boys;
He hears the parson pray and preach,
He hears his daughter's voice,
Singing in the village choir,
And it makes his heart rejoice.

It sounds to him like her mother's voice,
Singing in Paradise!
He needs must think of her once more,
How in the grave she lies;
And with his hard, rough hand he wipes
A tear out of his eyes.

Toiling, rejoicing, sorrowing,
Onward through life he goes;
Each morning sees some task begin,
Each evening sees it close;
Something attempted, something done,
Has earned a night's repose.

Thanks, thanks to thee, my worthy friend,
For the lesson thou hast taught!
Thus, at the flaming forge of life,
Our fortunes must be wrought,
Thus, on its sounding anvil, shaped
Each burning deed and thought.

# *Good Old Times*

AUNT JEMIMA reads the paper and exclaims, 'These deadly cars! Yesterday they maimed a draper and a dealer in cigars. They collide at every crossing, while immoral drivers swear, every minute they are tossing human bodies in the air. Always someone being mangled, always someone being slain; is it strange my nerves are jangled, that my topknot has a pain? We had no such grievous worries in the good old happy days, when we rode around in surreys, driving stately dappled bays. Would that Dobbin were returning from the shades where he is gone; for a joyride I am yearning, for a joyride, Dobbin-drawn!'

Said I, 'No sane man indorses such a wish as you express; I look back to dappled horses with a feeling of distress. Once I drove a spangled charger by the dingles and the fields, and my crop of grief was larger than my auto ever yields. Once a zephyr blew a paper, and old Dobbin shied thereat, and he cut a foolish caper like a circus acrobat. He upset the buggy, auntie, then he ran twelve miles or more, and they bore me to my shanty on a borrowed cellar door. Once I went to see the pageant of the circus at our gates, and old Dobbin seemed the agent of the furies and the fates. When he saw the gnu and tapir and beheld the tall giraffe, he kicked up another caper and he split the rig in half. I was crippled up, you betcher, crippled up both front and back, and they bore me on a stretcher to the portal of my shack. Let us not, dear aunt, be blinded to the truth that makes men free; horses all are feeble-minded and as fatal as can be.

'We are prone, as we grow older, to look back, with eyes distrest, and to say, in words that smolder, that the old things were the best. But the old things all were phony as compared with modern things, and an auto beats a pony all to smithereens, by jings. If you had to drive a sorrel or a buckskin or a bay, you'd be saying things immoral every minute of the day. Do not let your cheeks grow wetter with the tears of vain regret, for the world is growing better; progress is the one safe bet.'

# *Insuring their Safety with Firestone Tires*

The woman of today has made it her personal business to have every motoring safeguard at her disposal.

She knows that tires play a most important part in safe driving. She knows, too, that Firestone Balloons are built to provide extra safety and dependability, regardless of weather or road conditions—and that Gum-Dipping, the extra Firestone process, gives the greater strength and endurance that assures thousands of extra miles of trouble-free service.

The Firestone Full-Size Gum-Dipped Balloon is scientifically designed with a real non-skid tread that grips the road without skidding, giving the driver confidence in any kind of "going."

The pliable Gum-Dipped cord construction gives this tire unusual cushioning that absorbs road jars, eliminates annoying rattles and provides genuine riding comfort.

Then, too, the distinctive design and attractive appearance of Firestone Tires make a special appeal to the discriminating woman, no matter what car she is driving. Let the nearest Firestone dealer call at your convenience.

# Why Half the People Do Not Vote

## AN EXPLANATION

*By* ALLAN L. BENSON

IF $100 bills were to be passed around this fall, what percentage of the population do you believe would take the time and go to the trouble to walk a few blocks to get their money? Possibly about ninety-nine per cent would be the correct figure. A compound fracture of both legs would hardly be sufficient to keep some men at home. Everybody would be out except those who were in jail or in bed, with nurses looking after them. People can always be made to bestir themselves, provided they are interested in what is offered and believe they can get it.

Not so many would come out if they doubted whether they could get the $100. If they had made the trip several times without getting anything some would forever after remain at home. No man's time is worth so little that he wants to waste it in a manner that gives no pleasure.

How can you vote this fall, or at any other election without feeling that, in some respects, you are wasting your time? You are certainly wasting your time—more than wasting it—if you vote for things that you don't want. As to the things for which you vote, yet do not want, it would have been better if you had remained at home.

How can you vote only for those things that you want? You vote for a candidate for a certain office, let us say for a member of Congress. He stands for something that strongly appeals to you. You put that to the front of your mind and make your choice in his favor. But it is hardly likely that he agrees with you in everything. You may have voted for him because of his attitude toward prohibition, whereas he differs from you with regard to the League of Nations, the World Court, foreign debts and many other matters upon which, as a member of Congress, he will be called upon to vote. When he votes he cannot represent you unless he votes as you, if you had been in Congress, would have voted. Every time he votes against your wishes he does something to make representative government a failure, since representative government has no other virtue or purpose than to enable the people to express their wishes through those whom they elect to office.

*As a people we are not competent—nor shall we be for a long time—to pass upon many technical matters that must concern government. We can get men who are competent and we should get them. Moreover, we should give them power, subject to our peremptory order to halt. We should have a more efficient and a better government if the President, for instance, had the right to say to the people: 'Unless you object, I shall, at the end of six months, do so and so.' During the six months, the people could talk the matter over among themselves, make up their minds, and vote upon the matter. Once a year would be often enough, perhaps, to take a vote on such things. Frequent consideration of public questions would constantly increase our fitness to govern ourselves—and things would get done. There is no use letting things drag along year after year unsettled because our machinery for settling them has so much more braking power than it has engine power.*

Lack of interest in government and decreasing confidence in legislative bodies are the chief characteristics of modern political developments. In Spain, Italy, Poland, and some other nations in Europe, the people have so little confidence in legislative bodies that they have permitted dictators virtually to do away with them. In the United States we have so little interest in government that even in Presidential elections only about half of the qualified electors take the trouble to vote.

What is the matter? The explanation seems fairly simple. One cannot vote for many things that he wants even if he does vote. We are compelled to vote for men and prohibited from voting for measures. It has been so from the first but never until now did we feel it so much. One never feels the denial of a right that he does not want. In the beginning, nobody wanted the right to vote upon measures. Our forefathers were content to get a chance to vote for men.

A great deal of water has gone over the millwheel since then. The public schools have been busy. Tens of millions of adults know how to read. Daily newspapers are now read by those

whose ancestors—some of them—seldom saw even a weekly. Isolation is ended. With better transportation and more population, everybody talks to some one every day. Public questions are discussed. Opinions are generated about this and that. But when the time comes to express one's opinions at the ballot box and make them effective there is a hitch. No opinions are wanted there. We can vote only for men, not one of whom shares many of our opinions. The result is that voting is becoming increasingly ineffective. The more opinions we have the more nearly impossible it is to find a candidate for office who shares any considerable percentage of them.

WHAT is the remedy? It isn't to try to compel people to vote, whether they want to or not. The Swiss tried that for more than 200 years and gave it up because it would not work. A great deal of nonsense is uttered about our 'slacker' voters.

What is a vote anyway? As far as the public is concerned is it anything more than the contribution of him who casts it to the fund of public wisdom that is being accumulated to solve the question at issue? But suppose the voter has no wisdom—ignorant, in other words. That lets him out. Or suppose that none of the candidates for whom he may vote holds the views that he holds? Did you ever see an election in which you were opposed to all of the candidates? If so, was that because you had lost interest in government or because the candidates did not represent you? If you had been compelled to vote, anyway, what good would your vote have done for you or anybody else? Wouldn't you have been glad to vote if you could have voted for the things you wanted?

The remedy for our growing lack of interest in voting is to give us an opportunity to vote for measures as well as for men. Representative government should not be dispensed with. We cannot settle every little thing by ballot. But we can settle the big things. We know enough now to do that. We have gone a long way since our government was established. The political clothes that fitted us then are too small now. We have ideas that we want to express. We can express them if given a chance. We haven't much chance as long as we are compelled to vote for men.

Here is one of a thousand illustrations that might be given. The writer knows a United States Senator who is a member of a certain religious denomination. Church people vote for him because he is a church man. As a church man they assumed, when they voted for him, that he was also a prohibitionist. He never drinks a drop and, furthermore, all of his church training tended to put him on the side of the drys. But he votes as wet as the wettest. He has so many large cities in his state that he feels he has to vote wet to be reëlected.

What are his church constituents to do when he comes up for reëlection? They can vote against him, on the prohibition issue, of course, but what will that do to the rest of their political beliefs? As to some other measures, this Senator really represents them. He believes as they do about the League of Nations, the World Court and foreign debts. Or, rather, he believes as some of them do, because they themselves do not all hold the same views. If they put him out, on the prohibition issue, they also put him out with regard to some things concerning which they agree with him.

The remedy for lack of interest in the ballot is to make the ballot of more interest to us. Give us a chance to use the ballot more effectively. Instead of compelling us to vote only for men, as we usually have to do if we vote at all, let us vote for measures as well as men. Lawful ways could be provided to bring the principal issues before the voters. What an election we should have this fall if the people were permitted to vote for the things in which they are really interested.

Nothing but big questions should be submitted. Nobody wants to vote on the little things. Let our representatives attend to them. But we do want to vote on the big things. Every vote would then be a bull's-eye. No voter would be misrepresented about anything. And when we had finished, we should definitely know where we stood. That is more than we now know about any of these questions. We think we know we are overwhelmingly against the League of Nations, and we probably are against it, but nobody definitely knows.

In the beginning, Mr. Coolidge thought we were overwhelmingly in favor of the World Court, but it was only his guess and since then he has considerably slackened off on his guess. He now doubts whether he was right in the first place as to what we thought.

If we could have voted on the subject we could have told him and he would not have had to guess. Think of running a country that way—leaving the President to guess what we want!

WE have assumed too long that the democratic ideal was handed to us by our forefathers in a final, finished state. That is a mistake. Nothing in this world is final. The democratic ideal was made for man, not man for the democratic ideal. As man changes—as he grows or shrinks—the ideal must change or there is a misfit. We are not shrinking, we are growing. From experience we are increasing both our interest in and our knowledge of public affairs.

Yet we have never wholly governed ourselves and probably never shall. Self-government could never be complete and notably successful unless the great majority of the people were expert in every branch of its practice. Such a people have never existed, nor is it likely that they will soon exist. Yet we are very much in need of the kind of government that only experts can give. Government is not a job for politicians—it is a job for the best trained brains we can find. And these trained brains, having been found and placed in office, should have power to act. It should not take the greater part of a generation to put into effect an idea which experts agree is practical and desirable. That is the great defect of democratic government as the world has come to know it—it is inefficient and it is slow.

Now an inefficient government is no more to be desired than any other form of inefficiency. Democratic governments lack push primarily because they are manned by politicians, secondarily because we have always hesitated to give our public officials much power. We have hedged them about with obstructions. Somebody's bright idea is thrown into the ring and, after years, finally appears in a party plat-

# Booth Tarkington
## *Talks of Many Things*

*By* MAY B. WHITING

'WE ALL know Booth Tarkington,' an old ferryman on the Kennebunk River told me, 'and he knows everyone and everyone is his friend.'

That well expresses the sentiment of the country, too, for all who have read Mr. Tarkington's stories have sensed the kindly, sympathetic spirit which created them and have felt that they knew the author as a comrade. And Mrs. Tarkington has the same genial spirit of companionship, the gift of seeing a neighbor as a fellow-farer. She is a handsome woman who at once gives the impression of generous, cheerful efficiency, and, to quote the same homely but sincere acquaintance, 'Everybody likes her. They can't help it.'

Pictures of Mr. Tarkington are familiar to magazine readers, but none, I think, gives an adequate portrait of the man. For one thing, Mr. Tarkington is noticeably tall and broad-shouldered, but the unusual size of his head detracts from the impression of height in a picture. Then, too, no photograph can portray the eyes, for they are deep-set, dark brown, and forever changing from a thoughtful expression to a mirthful, boyish twinkle with merry little lines at the corners.

From early June until mid-November Mr. Tarkington lives at Kennebunkport, Maine, so that New England has a claim on him as well as the Middle West. His handsome cottage, *Seawood*, is in colonial style, with a beautiful garden in front and a long winding entrance drive. In the rear are the hills, fragrant with wild rose, fir, and juniper. The porch is particularly attractive with its cobblestones and its flowers, and in the vestibule the fan doorway, hooked rugs, mahogany table and silver candlesticks, give a charming air of welcome.

Of course the most interesting room is the study. It is two steps down from the rest of the house, and is spacious and airy. Mr. Tarkington does not write in such wide, luxurious quarters, but in a little balcony overlooking, where the simple furnishings do not tend to distract the attention.

For there is a great deal in the study to set the mind roving. There are carved chests and tables and curios from abroad where Mr. Tarkington lived for five years, and, revealing his interest in people, a fascinating collection of dolls dressed in the costumes of far lands. Besides these, and much more alluring to run-away thoughts, are pictures of ships and a delightful array of ship models, for ships are Mr. Tarkington's hobby. There are ships of our old navy, Spanish galleons with all sails set, wicked pirates with the Jolly Roger floating and the bad men themselves, be-sashed and be-kerchiefed, on the decks, and there are models of good, sensible 'down-easters' that cleared from Kennebunk Harbor.

'Not many are really valuable,' said Mr. Tarkington deprecatingly, 'not many drawn to scale, and a connoisseur would pick out only a few. But I collected most of them about here; some were carved by old sailors whom I knew, and they all mean something to me.'

It seemed strange that a man from the Middle West should be so fond of the ocean.

'And yet I always was,' explained Mr. Tarkington. 'Where I lived as a boy in Indiana it was dry with almost no water. But there was a little pond, a mile or so away, and I used to walk out to it and pretend that it was larger. I used to pretend that I could not see across it. I always had an intense desire to see a large body of water.'

I suggested that possibly some of his people had been seafaring.

'That may be,' assented Mr. Tarkington. 'I am of the usual Middle Western stock, two grandparents from the South and two from New England —Connecticut, in my case. They were a rugged people. I remember my grandmother at ninety refusing to take an easy-chair. Of course early New Englanders were mostly shore dwellers, and I think likely my ancestors in England lived by the water, too. At any rate, it seems to me that in some way I belong to the sea.'

'It is a curious sense, that of belonging,' I agreed.

'It was the same way when I lived abroad. That is, the sense grew upon me. In many ways I liked living there better than here and I had not thought of returning. But the feeling of not fitting in, of not *belonging*, grew upon me, and it seemed perfectly natural for me to get back to Indiana where my roots are. And I have always been glad that I lived in America.'

I knew that America was glad, too, for his wholesome influence, but I did not say so. I only asked if he thought it was possible to express America without being sectional.

'I don't just see (Concluded on page 23)

# Farming Must Become A Chemical Industry

## *Development of Co-Products Will Solve Present Agricultural Problem*

TO ALL appearances, our agriculturists are a most industrious class but in comparison with other industrialists they share no such full degree of prosperity. Many are the explanations offered for this disparity and just as many solutions have found expression in the daily press.

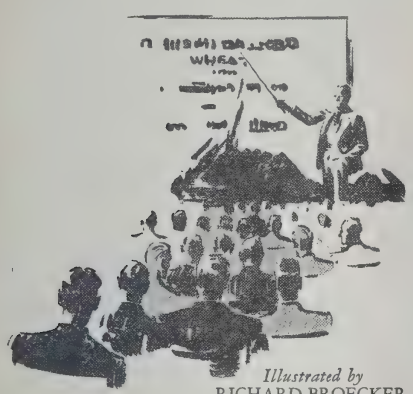
To our knowledge, little or no discussion has yet appeared that draws attention primarily to organic chemistry as the basis of all agricultural activity. Everyone seems to view the situation through the haze of bygone days. They would picture the farmer as a tiller of the soil operating solely and almost directly in providing food and raiment for mankind. Such indeed has been the story for many millenniums but today a new era is dawning and we must contemplate its early manifestations if we would gain a true insight into agriculture.

When we contemplate the science of agriculture we are forced to define an agriculturist simply as an organic chemical manufacturer. He is nothing else, never was, and never will be other than an organic chemical manufacturer.

Under this appellation we must consider our agriculturist, in the light of modern advance in organic chemical manufacture. If he were advancing abreast of the times, he would be enjoying success, for we cannot fail to view the recent advance of our organic chemical industry in America as anything short of marvelous.

A brief survey of the state of the organic chemical industry in this country must here claim our attention if we would attempt to draw valuable lessons therefrom and in turn seek to apply these lessons to the agriculturist whom we have just depicted as an undoubted failure in the field of organic chemistry.

Prior to 1900 there existed in America no organic chemical industry worthy of note. During the World War there arose a great dearth of all chemicals, and particularly was this stress felt in the organic field. The cutting off of imports gave the greatest possible protection a manufacturer could ask and hence many essayed to enter this field, hoping that by the time the war was over their manufacturing processes might have reached such a degree of perfection that they could continue in this work, a work clearly indicative as a necessity to every leading nation. Immediately at the close of the war the embargo on chemicals was continued in force pending the passage of a protective tariff. In September, 1922, the beneficent Fordney-McCumber Tariff became a law, and herein lay the turning point of modern chemical-manufacturing America from the old-time raw-product chemical-supplying America.



Possibly there are those still extant who look upon the tariff as a political question. Had it not been for the tariff of 1922 with its strong protection for organic chemistry, this enormous industry would have been lost to America and thus the greatest industry of all time left in the control of foreign powers. As it was, heaven smiled upon us and the manufacture of organic chemicals has progressed by leaps and bounds to an extent little dreamed of even by the early financial promoters. It may not be generally known that the total annual output of all our iron and steel plants is scarcely one-fourth in value to that of our manufactured food products which, exclusive of all farm staples used directly as foods, amount to $13,000,000,000 annually.

The organic chemical industry is an industry distinctly different from all other industries. It involves the same general principles of all industries but presents the further aspect of unrestrained uncertainty. Any one operation may completely face about to proceed in some other direction. This

ease of chemical shift makes always possible the creation of other products than those in view. Such side-products, or by-products, may spell defeat or success to the enterprise. Only under careful and constant scrutiny by organic chemists can organic chemical manufacture ever hope to succeed.

FURTHERMORE, we must note the coördination of chemical processes such that in one plant we may produce several compounds from as many starting points but through such closely related procedure as will enable the same skilled workmen to carry out these similar manufacturing steps at the same time, or possibly in the same vessels, when considerable intervals of time elapse between the discharging and further charging of main product. This production of coördinated products or co-products (as we shall term them) operates decidedly for lower overhead charges and constitutes likewise a decided factor in the success of chemical manufacture.

During the war, possibly, the ends sought justified the means. At any rate, by-products were thrown aside. But in these latter days by-products are fast accounting for themselves and that exceeding well. In fact, the wonderful success of this vast industry

*Illustrated by* RICHARD BROECKER

*The scientific authorities at the 'agricenter' simply direct the work of the superintendents.*

may be attributed primarily to this one principle—the interchangeability of main products and co-products with by-products according to the demands of the market. We may make so bold as to draw the conclusion that where the by-products in organic chemical manufacture are not conserved for other processes, then the likelihood of the main product continuing in production under such adverse manufacturing conditions is extremely small.

The American organic chemical manufacturers deserve the highest praise for their determination and their perseverance. The position of by-products is everywhere glorified. From these seeming wastes that once confronted us we prepare now the most fragrant of perfumes, the fastest of colors and the most efficacious of medicinals.

In the beginning of the 19th Century, coal tar was viewed as an uninviting and unavoidable black waste. In 1825 Faraday identified its chief component as that of benzene and by 1865 Kekule had announced his constitution of the benzene molecule, thus opening the way for scientific interpretations of the entire field of dyes. The unfolding of molecular structure as applied to organic compounds was rampant. Organic synthesis progressed with such enterprise that today we can rejoice in the knowledge of almost 200,000 organic chemical entities.

However, progress will not cease. Only from the beginning of the present century has the work of organic chemists registered appreciable progress in unraveling the constitution of that other unknown mixture, 'cellulose.' Apparently, this century is to be a repetition of the century just past in the utilization of another unavoidable waste.

IN THE study of cellulose, lignin, starch and sugar, we are opening the door to one of nature's complexities and from the knowledge so gained we shall be abundantly able to build up even greater molecular complexities than nature ever attempted. Before another century rolls around the organic chemist will have over a half-million chemical entities to his credit. The field of carbohydrates not only surpasses the coal-tar field both in value of material and in distribution but presents far greater possibilities of adaptation for the future.

Now, what does all this mean to the farmer?

In the past the organic chemical manufacturers have drawn mainly for their raw products from coal, coal tar, natural gas and wood distillates. No grudge whatsoever was entertained for the farmer, but outside of simple alcoholic fermentation little of chemical adaptation of farm products was understood by these manufacturers. Chemical science was concentrated upon the coal-tar field simply because chemists knew more about coal tar than they did about the more appetizing products of the farmer.

AS WE become acquainted with the carbohydrates there need be no fear but that we shall absorb the entire supply within a reasonably short period. The time is not far away when the feeding of corn to hogs will be classed with that other unholy act, the feeding of raw bituminous coal to a furnace for heat supply. Staple agricultural products must not be supplied to the consumer directly but must come to him indirectly through the chemical manufacturer. In other words, the valuable by-products that lurk in grains must needs be removed in order that the main products can be supplied at lower cost.

These predictions presage the continuance in prosperity of the chemical manufacturer, and a new undreamed-of era of prosperity for the farmer. As the industries manufacturing organic chemicals advance, more and more will agricultural products enter these industries and hence more and more will these blessings unfold themselves to the farmer. Beyond cavil, the only hope for the agriculturist is this expansion in the organic chemical industry. This development is surely coming, though its progress appears not so rapid as the agriculturist *(Continued on page 24)*

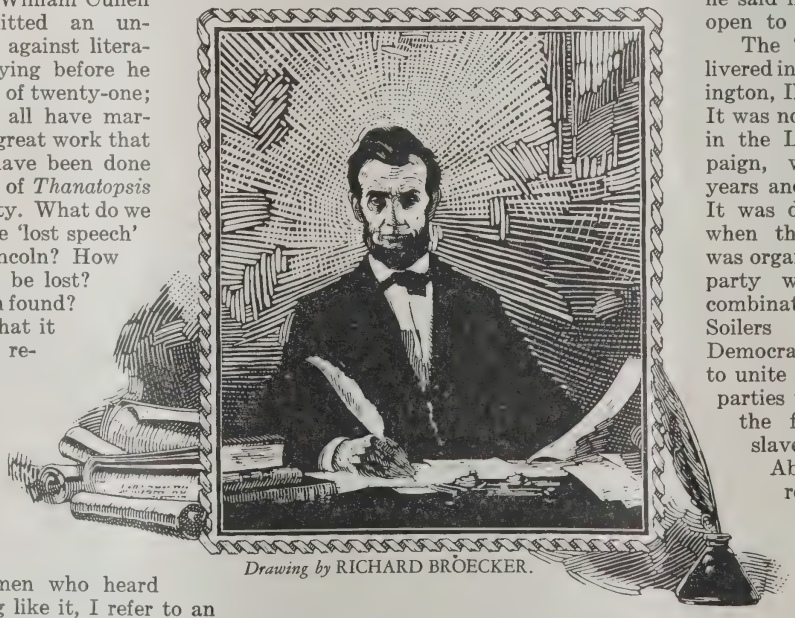
*Farms must be brought together under a single head called an 'agricenter.'*

## William E. Barton Sheds New Light on

# Lincoln's Famous *'Lost Speech'*

IT IS now seventy years since Abraham Lincoln delivered his famous 'lost speech.' Round the indistinct memory of that address is the halo that accompanies lost things. The 'lost continent of Atlantis' probably never existed in geography, but we cannot spare it from literature. 'The lost cause' is forever enshrined in the heart of the South. 'The lost chord' gave Sir Arthur Sullivan a theme for his best piece of music. 'The lost arts' afforded Wendell Phillips a theme for an inspiring address. And everybody knows about the lost fish which every fisherman has hooked and not landed.

There is no disputing the value of things thus lost. No one can measure the fish that slipped off the hook or the harmony of the lost chord. And no one can now dispute that Lincoln's 'lost speech' was all that tradition affirms. It probably was all that and maybe more. It is the speeches we have that can be parsed and analyzed. It has been said that William Cullen Bryant committed an unpardonable sin against literature by not dying before he reached the age of twenty-one; then we could all have marveled over the great work that would surely have been done had the author of *Thanatopsis* lived to maturity. What do we know about the 'lost speech' of Abraham Lincoln? How did it come to be lost? Has it ever been found? Is it possible that it may still be recovered?



Just by way of showing how far the 'lost speech' has become a myth, even in minds of some of the men who heard it or something like it, I refer to an article published about twenty years ago in New Haven, Connecticut, by Lucius B. Hinman, who spent his youth partly in Kansas and partly in Illinois, and returned to his native state, Connecticut, for his last years. He said:

'Hundreds of young men went from Ottawa, having heard that Mr. Lincoln was to debate with Douglas in Bloomington. They made up a big party and went over.

'Lincoln had the opening hour in that argument. It was the famous "lost speech" of Lincoln. There were reporters present but they were too excited to take notes after Lincoln began. They went wild. Everybody went wild.

'It was in that speech that Lincoln made the point that gave Douglas the temporary advantage in the campaign for the Senate but which two years later won the Presidency for Lincoln and lost it for Douglas . . . It was in the public square, and there were ten thousand people present.'

I copy this from a newspaper clipping which unfortunately is not dated, but it was about twenty years ago that it appeared. There is more of it, a half-column, and it shows several things.

*Drawing by* RICHARD BROECKER.

First, this Mr. Hinman was evidently a truthful man, and highly regarded in New Haven, and he had actually attended the meeting he remembered and had heard Lincoln speak.

Secondly, while he may have gone to Bloomington at some time for a political rally, the meeting which he described was evidently in his own town of Ottawa.

Thirdly, in his memory of what he thought he heard he confused the Bloomington speech, which I am quite sure he did not hear, with the first joint debate at Ottawa, which he did hear, and the second joint debate at Freeport, which he did not hear but about which he had heard much. The Bloomington meeting occurred not in the public square but in a hall, and nothing that Mr. Hinman remembered occurred in connection with that meeting.

I mention these things because these are the conditions the historian has to meet in sifting recollections. Truthful men do not always tell the truth concerning what happened many years ago. They color it sometimes more and sometimes less. Fortunately, there is no question as to where the 'lost speech' was delivered. What he said in the speech may be open to discussion, however.

The 'lost speech' was delivered in Major's Hall, Bloomington, Illinois, May 29, 1856. It was not one of the speeches in the Lincoln-Douglas campaign, which occurred two years and some months later. It was delivered on the day when the Republican Party was organized in Illinois. That party was formed by the combination of Whigs, Free-Soilers and Anti-Nebraska Democrats. Its endeavor was to unite all men of all the old parties who were opposed to the further extension of slavery.

Abraham Lincoln had returned to political life in 1854 on the repeal of the Missouri Compromise, and was in that year a candidate for the senatorship from Illinois as an old-line Whig. He continued to think he was a Whig for two years more. He was very reluctant to form any new affiliation. He had not joined the Abolitionists nor (*Concluded on page 19*)

# The Use of Great Names *in* 'Blue Sky' Swindles

*The ace of trumps in the 'Blue Sky' game is the free use of great names to impress the small investor.*

*By* RALPH W. BUDD
*and* J. OLIN HOWE

*Illustrated by* W. W. CLARKE

IT IS hard to see what could have been worse for the State of Florida —and for more than a little of the rest of the country—than the massing of the 'Blue Sky' cohorts on the great winter-resort peninsula the moment they sensed the easy money—very early in the game, be sure.

'Come on to Florida!' the high-pressure boys hailed each other in New York—Chicago—Cleveland—Philadelphia—wherever they chanced to be. 'That's where the going is good!' Many a familiar face was missing from Broadway or State Street, and from northern cities generally. Men under indictment for operating bucket shops hurried to Florida and others who had been convicted of this went down as soon as their sentences expired.

The Florida land boom meant to them that good times had come again for the 'cold-turkey boys' and the 'reloaders'; the price of a railroad ticket was all they needed to become 'binder boys' down where Ponce de Leon once searched for a certain spring.

This was not Florida's fault, of course; it was her misfortune; and doubly so when some who had long been used to operating with other people's money ran shoestrings into sizable bank rolls.

It will be long before the state entirely recovers from the results—and what the Florida real estate boom has done to the rest of the country is enough. 'Blue Sky' realtors operated in many parts of the United States.

Had speculation in Florida land been confined to those who could go there, that would be something. It wasn't. There were twenty-odd Florida real estate promotions represented more or less elaborately on Atlantic City's Boardwalk during the season of 1925.

Far be it from us to wish to cast aspersions on Florida, or any community in it. Not an aspersion. There isn't the slightest occasion for it. If anything, the state was the victim of her own glorious hospitality. And she is cleaning house now—shaking out the undesirable elements and stabilizing her real estate market.

State and city governments, chambers of commerce, banks, railroad heads, leading business and professional men—all are lined up to straighten out the realty situation on the basis of Florida's remarkable advantages and attractions as the nation's winter playground, which cannot be taken away from her. And they're doing it.

The 'binder boys' and 'Blue Sky' shoestring operators have been up against it for months. Many have been eliminated officially and many more by the collapse of the houses of cards they had set up, and have left the state.

Soundly financed developments, where values are as sure as is humanly possible, are going right along, of course—and there are plenty of these. One huge tract owned principally by a wealthy New Yorker won't be ready for opening to the public, even, for some years to come.

But the other kind—the 'Blue Sky' kind—whose nominal owners could not inflate fast enough to keep up their payments and where in consequence purchasers of lots have in turn lost property and payments both—how many there are of these and what the total of the losses where there never was sound financing, none can say. It must reach huge figures. Of course there will be salvage—how much is doubtful.

The situation among certain Connecticut investors is no isolated instance. Hundreds of Nutmeg State purchasers of land through Florida syndicates are now called on for assessments to save their property from foreclosure. The supposed owners who sold it cannot meet their payments.

Their letters say the property is 'all right,' but 'vicious northern propaganda' has checked sales and even caused cancellations of sales agreements, leaving the syndicate without ready money to continue development and meet interest charges on loans. The Florida banks, 'probably on account of the Federal Reserve banks refusing to rediscount real estate loans,' are not only unwilling to furnish additional funds but 'are insisting upon curtailment of loans and mortgages' and insist that payments due be made promptly.

The worst of this is that buyers often have not bought land but syndicate shares and may have obligated themselves to meet such assessments. Some, at least, of their certificates refer to a trust agreement on file in Florida of whose contents these buyers are uncertain.

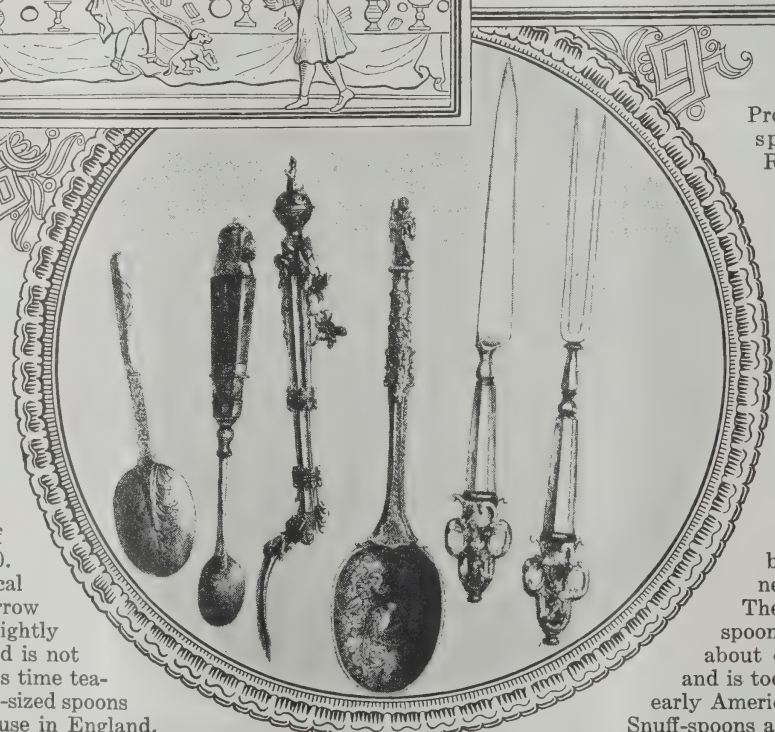
Numbers of them, moreover, are folks of relatively small means who have sunk all their savings, or a large part, in the venture, and no demand of syndicate managers (*Continued on page 20*)

## A Brief Historie of Those Noble Tools—

# Ye Knife—Ye Forke—Ye Spoone

*By* LOUIS C. KARPINSKI

THE three instruments which greet us at the dining table have a long and honorable history, having a vital part in the story of man's conquest of nature. Progress from the natural instruments, the ten fingers, is recorded in the tableware, particularly in the fork which was the latest of the three to appear upon the scene.



The spoon began to be used when the primitive savage reached for an oyster shell to dip out a drink of water. In Latin, the word for shell, *cochlea*, has the meaning 'spoon.' Among the early Saxons some type of wooden instrument was in use as the word 'spon' means splinter of wood. An interesting form of early spoon is one having a handle with a pointed end. This was the first form of fork but its development was long delayed. Among the Egyptians, spoons of wood and ivory were used, particularly to remove the marrow from bones.

The earliest known American spoon was made by John Hull, of Boston, about 1660. This has an elliptical bowl and a straight narrow handle which is only slightly enlarged at the end and is not decorated. About this time teaspoons and the dessert-sized spoons were just coming into use in England.

In the good old days the soup-spoon was the popular weapon of attack upon liquid food. Spoons were made in America before knives or forks, for the manufacturing process was quite simple, not involving much machinery; coin silver was often used as this had just about the requisite degree of hardness.

*Above—A king at dinner. Left—Complete array of instruments used in early culinary department.*

*Circle—Group of highly ornamented tableware. Directly above are reproductions of old drawings depicting, left, a royal feast, and right, a 17th Century dinner party.*

The greatest variations in American spoons are found in the handle and in the joining of stem and bowl. The Puritan, or 'slip stem,' spoon of John Hull has a short V-tongue projecting into the back of the bowl. The long rat-tail join on the back of the bowl was common in early days, but later spoon-makers made the V into a handsome ornament. Prominent among silver-spoon-makers was Paul Revere, silversmith as well as courier and patriot. Among the spoons which he made are perforated ones, to take the floating cork out of wine, and, mark you, for use in New England.

Spoons were often presented at Colonial funerals to be used in memory of the deceased. One enterprising silversmith made such spoons with a coffin-shaped bowl, but these were never really popular.

The pointed 'fiddle' type spoon became very popular about one hundred years ago and is today the most common of early American spoons.

Snuff-spoons and salt-spoons, and even (horrors!) ear-spoons, were later devices. But a most interesting spoon is one which reverts

(Concluded on page 27)

# MR. FORD'S PAGE

THE rising discussion of money in the world is a sign of coming good. While many run ahead with theories of solution, and waste their power in contentions about the merits of various methods, public attention gives evidence of being more and more focused on the system that exists. It is in this *attention* that hope for the future is found, for nothing so quickly disposes of fallacies than seeing through them; to perforate them with darts of clear understanding is literally to shoot them full of holes. It is the only way that fallacies are killed.

It is becoming clear that money is not wealth. It is becoming clear that money does not even measure the wealth of any community, that is, there is not an actual dollar existing for every so-called dollar's worth. It is becoming clear that there is more money than gold, even though, for reasons that suffer under examination, money is supposed to be based on gold. It is becoming clear that there is not enough money in the banks of any nation to pay even a small part of the bank deposits of the nation. It is plain as day that money, a national commodity, has been made a private concession. And everyone knows that in the conduct of modern business, actual money plays an ever-decreasing part, private money in the form of checks enabling a relatively small stock of official money to carry the burden of exchange.

These are matters of knowledge more than matters of complaint; if any complaint exists it is against the strong efforts which have been made to conceal this knowledge from the people. Whence arises the fear that the people should not be encouraged to question or know the mechanics of a system that touches them so intimately and vitally at every point of their interest?

All the above facts may be conceded without constituting a challenge. The challenge grows out of the failure of finance to perform the service which it professes to give the world. It is not to be regarded as even an attack on financiers. The least knowledge of the facts increases respect for the financial type of mind. But it cannot be said as yet that the financial world has become scientific. It cannot answer the simplest questions about money. It is still pre-scientific, as astrology was before the coming of astronomy, as magic was before the coming of medicine, as superstition was before the arrival of moral philosophy and enlightened religion. It knows the rules of banking under the present system, just as the priests of the ancient healing gods knew the temple ritual, but it does not yet know the science of finance as modern medical research is beginning to know something about the natural basis of the healing art.

This is indicated by two grotesque but tragic conditions existing before our eyes. One has been called 'the financial restriction of production.' The control of production by finance by reason of its artificial inflations and deflations, and by means of the power conferred on it by its control of Debt, is already impressing the thought of productive peoples. Even uninstructed people know that directly money is used to restrict the flow of energy, it is aiding an anti-social program. Money is a transportation system in part, justified only as it helps to carry the work of the world. When the power is cut off and the world's work stopped, though human need continues and the material to fulfill the need is always at hand, there comes at once a sense of misused power.

> *IT is the supreme indictment of the international money system that it can be so manipulated that it profits from the poverty of whole nations. A system capable of such manipulation cannot hope to remain unchallenged. It is plain that money, a national commodity, has been made a private concession. Directly money is used to restrict the flow of energy, it is aiding an anti-social program. Money is a transportation system in part, justified only as it helps to carry the work of the world. But by some exercise of control not made plain, money becomes an obstacle to effort and lays nations low as plagues and wars have never done.*

The other condition is the breakdown of countries which are as wealthy and full of productive energy as they ever were, but are thrown into idleness and need because of some power with which even the governments cannot or dare not deal. The land, the people, the raw materials, the means of production, the will to work, the need for supplies exist in these unfortunate countries just as they have always existed, but something, it seems, has gone wrong with the money system. The money is there, but by some decree, by some exercise of control which all the laborious explanations do not even begin to explain, it becomes an obstacle to all effort and lays nations low as plagues and wars have never done. Germany, France and now Belgium are examples of this. But the source of the power exercised over them is still a secret.

These two conditions are not two different things but two degrees of the same thing. We have had a touch of it in America, under another name. It is the hand of the same power, working the same mechanism. And it does not result in universal poverty, only in poverty for the productive part of society. It is the supreme indictment of the international money system that it can be so manipulated that it profits from the poverty of nations.

# EDITORIALS

## *As the Ballots Fall*

SENATOR LENROOT, of Wisconsin, led the fight on the floor of the Senate to get this nation into the World Court. He has been defeated for reëlection by the voters of his own party.

Senator McKinley, of Illinois, voted for the court. He has been defeated. Senator Pepper, of Pennsylvania, voted for the court. He has been defeated. Senator Stanfield, of Oregon, voted for the court. He has been defeated. Senator Means, of Colorado, voted for the court. He has been defeated. The late Senator Cummins, of Iowa, voted for the court. He was defeated. Senator Gooding, of Idaho, voted for the court. He recanted at the last moment, and was renominated.

Senator Trammell, of Florida, voted for the court. He is not up for reëlection, but he has publicly declared that if he were given the opportunity to vote over again, he would be against it. Moreover he states his intention of introducing a resolution, when Congress reconvenes, to rescind the Senate's action.

While European politicians are debating whether to accept the Senate reservations, American citizens are registering their sentiments. Perhaps, as its proponents insist, the World Court has not been an issue in this campaign. Perhaps the people are apathetic at the prospect of becoming embroiled in the quarrels of the Old World. Perhaps the amazing regularity with which the pro-court Senators have been defeated is a mere coincidence. But if it is only a coincidence, then it is the most astounding manifestation of political concurrence in the history of the United States. It is a coincidence that should serve as a grave warning to all future Senators.

## *Mother's 'Punkin' Pie*

A SWEET and pungent odor drifts into the roadway. We sniff reminiscently and identify it as chili sauce. A little farther on we catch the aroma of cider, made from newly fallen apples. Here in the little white cottage mother is making apple butter. And just beyond we smell the sharper, more piquant odor of pickling compounds. The aroma of ripe apples, being made into dumplings. The essence of burning cinnamon! And on the low window shelf we see great golden pumpkin pies cooling. Not filled with the prepared gumbo we know in restaurant pies, but rich brown pumpkin with black splotches and raised skin, darkened crust and an inch thick! The pumpkin pie is an American institution. A famous British chef promised pumpkin pie to visiting soldiers during the war. They were lonesome lads who yearned for the cooking of their boyhood. They told him how to mix the filling and then sat back and waited. And when he brought the pie it was not open faced; it had crust on top! The pumpkin pie of America cannot be imitated.

## *The Alley Pays Tribute*

WHEN it comes to matters of taste it is hard to beat the movies. But Tin Pan Alley seems to have done it. Drawing their inspiration from the widespread publicity attendant upon the death of a popular film actor, the busy mawk-rakers of the Alley have evolved a new masterpiece. Part of the refrain follows:

> There's a voice singing, 'Lead Kindly Light,'
> With a smile that has made the world bright,
> Valentino, goodby,
> But way up in the sky,
> There's a new star in Heaven tonight.

There are, no doubt, unkind scoffers who will refuse to believe that this was meant to be taken seriously. And there are possibly some who will suspect the Alleyites of a latent sense of humor, despite precedents to the contrary. But the evidence shows not only that the song *is* taken seriously by its sponsors: it is, in their opinion, a wow. 'It's got Valentino's picture on the cover, ain't it?' one of them is quoted as saying. Surely this is a clinching argument. But proof conclusive of their sincerity comes from knowledge that the Alley's tribute was on sale even before final rites for the dead had been held. Rumor has it, in fact, that rivalry was keen to be first with some such lament.

And there is really something quite touching in all this eagerness. Others may enter into controversy over the relative merits of Valentino's art, but not so the fellows of the musical world. For them the path of duty lies ahead; for them no rest till it is trod. Say what you will about its faults: Tin Pan Alley *does not forget!* It doesn't forget—for instance—that over a million copies of a similar doleful ditty were sold at the time of Caruso's death.

## *The Direct Primary*

A GREAT clamor resounds throughout the land to abrogate the direct primary method of nominating candidates and return to the old convention system. Almost without exception the cry is raised by the same classes and the same interests that fought the introduction of the direct primary. They insist that the primary is expensive, that the voters do not take an interest in it and that political organizations are as well able to retain control through it as by means of the old cut-and-dried convention.

All this is only relatively true. Primaries are expensive and the electorate apparently apathetic, but organizations cannot handle them as easily as they can conventions, or they would not be parties to the widespread propaganda for their abrogation. At present the responsibility is right where it belongs—on the shoulders of the voters. If they persist in overlooking their opportunity to curb 'gangs' and 'rings' it is their fault.

And every time the voters are aroused they can, and frequently do, break 'bosses' and 'gangs' and wrest from them much of their autocratic control. It is this menace rather than the expense to the public and the candidates that the agitators are seeking to remove. The primary is not a perfect piece of political machinery, but it is better than former methods of nomination and the people cannot afford to have so potent an instrument taken from them.

---

## *News From Russia*

FROM Russia comes interesting news. Trotsky is out again. Kamenev, alias Rosenberg, is out. Zinoviev is out. Radek, Pyatekov, Joffe—all Jews, holding high Soviet posts—are out. The only Jew remaining in a position of importance is Litvinov, who remains Vice Commissar of Foreign Affairs because of Tchitcherin's serious illness. Hundreds of Jewish minor officials are out. And Jewish policies are being abandoned. The Communist Party, largely the creation of Jews, threatens to become anti-Semitic.

The sudden change came about with the mysterious death of Djerjinski, terrorist head of the cheka, who was credited with the death of hundreds of thousands. While he lived Djerjinski was powerful enough to hold his fellow-racialists secure in their posts; but with his death Stallin began replacing them with Russians, Georgians, Letts, Poles, Armenians and Caucasians. The revolution was conducted by minorities oppressed by the imperialist government in former days. Strongest of these was the Jewish minority which instituted the red terror to maintain itself in power. But the Marxian policies adopted by the Soviet Government have brought on an economic crisis which has at last forced the issue. Donald Day, in a dispatch to the Chicago *Tribune*, dated Riga, Latvia, September 10, tells an interesting tale. He says:

> M. Djerjinski last winter foresaw the present economic chaos. He endeavored to persuade the Jewish clique to abandon their ideal of a world revolution for the time being, first putting Russia on its feet economically. He was in favor of the abolition of the foreign trade monopoly, the increase of private trade within the country, inviting foreign capital to come in and invest, and the restoration of more or less capitalistic social conditions, under the phrase of 'state capitalism.' He wanted to try to continue state control of heavy industry and let private capital take care of the others.
>
> The Jewish clique, on the other hand, demanded a continuance of the present foreign and internal policy. They advocated again confiscating the peasants' grain to sell abroad rather than compromise with capital. They wanted additional large sums for the advancement of a world revolution, and they opposed any further concessions to private capital within the country.
>
> They contended that the economic restoration of Russia was a minor point in comparison with the importance of a world revolution, whose cause they saw being advanced by every little industrial conflict abroad.
>
> Economic restoration of Russia, which meant non-communistic patriotism vs. the advancement of the cause of a world revolution, or true Marxism, became the two opposing points of view in Moscow. True Marxism lost out.
>
> The Jews being an international race of people, it is more or less easy to understand their ideal of a world revolution, where they would come out more or less on top. They did everything humanly possible in Russia to stifle nationalism and patriotism.
>
> But by granting national autonomies to various so-called oppressed minorities, by killing off the Russian intelligencia, and muzzling what remained, by changing the name of Russia into Union of Socialistic Soviet Republics, they developed Russian nationalism instead of stamping it out. It was the American prohibition law, in another land, and in another phase, with practically the same results.
>
> The Jewish communities have not advanced the cause of their race in Russia. Instead, they have made the position of the Jews in Russia more critical than it ever was. There have been pogroms in the past, and with the Communist Party turning anti-Semitic, it looks as though there will be pogroms in the future.
>
> The Jewish question in Russia, which always was a major problem, is just as important as it ever was, and this new and peculiar development in the ranks of the Communist Party deserves the serious attention of the Jews of the world.

We no longer feel like a lone voice crying in the Wilderness.

*Drawings by* GERALD VAN DER HEYDEN

WE ARE crackling with novelties and innovations, here in the 20th Century. Can it be that we are tiring of it already, and are starting in to dig out Tut-ankh-amen, excavate the Aztecs in Mexico, Roman ruins in North Africa, Nineveh in Asia, in a frantic quest of a fresh thrill?

I have myself sat through an alleged reproduction of scenes and folks in old New York (Anno Domini 1880—as if *that* were old!) and of the Covered Wagon period out in California, and numberless reproductions of ancient periods: they packed the movie houses. Their archeology was all wrong, but nobody minded that, because nobody was alive to tell: enough that it was called old; and we were enchanted to learn that the women of 4,000 years B. C. powdered their noses, just as now.

The point is, that between Tut-ankh-amen on one side and interatomic forces on the other, there is a chance to put over almost anything; and I, who am spending the winter at a western university town (boy-and-girl style), am poignantly reminded of the Harvard of the 1860's, part of which I was, by the abysmal differences between that and this, and I am moved to tell about them. Were a Neanderthal man to turn up among

us, or even a Cro-Magnon, or an Elizabethan, and begin his tale from a soap box on any street corner, he would draw an audience; and his facts, for the average listener, would be less strange than are mine. Moreover, no other collegian of that fantastic day survives for the purveying of first-hand, I-myself-was-there information; and no hearsay is trustworthy, so here is my story.

*****

Cambridge, in my memory's eye of 1860, is a small, comely town on the banks of the Charles River, three miles by horse car from Boston: or you could walk it if you were in a hurry; and people had legs in the sixties. It was a nice walk, with the river just across the meadows; and you saved the car fare, three cents, quite an item in one's expense account.

STARTING from Parker's, on School Street, Boston (of which, more anon), you arrive in less than an hour in Harvard Square, an irregular space, the junction of three streets; and you see before you a time-honored wooden pump, and just beyond it a flight of granite steps leading into the town post office. Farther northward the country road would take you past a handsome mansion on your right, with the poet Longfellow perhaps emerging from the doorway, smiling, smartly clad, and very good-looking in his early fifties. Still keeping onward, you would see Lowell's house withdrawn behind its trees; but Lowell is a good deal of a hermit, and doesn't encourage callers. The village of Watertown is a couple of miles beyond, but let us return to the Square.

The wooden-fenced inclosure which contains the Harvard College dormitories and other buildings now lies east of north across the way. You have pleasant glimpses of ancient brick buildings and tall wide-branching elms; and in and out of the gateposts, and entering or leaving the buildings, and passing from sun to shadow beneath the trees, are numbers of nice young fellows, in wide peg-top trousers, soft hats or caps, with once in a while a 'beaver' sending forth black gleams. They come and go with hands in pockets, or playing with a cane, well-mannered, agreeable youths, these grandfathers of the boys of 1926. They make a comfortable little population of about four hundred, including the law school; each of the undergraduate classes numbers from sixty to seventy. The freshman class of '71, which entered college just as I was leaving, was the largest on record —nearly *eighty!* And prophets were declaring that the time would come when there would be a full hundred men to a class, or even more. But nobody was bold or imaginative enough to foretell a coed. There were girls enough about, but they were the Cambridge young ladies, lovely in their hoop skirts and wide hats, but remote and intimidating; your love of them was as that of the moth for the star.

THE four or five ancient brick buildings faced the white limestone edifice, with a flight of steps at each end, containing the recitation rooms, and the awful chamber in which the faculty meetings were held. Back of that to the left was the college chapel, and still farther eastward the little circular building with the conical roof, fitted up within as a gymnasium. Northward across the road was a triangular piece of vacant ground, the Delta, where we played baseball, and football—when that was permitted. Harvard College—we didn't speak of a University—was a lovely place, just big enough and just small enough to be loved, and it was the abode of felicity, four hundred strong. Everybody knew everybody else, for one thing, and no unimportant thing either!

A holy and tremulous joy of anticipation seized me as I contemplated the actual prospect of becoming a collegian! One lion in the path—the examination for matriculation; and if it hadn't been for Professor Gurney, who coached me for six months, it would have been a lion indeed. I got through, however, with three 'conditions,' all in mathematics; and I may confess that I never made good on them; but what of that?—I have ever held mathematics in low esteem. And when, one day, I had gone to the blackboard to work out a problem for that famous and terrible mathematician, Professor James Peirce (Jimmy Peirce, as we profanely dubbed him) and had 'deaded' there, and returned to my seat, he said, 'Kindly remain after the others have gone, Hawthorne.' My comrades glanced at me commiseratingly as they went out.

THE professor, with his bushy red beard and smooth hair parted in the middle, beckoned me to his desk: 'Hawthorne,' he said, 'are you *NEVER* going to make me a recitation?' in a soft but appalling voice.—'Professor, I do try; but somehow— —' I stood, expecting sentence of expulsion, or rustication at least.—'I see! Well, would you oblige me by coming to my room in Holworthy, about eight o'clock this evening?—Thank you; that is all.' At eight o'clock I appeared. The executioner shook me warmly by the hand; it was a snug little room, a bright coal fire, easy-chairs, and my host in an easy-going dressing-gown. —'Hawthorne,'—he looked at me earnestly—'do you drink?' Attacked at this unexpected angle, I faltered and hesitated. 'Because, if you do,' he resumed, 'I have what I believe to be some very fair bourbon, and also rye, if you prefer that—which shall it be?' The scene becomes dim; but in a few minutes we were pledging each other over a smoking and scented tumbler of something; pipes were introduced; we sat and chatted at our ease.

During the next hour the professor had sweetly and unobtrusively drawn from me the simple and innocent annals of my career; and at good night he said, with another warm handclasp, 'In future, Hawthorne, I shall not call you up for recitation; but at the close of the term, I shall give you the average mark of six: many men of many minds, you know: and many of our best men have shared your distaste for mathematics.'—It wasn't the rye, or the bourbon; but I learned that even a professor of mathematics may possess a cordial and understanding heart. May his name be blessed!

BUT that examination day! I had been timidly prowling around Cambridge, as the 'collegians'—how I caressed that term in my soul, seeing in its possession the acme of human happiness and ambition!—began to gather for the term; and I would follow with my eyes and even with my footsteps various cheerful and well-attired young men, comparing their urbane and self-possessed aspect with my own rude countrification, and wondering whether I would ever become like that! Especially did I seek for Blaikie, the athletic hero of that period, whom I fancied I must recognize by intuition: a glorious demigod, strong like Hercules and graceful like Mercury; Bill Blaikie, who would row in the Harvard crew; 'Bull' Blaikie, who could put up the 100-pound dumb-bell! Blaikie was half of Harvard for me, for Harvard, in my view, was more than half an opportunity for athletics, and he was the embodiment thereof.

I never thought at all about the college curriculum; that was merely an unwelcome and ill-judged addendum of the college career; what I looked forward to was athletics and the companionship of Harvard men; and, after sixty years, I incline to think that I was not unwise.

The heart-trying day arrived at last, and I sat with one examination paper after another before me, and beside me and up and down the long tables sat my companions in mental dissection, serious and intent. The list of questions was neatly printed, and at first glance entirely unintelligible. I knew nothing. I was lost! Time was passing too, fast and faster. Not before nor since have I known how little I knew. At last I would make shift to scribble down something; but oh, those jaws of Ignorance, how wide they yawned!

My depression as the day proceeded was grim and dark, when all at once Professor Gurney, *(Concluded on page 22)*

*A bird wave in the winter woods. The species, as most usual, consist of titmice, the white-breasted nuthatch, downy woodpeckers, juncos, tree sparrows and one brown creeper.*

# *The Ebb and Flow of* The Winged Waves

By S. F. AARON

*Illustrated by* the AUTHOR

THE early naturalists and special students of ornithology seem to have noted carelessly the habit of association among those birds that do not habitually flock together. The true flocking habit has been always, of course, exceedingly obvious. That many other species when migrating or journeying about in search of food during the fall and winter season gather in scattered companies was especially observed by Coues, Burroughs and Minot. But there remains much of interest to record.

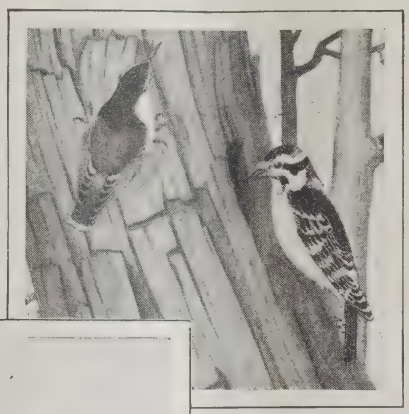
Among the water birds and waders there is a vast majority having the flocking habit: gathering and moving about in mass formation, acting in unison, all alighting and leaving together, as though under a drill master. There are few solitary species among the waders and among the swimmers fewer still. In nearly every North American locality may be observed throughout the year more than one hundred and fifty land birds, and of these there are but fourteen kinds that flock, as that term is best understood. The blackbirds, shorelarks, cedarbirds and doves lead the list among migrating species; the grouse and partridges all go in coveys. Then, too, the vast gatherings of swallows must be reckoned with.

But aside from the hawks and owls, the very occasional gatherings among which are strictly family affairs and then not at all influenced by amicable relationships, there are only about forty species that may be termed solitary; that is, not traveling with their own kind nor in the company of other species. The kingfisher, the whippoorwill, the cuckoo, the humming-bird, the shrike and all the true flycatchers are notable examples.

All other species of our passerine birds have persistently gregarious instincts expressed by gathering into scattered companies, each member thereof moving independently, but keeping almost unerringly with its fellows, perhaps all its own species, or of many kinds. Thus most of the finches, which include all our sparrows, most of the wood warblers, the larger portion of which migrate to the northern tier of states and Canada to breed, all of the titmice and the nuthatches, some of the thrushes and woodpeckers, and even the bluebirds, may be termed socially inclined, the latter, however, yielding more to family ties. These somewhat desultory associations of birds journeying through the fall and winter woods, or in the spring, either heading directly north or south or spending the season with us, have been very aptly likened to waves; they resemble the ebb and flow, almost regular in uniformity of action.

At one moment we are standing among the silent trees with nothing more to arouse interest than the challenge or scurrying of a curious squirrel, the faint rustling under the leaf carpet of a shrew or a deer mouse; nothing visible perhaps but the breeze-stirred twigs. And then, suddenly, there is a flit of wing, an almost inaudible chirp, the nearing *chickadee, dee,* or the *hank, hank* of feathered friends and within half a minute we are among a small host of busy little gleaners: black-capped titmice balancing themselves on branch and twig, the nuthatches cheerily searching every cranny, the downy pecking a bit of wood that bids fair to hold a larval borer, the juncos scratching, darting everywhere, their white tail feathers most conspicuous, the brown creepers methodically covering every inch of tree trunk. Perhaps a mouse-like winter wren with uplifted tail has joined the company, or a pair of equally small and surpassingly active kinglets. There may be a few tufted

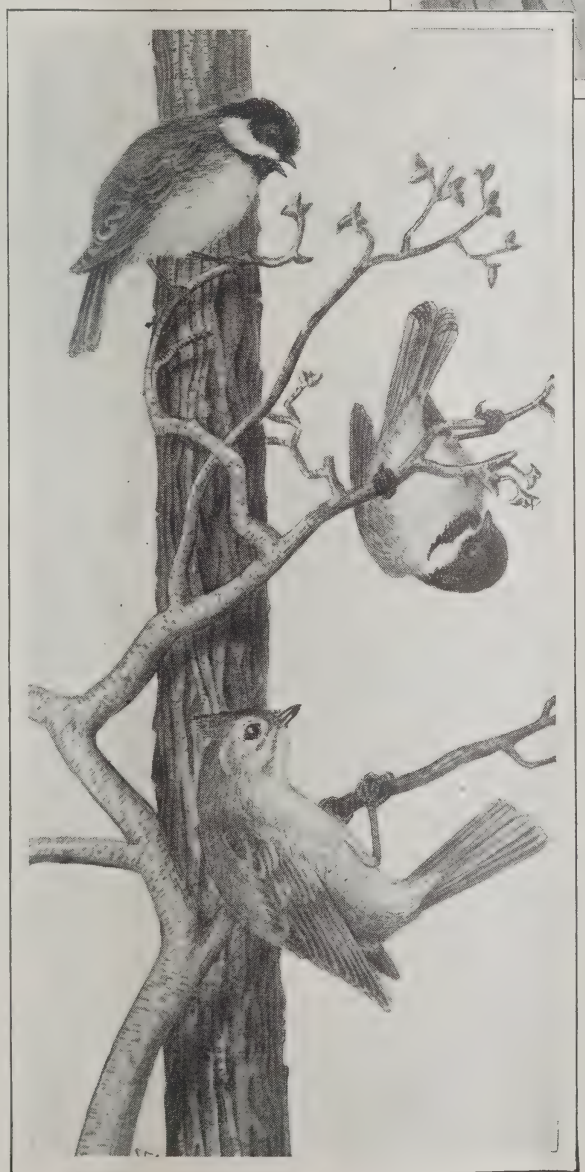
titmice with perhaps a belated hermit thrush to swell the busy bunch, loud scratchings in the dead leaves disclosing their whereabouts.



Then, as suddenly, all are gone, whither it may be hard to tell, even if we knew the general direction of their course. But with not a little energy and some lively scrambling these bird waves may be followed, though sometimes they move rapidly by long flights from woodland to woodland, over fields, across meadows, valleys and streams, sometimes over rivers and not always heading south. Every direction is pursued by the wintering birds.

There can be but one explanation of this habit of association and the mass-flocking instinct. Where there are many eyes and many voices to discover and warn against enemies, these enemies have less chance to make a surprise attack. Otherwise there could be no reason for flocking, as food is more difficult to obtain in quantity within the somewhat restricted area covered in a daily search.

Quick judgment and sharp-eyed discernment keep these little birds together, their methods of seeking food being so different. It is certain that they assemble for hours at a time, often taking on recruits and now and then losing some. Frequently a lucky member will make a rich find that it shall not wish to desert until all is devoured and so the company goes on without the fortunate one, who may become a solitary traveler for a time, perhaps knowing the direction of the company and catching up or joining another company later on. This explains the finding of solitary birds of the social species and the noting of others passing swiftly through the woods as though upon some definite quest.



These bird waves mark not only the migrating seasons, but also the winter months when certain species become resident throughout areas affording shelter and an abundance of food, as within dense forests of varied growths. Bird waves may also consist of a single species, often a large flock and perhaps a few of another kind, as with the junco and the tree sparrow.

Other species, as the song sparrow and myrtle warbler, sometimes join the flocks of juncos.

Right—*Two of the commonest bird-wave members: the white-breasted nuthatch (left) and the downy woodpecker, smallest of his race. The hairy woodpecker is similarly marked but larger.*

Below—*Two common species of titmice: the chickadee (top), and the tufted titmouse, in characteristic attitudes.*

Many birds that migrate or winter in scattered companies show a decided preference for their own species, as the bluebirds, robins, purple finches, white-throated and fox-colored sparrows, the pine siskin, both species of crossbills, the Savannah sparrows and the goldfinches, and all of those also that flock in mass formation. It might be wondered why the mild-mannered and sweet-voiced little goldfinches keep mostly to themselves, but they evidently wish to avoid the bullying tactics of other birds. They also feed at greater length in one spot, on weed heads mostly, thus journeying slowly and often more in the open than most winter birds.

Many species, even among those that may be generally termed solitary, travel about in pairs; probably these are birds that mate for life and choose each other's company at all times. Noticeable among these are the kingfisher, the kinglets, the cardinal redbird, the palm warbler and sometimes the water wagtail. Most birds that so remain and have less inclination to join the mixed companies are either good dodgers or good fighters and have little fear of enemies.

I have seen a winter wren gleaning alone about old brush piles and remain at its task while a bird wave swept by it and away. Like the goldfinch the plainer bird is a slow traveler and its presence in bird communities may be mere chance.

You may note a company of birds loitering in a sheltered vale for an hour or more, then finally reach a hilltop to the west, encounter a stiff, cold wind and immediately return to the valley.

I have seen a wave made up of chickadees, creepers, nuthatches and woodpeckers, going northwest, cross that of a bunch of juncos and tree sparrows, going southwest; for a moment they were mingled, but each company maintained its way, separating from the others fully.

Interest attaches to the militant manners of most socially inclined birds. As with pecking and fighting hens in the poultry yard, the distinctly gregarious, yet ill-natured horning kine that bawl when separated from their fellows, and horses that from instinct born of long and wild heredity hang closely together in danger, yet bite and (*Concluded on page 18*)

# The Voyage of the Victoria

## WHEN PIRATES RULED

*Twelfth of a Series*

*At the Moluccas the Spaniards bought like mad.*

BY CHARLES J. FINGER

WOODCUTS BY PAUL HONORÉ

THE dominating figure was gone and for a time there was confusion. The fleet returned to Sebu, without the body of Magellan, and a hasty council was held at which a dual command was agreed upon, with Duarte Barbosa and Joao Serrao as masters.

The first official act was the dismantling of the trading station and the removal of the stock to the ships. Meanwhile, Enrique the slave, who had been slightly wounded at Mactan, dreamed dreams. In a way he had tasted power while acting as the mouthpiece of his master and admiral. He had been engaged in wire-pulling, and intrigue, and planning, and flattery, and his mind was excited at thought of the ease with which things had been accomplished with his help. But he was a slave, and with the return of the fleet to Spain would be still a slave. Meanwhile his own countrymen were only a good swim away.

One day Barbosa came to him, blustering a little because of his new authority, and ordered the slave to go to work, declaring that his wounds did not unfit him for service. The slave arose, went about the immediate task set him, but watched his opportunity, and when the moment was propitious, slipped overboard and swam ashore, where he sought the Sulu king.

There are accounts of what he said and proposed, but all that must be rejected as impossible of proof. But we know very accurately what happened. He became an active plotter, strong because he knew the habits of his former masters, earnest because he wanted his freedom, successful because what were complexities to his new allies and countrymen were simplicities to him.

So there was the framing of a clumsily arranged decoy, and Enrique swam aboard again and was ready to act as interpreter when his allies came. Presently kings and chiefs came aboard, and captains and officers were invited to a farewell feast ashore, at which, it was announced, a valuable present intended as a gift for the king of Spain, and promised to Magellan, would be tendered. Enrique interpreted, and when Serrao voiced suspicions, the slave said things to disarm them, with the wisdom of one familiar with the moves of both sides. So at the end twenty-seven men rowed ashore, with them Serrao, Carvalho, Barbosa, Espinosa, San Martin the map maker, Pedro de Valderrama the priest, and others of importance.

Some afterward said that both Carvalho and Espinosa were privy to Enrique's doings and conceived the whole thing. That again is incapable of proof. What we do know is that both Espinosa and Carvalho stayed by the boat and refused to accompany the party up the beach to the feast. We also know that at the first sign of trouble they pulled off to the ships. What they and those on board saw was a strangely swarming mass of savages, some of them leading the priest and a few in one direction, others gathering about the rest of the party. Then there was indescribable confusion, nothing very clearly seen but a pushing, swaying crowd of natives, now and then a helmet, now and then a white man struggling against great odds.

Across the stretch of water came the shouts of men and the wild yelling of savages. At that it became clear there were fearful things afoot. Sometimes there were billowing movements in the crowd and when a man went down natives stabbed and trampled him, or beat him to death. On board, neither Carvalho nor Barbosa moved a hand, but a gunner or two made haste and the bombards bellowed, at which the fighting waned a little.

Soon from the main body a party detached itself, and those who watched saw Serrao, bound and wounded but struggling with his captors. They heard his voice, calling upon his shipmates in an agony of terror to send a party ashore. But Carvalho gave a command and the ships stood out to sea, but not before those on deck saw Serrao struck down, stabbed, beheaded. Thus twenty-five met their death and the destinies of the fleet were in the hands of a rascal and a betrayer. Also the first round-the-world passenger completed his voyage, for Enrique stayed with his own people.

None dared to dispute Carvalho's authority, so when the fleet dropped anchor near the island of Bohul, he declared himself captain-general and took command of the *Trinidad*, appointed Espinosa, the paid slayer of

Mendoza, captain of the *Victoria*, and ordered the *Concepcion* burned. For a time there was a question whether it would not be better to abandon the voyage and take to some island, but to Carvalho's notion piracy promised a livelier life, so the course was set for Palawan where they stayed a few days, watering and provisioning, then the fleet set sail for Borneo. All that time, biding his opportunity but unable to do anything to prevent what he deplored, Sebastian del Cano, the man of knowledge and self-discipline, did his work and said nothing. An objection or a protest might have meant death, so he pursued a Fabian policy.

As for Carvalho, he held supremacy on his reputation as a desperado and carried himself as a very dreadful personage. His first overt act was the capture of a Moorish ship in which there was very little treasure, but three Moors were taken prisoners and detained as pilots to conduct the fleet to Brunei. Three weeks they lay at anchor there, and then something happened. Perhaps it was a case of bullying and blustering, perhaps the Moors made the true situation known. At any rate, five sailors, one of them Carvalho's Brazilian son, were taken by the natives and the chief refused to release them. Two of them, Greeks both, escaped and swam to the ships.

The next morning, July 29, things began to look serious, for a fleet of praus came out of the little bay just as a second swarm of praus steered a course likely to cut off the two ships from the open sea. So Carvalho opened fire with the bombards and made sail, leaving the three sailors to their fate. Twenty-four hours later the *Trinidad* sighted a large junk, gave chase and captured it, to find that their prize was a native ship of war commanded by a Luzon prince. On board were sixteen men and three women 'of great beauty,' all of whom were taken prisoners.

Very soon after that Carvalho's stock began to decline, for there were doubts thrown on his statement that the three women 'of great beauty' were not being guarded as gifts for the queen of Spain. It was also whispered that the thin pretense of keeping the Luzon prince as hostage for the three sailors might as well be abandoned, eavesdroppers having reported that certain negotiations were under way which were being kept secret. Criticism broke into open revolt when the prince escaped one night, some of his men with him, and the moral code of the men received a shock when it was discovered that the prince's jewels, with much gold and silver, were in Carvalho's private chest. That piece of stupendous impudence was the end of things for him.

One day Sebastian del Cano made an illuminating attack upon Carvalho's record, charging him with being a traitor and a self-seeker, denouncing him as an inefficient rascal who kept his place by thundering and threatening, and at the end it was abundantly clear that Carvalho's hold upon the men was not worth considering. So Sebastian del Cano pronounced himself captain and Juan Baptista Poncero as chief navigator, then stood, sword in hand, challenging anyone to dispute his claim. The main issue was a return to Spain with the least possible delay. Sebastian del Cano declared himself for that issue. Carvalho was left without a shred of authority and his complaints were heard with indifference and apathy.

The new commander took things in hand vigorously, beaching the ships in a cove on the Bornean coast, perhaps at Palawan, perhaps off Banguey, and the refitting and cleaning was a terrible task that lasted for six weeks. Indeed the mind is staggered in contemplating the makeshifts and expedients to which the men must have been pushed. Not only was the insufficiency of equipment a drawback, but they were in a place where they worked knee-deep in mud, where there were contaminated air and burning heat, where there were stinging and poisonous insects, where a mist arose like steam so that men fell exhausted at the slightest effort. It was there that the bombardier of the *Victoria* died. He had been wounded in the Mactan affair and in that unhappy place, after infinite torture in the vermin-infested cabin, at last became a thing all purple and swollen, screaming maledictions on all who sought to relieve him.

It was September 27, before they sailed from that place of fearful toil and steered for the island of Sulu. The first ship they sighted fell a victim to them. On board was a rajah who had treated them with kindness at Palawan, but because of misery and suffering there was a sullen savagery about the voyagers that made them forget benefits received. So a bill of ransom was prepared and eight days later the ruler gained his liberty after his son had brought to the ships four hundred

*Carvalho held supremacy as a desperado. The 'Trinidad' captured a large junk and three women were taken prisoners.*

measures of rice, twenty goats and twenty pigs, and a hundred and fifty fowls.

Southwest of Mindanao they sighted another prau. To attack anything seen had become a matter of course by that time, so they engaged it. But the natives made valiant resistance before they gave up, and seven were killed. From the captain, Sebastian del Cano learned that they were that praus would scour the islands for spices and precious woods; on the other that Spain stood ready to defend the peace and honor and security of the king of Tidor and his subjects, and a signed treaty ended the conference.

Then there were other treaties and trade arrangements with the Gilolo monarch, and the ruler of Makian, and the chiefs of

*The new commander took things in hand vigorously. The first ship they sighted fell a victim to them.*

only three days' sail from the long-sought Moluccas. He hinted at other things—at Portuguese influence, at that old Serrao who had cast his lot with the native king having been poisoned for reasons of state.

Over a sea of perfect blue beauty the two ships sailed, coasting past Timor, past Mayo, past the northern tip of Celebes, then, on Wednesday, November 6, 1521, they came in sight of a volcanic peak and were swept into a winding strait with deep water and a palm-fringed beach, where the air was heavy with aromatic waters, and sea fowls screamed, and the world was indescribably beautiful. 'The pilot . . . told us that these were the Moluccas, for the which we thanked our God, and to comfort us we discharged all our artillery.' Then he adds, in swift summarizing mood, 'nor ought it to cause astonishment that we were so rejoiced, since we have passed twenty-seven months, less two days, always in search of these Moluccas . . . '

Three days later physical miseries and hardships were almost forgotten like a bad dream, and principals were engaged in the great game of economic sovereignty. For the native prince, Almanzor, welcomed the Spaniards with ceremony, and soon ulterior motives were revealed. The neighboring island of Ternate was under Portuguese influence and he sought an alliance with Spain to the end that there might be a revitalized Timor. After that matters did not lag. On the one side were promises Ternate, and the king of Batchien. There was a great giving of gifts too, of Brunei gongs captured in the raids on junks, of beads and glasses, and the 'three women of great beauty' to the Sultan of Tidor. As for the Spaniards, they bought 'like mad,' says Pigafetta,* and so active was the trading that the shipmen suffered from an *embaras de richesses* and one of the weather-worn old ships could not stand the strain. On the day of sailing, December 18, Sebastian del Cano stood out to sea with the *Victoria*, but returned, noting signals of distress from the *Trinidad*. The old hulk had sprung a leak.

Examination showed the trouble to be so serious that it was clearly impossible for the *Trinidad* to continue the voyage. As a precautionary measure the *Victoria* was also lightened to some extent. Then the crews were redivided, fifty-three being told off to serve on board the *Trinidad*, forty-seven to sail on the *Victoria* with Sebastian del Cano. Also thirteen natives supplemented the *Victoria's* crew. It was further agreed that the *Trinidad*, Captain Espinosa commanding, should sail for Panama.

At last, on December 21, 1521, the two ships saluted each other and the *Victoria* swayed seaward, and when night fell she was homeward bound.

*'*conperammo garofani a furia,'* he puts it.

# The Winged Waves

(*Concluded from page 15*)

kick each other from motives of greed and jealousy, most of our wild birds, though we like to think of them as gentle little companionable creatures, fight like feathered natives of Kilkenny among themselves. Among chickadees, nuthatches and all of the finches almost half their time is spent in squabbling. We might expect the flocking blackbirds to be amicably disposed throughout, but they, too, peck and drive each other.

Most strange it is that these birds know one another and properly gauge one another's prowess. Some are bosses and others are cowed. It is less common to see an actual encounter, though such when strangers meet is apt to be savage and even prolonged, depending upon the species. Tufted titmice fight fiercely, as do bluebirds and nuthatches; juncos rise in air after the native sparrow manner and it is all over in a few seconds; either they cannot stand punishment, or they inflict much pain quickly. I have never seen chickadees, brown creepers, kinglets, nor the woodpeckers come to grips. Like John Burroughs' cattle, it is very probable that these sudden clashes decide matters for some time and that there is no dependence put upon the winning of other battles.

More natural are the disagreements between birds of different species. Thus, juncos and song sparrows are never at peace when traveling together; the latter bird is a little scrapper and a bully, not fearing anything its size and ever ready to attack all others of the feathered caravan.

Very extensive bird waves, even of more than a dozen species, are rare. The more common make-up is of eight or nine kinds; these are given in italics in the list below, from one of my notebooks for 1925:

December 17th: Ran into a bird wave the extent of which, in numbers and species, is remarkably unusual. The very roughest sort of an estimate perforce must include more than three hundred birds and they covered at one time a space of considerably more than three acres. Commonest among them were the *chickadees*—probably more than a hundred of them; perhaps there were as many *juncos*. There was an inestimable number of *white-breasted nuthatches*, a score or more of *downy* and *hairy woodpeckers*, the latter predominating and, strangely enough, there was a far larger number of females; there were a great many *tufted titmice*, even perhaps a larger number of *brown creepers*, a few *song sparrows*, twice as many tree sparrows, perhaps twenty or thirty goldfinches, three or four purple finches that mostly sat about and moved indifferently as though out of place with so few of their own kind; several white-throated sparrows that kept pretty much to themselves and together, one lone fox-sparrow that surely was a chance member, three pairs of golden-crowned kinglets, one red-bellied woodpecker, one ruby-crowned kinglet that must have lost its mate, one yellow-breasted woodpecker and two or three hermit thrushes that merely went along with the others as a protective measure. It would have been difficult for a hawk unannounced to have made a foray upon that company.

# Lincoln's Famous 'Lost Speech'

(*Concluded from page 6*)

the Free-Soilers nor the Know-Nothings, believing that the Whig Party was the one and only party that was destined to humble the pride of the slave-holding democracy. In this hope he was doomed to disappointment. The Whig Party went to pieces, and Lincoln was not very swift in discovering that it had done so.

But when Lincoln, after long hesitation, decided to join the new party, he went in with ardor. He was a delegate from Sangamon County to the first state convention. He was not a candidate for any office at that time, but it was understood that he would contest the senatorship with Douglas two years later, as he did.

At Bloomington, a rather heterogeneous group assembled. John M. Palmer presided. He had been a Democrat, and he later returned and died in that party, as did also Lyman Trumbull, who was present at Bloomington. At the other extreme were men like Owen Lovejoy, brother of Reverend Elijah P. Lovejoy, the man who had suffered martyrdom for his faith in freedom. And there were Whigs who were almost as extreme as the Abolitionists, and others, like Senator Orville H. Browning, who were firm in their belief that slavery was one of the perpetual guaranties of the Constitution, although most of those men were sorry it had to be so. On the floor of the convention Browning led the Conservatives, and his was perhaps the leading spirit in the framing of the platform—at least he thought it was so—while on the radical side the leader was Owen Lovejoy, later a member of Congress.

LINCOLN was a harmonizer, and he urged that the convention stand rather firmly on the principles of freedom and equality in the Declaration of Independence, and his advice had great weight. Largely through his influence the convention, so mixed in its composition, proceeded to make its platform without division, and Lincoln was chosen to head the state electoral ticket. While that was a rather empty honor, it put his name at the head of the party masthead.

So the convention moved toward its close harmoniously, and was ready for its thrills and got them. James S. Emery, from Lawrence, Kansas, was present and by invitation made a speech concerning the hardships of free-state men in Kansas. They had suffered loss of property and even of life in the struggle which was to bring Kansas into the Union a free state. His was an eloquent and moving appeal for the support of the new party in keeping slavery out of all the territories.

Lincoln himself was deeply stirred. Toward the end of the day he took the platform—it was about half-past five—and he spoke for more than an hour. He began as he usually began, calmly and with deliberation, but his blood was stirred, and he soon warmed up to his theme.

Some people say it was because the hour was late and the papers had all that they could print. Others say that it was because they were carried away with the ardor of Lincoln's eloquence. Be the explanation what it may have been, no report of that speech was preserved.

And not everyone who heard it was profoundly affected. Senator Browning, as chairman of the Committee on Resolutions, was sure that his was the really important part in that day's work. He said so in his diary, not with conscious egotism, but as a simple statement of fact. As for the oratory, he said:

'I was called out and made two speeches in the afternoon. Convention also addressed by Lovejoy, Lincoln, Cook & others.'

As far as Browning was concerned, the 'lost speech' was a total loss.

YET Browning, absorbed in his own work, was in the minority in his lack of appreciation of Lincoln's address. Most who heard it were aware that they were listening to real eloquence. The tradition of that 'lost speech' was a lasting one not only in Illinois politics but in literature. The whole world is interested in what Lincoln said that day.

A few years ago I was invited to deliver an address in Bloomington, and I requested in connection with it the opportunity of meeting every known survivor of the 'lost speech.' To my great joy, they were assembled and I catechized them in detail. The notes I made as they were speaking were transcribed within a few days and copies were sent to these men for correction and signature. Some of the men, in their letters of reply, added other items which occurred to them. So I have a rather valuable lot of manuscript, not very large, to be sure, with first-hand testimony as to the 'lost speech.'

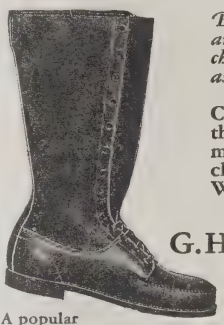
I am inclined to think that Lincoln was very willing that his speech should be lost. This opinion is not original with me. Others have expressed it, including Hon. Joseph Medill, of the Chicago *Tribune*, who heard it. Under the spell of the occasion, the degree of harmony attending the work of the convention, and the passion stirred by the speeches of Lovejoy and Emery, the convention was ready for a red-hot speech, and Lincoln made it. He had no mind to retract it.

But on the other hand, he realized when the convention was over that his passionate expressions uttered in that atmosphere would not be in accord with the views of the new party as a whole. It was still inchoate and made up of men of widely divergent views. Read in cold print it would not carry with it the spell of the meeting at which it had been delivered. Many men who were coming with hesitation into the new organization might be repelled by too radical a deliverance. Indeed, Lincoln's concern for the next two years was to keep conservative voters from thinking him more radical than he was. I think he was relieved to find that it was not reported.

I have at least this reason for my belief. Lincoln and his partner, Herndon, were on intimate terms with Simeon Francis, owner and editor of the Sangamon *Journal*. Lincoln could get anything he chose into the *Journal* of Springfield, or for that matter into the *Pantagraph* of Bloomington. If he had wanted his speech printed, he could have written it out that night in Bloomington or next day in Springfield. The fact that he did not do so is a reason for believing that he did not care to do so. The event was an important one; Lincoln knew it. It was too important to be wrongly done. I think he preferred to leave it spoken but not printed.

BUT I think we know pretty nearly what he said. I think if we read his Peoria speech of 1854 we know the principles that must have entered into this address, and we may be sure that he did not go so far as he did two years later in his 'house-divided-against-itself' speech.

However, I do not think we can reconstruct the 'lost speech' out of the Peoria address. That was a set, formal, well-wrought-out argument. The 'lost speech' was very different. Just one week before the convention met in Bloomington, Lawrence, the capital of Kansas, had been looted and partly burned. Ex-Governor Reeder, who had been appointed by the Pierce administration to enforce the Lecompton or slavery constitution, and who had revolted and resigned, was present at Bloomington, and he and Emery were heroes of the hour.



The Gettysburg Address failed as oratory but won immortality as literature. The 'lost speech' would probably have failed as literature, but it succeeded as oratory. And as literature that wakened doubts and would have had to be defended, it was better not to have been printed.

Oratory is one thing and literature is another. Demosthenes did not produce as great literature as certain other of the Greek orators, but when he spoke, men said, 'Come, let us go and fight Philip!' That was great oratory, and that was the sort to which belonged Lincoln's 'lost speech.'

# Walking On Your Uppers

WHEN you wear Moccasins you walk on a single piece of smooth, soft upper leather—not a sharp edged innersole. Moccasins do away with the necessity for welt, innersole or bottom filler and are the lightest, most flexible and most comfortable footwear made.

Bass Moccasins are more than just shoes—besides the above advantages which cannot be duplicated in any other footwear, they are made from the best materials obtainable and wear like iron.

A popular style for hunting.

*Buy Bass Moccasins and let yours and your children's feet grow as nature intended.*

# Great Names in 'Blue Sky' Swindles

(*Continued from page 7*)

nor order of Florida court will get blood from a stone.

Wonderfully evasive documents have passed as to Florida land. Agreements for deeds to it, now before the writer, provide such a payment on signing contract and such a payment by the month, the unpaid balance to draw 6 per cent interest until the full purchase price is paid, 'when the seller shall deliver *in due course of business* to the purchaser, without further expense to the latter, a Warranty Deed.' Whatever that means. Anyway, the interest on other people's money adds quite something to the price of the lot.

Lest it be thought that strictures on the 'Blue Sky' clan are too severe, there is also in hand a gay booklet extolling one development under the title, *Where Dreams Come True.* In it are pictures of the handsome yacht club on the property, the seventh hole on the golf course, a typical home, and so on. The yacht club pictured as on this Florida property *is the Atlantic City Yacht Club!*

Speaking of literature, here is a gem. It appeared in a page advertisement in a northern newspaper, in an important city.

*Florida banks are unwilling to furnish funds, and insist on prompt payments.*

WHISPER THIS!

*One thing giving importance to the boom (in Florida land) must be whispered. Florida is a wide-open state and free and independent citizens like it. The Volstead Act may have been adopted by the legislature, but, if it was, they do not like to be reminded of it. There are no Blue Laws, no interference with personal liberty.*

There is a New York State story in which a 'Blue Sky' salesman and a local realtor made sales and took money without having title to any land whatever. Before knowledge of this became general and before many had been bitten, the local chamber of commerce forced restitution, and it developed that the local realtor had himself been badly deceived.

Reloaders' have been mentioned more than once in these articles. Everybody may not know what a 'reloader' is. He is the experienced, wily salesman of worthless stock who persuades the 'bird dog's' customer to buy several times as much stock as the latter had planned to do. He scents money from afar, and knows how to get it. His methods are too many, too varied, too devious to be told of in a paragraph. They deserve an article by themselves.

The Florida land business was made to order for the 'reloader.' 'We are trying to get a large block of this stock in the hope of saving something from the wreck'—'The largest stockholder in the (defunct) corporation has recouped his losses in Florida land and would help you to do the same'—'A leading director is anxious to make restitution'—these and other phrases are used on the sucker lists of 'Blue Sky' promotions in making a new and (the 'reloaders' hope) attractive offer for stock previously peddled. It has proved such—to the tune of millions of dollars.

The offer is to pay as much as or more than you paid for the 'Blue Sky' stock, but to apply this to the purchase of Florida land, certain to advance in value, and which they agree to resell at a better price, charging you a commission.

They cannot lose. One 'reloading' company in New York City paid $18 a lot for its Florida land and sold it at $450 a lot, allowing one-third of this price for the worthless stock they took in exchange. They could well afford this concession.

Another offered 80 per cent of the price paid for stock in a chain store corporation of which the reloading salesman said it was 'not yet in the hands of a receiver but we will soon have stock enough to put it there—*if* this 80 per cent was taken in land near one of Florida's most important resort cities.

One easy mark turned over his stock in a motion picture company—worse than worthless—and $100 in money for 14 Florida lots. He was credited with $2,450 on the lots and was to pay $3,850 more. He had actually paid $1,477 in cash on this deal when he decided he was a common or garden sucker—and quit.

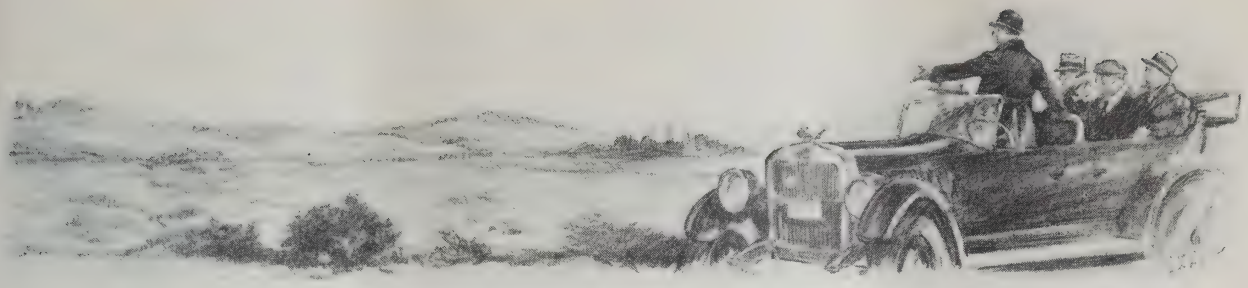
It would be possible to go on with this kind of incident at great length. Thousands of disappointed holders of 'Blue Sky' stock, hoping against hope that some day their ship might come in, have been easy to convince that it had. They have again thrown good money after bad, a chronic activity with the rainbow chasers.

Smooth-tongued 'reloaders' offered cash for their stock over the phone and insisted they had been misunderstood when their victim reached the handsome offices later—to be told that a man not to be named wished to free himself of all possible blame in the sale of certain stocks which turned out badly and would let them in on a highly profitable Florida land deal. They were 'let in,' surely—and the only cash to pass was their own.

There ought to be a moral in all this—indeed, there must be—if it doesn't stand out and cause every would-be investor to get *all the facts* before paying out a cent or signing anything, why attempt to make it plain? Fortunes have been made in Florida land—are being made—will be made—but if by anyone in 'Blue Sky' ranks, his name will not come from a sucker list.

The ace of trumps in the 'Blue Sky' game is the free use of great names to impress the small investor.

Millions of dollars are lured into the one-way pockets of the 'Blue Sky' crowd because smooth stock salesmen use the names of important persons with such familiarity as to make the gullible think they lunch with the owners of these names daily, back in New York.



A case in point—with a different outcome—a true story, except for names:

One James Wagner arrived in the busy little city of Mittenton, New York, on a starry evening last spring. Before retiring he took a walk about the bustling business center. The signs seemed auspicious.

Bright and early next morning Wagner—a well-dressed, fine-appearing man of engaging personality—presented himself to the mayor at the city hall, let his light shine on other city officials and proceeded to the local newspaper offices to spread the glad tidings. He was about to do a great thing for Mittenton and its surrounding country by way of development of a water power a few miles outside the city, where thousands of horsepower of 'white coal' were going to waste.

As Wagner met other prominent citizens of the town he added to the favorable impression which was rapidly spreading by saying he was an engineer well known in New York engineering circles, a graduate of the Naval Academy at Annapolis and had to his credit accomplishments of no small moment in laying out the Nicaragua Canal.

Around this magnificent water-power development, he said, he would bring into being the lovely suburb of 'Edgewood,' plans for which he had completed before leaving New York. Here he would build model factories to employ 700 persons and model homes, a beautiful golf course with its handsome country club, a half-million-

*Salesmen load prospects in their cars and taking them to the subdivision, dilate on its brilliant possibilities.*

dollar hotel and a delightful summer resort by the lake to be formed by his power dam. There would be ample electrical power for all his purposes and enough besides to supply the country roundabout. Tenants for his model factory plants had been arranged for before he came to Mittenton.

Wagner lost little time in informing each person he met that he was backed by important metropolitan financial interests. In Mittenton the names mentioned were impressive when spoken with the unction used by Wagner. The question of financing troubled him not at all. His backers had agreed to build the half-million-dollar hotel, he added. He had little doubt that they would plan fine country estates nearby, as well. At the same time, not without some show of reluctance, Wagner did concede that if Mittenton people felt that home folks should have a part in the enterprise, he could possibly arrange to let them in. If so, it would be on the ground floor, they could be sure of that.

It took but two or three days for the fellow to have numerous Mittenton citizens well on the way to complete hypnosis. He kept his story going in the newspapers, and also he met the county supervisors, drove them out to look over the site of his development and urged them to build a hard-surfaced road from Mittenton to Edgewood—which they just about agreed to do.

Finally it was announced he would hold a mass meeting—because of the widespread interest in his plans and so as to tell Mittenton his full story. This meeting was held on a Friday evening, less than a week after he arrived in town, and was heavily attended. No stock subscriptions were taken that evening, for some reason, but Wagner was planning a whirlwind stock-selling campaign to start Monday morning, and giving himself Saturday and Sunday to get in possible big private subscriptions.

On Monday morning Wagner was not in Mittenton. The blow-up came before that, and rather suddenly, too, as is the way when the most modern methods of suppressing 'Blue Sky' artists are invoked.

Mittenton has an active chamber of commerce, with a live-wire secretary. He wanted to know, and after Friday night's meeting dispatched a night letter to the New York headquarters of the investors' protective service. Saturday morning he followed this up with a long-distance telephone call. Saturday is an office holiday in New York and the persons whose names had been given as backers were at their country places on Long Island, and out on the golf links. But investigation showed that Wagner was quite unknown in engineering circles.

When the principal 'backer' was finally reached, he at once utterly disavowed Wagner and all his works. 'This man,' he said, 'came to me a while ago—I had met him somewhere—with a rather fantastic water-power scheme which he said was located in the Adirondacks. He claimed to be a hydroelectric engineer.

'To be frank,' this gentleman said, 'I paid little attention to him and got rid of him as soon as I could. He did ask me if we would be interested and I said, "Go ahead and make your engineer's report and if the project looks practical and we like it, we might have it looked into." That was absolutely all. I made him no promises, neither invested a dollar with him nor discussed doing so, and authorized no use of my name whatever.'

The other said much the same thing.

On the basis of this investigation, the Monday morning newspapers in Mittenton carried a full exposé of the promoter and his Edgewood dream. But, as said, he was not there to read it.

Yet, in point of fact, this was no dream. It was the old 'Blue Sky' come-on scheme which has been worked on hundreds of communities for, in the aggregate, an enormous amount of money. 'Get-Rich-Quick Wallingfords' have taken pots of money out of town after town with it. In almost any live town there is such a skeleton in the local closet.

'Blue Sky' literature is literally loaded with names which mean something. Before me as I write is a piece of it that even goes back to Daniel Webster for a quotation—'Opportunity is the chance within one's power to make gain.'

'One good investment is worth a lifetime of saving,' the late E. H. Harriman is quoted as saying; and this phrase has been for years a very bulwark of 'Blue Sky' publicity. It has been used in a thousand glowing prospectuses, has lured millions of dollars of savings into the hands of a conscienceless crew—and is still going strong.

'Buy when the stock is first offered.' If Chauncey M. Depew ever said such a thing, it was with a content as remote from anything 'Blue Sky' as is humanly possible, but it, too, has brought in many an unholy dollar.

'Don't delay; get in while you can,' they quote John D. Rockefeller; and 'One dollar invested at the right time and in the right place would earn as much as one man steadily at work'—the late Jay Gould.

No 'Blue Sky' literature ever fails to contain more or less of this sort of thing.

'Charles M. Schwab says: "The foundation of wealth is the first hundred dollars well invested."

'J. Pierpont Morgan says: "Idle money never made anyone rich. You must set it to work," and "Follow your own judgment and as a rule it will be right."'

I quote literally from recent prospectuses. No one knows where these remarks were made, if they ever were made, or in what connection; but care in using them keeps the user inside the law. And 'Blue Sky' prospects, who usually see the promotion output of one person, know nothing of the similarities in the general run of such.

Well-known names have played a prominent part in the Florida land gambles of the 'Blue Sky' clan. Judge Landis said, humorously, 'There is only one way to stop this tremendous development of Florida, and that is to station a line of militiamen across the northern border of the state with orders to shoot everybody that tries to enter.' This was a godsend to the 'Blue Sky' writers, who promptly extracted the humor and broadcast it as a serious statement.

The Government recently proved that several hundred thousand dollars' worth of stock and gold bonds had been sold and individuals had been induced to invest as much as $25,000 apiece with an oil company, which paid its officers large salaries, but the only oil ever obtained from property claimed by the concern yielded but $4,295 cash.

# The Harvard of Our Forefathers

(*Concluded from page 13*)

who had coached me for the trial, called me to him and said, 'Stop being scared! Stop it! You know more than enough, more than most of the boys here; thaw out your wits, my boy; be yourself!' Back I went to my task, with a desperate and reckless courage; and the thought of Gurney's confidence carried me through.

Meanwhile our papers were being passed upon by that composite monster called the Faculty. Blessed is he who expects nothing, for he shall not be disappointed. The moment I had finished my last sheet, I was serene and clear. I was sure I had failed, but had the thing to be done over again, I could have won a complete success.

Yes, I knew it all now: but it was too late. I could have answered the mathematical questions even. I stood with threescore other fellow-pessimists at the foot of the white stairway leading up to the Hall of Judgment where sat the conclave of Rhadamanthuses who played with our fate. One after another of us heard the summons, and went up; and after a brief interval, reappeared.

At last, like the crack of doom, my name, and a thump on the back from Clem Fay: 'Up you go, old man, and good luck to you!'

HOW I mounted those interminable steps; all details of the scene above upon which I entered; who placed in my hand the open sesame to the gates of Paradise—all this has passed from my memory, if indeed I ever knew. But I rejoined my companions like a balloon of optimism, hardly keeping my feet on earth: all was well!

After a day or two of seraphic bliss—before the class of '67 had attained full self-consciousness, the whole threescore of us found ourselves massed on the Delta for our first trial of strength with the hated sophomores of '66. The pretext was football. And yonder opposite, a dozen yards away, stood in serried ranks the drilled and confident army of our foes. Somebody kicked the ball, a black, spherical ball, unlike the oval missile of today. The rules of the game were simple: get the ball over the other fellows' goal-line, and knock down every man you meet. It was already twilight; as Scott says, 'In dubious strife we darkly closed, hand and foot and eye opposed.'

In that hour, like Tennyson's 'Ulysses,' each of us drank delight of battle with our peers, far on the ringing plain of Harvard Delta. I happened to be in the front rank of our advance, and found myself front to front with a broad-shouldered, ruddy-faced young fellow, at whom I struck heartily. Down he went, with an expression of great surprise on his handsome visage, and it wasn't until days afterward that I learned that he was accounted one of the most redoubtable of the sophomores—Ned Perkins, no less! By that one chance blow I achieved renown which clung to me all through college. Such is life! Ned and I became great friends, and he never realized that he could have licked me any day.

Alarms and excursions. With more than a hundred warriors on the field, each fighting independently, with all order abandoned and darkness falling, description becomes difficult. The field was strewn with fragments of clothing, and with not a few bodies.

Then a whistle blew, and the rumor spread that the minions of the faculty were upon us. In truth it had been announced before the game that any disorderly conduct on the part of the players would be severely punished by the college authorities. This was worse for the sophomores than for us, because they were all personally known and we newcomers were not. Therefore, in a few minutes, the class of '67 were left masters of the field; and we justly claimed the victory. It was the last battle of its kind at Harvard.

Hazing?—Oh, yes.

There was a deadly organization known as the Med Fac. It was inherited by class after class of the sophomores, and the name was a contracted form of Medical Faculty. It had nothing to do with the healing art; on the contrary, it was composed of the most bloodthirsty young persons available, and its object was to inflict mental and bodily torture and indignity upon freshmen. Many of the legends about it reveal diabolic ingenuity. But in 1863 their virulence had begun to abate; the faculty were down on them, and a few summary expulsions from college of detected members had an effect. Of course, the plots of the operatives were shrouded in deep mystery.

I made no personal acquaintance with the gang at its apogee, but one evening about a dozen hilarious sophomores crowded into my room, where, also, happened to be foregathering some half-dozen of my freshman friends, Clem Fay among them. Clem was rather small, but well made, and had an admirable biceps: what was more to the point, perhaps, he had hair of the hue of yellow flame. The sophomores began to inflict unwelcome attentions upon some of us: the occasion was made more interesting by the irruption of a little crowd of juniors, who packed themselves into the spare space of the room, interested to observe how their successors in oppression worked.

Presently, a couple of experts laid hands upon Clem Fay, who wore a wiry grin, which was perhaps misleading. At all events he suddenly let out his left, and the recipient of the blow toppled backward and his head came into painful contact with the bureau. In a moment, there was free fighting; but a moment after, the door was kicked open, and on the threshold stood George Washington Copp Noble, assistant tutor in Latin, weight about 130 pounds, but able to whip his weight in wildcats; handsome, smiling, cool, debonair. He lived in the room above mine, and hearing sounds below, had come down to investigate.

'You may pass out, gentlemen, one by one,' he said.

BUT I recognize the futility of attempting to squeeze into the limits of a magazine article even a fraction of the life at Harvard College of the 1860's. I will tell just one thing more, and then hold my hand—a thing personal, and strange.

On a Sunday, which fell near the middle of May in my first college year, I walked over to Concord for a look at the home folks. My father had been ailing of late; no specific thing the matter, but he had lost flesh and looked pale. I had been rereading, recently, Longfellow's poem, *Evangeline*, and had been impressed anew with the eloquence and pathos of the passage describing the death of Gabriel, Evangeline's long-sought lover. My father and I were sitting alone in the little library at The Wayside; the book lay on the table, and I picked it up and read the page or two aloud to him. I couldn't keep the emotion out of my voice, partly because of a thought passing through my mind, unexpectedly and for the first time, 'What if my father were to die!' After the reading, to which he had listened attentively, with a look of reverie on his face, we both sat silent, till I got up and went out. I was to walk back to Harvard that afternoon, and it happened that I didn't see him again.

CHARLEY MacBurney, bow-oar of the Harvard crew, had visited me the week before, to notify me of my election to the Delta Kappa Epsilon; and toward evening of the eighteenth of May of that year, 1864, he came to conduct me to the initiation ceremonies. These college affairs were carefully invested with mystery, and Charley maintained a grave and ominous bearing. He blindfolded me, and led me hither and thither, I knew not where, in the warm and quiet dusk; at length we stopped, and I heard a knock on a door, followed by some occult phrases in a hollow voice; I was pushed forward, and felt the atmosphere of a closed room.

It is not permitted to reveal what wild and appalling doings followed during the hours after that. I passed through even the most strenuous of them with a pleased tranquillity which surprised me. Finally, I was led down to a lower, crypt-like region, and there made to lie down in a long, narrow box—a coffin in fact; and I was left there in the darkness. I rested there for a long while in much peace and contentment; after the labors, pains and trials of life, this was death, and it was grateful.

At one time, someone, man or ghost, came and sat upon the coffin lid, and conversed with me for a while in quiet and friendly tones. He departed, and presently others came, in long black robes, and raised me up and took me to a higher region: suddenly I heard a door thrown open, at the same moment the bandage was taken from my eyes, and I was propelled into a large room brightly lighted, filled with young fellows in natural human garb, many of whom I knew. They greeted me with shouts, and gave me to drink, and thumped congratulations on my shoulders. I was a Deke, full-fledged! By chance I noted that the clock on the wall marked half-past one.

About nine hours afterward, in the lovely and soft spring morning, I was strolling with a friend, Frank Stearns, down a tree-shadowed Cambridge street, when we met another man, whom I knew but slightly; he had a troubled look: he beckoned Frank aside and murmured to him privily for a few moments. Then my friend turned to me and said, 'Bad news for you, old man!'

'My mother?'

'Your father: he died about one o'clock this morning.'

It was the hour when I had been lying in the coffin. But it wasn't until months afterward that the coincidence struck me; they are strange things—coincidences!

# Booth Tarkington

(*Concluded from page 3*)

how,' reflected Mr. Tarkington. 'In fiction, at least, a certain background is necessary, and it must be local. But many characteristics are local and at the same time American. I suppose Middle-Westerners are not wholly unfamiliar in other parts of the country, and yet the Middle-Western farmer is quite different from the native population here. He is easy to get acquainted with, not suspicious, and immediately takes you into his confidence. Here it takes at least a year to get acquainted, but the people are worth knowing, with a real flavor of originality.'

It seemed to me a remarkable ability to be able to reproduce in middle life the thoughts of youth. I wondered how it could be done.

'Just by concentrating on that period of life. Anyone can do it.'

I could not agree to that, but Mr. Tarkington persisted. 'I believe it is a fact. The business man is not accustomed to do his thinking that way, doesn't concentrate on that sort of thing, but that's all there is to it.'

I objected that for most of us the details and responsibilities of life crowd back the emotions of youth almost beyond recall.

'But the fact that you *do* recall them proves that they are there or you would not recognize them. Only you are not accustomed to bringing them forward.'

Mr. Tarkington explained that his wife had first suggested that he write a story for boys, because, although he did not realize it, he was always joking about them and quoting their sayings. Once started on that line, he found it the easiest and the pleasantest.

'And no doubt,' I said, 'a chance bit of conversation opens for you a whole vista of ideas and emotions.'

'In a way, yes. For example, I heard one of my nephews speak contemptuously of a lad who seemed to me well behaved enough. "What's the matter? Don't you like him?" I asked. "No, I don't," he replied, "they call him the *Little Gentleman*." That gave me an idea for a story. I like to think of my writing as a bit of life that is true rather than as something projected.'

'The reactions of young people must be interesting. No doubt you receive many letters.'

'Yes, I do. A good many young people were insulted by *Seventeen*. I had a letter from a boy in Buffalo who said that I had wronged every person that age and that I didn't know what I was writing about. He, for instance, was seventeen and he went around with a man twenty-one and that week he had lost three dollars matching.'

I asked Mr. Tarkington what he thought of the so-called revolutionists.

'I can't help thinking that they are wrong. It isn't that the whole of life is not worth expressing, but in their insistence on expressing all they emphasize only the disgusting, while some of us still believe in good taste. It is not so bad to try to tell a shocking fact as to try to tell it in a shocking manner. Henry James could say the most awful things and never give offense.'

Asked what books had particularly influenced him, Mr. Tarkington replied:

'Like most men of my age, I loved Stevenson and Barry, then Meredith, James, Howells, and Mark Twain. But the old enthusiasm, the old excitement, does not come. Not that I don't enjoy reading. Last year I picked up a book which pleased me very much, *The South Wind*. The scene was laid on the Island of Capri, where I had lived, and I at once recognized the characters; then looked back and saw that the author was an old friend and neighbor of mine at Capri. He had taken the people whom we both knew, chopped them in two, and fitted the pieces together neatly. I suppose, being a writer myself, I notice that sort of thing.'

# A Chemical Industry

(*Continued from page 5*)

may desire. *Those who talk of solving the farmer's troubles simply by marketing surplus farm products live only for today. We shall be importing large quantities of grain within ten years.*

We cannot overemphasize the importance of our farm products becoming the greatest source of raw materials for American manufacturing plants—second only for the time being to coal tar in importance.

There must be brought together under a single head a vast number of farms covering in extent thousands of square miles. In some of our larger states there may exist, perhaps, several of these groups, centered about some large establishment which we shall term 'an agricultural supply center' or, more briefly, 'an *agricenter.*'

UNDER such a grouping of farms we can picture to ourselves that most desirable of conditions which makes for steady industrial progress, namely, the employment of men of talent who shall direct the researches, economics and finances necessary for successful farming. The single farm is so small a unit that between its intake and output no leeway is permitted for any employment of specialized talent.

Whether the farmers actually hold ownership in these 'agricenters' is of no consequence; they must, however, abide by the decision of those in authority. Seed for planting is to be supplied the farmer and the harvested grain is to be returned at once to the 'agricenter' or to one of its storehouses. Special fertilizers for any particular crop will be supplied with the seed and thus the harvest of a crop of highly desirable quality will be reasonably assured. If a crop fails for any such reason as an act of Providence, the farmer stands to lose nothing but his labor. No outlay of money is at all necessary on the part of the farmer. His entire duty is to cultivate the crops and his profits accrue from the sale of harvested products after the deduction of initial and operating expenses.

The 'agricenters' will determine the quantities of grains to be grown in their respective domains when once they have closed their contracts with the various manufacturers. Apportionment of the required plantings for the individual farmers will be reckoned primarily upon the total acreage submitted by each farmer.

Consideration at all times must be made for reasonable carry-over from season to season of all farm staples to provide against possible crop failure in any one season. The farmer, of course, will further share in whatever excess profits accrue to the 'agricenters' upon such sales of stored staples.

The success of this plan rests entirely upon the character of the organization and the willingness of the agricultural community to abide by the pronouncements of the organization. Men of high character and training alone could ever succeed in such an undertaking.

Thus, at every 'agricenter' we should have a real industrial leader together with lawyers, bankers, botanists, biologists, and chemists in close association. The scheme may appeal as an idle fancy to many but in this form or some variant it is as sure to come as the sun is to rise tomorrow.

What after all is the farmer but an industrialist and we would give him that more definite appellation, the superintendent of a unit in the industry. It is the farmer's duty to bring about the manufacture of products under the direction of those who want the products for further industrial use. The management and scientific authorities at the 'agricenter' simply direct the work of the superintendents (the farmers). The failures, however, on the part of the superintendents must be borne by the organization. And further, by analogy, a number of reverses recorded against any one farmer must necessarily deprive him of his title of superintendent. Even though such a misfit owned a farm, he would be left henceforth to pilot his way alone or, more than likely, he would enter the ranks of the laborers employed by the 'agricenter' and go from farm to farm to assist in crop cultivation and harvesting.

WHAT a pathetic sight to see a reaper in a farmer's possession. Our hearts cry out to heaven, 'Why this curse upon a good man?' The farmer is neither an engineer nor a corrosion expert. He does not need the reaper any more than a score of farmers' families need a hearse. Once a year in use and then given up to disintegrate until the next harvest. The 'agricenters' of the future will own all reapers and complex farming machinery. They will send these implements and the proper crews to the various farms, as occasion demands. Night crews as well as day crews will operate in all communities and provision themselves without recourse to the obsolete, unsanitary and nerve-racking methods now in vogue. The farmers will, of course, aid these crews whenever possible, but always under the direction and employ of the mass harvesting experts. Certainly not less than fifty cents an hour with meals, according to present-day standards of wages, will be paid the members of these crews.

AT EACH 'agricenter' there will be soil and drainage maps of every acre under surveillance. Some small section may indeed be found highly suited for the production of a rare and highly valuable commodity, and possibly the farmers directly concerned need to cultivate only a few acres each to reimburse their exchequers for their annual living expenses. Scientific farming will be rampant, but what is still more important, efficient utilization of products will be triumphant. Today we need not journey far into the farming lands to become disheartened and dismayed at the frightful orgies of organic chemical waste. Agricultural raw material is lying in rotting piles. In Iowa we have seen farmers sitting by the hearth where burned their harvested corn. The farmer and the industrialist have both been to blame; the farmer in that he knew not what to raise, the industrialist in that he knew not what to advise.

The system such as has been described must come from a willingness on the part of the farmers themselves. The coöperative marketing agencies now springing up in America will undoubtedly serve to convince our agriculturists of the need of larger and more powerful organizations.

At this point it will be necessary to call attention to a few farm staples and note their possible uses. Oats is used primarily as a feed for livestock and for the manufacture of cereals. From the hulls about ten per cent by weight of furfural is easily obtainable through a simple steam distillation process. This furfural is already finding a market. From the furfural we shall derive

a large number of chemical compounds of considerable value. Though the hulls constitute but thirty per cent of the weight of the oats, the chemical compounds derivable from this fraction will certainly approach a value equal to that of the remaining seventy per cent of the oat kernels.

Sugar cane has been cultivated primarily for its sugar content, but one-fourth of the total weight of the sugar cane consists of the tops and these may serve admirably for silage. One-fourth of all the sugar cane and sorghum stalks grown in our southern states is now furnishing a by-product for further manufacture. In Louisiana we note the average yield per acre of twenty tons of sugar-cane stalks which, after extraction of the ten per cent sugar content, yield a bagasse capable of giving another ten per cent of the original weight of cane, in the form of dry fiber, even stronger than wood fiber. From this fiber is now manufactured celotex, a kind of board of non-heat-conducting properties, especially suited for the lining of refrigerator-cars and interior walls of buildings. In this connection, we may assume that the stalks of wheat and corn will come into use in the preparation of similar, but coarser, wood substitutes.

OF GREATEST interest in the last few years is the development of the soy bean industry. This bean is distinctly rich in nitrogen. Soy bean oil is used for making lard and butter substitutes, for soaps and for edible oil. It is also used in the making of waterproofing materials, enamels, varnishes, and printing inks. The oil cake is an excellent stock food and finds use further in the manufacture of a flour for man's consumption and for special food for invalids and infants.

Corn gives a great number of products. The germ yields a fine cooking oil (one pound per bushel) and paragol, a substitute for rubber. The germ residue is an excellent cattle food. The starch granules of the corn are convertible to laundry starch (33 pounds per bushel) and already 50,000,000 bushels of corn is diverted into this channel. From this corn starch we derive corn syrup, dextrose and crystalline maltose. This latter is a recent development of the Bureau of Chemistry and is made by mashing starch with malt and allowing the mixture to hydrolize for a week. About twenty-five pounds of sugars can be made from a bushel of fifty-six pounds of corn and a residue of about fifteen pounds of molasses collected.

From the corn-hulls we obtain gluten (14.5 pounds from each bushel). This is a valuable tissue-building food for livestock. From this same source we also obtain phytin, a food containing twenty-one per cent assimilable organic phosphorus, especially valuable for those suffering from nervous disorders. The cobs of the corn, which amount, all told, to 20,000,000 tons of our total crop of 3,000,000,000 bushels, may be made to yield, by simple steam distillation, an adhesive substance valuable as briquetting material and also an appreciable quantity of furfural, previously mentioned in connection with the oat-hulls. From the corn which enters the butyl alcohol industry we obtain per bushel about ten to eleven pounds of solvents made up of about thirty per cent acetone, sixty per cent normal-butyl alcohol and ten per cent ethyl alcohol and certain high-boiling acids, all of which are meeting with increasing demands in the industries. In this fermentation of starch, present in corn to 60 per cent by weight, a large quantity of carbon dioxide and hydrogen in equal volumes is simultaneously evolved. These gases constitute a weight almost twice that of the combined solvents. The remaining 40 per cent, or non-starchy material of the corn left after fermentation, contains 10 per cent of protein and considerable fiber and pentosans. This residual mixture when carefully dried is well adapted as food for stock and will be returned to the farm in ever-increasing proportions. The gaseous hydrogen evolved in these fermentation processes is soon to be employed for the synthesis of ammonia by combination with atmospheric nitrogen and thus is insured a low-priced ammonia. The ammonia in turn may then be made to react with the waste carbon dioxide under pressure to yield urea, one of the most desirable forms of fixed nitrogen for fertilizers.

When we reflect upon the great waste in our corn today—some forty per cent for swine, twenty per cent for horses and mules, fifteen per cent for cattle, and only ten per cent for man and fifteen per cent for manufacture—we know full well that the chemical utilization of this crop is most inefficient. More of the corn must come into fermentation processes and more soy beans must be raised to furnish greater and greater amounts of food for livestock. Those vitamines which are present in the corn and have such beneficial influence upon hogs must be isolated and supplied to the hogs through some medium other than raw corn. The coming utilization of cornstalks in chemical processes will naturally lower the price of the corn grain and it may still be possible to feed livestock with appreciable quantities of corn without encouraging chemical waste.

Worthy of particular attention on the part of southern landowners is the assuredly growing importance of peanut oil. From this oil by hydrogenation an excellent substitute for lard is obtainable. Hogs take particular delight in rooting out the ungarnered peanuts left in the ground. Each acre can thus afford nutriment to fatten thirty hogs up to within three weeks of sale when corn, for the present, must be used to bring the hogs into first-class condition.

Moreover, we must introduce new crops into various parts of the country for cultivation. A Chinese seed, *Aleuritis fordii*, has just recently been planted in Central Florida. From this seed we shall obtain tung oil, especially adapted to high-grade varnishes, paints and linoleums.

UPON poor southern land we shall grow dasheens and yams which yield such large starch crops, particularly adapted for fermentation.

The long-leaf pine is destined to come into prominence by reason of the new developments in the chemistry of turpentine. From the pinene fraction of turpentine, synthetic camphor is now produced abroad at such prices as to make it highly competitive with natural camphor. Whereas the remaining portion of the turpentine by careful halogenation and oxidation yields an excellent substitute for the best quality of linseed oil.

Upon poor northern lands, notably in Michigan, Norway spruce will be planted. In twenty-five years, the spruce will be ready for cutting and shipment to artificial silk plants. With the replacement of young trees for those cut each year, this will give the Michigan farmers something to secure

them against failure in other crops. A new waste product in the artificial silk industry is found to possess qualities approaching those of wool; though not so soft to the touch nor of the same warmth, in garment form, these desirable properties will soon be supplied either by admixture with other organic chemical products or with wool itself.

There appears to be no end of possibilities for farm lands. We must, however, introduce a method of cultivation of the right crop on the right soil and this under scientific control. It is appalling to reflect upon the frightful losses in our cotton crop, due primarily to the ravages of the boll weevil. In 1914 the average yield of cotton per acre was 209.2 pounds. In 1923 this yield dropped to 130.6, or a loss represented by 5,000,000 bales of cotton on the acreage planted; practically one-third of the crop possible. Though the average yield of cotton per acre in 1925 rose to 167.2 pounds, the expense incurred in bringing this crop to the market restricts considerably any attractive financial returns to the grower.

WHEN we consider the mounting costs attached to the cultivation of such well-known crops as cotton, we cannot overlook the possible introduction of the culture of weeds or such material inherently resistant to all ravages of disease and insects. It is not beyond hope that common milkweed will more than likely claim the attention of our organic chemical manufacturers. And certainly the expense of its cultivation cannot be appreciable. Such weeds will be grown primarily for their plant juices and secondarily for linters and cellulose. The Jerusalem artichoke (*Helianthus tuberosus*), or the sunflower that grows wild on western lands, will soon be domesticated and diverted into chemical manufacture. The War Food Committee of the Royal Society of Great Britain reported this plant as capable of producing the greatest amount of food per acre. It can be grown on waste land and without cultivation. The average yield per acre may be made to approach twenty tons, whereas the Irish potato yields not more than three tons per acre. Freezing does not affect the tubers; hence they may be left in the ground until needed. These tubers contain a carbohydrate known as inulin, a product hydrolyzable into levulose or fructose, with a yield amounting to ten or twelve per cent of the weight of the tuber. This fructose is fifty per cent sweeter than ordinary sugar and its preparation in pure crystalline form has just been completed by investigators at the Bureau of Standards. Although this sugar is somewhat deliquescent, this need not interfere with many of its possible uses. When fermented the carbohydrates of the artichoke yield alcohol and acetone, but this fermenting proceeds somewhat more slowly than in the ordinary fermentation of glucose. The artichoke may also be used as food in the same manner as potatoes and the seeds undoubtedly will find a market for the production of oils and meal.

The adaptation of all sorts of agricultural waste to a multiplicity of uses has only just begun. There are as many possibilities ahead of this enterprise as there were a century ago for the utilization of coal tar. This statement may seem utterly absurd to the layman, but to the chemist it is a certainty.

When an end has been made of agricultural waste, recourse will be directed to those final wastes of all chemical plants, carbon dioxide and carbon monoxide. Modern chemistry already hails this as the inauguration of a new era in organic chemical manufacture.

The analogy between farm and organic chemical plant is certainly obvious. We should not, however, overlook that apparent discrepancy in the analogy which concerns the processing time periods. In the plant a process may require several weeks, sometimes several hours, for completion. Whereas upon the farm the active growing period extends from thirty to ninety days and after the harvest the rest of the twelve months finds the farmer with a closed-down plant.

The organic chemical manufacturer was once just as seriously handicapped by unusual and long-time processes. Operating and overhead charges retarded any real progress in his competition with nature. But the working up of by-products and the installation of co-products gave him at last his opportunity.

The agriculturist has only to adopt these same methods. The co-production of cellulose and allied compounds through long-time processes, as, for example, the growing of trees, will serve in a similar manner to cut down the overhead and operating charges on the farm. In fact, the latter item may become practically nil. The relative time factors—three months for a crop to twenty years for tree growth—obtains only at the inception of the enterprise. The actual ratio will more nearly approach three months to two years in northern climes when the system is well under way. However, in arboriculture the farmer must not expect to reap much greater quantities of cellulose than about 50 cubic feet or 1,500 pounds a year an acre.

When appreciable portions of our farms are given over to the development of co-products, naturally there will remain less acreage for main products, but here again just the farmers follow the men in the plants. Increased use of fertilizer, a thousand pounds an acre, and intensive cultivation of the rich soil will make for abundant crops of desired quality and more handsome profits. Main products must be pushed to the limit if we would cut down operating expenses. The actual growing period now required for a given crop will be materially shortened as time goes on. Already we have at hand certain chemical methods for treatment of seeds that will reduce the germination period by twenty-five per cent.

IT IS these future developments in the chemical adaptation of cellulose that bring us directly to the crux of the entire problem of agriculture. If those who strive for publicity in solving the farmer's troubles could only read the signs of the times, if they could only look upon this chemical world from a chemical point of view and educate themselves to comprehend what chemical science is doing, these men might then lend a hand that would actually help.

Farmers all about us industriously pursue their time-worn practices. All fared well until this modern era of cellulose chemistry began to reveal itself. Now impending disaster stares these good men in the face. Certain politicians clamor loudly for some sort of price-fixing for farm products. What possible help will price-fixing bring? The farmer is primarily a manufacturer of carbohydrates, and that particular form known as cellulose which comprises the large portion of his forests and the waste from grains is positively going directly from nature into our manufacturing establishments and will soon drive from the market all higher-priced cellulose which the farmer has been taught to raise from time immemorial.

Cotton, for example, consists of ninety-six to ninety-seven per cent pure cellulose and brings a price of about eighteen cents a pound. Norway spruce when subjected to special treatment is delivered today as a ninety-four to ninety-five per cent pure cellulose at the price of five and one-half cents a pound. From this spruce fiber the best of artificial silk can be made. Even the waste cotton linters at 4 cents a pound cannot be brought into a proper state of purity at a price as low as spruce fiber.

Nature has been extraordinarily kind to man and is continually endeavoring to afford him a better and better living. The chemists are diverting all of nature's waste into useful products for man's consumption and now must demand of nature her cheapest raw materials that can be worked to this end. Those products which mother earth supplies with little or no cost will form the basis of many of the chemical transformations yet to be inaugurated. The farmers, therefore, are left with these three classes of activity, arboriculture for cellulose, animal husbandry for protein and milk, and the growing of highly valuable organic staples, chemically adaptable in the most diversified directions. Food and raiment will be manufactured in the manner of by-products and the agriculturist, acquitted of his millennium-old duties, will join the ranks of the organic chemical manufacturers in their never-ending inventions.

# Why Half the People Do Not Vote

(*Concluded from page 2*)

form. The party next gets it past one branch of Congress while it sticks in the other. Perhaps in a few more years it passes both branches of Congress only to be vetoed by the President. Under the next administration it may pass both houses of Congress and be signed by the President only to be declared unconstitutional by the Supreme Court.

By the time the measure has been trimmed to suit the court and passed again by Congress and approved by the President the situation that at first made the measure seem desirable may have so altered that it does not fit the occasion. It can be altered, of course, but meanwhile there has been a great deal of costly delay. The head of a business would have made a move of equal relative importance and put it into effect in a short time.

Keep this fact of human nature always well in mind: Human beings are usually much better judges of what they do not want than of what they do want. They seldom mistake a wrong, but often overlook what would be a benefit. They are very capable of saying what they would dislike but oftentimes utterly incompetent to determine what should be done. They are incompetent because they are not experts in the management of industry, in finance, and many other matters with which government has to deal.

# Ye Knife—Ye Forke—Ye Spoone

(*Concluded from page 8*)

to the Egyptian spoon for getting the marrow out of bones; this was made in England with a long slender bowl and sometimes a groove in the handle to be used for smaller bones. It must have been an interesting sight to see tnese marrow-spoons in operation at a great feast, each guest with a bone. What a fine scene for a 'movie'!

'Spooning,' in the modern sense, was first employed in England, probably being derived from the use of the noun 'spoon,' or a 'spoony,' for a simpleton, or, as the serious *New English Dictionary* says, a 'noodle.'

In the Stone Age man learned that a cutting edge could be placed on flint or stone to make a serviceable tool. In a later age bronze was used.

In general an instrument frequently resembling a butcher's meat axe was used to prepare pieces of meat of a size convenient to fit the hand. Greeks and Romans, even in the days of luxury, ate with their fingers.

The finger bowl was essential, and servants passed towels and bowls with perfumed water after each meat course. Occasionally a Roman tried the dubious experiment of eating with a knife. On ancient monuments some of these innovators have been depicted with knife in hand conveying a morsel to the mouth in a manner distinctly contrary to Hoyle.

The fork best known to the ancients was the pitchfork, and it was many years before a miniature edition for use at the table was conceived. However, large two-tined forks to assist in preparation of food were used by the Romans, but did not develop further. A skewer was used in early England, and in the *Boke of Curtasye*, the guest is instructed 'not to pick his teeth with his knife nor with a straw or stick,' which seems reasonable.

The table-fork appears to have been invented about a thousand years ago in Italy, for in the year 1060 Cardinal Pretro Damiani preached a sermon against the unholy use of this new instrument, a symbol of luxury. Did not the Almighty give to man five fingers on each hand? Why then use a pronged tool, flouting nature? But the wicked Italians continued to use this instrument, even making it of silver and of gold.

Queen Elizabeth was the proud possessor of two forks, and soon the instrument threatened the table manners of the Britons. In England also, sermons were preached against the custom as 'an insult to Providence not to touch one's meat with one's fingers.' However, Ben Jonson, in his work with the interesting title, *The Divell Is an Asse*, hit the nail on the head when he said that forks were 'brought into custom here, as they are in Italy, to the saving of napkins.' Smaller laundry bills made forks popular.

Two-tined forks were the rule until the opening of the 18th Century when it became possible, but not correct, to eat peas with a fork. However, at this time, the knife was remodeled with an enlarged hollowed end so as to serve a fair mouthful of such elusive food.

In early English a knife was called a 'whittle'; hence our term 'whittling.' The Latin word was 'cutter,' which gives us 'cutlery.'

Sheffield appeared upon the map with fine steel in the 14th Century, and from that time knives and forks largely came from England.

For centuries forks and spoons were rather rare. The great Montaigne in 1580 expressed his astonishment at the Swiss table provided with a spoon for each person.

In wills of the time of Shakespeare spoons and forks are commonly mentioned, being listed with the jewels.

'Fingers were made before forks,' is certainly a truthful statement, and it took many centuries for man to acquire the habit of interposing such instruments between himself and the tempting morsels given by nature and embellished by the cooks.

# Chats *with* Office Callers

***The Faddist*** came in. He had a roll of music in manuscript and expounded at length on the music of the future, but was at a loss when someone asked him what the music of the future had to do with the present, and if it were for the future why not leave it until then. But he had a certain pleasantness about him nevertheless, and, on leaving, presented us with a copy of part of a futuristic opera as composed by a gentleman named Antheil. The orchestration was this: Voice through an electric amplifier; sixteen electric pianos controlled from a switchboard; eight xylophones; a battery of amplified phonographs; four bass drums; four electric buzzers; four pieces of steel; a buzzing electric motor. The comfortable and uplifting reflection is that we live in the present.

❦ ❦ ❦

***The old Irishman*** who dropped in was stuffed full of tales. He had been a hard case in his day, but the hero had passed into the saint with the years. Interested because of the news of the release of the Sinn Fein prisoners in Belfast, he told of Fenian activities, of the Invincibles, of the fire-eater named O'Donovan Rossa whose idea it was to dynamite buildings by way of reforming men. And he had a soft spot in his heart for Parnell who set himself to paralyze the legislative efficiency of the English Parliament. Once, he said, he asked Parnell how he came to acquire his extraordinary knowledge of the rules of the House. The Irish leader's reply was, 'By breaking them, of course!'

❦ ❦ ❦

Then there was ***an Ancient Mariner,*** a ship captain with a face like mahogany, and a farseeing eye. He seemed to have been everywhere, to have seen everything, to have read everything worth reading. About literature he was emphatic, waxing almost oracular. 'Sir,' said he, referring to Dreiser and his popularity, 'I have read, or tried to read something of the man. But he is dull. His success is a triumph of ineptitude over ability. Posterity will forget his name utterly. But Conrad—there's a man for you! He is the seaman's favorite. On my last trip his *Youth* and his *Victory* were read to rags and tatters.'

***The Man from the West*** had much to say about the singing of so-called cowboy ballads, holding that the proper way to render them was in a sort of easy-going way, with long rests between lines, with a dwelling upon certain words, and without musical accompaniment. 'Cowboys don't carry pianos with them,' he said, 'so why get things out of focus by trying to sing the songs as they are never sung?' Nor could he refrain from a certain indignation when someone said something about cowboys singing cowboy songs. 'Why should they?' he asked. 'Do you editors start work at sunup with songs about printing? Does the trainman chant about his locomotive? Does your wife go about singing of the delights of dishwashing? A cowboy is as likely to sing a hymn, or an old-fashioned ballad, or a sea song, or anything that comes into his head. But believe me, he is sick and tired of songs about Dying Cowboys and Trappers' Laments.' Then he told a tale of a patronizing kind of man who went to Uvalde County to get material for a novel. To the camp cook he said: 'I like this free and open country. I suppose I can get pure ozone here.' 'No you can't,' said the cook. 'There ain't a bootlegger in the county.'

❦ ❦ ❦

One man told the story of his visit with ***a Film Censor*** who disposed himself comfortably in a morris chair then went to sleep until the operator woke him when the reel had been run off. He spoke of the amount of sickly sentimentalism in film stories. He also spoke of the appalling amount of bloodshed, the hairbreadth escapes from most desperate dangers by feats of superhuman valor, and the impossible way in which screen heroes slew enemies right and left. In his opinion, most of our modern film stories were not at all different from the blood-and-thunder weeklies in which boys delighted forty years ago. But, in what Don Seitz called the Dreadful Decade, that kind of thing engaged boys and boys only, while nowadays grown men and women enjoy them. That, with all our advancement, adults should still find enjoyment in glorification of the brutal passions seemed odd to him. In fact, he said, in spite of all efforts to lift the popular taste, things were much of a muchness with the old days when in popular novels the villain had to be foiled, the hero had to triumph and the lovers had to be united.

❦ ❦ ❦

***A Book Reviewer*** who often writes for the New York *Herald Tribune* spoke of Stuart P. Sherman, that newspaper's noted critic, who died so recently. He regarded Sherman as a man who had had the advantage of a disciplinary education. His work rested on real research and patient labor, and personally he was a man of amiable and attractive character. Scholarship had broadened him and he did much to widen the artistic horizon of his time. In criticism he possessed a special and unique gift. Not the least of his gifts was that he knew how to surround himself with good men to whom he gave a free hand, so that a zest and pungency pervaded the columns of his paper.

❦ ❦ ❦

A Dumas story was recalled by ***the Writer.*** An interviewer went to the older Dumas with this question: 'You are an octoroon, I believe, Mr. Dumas?' 'Certainly,' answered the novelist. 'And your father?' 'He was a quadroon, naturally.' 'And his father?' 'A mulatto, sir, a mulatto!' 'And his father?' 'A negro, of course!' 'Might I ask what his father was?' 'An ape, sir!' roared Dumas. 'My pedigree ends where yours begins.'

❦ ❦ ❦

And there was ***the Man from Africa,*** from Rhodesia, to be exact. His talk was not of diamonds or gold or wealth or well-appointed houses, but of the man who opened Africa, David Livingstone. The tale he told of the explorer was of breath-taking interest, and the marvelous thing was that flesh and blood could have done so much by sheer pluck and endurance and persistence. But very clearly and distinctly he saw his goal and marched to it, his unselfish love his weapon, his gentleness his armor. Nor was there in his trail either wastefulness or destruction. Yet by his efforts Africa was opened for those who are developing it today.

❦ ❦ ❦

***The Man from the Ozarks*** mentioned the Strange Case of Mr. Roger Dodsworth, which, a hundred years ago served to delight those agog for a new sensation. For, the newspaper report had it that in July, 1826, a Swiss came upon the body of a man embedded in ice, on Mount St. Gothard. A Dr. James Hotham took matters in hand and 'treated the patient in the manner customary with cases of suffocation,' whereupon, 'what was the astonishment of everybody when the individual, having recovered the use of his faculties, declared that he was Roger Dodsworth, son of the antiquary of the same name, born in 1629, who, returning from Italy in 1660, a year after the death of his father, was buried under an avalanche.'

Which called to mind another famous hoax by which some hardened offender led a confiding public to believe that at Pompeii in 1811, workmen found in a sarcophagus a human body, which, 'on being exposed to the air, exhibited in the arms, legs and throat those convulsive movements which are observable in those subjected after recent death to the operation of galvanic shocks.'

# Can You Tell Me?

QUESTION: Does the United States have a border patrol to prevent the smuggling of immigrants across the borders of Mexico and Canada?

ANSWER: Yes. In the 1925 Appropriations Act for the Department of Labor $1,000,000 was appropriated for that purpose; but it is probably not working up to 100 per cent efficiency, as it is largely in its infancy and they have a difficult problem. The appropriation was hardly sufficient to provide an adequate force to handle the situation.

ǂ ǂ ǂ

QUESTION: How many immigrants have entered the United States within the last twenty-five years?

ANSWER: The annual Report of the Commissioner General of Immigration for 1925 states that for 27 years, 1899-1925, there was a total entry of 17,930,397.

ǂ ǂ ǂ

QUESTION: How were they classified as to race or people, in what percentage?

ANSWER: They were divided as follows:

| | |
|---|---|
| African (black) | 135,810 |
| Armenian | 76,705 |
| Bohemian and Moravian (Czech) | 161,152 |
| Bulgarian, Serbian and Montenegrin | 165,509 |
| Chinese | 60,800 |
| Croatian and Slovenian | 485,899 |
| Cuban | 77,940 |
| Dalmatian, Bosnian, and Herzegovinian | 52,186 |
| Dutch and Flemish | 209,099 |
| East Indian | 8,279 |
| English | 1,118,239 |
| Finnish | 227,611 |
| French | 438,484 |
| German | 1,370,829 |
| Greek | 501,531 |
| Hebrew | 1,848,167 |
| Irish | 851,423 |
| Italian (North) | 607,319 |
| Italian (South) | 3,220,963 |
| Japanese | 261,174 |
| Korean | 9,240 |
| Lithuanian | 263,606 |
| Magyar | 492,916 |
| Mexican | 479,443 |
| Pacific Islander | 1,158 |
| Polish | 1,486,552 |
| Portuguese | 186,964 |
| Rumanian | 148,642 |
| Russian | 260,210 |
| Ruthenian (Russniak) | 266,145 |
| Scandinavian (Norwegians, Danes and Swedes) | 976,454 |
| Scotch | 468,675 |
| Slovak | 537,531 |
| Spanish | 191,109 |
| Spanish American | 43,748 |
| Syrian | 102,709 |
| Turkish | 22,113 |
| Welsh | 44,259 |
| West Indian (except Cuban) | 29,582 |
| Other peoples | 40,222 |

QUESTION: What state spends the most money, per capita, on education?

ANSWER: Montana is alleged to have that distinction.

ǂ ǂ ǂ

QUESTION: Are the prohibition laws of the United States in force in Porto Rico?

ANSWER: Yes; both the Eighteenth Amendment and the Volstead Act.

ǂ ǂ ǂ

QUESTION: How many immigrants were admitted to the United States last year?

ANSWER: For the fiscal year ended June 30, 1925, a total of 294,314 immigrant aliens were admitted.

*In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.*

QUESTION: How many ships are there in the American Merchant Marine, operated by the United States Government, and what is the total tonnage?

ANSWER: The United States Shipping Board operates 1,005 ships, with a gross tonnage of 5,106,800 tons. Less than thirty-five per cent of this fleet is now in active service.

ǂ ǂ ǂ

QUESTION: Why doesn't the Government take some action against advertisers who offer fake medical preparations to reduce weight?

ANSWER: The Post Office Department is exercising the utmost vigilance in suppressing such dangerous quacks. Orders for fraud have been issued recently against the advertising of two reducing soaps, a reducing gum, and a reducing bath salts. The Post Office Department is overburdened with such fraud investigations and the mere fact that advertisers of this sort continue to flourish does not indicate that they are approved. Our Government hasn't had time to get around to all of them yet.

ǂ ǂ ǂ

QUESTION: How many colleges, universities and professional schools are there in this country and what is their total enrollment?

ANSWER: There are 900 colleges, universities and professional schools, having an enrollment of 700,000 students. Of this number 450,000 are men and 250,000 are women.

QUESTION: Can old automobile tires be reclaimed and the rubber used in the manufacture of new ones?

ANSWER: The Bureau of Standards has been making a thorough investigation of this question. Many manufacturers because of the high cost of new rubber have been doing considerable experimental work along this line. The results of the Bureau of Standards' investigation are contained in Technologic Paper No. 294, entitled, *Wearing Qualities of Tire Tread as Influenced by Reclaimed Rubber.* This may be obtained for five cents a copy from the Superintendent of Documents, Government Printing Office, Washington, D. C.

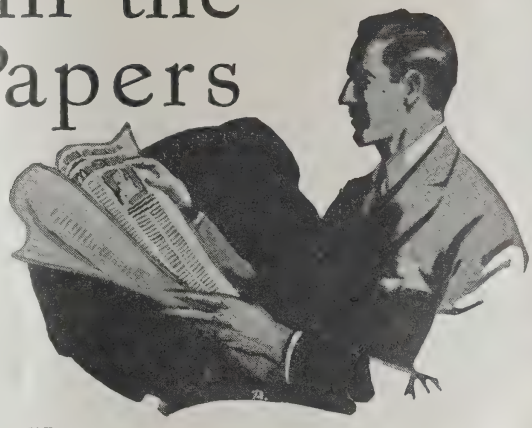
ǂ ǂ ǂ

QUESTION: Our class has had some discussion as to the wealth of the United States. Could you give us some figures which will set this forth?

ANSWER: The United States holds about 45 per cent of the world's monetary gold holdings. The New York Stock Exchange lists 70 billion dollars' worth of securities. The crops of the nation are worth 12 billion dollars each year. The wealth of the country in 1924 was estimated at 320 billion dollars. The income of the people of the country is around 80 billion annually. The annual tax bill of the United States is nearly eight billion dollars. The banking power of the nation is estimated at 62 billion dollars and bank clearings run at the rate of ten billion dollars a week. These statistics probably give you the figures you desire.

ǂ ǂ ǂ

QUESTION: Why doesn't the Federal Government make a thorough survey of traffic congestion in our large cities? This has become a national problem.



ANSWER: The Domestic Commerce Division of the Bureau of Foreign and Domestic Commerce has made such a study and published a report as *Trade Information Bulletin No. 394.* This may be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., and is free of charge. The report deals with the decentralization of business which tends to alleviate traffic congestion through the establishment of shops outside the congested areas.

ǂ ǂ ǂ

QUESTION: Is divorce increasing in the United States or is the reported greater number due to an increasing population?

ANSWER: Divorce is on the increase both as compared to the total population and to the married population. In 1870 the divorces per 1,000 total population was .28; married population, .81. In 1880 the figures were .39 and 1.07. In 1916, 1.13 and 2.81, while in 1923 the latest available figures showed 1.49 divorces per 1,000 persons and 3.6 divorces per 1,000 married persons.

# I Read in the Papers

M. Loewenstein, Belgian banker, set the world by the ears when he offered a few days ago to lend his government $50,000,000 for two years without interest. At first blush it seemed as though a patriotic, benevolent and exceedingly wealthy individual had come forward to the aid of his country without hope of profit, guided solely by dictates of the soul. But now the proposition takes on a different guise. What, asks the world, does M. Loewenstein hope to get out of it? Who will help him get this fund together? The answer comes forth at once. American capital and capitalists are behind him, of course, seeking to tighten an already insidious clutch upon the resources of a debt-ridden nation.

*M. Loewenstein Makes an Offer*

News dispatches indicate that the proposal will be rejected, although some writers purport to have uncovered a gigantic undertaking which would involve a large loan to France as well as to Belgium. The trail of the familiar 'octopus' is traced all around and over the project—the same slimy creature which figured so largely in American muckraking days of old. The money would not draw interest, direct, but, as described in cabled reports, would be exchanged for certain privileges, monopolistic in character, of a sort to give a huge trust control of particular industries.

The thing verges on the fantastic. Imagine a program which for so paltry a sum as $50,000,000 would provide the lender with control of the telegraph and telephone systems, electric power exploitation, silk, or coal, or iron of any highly industrialized nation. And, as announced, the loan would be only for two years, a term too short for any comprehensive development of a true trust idea. Were it not for the fact that M. Loewenstein stands as a responsible figure in Belgian banking, the proposition would be received as an empty gesture against a background of publicity with a purpose not clear.

There must, however, be considerable more substance to the scheme than that. Just what it may be cannot be determined as yet, but commentators who seek to separate economic incidents from their frequently accompanying non-economic elements sense an internal business contest behind the scenes. In other words, they feel that the $50,000,000 offer must be merely the bait for some far greater undertaking which keen Belgian minds are striving to complete. The dénouement ought to be interesting. —*The Wall Street News.*

The province of Quebec makes a square yard of concrete road out of the profits from every quart of liquor sold to American bootleggers. American highways, however, are still paved with good intentions.—Kansas City *Times.*

A new opera is exciting the people of Budapest, with flapdoodle on the part of critics who take it seriously. It is the monkey opera, a burlesque and a satire, and no more to be taken seriously than *Gulliver's Travels.* The author, Ferene Herozeg, ironically suggests the inferiority of men to apes. The hero of the play is Vanno, a jungle ape, who, having seen some modernistic cutting-up in human society, comes to the conclusion that a self-respecting monkey would not desire the company of human beings. On that theme the author hangs much pungent criticism of latter-day silliness somewhat in the manner of Swift in dealing with his Houyhnhnms, where horses are civilized and human beings as Yahoos are despicable and brutish. But the critics seem to have overlooked the allegory.

*That Monkey Opera in Budapest*

A military expert predicts that the next war will be fought by wireless. From what we heard the other night we had the impression that it had started.—*Punch.*

The common opinion that chess first came from China is incorrect, according to experts who have been delving into the origin of the game for the past sixty years. The game originated in India—northern or central—probably before A. D. 600. The game was well known throughout the whole of India, with the exception of the southern provinces, and in Persia in the latter part of the Sixth Century. The oldest references to the game are found in Persian and Indian literature soon after A. D. 600, while no Chinese manuscripts mention the game until the Eighth Century. It is true that there are references of much earlier date, to games played on boards or tables, one as far back as the time of Confucius, and these names have been erroneously translated as chess.

*Chess Comes From India Not From China*

Some Chinese scholars agree that the game came to China from India not earlier than the Sixth Century. The game was greatly altered by the early Chinese players. Pope translates Homer's lines, 'At chess they vie, to captivate the queen.' But the Grecian game was a kind of checkers played with small stones, and there was no queen, which piece was adapted in Europe in the Ninth Century. There has never been any female piece of any kind in the Asiatic game.

Persian records show that the game was introduced into that country from India in the middle of the Sixth Century, and it is evident from all accounts that the Near East had no records of the game in the Fifth Century and the Arabians had none before their conquest of Persia in the latter part of the Seventh Century. The first records of the game in the Western world are in the Eighth Century when the game was played in Southern Europe, coming to England in the Eleventh Century. The present game with its rules dates from 1490.

The United States having helped make the world safe for democracy, the grateful world will now help make the United States safe for prohibition.—Toronto *Mail and Empire.*

A tidal wave has destroyed Palmerston Island.

In 1862, William Marsters, who had polygamous notions, collected a few Polynesian wives and settled on the island. Today his descendants number more than a hundred, and the tidal wave which swept the island has reduced them to a primitive mode of life.

*Men Who Would Be Kings*

Marsters was not the only self-appointed king. Swain's Island, 200 miles from Samoa, has its King Jennings, an American, the grandson of one Eli Jennings, who settled there in the middle of the 19th Century with the daughter of a Samoan chief as wife. The present population is seventy. Another similar case is that of the Cocos Islands in the Indian Ocean, and their monarchs, Ross and Hare. Ross ruled like an Oriental potentate, from 1825 to 1854, with harem, musicians, courtiers and slaves. Then there is Sarawak, ruled by the Brooke family and formally recognized by King Edward VII.

Coming to modern instances, there are reports that Josef Djugashvili, man of mystery, has appeared in Russia, and his expectation is to master affairs by efficiency and successful administration, perhaps achieve imperial mastery.

A New York man has invented a hat which is secured to the head by means of suction. Judging by the films, the American detective has always worn this sort.—London *Opinion.*

From Prague comes the news of the discovery of a 20,000-year-old mammoth found on the River Amur in Eastern Siberia, the first complete mammoth discovered. But there's nothing new in this, for in 1799 a complete mammoth was seen in Siberian ice, flesh and hair and bones, and the hunters fed their dogs on its flesh. Also in 1803, the skeleton of one was found in Harwich, England.

*The Old and the New*

Again, as evidence of the antiquity of the new there is this: In France, during the Directoire period women had their hair bobbed and it was said that long hair had gone forever. The fashion was known as *La Titus.* But as bobbed hair offered little in the way of change, the bob was succeeded by the close clip in the knave of hearts style as popular today; and after that, in Napoleonic days, feminine again became feminine, so curls and ringlets were the rage. Whereupon Marie Antoinette's modiste said this: 'Fashions are always changing, and the new one is merely one that is old enough to have been forgotten.'

# Briefly Told

JAPAN HAS CASTE AS well as India. The *eta* consists of 2,000,000 to 3,000,000 persons who are untouchables, or pariahs, tainted not by disease but by the misfortune of having been born into the lowest caste.

A MEMBER OF THE British Parliament declares he will ask his government to furnish every man, woman and child with a gas mask and to establish classes for instruction in its use. He believes this precaution will be essential for the next war.

THE DEAD SEA is highly impregnated with mineral matter and the bather can float easily. He finds difficulty in swimming, however, as his feet tend to fly up out of the water.

THERE ARE ABOUT 70,000 buses in the United States, operated by 5,800 companies over 22,850 routes.

THE WORD STARBOARD comes from the old Saxon *steorboard—steor* meaning either rudder or steer, and *board*, side. Starboard gets its present meaning from the time when vessels were steered by a paddle or sweep worked from the right side.

MORE THAN FOUR HUNDRED tramps, recently arrested in New Orleans, were put to work cleaning the streets.

THE PERCENTAGE OF SAFETY in airplane travel in Germany during 1925, according to official statistics, was 99.997. During the first eight months of 1926 not a passenger on the seventy-five airplane routes of that country was injured.

IN LAKE MAGADI, Kenya Colony, Africa, there is a stretch of water fifteen miles long by four miles broad, which appears to be frozen even at the height of summer. Carbonate of soda crystals cover the lake's surface and are so thick in spots that they will bear a man's weight.

ANCIENT CAVEMEN STOOD at narrow entrances to caves and as bears rushed out, they cracked them on the nose with heavy clubs. The bears thus stunned were easily killed. Bones recently found gave the clue to the old pastime.

DIOGENES, FAMED FOR centuries as the searcher after truth, has come down to our generation under the shadow of a lie, modern researchers declare. He never lived in a tub at all. The allusion was made by a biographer, who remarked that a man so crabbed 'ought to live in a tub, like a dog.'

SO LARGE A CROWD of the curious gathered when a butterfly put in appearance at 42nd Street and Lexington Avenue, New York, that police reserves had to be called to control the situation.

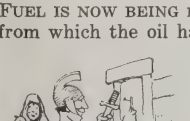
A CABLE SHIP HAS DISCOVERED that the bed of the Atlantic Ocean near St. Helena has risen two miles in the past twenty-five years.

THE ARMY MULE IS still an integral part of the United States Army, the War Department having recently set aside $20,000 for the purchase of these worthy animals at $165 a head.

GOVERNMENT EMPLOYES traveling at Government expense are allowed to tip waiters not more than sixty cents a day, and bell boys not more than thirty cents.

HIRED MOURNERS IN Mesopotamia pull out their hair to demonstrate the genuineness of their grief.

A MADRID NEWSPAPER has offered $7,600 to any person who can write an article convincing an international court of arbitration that Columbus was Spanish by birth.



UNTIL THEY WERE contaminated by contact with the white man's civilization, the Zulus were the most healthy people in the world, according to Sir W. Arbuthnot Lane, noted British surgeon.

THE UNITED STATES ARMY, during the past fiscal year, sold rags, rubber, tin cans, bottles and other junk valued at more than a million dollars.

BERLIN HAS MORE THAN two hundred beekeepers who have more than three thousand hives on the flat roofs of buildings.

NAP ON SILK HATS often comes from the fiber of milkweed.

FUEL IS NOW BEING made from raisin seeds from which the oil has been extracted.

IN MODERN TIMES WE hang symbols of death on our doors. Ancient folk advertised births in the same way. In Greece an olive wreath was hung on the outer door if the new-born child was a boy, and a wooden fillet if a girl.

THE JORDAN RIVER IN Palestine has never been navigable. No important towns exist along its banks and it empties into a salty inland sea. Its valley was the Wilderness of Hebrew times, and today is thickly forested.

DENSE FORESTS ONCE grew on the Sahara Desert and a race of people who subsisted by hunting and tilling the soil lived there, a University of Chicago professor declares.

FOURTEEN PER CENT OF the students in women's colleges work their way through school, a survey indicates.

THE BUZZING OF A COMMON housefly has a distinct musical quality, the vibration of the wings producing the note F.

ORNAMENTAL SUSPENDERS are the latest fashion fad in London, reviving an old-time custom. Pictures are stenciled or woven on the shoulder straps.

AN OIL COMPANY IN Mexico uses an airplane to transport its pay rolls, thus foiling bandits. More than $25,000,000 has been carried safely.

THE SKELETONS OF A dozen gigantic eels, fifty to seventy-five feet in length, were recently unearthed in an ancient sea bed in Wyoming. The eels bore resemblance to the fabled sea serpent.

NIGHT WATCHMEN IN Japanese cities carry two blocks of wood which they clap together to warn the citizens to be careful of fire.

THE AVERAGE INDIVIDUAL consumption of milk in the United States last year was 1.2 pints a day.

IN ITS BRIEF LIFETIME the silkworm spins about 4,000 yards of thread.

IT IS ESTIMATED that there are more than 20,000,000 blind persons in the world.

'NO ROOM TO SWING A CAT,' is an old naval phrase which does not refer to a feline. It was first applied to the confined space between decks on the old men-o'-war, which was so cramped that there was no room for the boson's mate to swing a cat-o'-nine-tails when administering floggings.

QUEENS OF SOME SPECIES of ants live fifteen years and longer, the workers living four or five years.

FARM FIRE LOSSES IN the United States in 1925 totaled $150,000,000, an increase of 65 per cent over 1920.

A COURSE IN PHYSICAL education is required by law in the schools of thirty-five states.

# NOTES · COMMENTS CRITICISMS

MR. FORD'S Page this week discusses the failure of finance to perform the service which it professes to give the world.

---

Many people have discussed farm problems; few have advanced remedies of real merit. Most of the proferred panaceas have been temporary expedients—price-fixing, curtailed production, and the like. Here's an expert who presents a new solution in a new way. (p. 4)

---

William J. Hale is chairman of the Division of Chemistry and Chemical Technology of the National Research Council. He is noted as a chemist, holds degrees from American and European universities, has studied agriculture here and abroad, was formerly professor at the University of Michigan. He is the author of many books and magazine articles, and a number of chemists' societies here and abroad. His plan has been received with enthusiasm by chemists and agricultural experts throughout the country. (p. 4)

---

Science provides the key. Organic chemistry can transform farm products now discarded as waste into valuable commodities. By utilizing oat hulls, cornstalks, sugar cane tops, wheat straw and similar things it can double the return from agricultural produce. Not only will the new system increase the farmer's profits, declares Dr. Hale; it will lower the cost of food to the consumer. The article is an interesting outline of what might be termed the *new agriculture*. (p. 4)

---

AGRICULTURE quite naturally suggests birds. And few persons write so delightfully on birds as does S. F. Aaron, the Pennsylvania naturalist. His story on 'winged waves'—the migratory tendencies of birds—is sure to appeal to you. (p. 14)

---

There's an intriguing title to Allan L. Benson's story—*Why Half the People Do Not Vote*. The article bears out the title. We have seen many explanations as to why American citizens disfranchise themselves by refusing to go to the polls, but none so lucid or comprehensive as this. It gives some new thoughts on politics. (p. 1)

---

Suppose a month from now you could register your direct opinion on the World Court, on war debts, on taxation—and have that vote immediately effective! Would you go to the polls or would you stay home? (p. 1)

---

From Willard Cooper, New London, Connecticut: THE DEARBORN INDEPENDENT contains too many amateurish, journalistic articles of Americans. Most of these things are obvious, few are scholarly.

---

From A. A. Robinson, Loma, Colorado: THE DEARBORN INDEPENDENT is a trifle too serious. Suited, I might say, to the ultra-brainy. Come down out of the air just a wee bit and be one of us. Please publish a little poem. It will aid digestion of the more heavy features, and a page of jokes by all means. 'Chats with Office Callers' is very fine. Shows the editor has a human side.

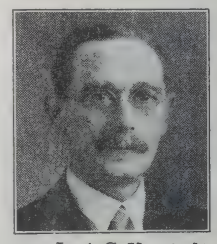
---

From J. C. Bierbower, Lampasas, Texas: I find in the third column of Briefly Told (issue of August 18) that you are in error in calling the fort that defended Baltimore during the War of 1812 'Fort Henry.' Its proper name is Fort McHenry.

[EDITOR'S NOTE: Mr. Bierbower is, of course, correct. Ours was a typographical error.]

---

From Charles E. Collins, Kit Carson, Colorado: You should devote space and effort to studying the farm problem. The present financial condition of our farmers is the most serious problem confronting the nation at this time. The rapid increases in farm mortgages in the past five years are very alarming.



[EDITOR'S NOTE: Mr. Collins is respectfully referred to Page 4 of this issue.]

---

Sermons were once preached against that unholy instrument, the fork, and all good citizens were exhorted to content themselves with the ten good fingers provided by the Almighty. But the fork prevailed over the preachment—for which we should all be thankful, for it provides Louis C. Karpinski with an enticing topic. (p. 8)

---

*Paradoxically, Dr. Karpinski, who is professor of mathematics at the University of Michigan, has made his hobby the study of early American maps. He has contributed many authoritative articles on this subject to* THE DEARBORN INDEPENDENT. *His story on Ye Knife, Ye Forke and Ye Spoone is in a different vein but one equally happy. At present Dr. Karpinski is in Europe, whence more of his delightful articles may be expected soon.* (p. 8)

*Louis C. Karpinski.*

---

WHEN William E. Barton writes about Lincoln, scholars pay close heed. For Dr. Barton (*Life of Lincoln*, etc.) is recognized as probably the country's most outstanding Lincoln authority. In this issue he writes on one of the most romantic episodes in Lincoln's life, romantic because wrapt in mystery—the famous Lost Speech. (p. 6)

---

Come to think of it, this is a mighty interesting issue all round. Take Julian Hawthorne writing on the Harvard of the 1860's. His story gives a vivid picture of the college life our grandfathers knew, a college life that has vanished forever. Incidentally Julian is the son of the greatest novelist America ever produced—Nathaniel Hawthorne. (p. 12) . . . And a delightful interview with one of the greatest novelists of today—Booth Tarkington—by May B. Whiting. (p. 3)

---

And Charles J. Finger comes to one of the most exciting stages of the *Victoria's* voyage: the time when pirates ruled. Magellan dead, renegades seized command and a career of pillage was adopted. Ships were seized, men made slaves, women prisoners. (p. 16) . . . For variety there's an article on modern pirates. The 20th Century swindler uses no ships; he used the names of great personages—and his loot would make the respectable pirates of the 16th Century blush for envy. (p. 7)

THE sinew and heart of man seem to be drawn out, and we are becoming timorous desponding whimperers. We are afraid of truth, afraid of fortune, afraid of death, and afraid of each other . . . We want men and women who shall renovate life and our social state, but we see that most natures are insolvent; cannot satisfy their own wants, have an ambition out of all proportion to their practical force, and so do lean and beg day and night continually . . . The rugged battle of fate, where strength is born, we shun.

# The Bond Orgy of the States

## Local Indebtedness Has Increased $2,000,000,000 in Five Years

By SAMUEL CROWTHER

*SOME of the state figures over a five-year period show that Alabama ran its debt from nine and a half to twenty-three millions; Arkansas increased its budget from one and a half to more than ten millions; California started with a debt of forty-six millions and a budget of sixteen and ended with a debt of ninety-four millions and a budget of forty-five millions. The mines of Colorado are giving out; nevertheless the state increased its debt from four to ten millions and its budget from five to twenty-seven millions. Supposedly conservative Connecticut had a debt of less than a million, but now it has a debt of sixteen, and where the budget was fourteen, it is now more than thirty-three millions. Illinois had no debt, but now it has more than one hundred million and it has nearly doubled its old budget of forty-six millions. Indiana increased its budget from eight to more than thirty millions, and Iowa did about the same, but in addition put on a debt of twenty-two millions, while Kansas put on twenty-eight millions. Michigan was a heavy spender, going from a debt of eight to seventy-four millions, and from a budget of seventeen to thirty-three millions. Other states vastly increased their debts but did not much increase their budgets.*

SOME of our public works could be erected by private corporations and managed at a profit. Private gas companies usually give better service than those owned by municipalities. The same is true of electricity and the telephone. Many of the old roads and bridges were built and controlled by private concerns and the tolls paid their way. But people are today prejudiced against paying toll, and roads and bridges have to be free—although shortly we may find private automobile roads being put down by private corporations on the toll basis, and they will pay because of the congestion of the public roads.

It is beyond the power of the ordinary governmental unit to spend millions in a couple of years erecting expensive bridges and roads. It would dislocate business to attempt to take in taxes all the money needed as it is needed. For instance, New Jersey has had to find funds for a vehicular tunnel under the Hudson to connect with New York and a bridge over the Delaware to connect with Philadelphia. It would have hindered the progress of the state to have waited for these essential links of transportation until such time as it saved the money. The issue of bonds was justified, for the cost was spread over a period.

There is no clear line of distinction between the cases in which bonds—taking a mortgage—are justified and when they are not justified. Common sense has to rule. Certainly bonds may not properly be issued for that which amounts to running expenses or to run beyond the life of improvements. It looks rather as though the rule of common sense had been shelved in local government.

From January 1, 1920, to January 1, 1925, the Federal Government reduced its expenditures about 3,000 million dollars, but, on the other hand, expenditures of state and local government increased about 2,000 million dollars.

During the same period our national debt was reduced by more than 5,000 million dollars, but our state and local debts went up more than 6,000 million.

The state and local governments were contracting new debts twenty times as fast as they paid off old ones and were going into debt more than four and a half times faster than before the war.

During 1924 state and local governments borrowed to a total of 1,432 million dollars; during 1925 they borrowed 1,258 million. From the present estimates of dealers in municipal securities, the borrowings for 1926 will be lower—estimated at about 1,000 million dollars.

The total public debt—that is, the debt of all the political divisions empowered to incur debts—is now greater than our war debt at its height in 1919—and then we had in force every sort of emergency taxation that we could conceive.

We have been curiously led into this financial mess. Until the war we never really knew what taxation was. The Federal Government paid its way with a surplus over by the tariff and the excise taxes. State and local governments did not spend much; our tastes were moderate and the imagination of politicians was limited. We went in heavily for state capitols and city halls and bought what we thought were fancy goods but which really did not cost much. Expenditures were limited by the unwillingness of citizens to pay taxes and of the local governments to borrow money.

Just as many people then as now thought they needed fur coats; but they would not borrow to buy them. By an extraordinary paradox, it was the unreasoned taxation program put out at Washington that shoved the country into municipal fur coats regardless of cost or the ability to pay for them.

The framers of the Constitution, knowing that the power to tax is the power to destroy, withdrew from the Federal Government the power to tax securities issued by the states or their subdivisions. It was a precaution against Washington strangling the financial neck of the states.

This went along well enough until the Federal Government began to put high surtaxes into the income tax—reaching 65 per cent in 1921. Then tax exempts came into their own. To a man with a big income a tax-free bond paying 4½ per cent would give exactly the same net income

as a taxable security yielding 11 per cent. Sound industrial bonds do not yield 11 per cent, and therefore rich men took their money out of business, where it would provide a solid foundation for wage increases, and put it into state, county, and other tax-free bonds.

There were not enough of these bonds to go around. Fifteen years ago a county or a school district in any of the sparsely settled states had trouble in floating bonds. The old-time Wall Street hanger-on, in addition to his regular pocket equipment of gold mines, copper mines, and coal mines, always had an issue or two of school bonds ready to offer you.

All at once came the tremendous demand for tax-exempts. The bond houses sent men all over the country urging every political unit that had the power to issue bonds to issue them, and these bonds were snapped up almost without inquiry. They had only to be tax-exempt to be salable. It is not human nature to resist money forced on one, and therefore billions of dollars flowed into the hands of politicians throughout the country.

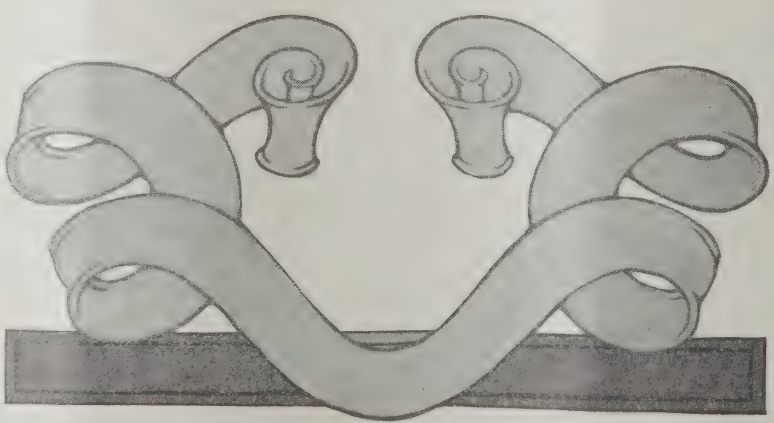
The chance to get money for the asking came at exactly the time when a deal of money was needed. The ordinary construction of roads and schools had practically stopped during the war. The great increase in automobiles and trucks forced the making over of the road system, and when a new school went up the best was none too good—for the money was at hand. Nobody, either in private or public affairs, was bothering much about costs. The world has never known such spending.

LAST year in state and local borrowing Tennessee took fourteen millions, West Virginia twenty-one millions, Washington seventeen millions, Texas fifty-one millions, Illinois seventy-two millions, and New Jersey seventy-five millions.

The cities have generally borrowed to their debt limits. Their debts have been growing at the rate of around a thousand million a year. The largest per capita debt is that of Norfolk, Virginia, with $258, and the lowest for cities over twenty-five hundred population is Quincy, Illinois, with ten dollars.

The average is $70. Of the big cities, New York has the highest per capita debt, with $193, and Chicago, the next largest city, has the lowest, $45.32. In the small cities—those between thirty and fifty thousand—the average is around $50 a head.

It would seem that the cities have been more conservative in their borrowing than might have been expected, and it is true that many of them are getting their finances into some sort of shape, but the real reason they have not borrowed more is that most of the loans have to go through New York, and the New York State law limits legal investments in municipals outside the state to seven per cent of any city's assessed valuation. A big issue can hardly be placed without the New York corporate investors.



THE borrowings by the towns and counties, the school districts, road districts, irrigation districts, and so on, are endless.

Mariuopa County, Arizona, in which is located Phoenix, has a population of forty-two thousand and a debt of a million and a half, of which more than half a million is for schools. Twenty-one bond houses bid for the last half-million! A high school district in Arizona is borrowing eighty thousand dollars for a stadium.

Taking figures at random from the *Bond Buyer*, which keeps close tabs on all issues, one finds that Sioux City, Iowa, has seventy-five thousand population and an indebtedness of two millions.

Most of the cities and counties of Florida borrowed heavily for schools, roads, and water. Berlin, New Hampshire, has sixteen thousand population and owes one and a half millions. Covington, Louisiana, has thirty-five hundred population and owes one hundred and eighty thousand dollars. Long Beach and Glendale, which are near Los Angeles, have about one hundred and fifty thousand people and owe six million dollars for their schools. Tuttle, Oklahoma, has less than a thousand population and owes $38,500. Walters, Minnesota, with one hundred and ten population, is borrowing four thousand dollars.

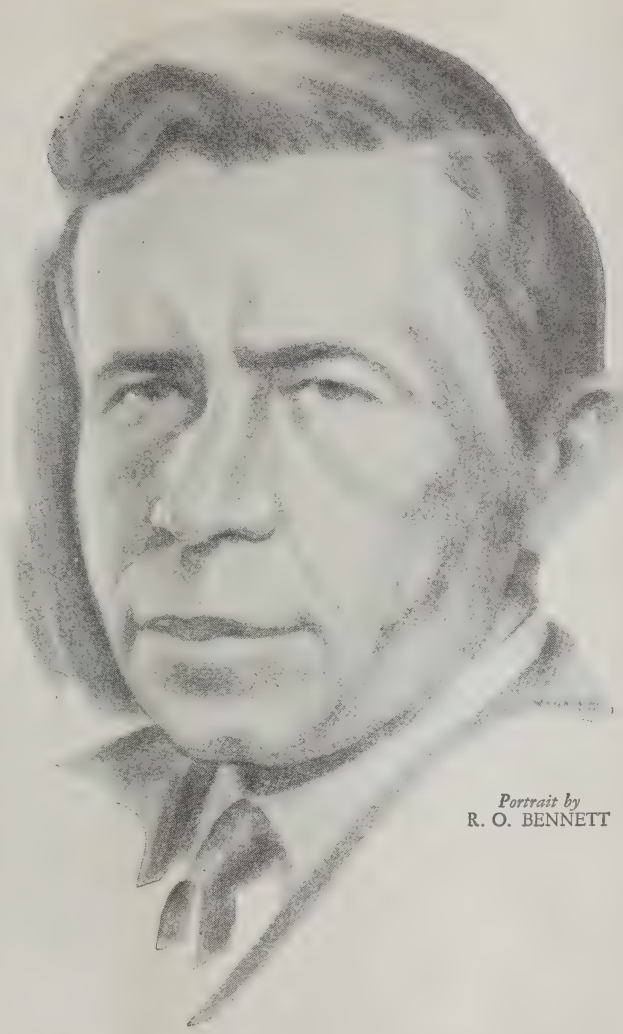
The Agate Irrigation District in Colorado, with four hundred population, has a debt of sixty thousand dollars.

Everybody has been around for a slice of money.

The big items are roads and schools. Beyond question we need the roads. We have been going through an era of transformation in transportation. These new roads have opened up the country in a way that we shall begin really to appreciate five years hence. In the incredibly short time of four or five years we have practically made over the country's network of roads—built more and better roads than the Roman Empire did during its entire existence.

Excepting in parts of the South, good roads are the rule and not the exception. Many of these roads are well built, but many others are political scandals. It is much the same with schools. The whole country is studded with magnificent schools. The little red schoolhouse on the hill is still with us, but a statesman would have as much trouble finding one in which to pass his youth as he would in finding a log cabin in which to be born. The modern schools are in really fine—in some cases almost magnificent—buildings with splendid playgrounds and swimming pools and gymnasiums. In all this the local school boards have but followed the lead of the universities in deciding that education rests on brick and mortar.

WHETHER these good school buildings contain good schools is not to be decided offhand—and anyway, that is the business of those who pay the freight.



Nobody can decide that the country is spending too much money by comparing present expenditures with prewar expenditures. There is no question but that we have bought a lot of good stuff. The real question is: Can we afford to spend so much money?

There is a growing feeling that we cannot afford to spend as we have been spending. At the November, 1925, elections the tide turned. The people of the country turned down seventy millions of new bond proposals and passed sixty-two millions.

But we have with us and shall have with us for a long time great interest and principal payments for the money we have borrowed, and also we have erected a most expensive establishment which will cost a lot to keep going.

What are we going to do about it?

*(This is the second of a series of articles by Mr. Crowther. The next will appear in an early issue.)*

# VILHJALMUR STEFANSSON

## *Arctic Empire Builder*

*By* BURT M. McCONNELL

ONE bright May morning, more than a dozen years ago, there came to me at the Union League Club in Los Angeles a telegram. It was from an Arctic explorer about whom the whole world was talking at the time, and the gist of the message was this:

> Will you join my expedition, and if so, on what terms?
> (Signed)
> Vilhjalmur Stefansson.

Within a few minutes my reply was on the way to New York City:

> Will join you within a week. Leave terms entirely to you.

That was the beginning of my acquaintance with Stefansson. A few months later we were marooned on a tiny island off the north coast of Alaska, and were compelled to stand helplessly by while an unprecedented gale broke up the ice in which our vessel lay, and eventually carried her to an icy grave.

It was characteristic of Stefansson that with his vessel in the relentless grip of the ice, with his scientific staff, dogs, sledges, and $200,000 worth of other equipment on board, he should quietly set about making new plans to explore as much as possible of the million square miles of unknown area between Alaska and the North Pole. For steadfastness of purpose is one of his outstanding characteristics.

Experienced Arctic explorers have said that Stefansson's journey by dog team over the moving ice of the Arctic Ocean, from the north coast of Alaska to Banks Land—more than six hundred miles—is the greatest single achievement in the history of exploration. Certainly, this was hazardous.

For the first sixteen days of the ninety-six-day trip, the writer accompanied the party, and during that time we were visited by a gale that blew at the rate of ninety-four miles an hour and carried the ice on which we were camped fifty miles out to sea. A polar bear sneaked into camp and was within twenty-five feet of the dogs before he was discovered.

Now, if polar bears knew the difference between a man and a seal, Stefansson says, they wouldn't be half so dangerous. But since they live exclusively by hunting seals, they are likely to mistake people and sleeping dogs for the source of their food supply, and attack them on that basis. This, in the opinion of Stefansson, makes them far more dangerous than the famed Kodiak bear of Southwestern Alaska. And he ought to know, for he has encountered dozens of polar bears.

Stefansson has said that he became an Arctic explorer by accident. Born of Icelandic parents at Gimli, near Lake Winnipeg, his early years were spent on the windswept prairies of North Dakota. Undoubtedly these endless plains had their influence in making him what he is at heart—a weaver of dreams. Stefansson believes, for example, that the day is not far distant when aerial routes between the Eastern and Western Hemispheres, by way of the Arctic, will be as common as steamship lines now are across the Atlantic. The so-called Barren Lands of the North, he maintains, are capable of supporting vast herds of reindeer which one day will add their quota to the decreasing meat supply of the world. His book, *The Friendly Arctic*, may be hailed by future generations as the book that made the Far North safe for humanity. He has lived to see the wild, free range lands of North Dakota transformed into endless fields of golden grain; and he visualizes the Far North as a potential empire for the use of man.

Up to the time Stefansson was fifteen he helped his father with the ranch work; then his father died. Three years later, when he had read every book he could borrow within a radius of forty miles of his home, Stefansson knew that he wished to have a college education. This he set about acquiring with that singleness of purpose and untiring zeal which are perhaps his most marked characteristics. At eighteen, with but $57, a new suit of clothes and a pair of shoes, costing in the aggregate $8.35, Stefansson for the first time in his life boarded a train. At the preparatory school he earned his living by chopping wood, tutoring, and teaching country schools.

His most remunerative job, however, was the care of two cows, for which he received his room and board. These creatures were given his undivided attention for weeks, and all was going well, when his landlady happened to overhear Stefansson discussing with some of her boarders the subject of religion. (*Concluded on page 25*)

# Pennsylvania—
# Chief Source *of the* Alcohol Flood

## *Law Violators Get Federal Distilling Permits Under the Rule of Politics*

By JOHN D. ERWIN

THE granting of liquor withdrawal permits to persons who have violated the terms of permits previously granted by the Prohibition Bureau or who have broken federal or state laws is prohibited or restricted by the language of the National Prohibition law. It was but a natural safeguard which Congress tried to throw about the situation when it incorporated the following provision in the law aimed at these persistent violators:

> Section 6, Title II, N. P. A.: 'No permit shall be issued to any person who within one year prior to the application therefor or issuance thereof shall have violated the terms of any permit issued under this Title or any law of the United States or of any state regulating traffic in liquor.'

It was the belief of the lawmakers who put this section in the act that there would be an elimination process under its operation which would gradually weed out the persistent violators, and that permits would be confined to those who came to the Prohibition Bureau with clean hands.

Have the prohibition authorities at Washington followed this provision of the law? Has the law been administered in good faith with respect to this alcohol withdrawal business? The record speaks for itself. It shows that some of the worst and most brazen violators in Pennsylvania have had the least trouble in securing new permits, even when the local prohibition authorities have strongly recommended against their issuance. Once more we have the rule of politics.

The federal grand jury at Philadelphia, which thoroughly investigated this abuse of the discretionary power given the prohibition authorities, has reported as follows:

> We have called before us in the neighborhood of fifty of these permit-holders; have looked at them; examined them; noted their type; their character; their evasive replies; their irregular ways of doing business; their irregular way of disposing of their goods; their lack of experience. We have inspected a number of their so-called manufacturing plants; have seen their supposed equipment. All of which leaves no room for doubt as to the illegality of the whole business. Some of these permit-holders were erstwhile policemen, drivers of bread wagons, plumbers, tailors, jewelers, newspaper venders, salesmen who could not definitely state what they sold; manufacturers of clothing and other things who could not state definitely where they previously manufactured; all of just the type and character which would be drawn into this business of the actual and reputed easy money made through a diversion of the alcohol.

Here we have a clear picture of those persons engaged in the alcohol diversion business! The prohibition authorities come in close contact with these permittees and applicants for favors from the 'dry' unit. They are not fooled about their character or their operations.

*The Internal Revenue Commissioner and his assistants have given to the law-violators known to Bureau officials through agents' reports and other official sources of information federal permits to produce alcohol in large quantities or to denature alcohol, or to store or sell alcohol at wholesale, or to use alcohol for manufacturing hair tonics, toilet waters, tobacco and disinfecting sprays or other preparations.*

This is particularly true in Pennsylvania, where the political 'pull' of the various liquor groups has been sufficient many times to overcome an adverse report from local agents. In certain instances the adverse recommendation of the revenue agents on the ground has been flaunted. It has been charged, with strong circumstantial proof, that prohibition directors have been transferred from one post to another for the reason that they are *persona non grata* to certain big liquor men in Pennsylvania.

No alcohol producing or denaturing plant can operate except by federal permit, and then only under such regulations as the Internal Revenue Commissioner, with the approval of the Secretary of the Treasury, may issue 'to prevent diversion of the alcohol to illegal use.'

The federal grand jury at Philadelphia, after devoting much time to the investigation of the alcohol business in that city, commented, in its report to the federal court, as follows:

> The Court will see, therefore, that from the manufacturing distillers, from the denaturing plants, and from these various permit-holders, comes the alcohol which in such immense quantities has been diverted to the bootlegging trade. All of these can only operate on permits granted by the Prohibition Department.

Section 3 of Title II of the National Prohibition Act lays down a direct command 'that the provisions of this act shall be liberally construed to the end that the use of intoxicating liquor as a beverage may be prevented.' This provision of the law the United States Supreme Court has faithfully interpreted. But the Internal Revenue Commissioner, his assistants and subordinates have used their own discretion as to who shall feel the full rigor of the law and who shall be exempt from its provisions.

Confining illustrations to the Pennsylvania field, the manner in which field agents have been thwarted when they sought to penalize law-violators in Philadelphia cannot be better shown than by the following letter, written November 24, 1925, from the assistant in charge of those men in the Philadelphia district:

> Mr. W. G. Murdock,
> Prohibition Administrator,
> Philadelphia, Pa.
>
> Dear Sir:
>
> I, in company with agent **R. T. Thomas**, today visited the Cuba Corona Chemical Company, 1022 Spring Street, Philadelphia, at 2:15 p. m., and found two men, Isadore Satinsky and Albert Schnes, who were in charge of the plant, and who refused to produce the records or permit us to inspect any records pertaining to receipt of shipments to this concern.
>
> As this is a direct violation and a third time that agents from this office have been refused permission to inspect the books, I again insist that this concern be cited immediately, even though they have friends in your office who are using every effort to keep a citation from being issued.
>
> If no citation is issued in this case, I intend to make a direct issue, if on or off the prohibition force.
>
> The bonded warehouse of this concern is practically a skeleton affair, held together by small strips of wood, and is absolutely unsafe and not fit for a bonded storeroom, and any agent or inspector that recommended this as a place of safety to place alcohol certainly did so with an intent other than for the best interests of the Government.
>
> Respectfully,
> (Signed) Herbert Smith,
> Assistant Prohibition Administrator.

On the same day that Assistant Prohibition Administrator Smith made this formal report to his superior against the Cuba Corona Chemical Company, he sent this personal note to Major Murdock *(Concluded on page 20)*

An Army Officer Discusses

# The Laws *of the* Sky *in* Future Wars

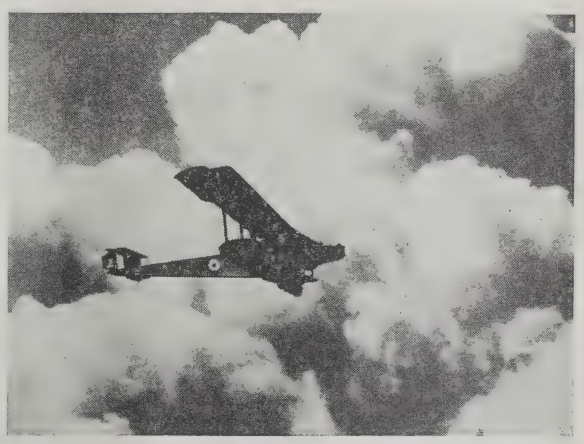
## *Will Anyone Be Immune From Attack From the Air?*

*By* CAPTAIN ELBRIDGE COLBY

INTERNATIONAL law is not a group of acts of legislatures and court decisions. It is made up of customs and rules agreed upon, and the agreements are very few indeed. There are no superior courts or sheriffs to enforce them, and they cover only part of the circumstances that might arise, and do not always cover those.

Take the matter of poison gas and submarines. The Washington Conference of 1922 said gas should not be used in war. Five nations signed the agreement. Four nations ratified the agreement within a few months, and the United States even put it into effect as far as training of the American Army was concerned. But one nation has not ratified it—and the agreement provides it shall not be binding until all shall have ratified. Thus it happens that the use of a weapon which is condemned by 'the popular opinion of the civilized world' is not completely forbidden by international law. That is all many such agreements amount to—and the vast number of issues that might arise are not covered by international law at all, but are merely a matter of custom and practice.

This basic idea, that international law is principally custom and practice, is very important when we talk about the laws of aerial warfare. Laws of land warfare and laws of sea warfare have grown up slowly as a result of centuries of custom and experience.



Aerial warfare actually commenced less than fifteen years ago when the Italians were using bombing planes in Northern Africa against the natives. In deciding what should be the rules that should govern the fighting fliers, nations have, practically speaking, only a few standards of judgment: (a) Humane feelings, (b) military necessity, (c) analogous provisions in laws of land and sea warfare, and (d) the widespread practice of the World War. And these standards are neither very clear nor of similar tendencies, so the matter is very confused.

During the World War there was a great deal of airplane bombing of civil populations far behind the lines. Both sides practised it, although the allied propagandists would have had us think that it was only the Germans who did so. There were arguments back and forth as to whether this city or that was 'defended' and therefore subject to bombardment, and as to whether or not bombing was intended to destroy military factories and depots or to frighten and weaken the civilians. Some of the bombardments were frankly carried out to disrupt great railway centers. Others were frankly executed against civilians as 'reprisals' for real or fancied misdeeds of the enemy. There is the difficulty. The practice of the World War is all we have to depend upon, and that is neither clear nor reliable.

General Pershing has said that 'extravagant tales of havoc done' were not verified by post-war investigations. We are too close to the World War to be able to judge safely. If you look at a bright light, you seem to see an image of that light wherever you may turn your eyes. The conflagration which lasted from Serajevo to Versailles was just like that. It has blinded and distorted our vision.

Then the lawyers come and have their say. A new weapon appears as God holds his assizes and hurls the nations against one another in combat. 'The art of war,' as the elder von Moltke said, 'consists in adapting the means at hand to the end in view.' A new means is discovered. In the World War the submarine and the airplane were new means. The allies said that the submarine must conform to the old rules established for surface craft. The Germans said the new weapon must have new rules because it could not safely conform to the old. The allies said, then you cannot use the new weapon. The result was bitter recrimination and misunderstanding.

Here is the airplane, one of the new weapons. Its chief value is its speed and its ability to cross the enemy lines in the open spaces of the air. The Russians announced that they would hang or shoot as spies all German aviators found within their lines—and tried to point to international law to justify their determination. But

(C) Publishers' Photo Service.

*THE old rules of warfare said you should not kill an enemy who surrendered. But when you are up in the air flying at a hundred miles an hour, how are you going to take the machine gun off another plane also flying at a hundred miles an hour? How are you going to disarm him, as you would a squad of infantrymen? How are you going to march him back to a stockade behind the lines when by a quick turn he can dive out of your reach, or perhaps into a cloud, and escape entirely. You have him in your power, as you pilot your plane, practically only as long as you are 'on his tail.' But if he has a slow machine and you have a fast one, and you cannot run your little monoplane as slowly as he can, you'll run right past him and he may be 'on your tail' and in a position to shoot machine-gun bullets into you. In the air, it must be war to the death. There can be no surrender.*

those very rules of land warfare to which they pointed saved the fliers. According to those rules, the uniforms the aviators wore gave them a clear status as members of an army.

Suppose you have a whole fleet of planes carrying poison gas over the capital of the hostile country. You circle around and drop a note, saying you will wipe the enemy out. He signals up, as Colonel Fuller suggests, and says: 'This is an undefended town. We surrender.' 'Very good,' you reply, 'you will now do as I say.' If you land, you are outnumbered, even by his traffic policemen or his decrepit 'Home Guards.' If you keep on circling about in the air, you may run out of gasoline or low on gasoline and have to scamper for home. Or a superior force of his planes may come over the horizon and sweep down upon you, and drive you away. Your trip will have been for nothing, all the risk of it and all the effort of it.

Attacks by air cannot be carried on this way. Their purpose must be to paralyze or damage enemy resistance. If you know where he has important military stores, or the railway centers through which the greatest traffic streams of his troops move, or the radio or telegraph focus of his superior command, you must fly quickly over these, and discharge your demolition bombs and get away as quickly and safely as you can. That is the best you can do.

The foot soldier with a rifle and bayonet in his hand, supported by auxiliary arms, supplied by complicated and ponderous services of supply which bring him shoes for his feet, food for his stomach, and bullets for his weapons—the foot soldier alone can compel and maintain a final and complete surrender. The aviator can strike a vital blow, but he cannot well secure a capitulation.

Into the harbors of a maritime nation there come shiploads of foodstuffs and cargoes of ammunition and weapons manufactured by and bought from 'neutral' countries overseas. The enemy is right in saying that the stoppage of this trade is a proper act of war. The guns may be used at the front. The foodstuffs may be sent to the army. The merchandise may support the financial life of a commercial nation, just as the Supreme Court of the United States once said that cotton was the very life of the Confederacy and the main support of the rebellion against the Union in the Civil War. In years gone by, you could stop this trade so profitable to the foe, only by getting command of the seas and establishing a blockade.

In the World War, the newer and more practical submarine enabled Germany to sink ton on ton of such shipments. In a future war, an aerial fleet may be used against such merchant vessels. During the World War

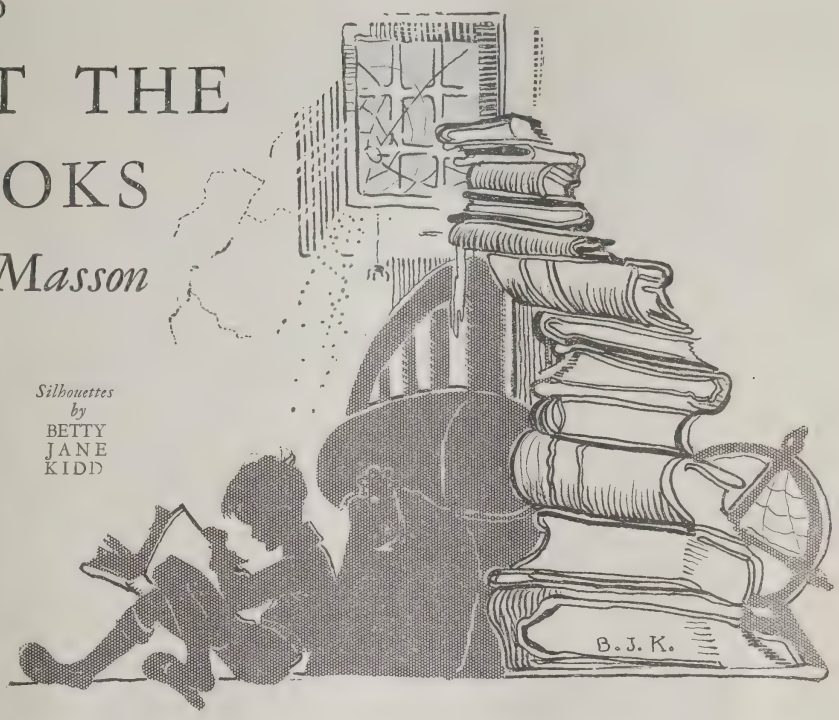
*Five De Haviland planes of the United States Navy, flying in eschelon formation over San Diego, California.*

the Germans argued that submarines could not take off crews and passengers, because they had not the carrying capacity to do so. They argued that submarines could not stop to make a 'visit and search' because a submarine on the surface is peculiarly vulnerable to a single small gun on a merchantman, and readily surprised and destroyed by a suddenly appearing hostile fleet. They insisted the only course of action was to give due warning that such traffic was at the peril of those who engaged in it, and then to sink on sight.

In wars in the future where extensive aerial operations are carried on, we need not be at all surprised to find the strongest aerial nation, whichever that may be, saying the same thing when its airplanes smash and sink merchant ships. Of course, the other side will rave and argue about 'atrocities' and 'noncombatants' but the strong air nation will insist on its right to employ its aerial strength and to take advantage of its aerial superiority.

Nor will the argument stop there. The age of the air is coming. Aviation has become a commercial thing, instead of merely a military thing. Even in this country the air mail is a common fact. In Europe passenger travel and express shipment by plane is very common indeed. There are commercial planes, as well as military planes, just as there used to be commercial ships as well as ships of war.

If a merchant ship was overtaken by a man of war, it had to stop for 'visit and search' on peril of being sunk. But how can a commercial plane stop in mid-air and submit to 'visit and search' unless all aviators become movie daredevils capable of climbing from wing-tip to wing-tip or clambering down from fuselage to fuselage on a swinging rope ladder? And the whole problem goes back to the speed of planes in the air and the ease of escape. The war plane cannot 'stop' its captive. It cannot bring it into port as a 'prize.' It cannot even keep it under its guns very long, without risk of being eluded. The brave and perhaps stubborn commander of a commercial plane will probably not meekly submit to orders to turn and land in the enemy country. He may attempt to escape in a favorable moment. And the practice will probably be to shoot down all planes encountered.



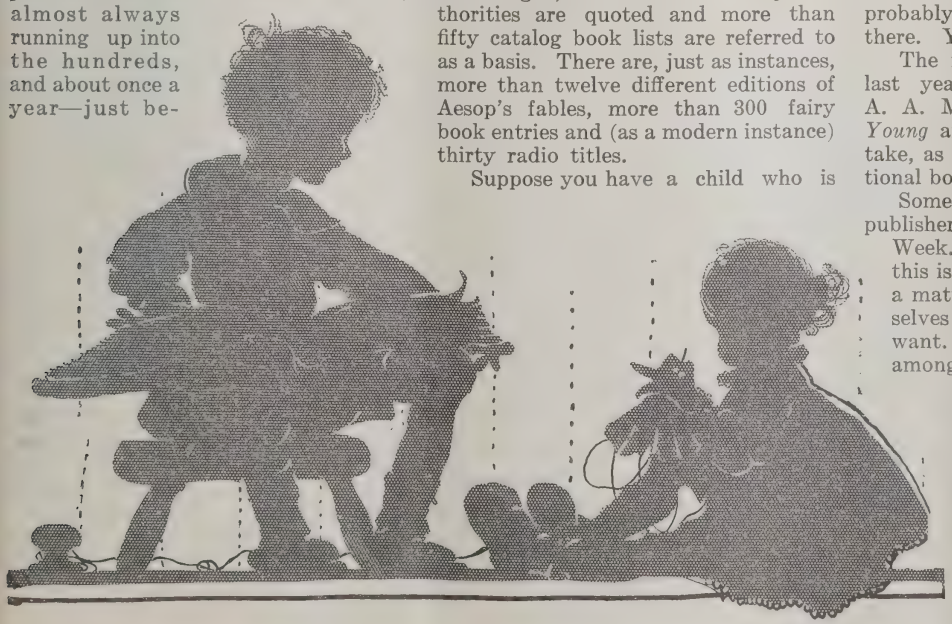
At sea nowadays it is fairly easy to tell a naval ship from a merchant ship. In the air a single machine gun is a deadly weapon, and a single machine gun that may set gas tanks aflame, or kill the precious pilot with his hands on the critical controls, may readily be secreted. All planes will very likely be treated as if they were war planes.

The object of a war is to render the enemy incapable of resistance. National interests and policies clash. Diplomacy fails. The battlefield is the place where judgment is rendered in the opinions at issue. The object of a commander is to do military damage, to destroy the effec- (*Concluded on page 22*)

Trust Your Children to

# PICK OUT THE BEST BOOKS

## *Says Thomas L. Masson*



*Silhouettes by* BETTY JANE KIDD

RECENTLY one of the most successful woman writers in the United States said to me over the telephone: 'I'm so thrilled over a discovery I have just made. I picked up Dickens and started to read him over again —mind you, after fully twenty years. To my astonishment I discovered that when I read him first, beginning when I was eight years old, I learned from him then everything I have ever known about writing.' She went on to say that a careful analysis of her mind-process meanwhile—looking backward —convinced her that her ability to create character was due to this childish absorption of one of the greatest masters of fiction, if not the greatest.

The same week I got this message, I asked one of the most prominent editors and literary men in the country what books he had been reading lately. He shook his head and said that he had no time for the new books, and was reading only a few of the old ones. Marryat was one of his favorites. Here is a boy's writer who can be read in preference to thousands of others, a generation after he wrote.

Talk about children's books! Every few months a literary review will publish a new list of books for children, almost always running up into the hundreds, and about once a year—just before Christmas—these lists are almost as voluminous as a telephone directory.

On the average, from ten to fifteen children's books are issued every month. In 1912 the books in print under the heading *Children* issued by one publishing house covered something like 4,000 entries. From January 1, 1912, to January 1, 1918, about 2,000 new children's books were issued. Last year there was compiled for one company a dictionary catalog of 4,100 books for children, with analytical entries for 863 of them. In this catalog, which is almost as big as a Webster's Unabridged, more than seventy authorities are quoted and more than fifty catalog book lists are referred to as a basis. There are, just as instances, more than twelve different editions of Aesop's fables, more than 300 fairy book entries and (as a modern instance) thirty radio titles.

Suppose you have a child who is extremely intelligent (as all one's own children always are) and you wish to give him some good books to read. If you went to a bookshop where children's books are displayed, you would be overwhelmed by hundreds of volumes, most of them of the most fascinating appearance. In this literary maze, you might take any book that looked as if it was good for a child to read.

And probably, in a general way, you would not go far wrong. But is it not plain that you are just gambling that this book you select is the best one?

If you went to a library, you would learn in a jiffy what is the most popular book of the year, and this would probably mean that it is not to be had there. You will have to buy it.

The most popular child's book of last year and this is undoubtedly A. A. Milne's *When We Were Very Young* and you will not make a mistake, as that is a very rare and exceptional book.

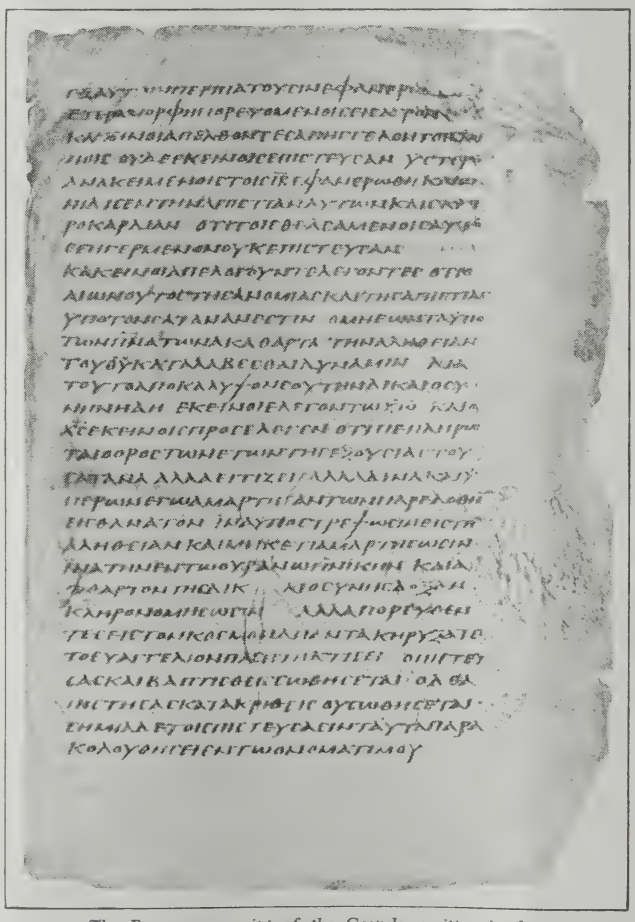
Some years ago some enterprising publisher thought of a Children's Book Week. The librarians tell me that this is very successful, and that, as a matter of fact, the children themselves pick out what books they want. I think the general feeling among librarians is that our American children, taking them as a whole, are fairly independent in their selections, and that when left to themselves, they instinctively go to the best books, or to put it in another way, their tendency is to go from a worse to a better book.

Last year (Concluded on page 27)

# Reliability *of the* New Testament

## As Proved by the Evangelists and Early Historians

By HENRY A. SANDERS



TWO previous articles have treated of the authors of the New Testament writings and of the transmission of the text to modern times. All of this has a distinct bearing on the question of reliability. The good faith of the authors, whether they are giving first-hand evidence or recording tradition, cannot be seriously questioned, while the text, though in the earlier years disfigured by errors of ignorance and carelessness, has been transmitted through so many independent lines of manuscripts that scholars have abundant material with which to restore the original.

Yet when we turn to the question of the historical reliability, other factors must be taken into consideration. First we must admit that of the New Testament authors only Paul and Luke are certainly responsible for the existing form of the works bearing their names. Neither of these two ever saw or heard Jesus. In all other parts of the New Testament we have either the work of men a generation later than Jesus or compiled books showing the records and traditions of that time. We have seen how the natural selection by the church eliminated the later and more fantastic or even heretical treatises from the church canon. In the main only the best survived, yet the quality of the accepted portion is very uneven. We find there first-hand documents, reports of eye-witnesses, less definite versions at second or third hand, and even traditions that had been handed down orally and had perhaps grown up from slight foundations during the first two generations after the Crucifixion.

Great events cast their shadows before and after them in secular history as well as in the traditions of the church. A good example is the disastrous defeat of the Romans under Crassus in 54 B. C. This was a famous historical event. It did not happen in some obscure corner and it is told by Livy, the great Roman historian, living at the time, though belonging to the following generation. Yet in an extract of Livy's work we read the following: 'In the year 54 B. C. Marcus Crassus set out against the Parthians. When he was crossing the Euphrates he disregarded many ominous signs. A tempest arose and tore the standard from the hands of the standard-bearer and sank it in the depths of the river. Then black clouds poured forth such rain that they were prevented from crossing; yet he persisted obstinately in his attempt and perished with his son and his army.' Here a real storm is doubtless recorded, but the thought that it was a divine warning against the campaign must be referred to the time after the defeat.

Other ominous signs were added a generation later in Valerius Maximus: 'When Marcus Crassus was leading his army into battle with the Parthians a dark-colored cloak was handed him by an attendant instead of the customary purple or white one; the soldiers assembled for his oration in silence; one of the standards could scarcely be pulled up by the chief centurion, and the eagle on another, that had been raised

# MR. FORD'S PAGE

THE war-makers are not through. There are still fair parts of the world undestroyed. There are still misled classes and countries that hold the delusion that war is a noble national pursuit. And there are still international financial influences that regard war as a great festival of profit.

Not that war is being openly sought, though in certain circles you will find it openly predicted. There are certain lines of business in certain countries that always know, sometimes in advance of the military men, when war is coming, and these men were talking of 'the next war' before the last one was over—if, indeed, it has ever been over.

It is no longer the glorification of war that serves the war-makers' ends; they do not openly preach the necessity of war as was done previous to 1914. But the method is nothing. The attainment of the end is all. It would be a fine thing for the world if people who are interested in peace would get this fact in their mind, namely, *to the war-maker the method is nothing; there are many methods of getting war.* To him the end is all.

If he can reach war through so-called pacifist methods, he will do so. Whether he detour to the right or the left is nothing to him—either way brings him back to his main desire. It is nothing new in the world to seek war through a false conception of peace. There is always a strong campaign for peace in nations that are soon to feel the brunt of war. National energies of thought and aspiration must be used up in some channel; if they can be diverted into channels of peace thought, it is as useful to the war-maker as diverted attention is to the conjuror.

So it is never reasonable to assume that the method that is being used is absolute guaranty of the end that is desired. A labor strike, for example, may move along under the banner of justice to the poor, and good people may be stirred in their sympathies toward it; yet the true purpose of the strike might be to destroy the business of some competitor, or even to undermine a nation.

Good people, above all, should be most careful about deception, above all against the use of their good intentions to forward the very ends that they abhor. It would be a most excellent exercise for every person who is interested in so-called peace propaganda to examine it quietly with this question: 'Wherein could *this* attitude of mind serve the war-maker?' Suppose that everything which is advised by professional pacifists for the United States were done, would it be of any possible benefit to those who profit by war? Could it be of service to those who may wish to make war with the United States as the prize? Bearing in mind that the war-maker does not care how he obtains his end, whether through peace propaganda or war propaganda, our attitude should be reviewed to see if it has any element that will serve the war-maker.

This is said because one is persuaded that there can be no real peace secured until the people are fully aware *who* and *what* it is that makes war. Even the most insistent peace propaganda sidesteps the question *who and what it is that makes war.* And the question is sidestepped because once it is answered war is doomed, and that is not the intention of the war-maker.

*THERE can be no real peace until the people are fully aware who and what it is that makes war. Peace propaganda sidesteps the question. It is nothing new in the world to seek war through a false conception of peace. The war-maker does not care how he obtains his end, whether through peace propaganda or war propaganda, and therefore we should examine our own attitude to see if it has any element that will serve the war-maker, who can use peace conventions and disarmament conferences, and is using them. If the United States could be mollycoddled in a day, 'the next war' could be brought on immediately.*

It is the one fact that causes scrutiny of so-called peace movements, that *they will not probe the facts as to who and what cause war.* Should they once open the question and begin to disclose the facts, they would become the center of such a storm of unpopularity as should rudely wake them from pleasant dreams of a world that is only waiting to be led into peace. The world will require more than leading, as our peace propagandists would find if they could be induced to open the question.

This matter of war is not poetry nor oratory nor sentiment nor emotion. When you tackle war you get into a situation that is something like war itself. The fact that professional pacifism is permitted to sail along as smoothly as it has is evidence that it has not yet touched the core of the matter. To think that the war-makers object to disarmament congresses, and peace conventions and conscientious objectors' discussions, and groups which encourage young college men to boast that they would never fight for their country —to think that these things offend the war-makers is to exhibit infantile innocence of the whole matter. War-makers can use these things just as well as not—and *are using them.* If the United States could be entirely mollycoddled in a day, 'the next war' could be brought on almost immediately.

Where is war stopped? Where it begins. You can stop war only where it begins and with those with whom it begins, and that is a matter that requires more than military courage to disclose and act upon.

# EDITORIALS

## *The Fifth Reservation*

AMERICA is getting her first taste of adroit World Court diplomacy. The sample quite naturally centers on the Senate reservations. Four of them, largely perfunctory, have been accepted without quibble. It is the Fifth Reservation, designed primarily to safeguard the fundamental rights of the United States, that furnishes the focal point for the concentration of European stratagem. It provides:

> That the Court shall not render any advisory opinion except publicly and after due notice to all States adhering to the Court and to all interested states and after public hearings or opportunity for hearings given to any state concerned; nor shall it, without the consent of the United States, entertain any request for an advisory opinion touching any dispute in which the United States has or claims an interest.

There can be no mistaking the meaning of this reservation. It is crystal clear. *The consent of the United States is required before the Court can entertain any request for an advisory opinion in which this country has or claims an interest.* Nothing could be more explicit. Yet the World Court Conference subcommittee is trying to 'interpret' a meaning which would nullify the reservation. In effect, what Europe wants is to give America the status of any single member of the Council of the League of Nations.

The crux of the present imbroglio is that no one knows the extent of the powers of the World Court! No one can say for certainty whether a majority vote or unanimous consent is necessary before the Court can entertain a request for an advisory opinion. The European politicians profess they do not know. The Court itself does not know. *The Senators who voted America into the Court do not know!*

The United States has been given no assurance that a majority vote will not rule in the matter of advisory opinions. If the Fifth Reservation is 'interpreted' to give the United States the status of a League member, under 'majority rule' an opinion might be asked on any subject in which America has an interest and ordered before the Court in spite of American protests. It is easily conceivable that in such case American interests would be overridden by both the Council and the Assembly of the League.

America is willing, even eager, to join in any true movement for universal peace. The nation has always been at the fore in any discussions of disarmament, even to its own disadvantage. But Americans do not believe that the World Court, as now constituted, is the instrument to bring about world peace. They view it as a mere adjunct of the clique-controlled League of Nations. Present actions of European politicians appear to justify their suspicions. The attempt to raise a cloud of confusion over Reservation Five will serve only to increase American distrust of the Court.

## *Romance and Reality*

BECAUSE of the financial success of rodeos in the larger Eastern cities, there are now those who clamor for a bullfight. Not only clamor, but try to 'create public sentiment,' as the term has it, by painting impossible pictures of courage, skill, dexterity, cool-headedness, prodigious valor, high-heartedness and allied qualities peculiar to the bull ring. They evoke a vision of brilliantly dressed men planting *banderillas* in the bull at the risk of their own lives; or noble *espadas*, graceful and careless; or satin-skinned horses bestridden by daredevils, and other men of reckless daring on foot.

But the reality? We hear little of horses blindfolded, of old horses pitted against the bull, deliberately held against a wall until gored again and again. We are told nothing of the bull, tired to the point of exhaustion, standing with head lowered, not in challenge but weariness, waiting for the last sword stroke—meanwhile bleeding from twenty wounds. We hear nothing of the man with the rake, the *chulo*, as he is called, who, while the baiting is going on, is in the arena armed with nothing but his rake or hoe, and whose duty it is to drag out of sight the blood and muck. And the *chulo* is the most significant figure in the bull arena. While the actors caper about with their cloaks and swords, he scrapes and rakes and hoes. When the bull turns in his direction, the *chulo*, who is generally an old man, *'Vayas!'* the bull away with a thrust of his tool; then goes on with his job. The *chulo* is the measure of the romance in the bull ring.

## *The Bear Went Over the Mountain*

FOR twenty years John W. Langley served as Congressman for the Tenth District of Kentucky, the mountainous region in the eastern part of the state. Then on January 12 of this year he resigned and five days later began serving a two-year sentence at the Atlanta Penitentiary. He had been convicted by a federal jury of conspiracy to violate the prohibition law. Presumably the trial was impartial. Mr. Langley was given every opportunity to prove his innocence but was found guilty. Even his influence as a member of Congress did not save him. Political Washington paid little heed to his plight—last January.

But since then momentous events have transpired. The bear has gone over the mountain and has seen many things. In the primaries Mr. Langley was vindicated *á la Ferguson* by his wife who won an overwhelming victory over the successor appointed by the governor. Word has gone forward that Langley holds the Tenth District in the palm of his hand. And much of the Republican strength in Kentucky is concentrated in that same Tenth District. Rumor has it that these sturdy mountaineers will not feel much like leaving their cabins and following the trails to the polling places on November 2—when Senator Ernst, staunch World Court adherent, is up for reëlection—if Mr. Langley is still languishing behind bars. And so now, after having served scarcely more than eight months of his two-year term, Mr. Langley is recommended for a parole by the Board of Pardons! Perhaps politics does not enter into the action. Perhaps members of the board feel that Mr. Langley was dealt with unjustly by the courts. Whatever their reason, their action was ill-timed. It will give rise to ugly reports.

## *In Defense of Jazz*

JAZZ composers of this country are righteously indignant over the caustic and uncalled-for comments on their art voiced by Ernest Newman, the music critic of the London *Sunday Times*. They are deeply wounded at his implication that the 'typical jazz composer is merely a musical illiterate who is absurdly pleased with little things because he does not know how little they are.' Nor is their pride assuaged by his comparison of their product to the singsong of a nursery rhyme, or his assertion that 'the thing is dead from the neck up.'

But what tries their souls, what rocks their patriotism to its very foundation, is his contention that 'the brains of the lot of them put together would not fill the lining of Johann Strauss's hat.' What does this English Johnny think he is doing? Is not jazz an *American* art, to be defended no matter what the cost in ink or dictionaries? 'I have never claimed any distinction for jazz,' plaintively retorts Paul Whiteman, one of its principal proponents, 'other than it is the true expression of a nation's song.' But isn't that enough to claim? The heart of a great country tenderly laid open for all to see!

'Red Hot Mamma,' 'Yes, We Have No Bananas,' 'So's Your Old Lady'—*the true expression of a nation's song.* What more could Mr. Whiteman add?

## *If Villon Were King of France*

THE legend and truth of Villon, the French poet of long ago, has a continuing infatuation for the youth of the day.

The legend runs that there was a king on the throne of France who as age advanced became weak from the continual 'yessing' of his subjects, the incessant agreement of the hangers-on-for-profit in his infallibility, until he began to believe it himself.

Then came the Duke of Burgundy before the walls of Paris, inducing these courtiers and hangers-on through graft to open the gates of Paris, that a new rule might begin. Burgundy brought the king to his senses and to a realization of his dangerous position. In his weakness there was nothing but surrender, and any situation was a relief.

Then into a low drinking place which he the king visited incognito for a respite from his troubles came Villon the poet, Villon the outsider, Villon the fighter, to stand on a cask of wine and recite to the assembled cutthroats and jailbirds the things great that he would do 'if Villon were the King of France.'

The king got an idea. Villon was drugged and the next morning awoke in the palace in royal robes, the new prime minister, while the king demanded that he make good on his high words.

How he, a lowly unknown, rose to the opportunity, drove out Burgundy and again established France is the climax to the tale.

The story persists as one of the most attractive of romances, and every youth visualizes as he reads it what he would do as king, or President, or steamboat captain or policeman.

The future of your government, your industry, your college, your church, no matter what it may be, rests today in the head of some youth dreaming what he would do if he were in charge: 'if Villon were the King of France.'

*Where more than a million pounds of butter are printed monthly.*

Huston Thompson Describes

# A Dairy Coöperative Sponsored And Managed by *Farmers*

'SOME grow and others swell,' Woodrow Wilson once remarked of men who come to Washington in pursuit of political preferment. This description may well fit not only politicians but also farmer coöperative organizations. Some coöperatives seem almost to spring up overnight, spread over the universe, swell to the bursting point and blow up when pricked by the attacks of their competitors; others creep at first, then walk, and ultimately mount up with wings as eagles in the domain of competition.

The life of the Land O'Lakes Creameries of Minnesota and contiguous states has been of the latter type. In a suitable background for a farmer coöperative organization, the inexorable law of necessity, that often seems so cruel and yet is really beneficent, drove hundreds of coöperative creameries into a single organization to escape the rasp of each other's competition and to withstand the competitive assaults of the great private corporations in the creamery and butter industry. The epic of the escape of 90,000 farmers from the hazards of the modern market where the single farmer has not even the proverbial Chinaman's chance, into a consolidation of coöperative creameries that can and do successfully dare the greatest accumulations of competing capital, is a subject worthy of analysis in these days when there is so great a mortality,

Copyright, 1926, by Huston Thompson.

both among private corporations and coöperative associations.

It is not by chance alone, nor even business acumen and skill, that the poetically named Land O'Lakes butter is distributed nation-wide by an organization of mere farmers, together with other by-products, to the tune of 79,000,000 pounds of butter and the jingling chink of $40,000,000. Behind its present-day formidable operations it has blazed a trail that other coöperatives may well study.

Minnesota, with its thousands of lakes and rich prairie lands, is ideally suited for dairying and as the home of the Land O'Lakes butter business. This state has an agrarian population of about 178,000 farmers. Of these, 108,000 were born in the United States and 67,000 come from European countries. Practically all of the foreign-born and many of those who first saw the light of day in Minnesota, or just across the border in Wisconsin and Iowa, have either been connected with coöperative organizations or have descended from coöperators who dwelt in Sweden, Norway, Denmark, Germany, Finland, The Netherlands and Switzerland. In those countries agricultural coöperation is an old story and its spirit, theory and practice are thoroughly understood and appreciated.

Ignorance and illiteracy are among the greatest handicaps people meet when they attempt to associate in organizations where team play is required. The greater the intelligence, the more easily does coöperation grow and thrive. Among Minnesota's farming population there were thousands who could not speak our language when they came over here. They came, however, from countries where illiteracy is scarcely known. In lands such as Finland, for example, the people proudly boast to the visitor that today there is no illiteracy. Our census records seem to indicate from the surprisingly high state of literacy in the Land O'Lakes country that the intelligence of these farmers has not stopped with their entry into the United States.

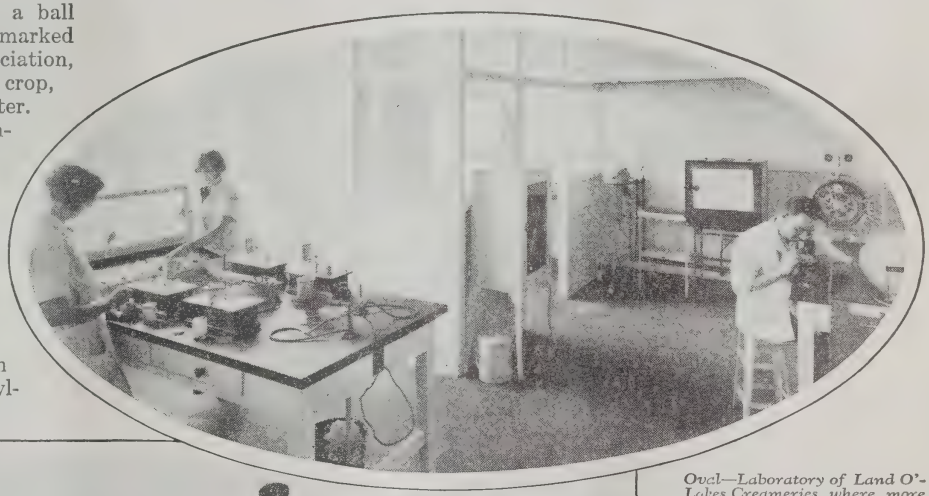
So it is little to be wondered at that with such a background for coöperative growth, when these farmers saw private capital purchasing their butter fat at discouragingly low uniform prices, with no price competition among the buyers, they sensed the same trouble which confronted this agrarian movement in the old country. To offset it, eventually they formed coöperative creameries that soon dotted the entire landscape of the Land O'Lakes country. Through these groups or units they hoped to acquire a competitive weapon with cheaper and more orderly marketing of a higher-grade product and to use it successfully against the great interests that were buying their most valuable product at monopoly prices.

Minnesota had its 'father of the coöperative creameries' in Professor T. L. Haecker who, thirty-five years ago, coming from Wisconsin, plodded up and down the State of Minnesota, where there were less than half a dozen coöperative creameries, pointing out to the farmers the necessity for getting together. While Professor Haecker did not organize the first coöperative creamery in the state, he can be truly called 'the father of the coöperative movement in the butter industry,' since he was its guiding spirit.

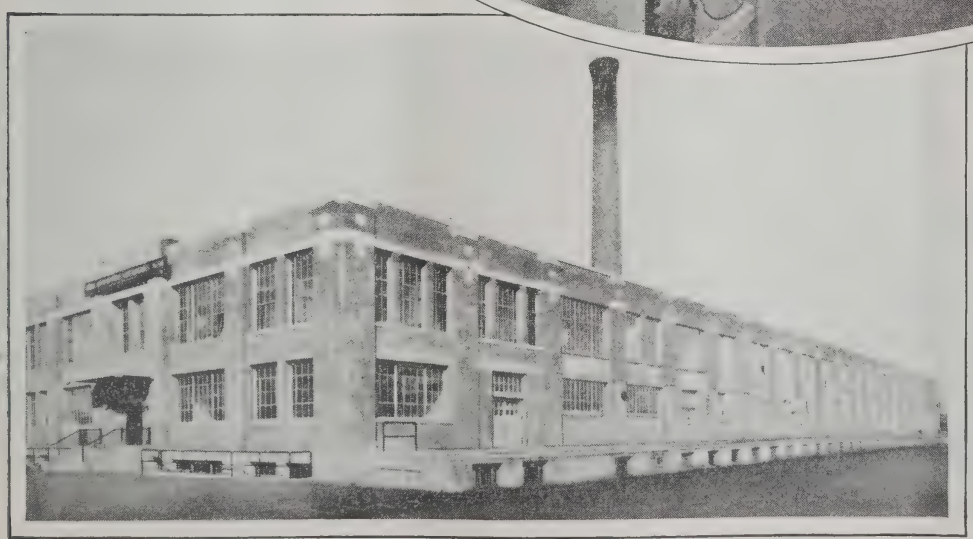
Under his leadership, in the ten years—1890 to 1900—500 coöperative creameries were organized in the state.

The Land O'Lakes farmer had either inherited or been taught to raise food supplies on the farm for his family and his animals, thus avoiding the high prices of our commission-ridden markets. In this way, even though his main crop should be poor in one season, he can at least carry himself along for the year without having to live a hand-to-mouth existence and go into debt like many farmers one finds in other parts of our country. The farmer who does not raise and store enough for his table from the farm to carry him through the year is like the prisoner with a ball and chain riveted to him, and is marked as a failure in a coöperative association, particularly if he depends on one crop, such as wheat, cotton or butter.

Professor Haecker, while confronted with the many obstacles that beset a pioneer and a crusader, nevertheless had good soil in which to propagate the coöperative butter industry with an intelligent farming class as independent of outside factors as it was possible for a modern farmer to be. Economic pressure from without and a coöperative knowledge within made it possible for his wise leadership to start the movement that culminated in the Land O'Lakes Creameries, Inc.



It may be asked why, with all of these favorable conditions at hand, it was necessary to evolve such an organization over a period of thirty-five years. Why was not the output of all the coöperative creameries corralled into one selling pool many years ago and the organization built with the overnight methods such as our industrial monopolies use? The answer is that a coöperative can't grow that way and continue to exist. At least that is what experience has taught.



The movement was never without assistance in its creeping stage, for there were always devoted and far-sighted men at the Department of Agriculture of the University of Minnesota who studied their difficulties and gave them the benefit of their advice.

One of the outstanding figures at that period was A. J. McGuire, who was connected with the University of Minnesota's Department of Agriculture. Mr. McGuire worked on the home farm until he was twenty-one, and then entered the School of Agriculture of the University of Minnesota, where he worked his way through by milking cows.

Subsequently, he was given charge of the dairy herd at the college, supporting Professor Haecker in his famous experiments on the amount of nutrition required for the production of milk and butter fat. Then he took the four-year agricultural and scientific course in the university, taught dairying and became absorbed in the movement for coöperative creameries, as applied to the dairying industry of the state.

Mr. McGuire has been with the Land O'Lakes in the capacity of manager ever since it was organized. He has followed in the footsteps of Professor Haecker, suggesting and directing the farmers in their feel for control of their own industry. In 1918 the idea of a great central distributing organization for all of the coöperatives, such as they have in Sweden, or the Danes employ at Esbjerg on their Jutland coast, or the Finns use to export from Helsingfors, had so yeasted in the minds of many of the local coöperative creamery leaders that gathered together to make plans for selling and distributing their butter on a coöperative scale, between a dozen or so creameries.

*Oval—Laboratory of Land O'Lakes Creameries, where more than 3,000 samples of butter are analyzed monthly. Left—New building of Land O'Lakes Creameries, at Minneapolis, Minnesota, built at a cost of $400,000.*

The practices of forty great centralizers of butter fat in that territory in placing 1,500 creamery stations throughout Minnesota, ninety per cent of which were in direct competition with the coöperatives, had caused consternation among the farmers. Many of the creameries very (*Concluded on page 26*)

# *The* Story *of the* 'BIG TEN'

## *How the* Western Conference *Came Into Being, And* What *It Has Done*

By WALTER MONFRIED

*Drawings by* W. O. FITZGERALD

IN 1895 a young physical education instructor and coach of the newly founded Chicago University teams had the idea that it would be a rather good stunt and worth-while publicity for his institution and the others in his section of the country to have a track-and-field meet in the city of Chicago among a few of the more prominent universities of the Middle West.

This young and inexperienced sports tutor was Amos Alonzo Stagg and the unprecedented track meet was the nucleus of what was destined to be the greatest athletic association in the world.

About six or seven of the larger state universities of the Lake states region answered his call to the meet, which was won easily by Wisconsin. Hitherto there had been little or no permanent organization among schools for the promotion of athletics, and few actual contests of any dignity or formality had been held.

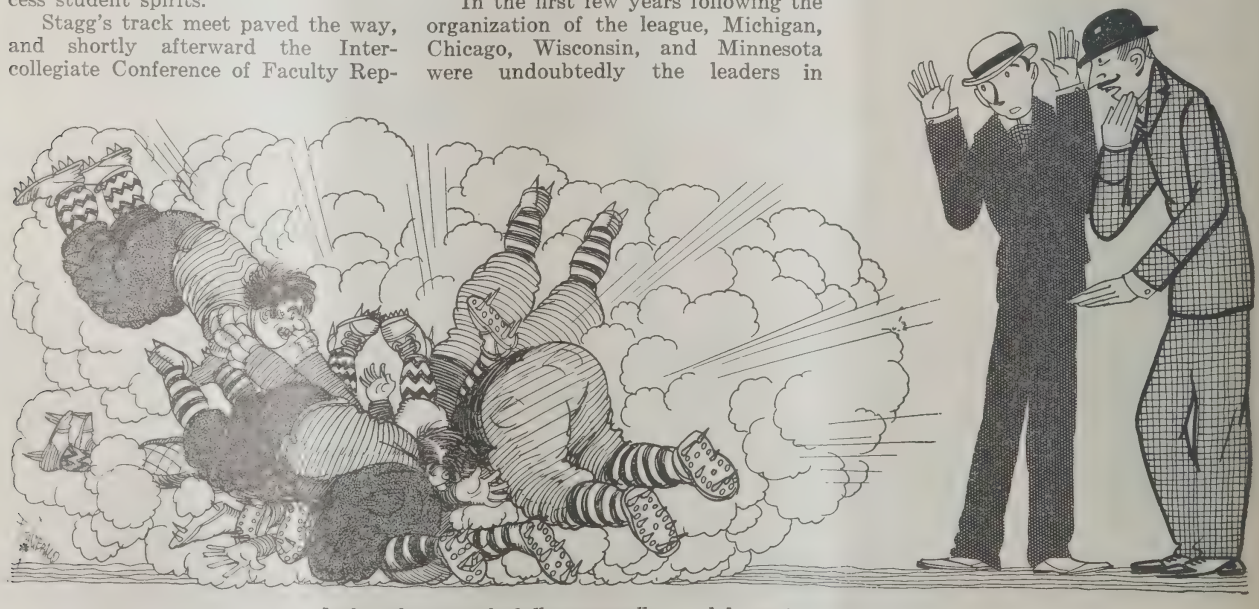
Athletics in the West were inconsequential in the early nineties; baseball was by far the most popular of all college sports. Football was generally regarded as unfit for college men.

With the rapid growth of interest and participation in athletics just before the 20th Century, it became obvious to the faculties of the various institutions of the section that some organization and form of control were necessary for the proper guidance of this new and vigorous outlet for excess student spirits.

Stagg's track meet paved the way, and shortly afterward the Intercollegiate Conference of Faculty Representatives was officially organized. This meeting, first held in February, 1896, was the direct outgrowth of the meeting of the presidents of seven universities which was held about a year earlier for the 'purpose of considering the regulation of intercollegiate athletics.'

Few if any rules guided the forms of athletic competition between schools at the time. Ineligibility rules, amateur rules, codes of ethics, and sportsmanship were hardly recognized. The austere heads of these seven schools were quick to observe, however, that if they did not take a hand in controlling the new interest, it would be sure to dominate them and the scholastic interests for which they stood.

At the time of its first official meeting, the Western Conference was composed of the representatives of these seven members: the universities of Chicago, Illinois, Michigan, Minnesota, Wisconsin, and of Northwestern and Purdue universities.



Two more large schools of the Middle West were influential factors in the athletic situation at that time, the University of Indiana and the State University of Iowa. Accordingly, their applications were received, and in 1899 these two became full-fledged members of the Conference.

In the first few years following the organization of the league, Michigan, Chicago, Wisconsin, and Minnesota were undoubtedly the leaders in practically all forms of athletic competition. Genuine intercollegiate football had been introduced at Michigan somewhat before its start at other schools, because of that university's proximity to the East where the game had a fine reception and because of the large proportion of eastern students who attended Michigan.

Minnesota had taken early to the game and had always had big, husky players, many of Scandinavian extraction, and consequently successful teams. Chicago, under the able coaching of A. A. Stagg, always managed to put out a strong team, as did Wisconsin, under the capable instruction of the renowned Phil King.

These four had practically a monopoly on the Conference championships for the first decade of its existence, but of these 'giants,' Michigan was undoubtedly outstanding. Fielding 'Hurry-up' Yost had come to the Wolverine institution from Lafayette in 1901 to take charge of the football teams, and his aggregations met with unparalleled success. His 'point-a-minute' squads from 1901 to 1905 are a byword with all followers of the great college game.

The first decade, 1895 to 1905, of the Conference as a regulatory body, was a period of some success, but not so marked as might have been expected. Many of the evils which led to the formation of the Conference still continued and even increased despite

*In the early nineties football was generally regarded as unfit for college men.*

the governing body's attempts at control.

Tramp athletes, professionalism, playing on the part of men who were not even enrolled in the institutions: these were but common occurrences in the first few years of the Conference. Football had degenerated steadily until it was almost as brutal and unscientific as its most ardent opponents claimed it to be.

In 1906, therefore, came the great upheaval. Casper Whitney, at that time the dean of all American sports writers, came West to investigate conditions, and the title of his resultant series of articles well bespoke his impressions. *The Shame of the Colleges* contained not only Whitney's own views, but also those of a great number of professors and men in private and public life who were interested in the welfare of the universities.

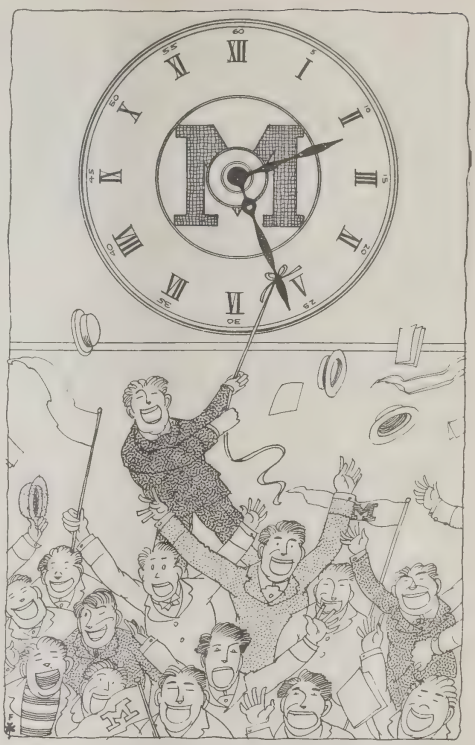
The faculty representatives of the Western Conference met in a serious session in 1906. Should it abolish football, in accord with the demand of thousands of influential persons? The members after deliberation decided against this final step, but resolved to take steps almost as drastic.

The task, as they saw it, was a complete revision of the football rules to delete the obnoxious elements then present. The result of their labors was the adoption of so-called open game, the use of the forward pass and the prevention of the mass attack and accompanying injuries. Intercollegiate football at that time really hung in the balance; if the faculty experiment had not succeeded it would have meant abolition of the game.

*The Conference adopted new rules, among them the abolition of the 'training table'—simply a ruse to give free board to athletes.*

The Conference altered football regulations and adopted new rules to put the game on a squarer basis. The abolition of the old 'training table,' often simply a ruse to give free board to athletes; the one-year residence rule, designed to prevent participation in college sports by the tramp athletes; and the three-year playing rule, drafted to limit the period in which the individual man could play; the provision that all athletes must be bona fide students carrying full work and attaining satisfactory grades: these were among the regulations adopted for the reformation of athletics.

Needless to say, these experiments worked well to an almost unbelievable extent. The most hopeful football lover could not have wished for a more complete success of the faculty advisory plan. All branches of athletics took a sudden upward turn. Then, and then only, did the Western Conference demonstrate its inherent power for benefiting the colleges and their athletics.



The last fifteen years have marked a steady progress in athletics. Not only football, but track and basketball have had a corresponding rise in popularity and excellence of competition; baseball, always a favorite pastime in western colleges, has maintained its popularity, but has been eclipsed by the three other major sports.

Practically the same membership and system have prevailed in all the years of the organization. Michigan, which was apparently dissatisfied with the restriction and class of competition found in the Conference, withdrew in 1908, but applied for readmittance and joined again in 1917. Ohio State University became a member of the league in 1912, and a rather prominent factor in its athletics as well.

During the war period the Conference suspended its activities as a controlling body, at the same time tendering to the War Department its services in carrying on athletic activities, both intramural and intercollegiate, in and among its members. It declared its former authority in effect on December 7, 1918. This was the period of the S. A. T. C.

Since the war, the Conference has enjoyed a period of unprecedented popularity and prestige. Football teams of the Conference are the peer of any representative group of teams throughout the nation. Coaches like Zuppke, Stagg, Yost, and Wilce are recognized authorities, as evidenced by the powerful and strategic teams which they have turned out.

Some of the greatest football stars of all time have performed for Western Conference schools: Baston and McGovern, of Minnesota; Aubrey Devine and Locke, of Iowa; Grange, Carney and Pogue, of Illinois; Eckersall and Steffen, of Chicago; Driscoll, of Northwestern; Cochems, Curtis, O'Dea, Gillette and Williams, of Wisconsin; Harley, Stinchcomb, Huff, and the Workman brothers, of Ohio State; Hanny, of Indiana; Oliphant, of Purdue; and all of Michigan's thirteen All-Americans, including Heston, Schulz, and Maulbetsch, have been players of well-nigh unsurpassed ability. Grange, Eckersall, and Heston are usually mentioned on the all-time All-American teams.

*Coach Yost's 'point-a-minute' squads from 1901 to 1905 are a byword with all followers of the great college game.*

When it comes to picking some of the greatest teams as a whole which have ever played the game, Western Conference teams must be looked at with respect. Wisconsin's team of 1912, which placed nine men on the first All-Conference eleven; the Illinois Pogue-Clark combination of 1914; Minnesota's 'wonder team' of 1916, with the renowned Wyman-to-Baston aerial attack; Iowa's conquerors of Yale in 1922; Ohio's 'last-minute' team of 1920; Illinois' marvelous working machine in 1923 and the first part of the 1924 season: what words of praise need be said for these?

Some of the annual games between traditional 'Big Ten' opponents have become veritable classics, rivaling the contests of the Big Three. No season would be complete without the time-honored Chicago-Illinois game; the Wisconsin-Minnesota contest, an event in gridiron circles for the past thirty-five years; the Michigan-Minnesota game for the pos-

# *Exploding* the Perennial *Myth*

## *That* Our Ancestors Were All Hardy, And We Moderns Are All Weaklings

*By* DONALD HOUGH

*Illustrated by* GEORGE HARPER

ALL ancestors were hardy, all moderns are weaklings. There is nothing new in this conception. No philosopher of 1926 made the astounding discovery that his country was founded by grizzled, rugged pioneers of outstanding virtue, and that the present-day crop of citizens has a faint down on the upper lip. Ever since civilization began, the lack of the strength, the moral and physical sturdiness of the fathers has been lamented; the weakness and the spiritual flabbiness of the contemporary growth has been decried.

No generation of human beings ever has been satisfied with current manners, current ideals, current character. Each one has read into the glorious past the most magnificent attributes. This started as far back as history has been recorded; and since we are concerned principally with America, let it be remembered that this was a fetish of the American Indian. We are carrying on the tradition in an efficient manner. Some weeks ago I read the usual article weeping over the passing of the sturdy Puritan tradition. It is done regularly. Even our living grandfathers can remember the days when men were men and blood was red and virtue was its own reward.

THE ease with which we arrive at rosy conclusions in regard to past eras may be largely due to the enchantment which distance proverbially lends; it may be due to that fortunate twist of the human mind which so conveniently forgets all evil, recalls only the good. It may also be due to the inclination of the investigators deliberately to look only for excellence in the earlier culture, and to look only for the opposite in that of today.

When this republic was in its extreme infancy, the men who did most of the work wore handkerchiefs in their sleeves, rouged their cheeks, and danced wickedly until morning. During the reign of our first President, the city of New York—our first capital—was the scene of Oriental splendor as judged by contemporary standards, was inhabited by dandies and sheiks, and drinking, petting, wild buggy rides and all other vices now supposedly being copyrighted by the younger generation were the pastimes of the gaily inclined.

Charges of a national moral delinquency were made, and such charges increased in volume and vehemence when the capital was removed to Philadelphia. During these same years, men were pushing on into what was then called the West, were stubbornly hewing farms from the fertile region south of the Great Lakes, were pushing the frontier on toward the Mississippi. Children in New England were walking ten miles to school; men were conquering the soil of Virginia; the first garden patches were appearing around the blockhouses along the Ohio. Strenuous progress was being made, at the cost of great effort. Yet I never have read, never have heard of, a single mention of these things by the critics of those times. They ignored all save that which suited their purpose. And the same system prevails today.

The critics of the modern sheikism, the cigaret-smoking, bobbed-haired, sophisticated flapperism, and of the spiritual paganism, moral lassitude and general drug store civilization in which we are said to be wallowing, perhaps live in the centers where such things predominate, and, like those who deplored the same thing, the awfulness of the early American effeminacy, see only what they see.

Perhaps the moaners of a future age will be the first to observe the magnificent character of today's Americans.

The day of the frontier in America has not passed. There are perhaps more square feet of frontier today than there were a hundred or two hundred years ago. A frontier is not a wilderness. It is the point of contact between the settler and the wilderness. Therefore there can be no frontier without both. The frontier of the days when Danny Boone was swinging his tomahawk along the Ohio was a small one. It was fierce for its size, but geographically it was small. As people moved on, as more came, the frontier grew larger. It has been growing larger ever since, although at the same time growing tamer and easier.

If you were to swing around from Northern Michigan, through Northern Wisconsin, Minnesota, Dakota, to the Rocky Mountains, thence south into Arizona and back, say, to the delta of the Mississippi, you would just about encompass today's frontiers. They are not so romantic as the old ones; there are no Indians, and there are automobiles. But they are frontiers just the same.

Last year I lived in a valley in the heart of the Rockies. The railroad was thirty miles away from the nearest point of the valley, which is ordinarily not very far but which was in this case because the most spectacular range of mountains in America cut across that thirty miles at right angles. In that valley live a thousand persons. There is one doctor; there are no dentists. The valley is seventy miles long.

THE altitude is high, consequently the winters are long and severe. During the greater part of the year transportation throughout the valley is furnished by mail stages which buck blizzards and wallow through snow up to the bellies of the horses. These are ordinary bobsleds with a canvas-covered hood over them similar to those used on the old covered wagons. Some have stoves in them, and on cold days the smoke issues in great white clouds from the tin chimney that is thrust through the canvas.

I have seen a mother with two small daughters embark in one of these stages to make a forty-mile journey

when the thermometer registered fifty degrees below zero. I have seen men take passage for the railroad on a mail stage pulled by six horses and which had no covering of any kind, when the thermometer was at sixty-two degrees below zero. I have gone over that pass, with two elderly ladies as fellow-passengers, in the worst blizzard of the year, when we had to almost dig our way along and when the front team slid from the road, was cut loose and floundered down the hillside in the snow.

There is a schoolhouse eight miles west of the little town in the center of the valley, to which come the children of the ranchers for miles around. That school presents a spectacle which would chill the cockles of the calamity-howlers' hearts. Stuck upright in the snow near the door are about twenty pairs of skis and snowshoes and they are there every morning. Some of them have come for many miles to form part of that grove.

In the rear of the school, as in the rear of each one in the valley, is a barn for saddle horses. Each horse brings from one to four children to school. There are two general modes of horseback riding in vogue among the younger generation of the valley. If there are no more than two pupils from one ranch, and if they are not too large or the horse too small, both ride on his back. The elder, or the brother in the event of mixed genders, sits 'up front,' while the other sits immediately behind and clasps mittened hands around the midriff of the captain of the craft. But if the patient cayuse can't carry the family quota to the school, one rides in a stock saddle on the horse, and the others ride on a toboggan that is hauled behind by means of a lariat fastened to the horn of the saddle.

The largest grade school and the only high school are situated in the town, which has a population of about three hundred. The more prosperous of the ranchers send their children to town to board during the winter if they are of high-school age; the very rich rent a small house and move in until school is over in the spring.

I could fill many pages with incidents and customs of the valley. There are no tiled baths there, no running water. The wood heater does the warming. In the autumn the men go out and get their winter's meat from the mountains: luscious elk, that is hung up to freeze in the woodshed.

A year ago I visited a town in Southern Utah that is one hundred and thirty miles from the railroad. A narrow, winding, canyon-skirting road crosses a mountain range to that town, and everything that is now there had to be hauled in—and it was only ten years ago that the first motor truck braved that road. Yet the town, which is seventy years old, has a population of twelve hundred and is modern in every respect. Its buildings are of brick; it has a shiny, plate-glassed drug store, two churches, a fine city hall, a large school of the most recent design and equipment.

The town is at the edge of the great desert of Arizona and is surrounded on three sides by burning sands and on the fourth by red-hot cliffs and oven-like canyons, yet the town itself is a veritable garden. The air is heavy with the perfume of luxurious flowers, the streets are cool and shady. The inhabitants have built pipe lines of California redwood to every trickle of water within a dozen miles radius back in the hills. This water is gathered in a reservoir, from which it flows through ditches, first in the streets, watering the rows of sweet locust trees, then through the gardens of flowers and vegetables, and finally over the hay lands and the grain.

I followed one of those wooden pipe lines far back into a canyon, and at the end of it I found an ordinary rain trough into which water dripped—dripped drop by drop, mind you, along a ledge ten feet in length. That is the spirit that has conquered that desert, and it is unrivaled by any spirit of the old days. Incidentally, the water supply is comparatively modern. Only a few years ago were the last of the pipe lines laid

Is it thus that America displays a weakness and a lack of that sturdy character that the dear ancestors had in such abundance? America still is growing, still is being built, still has many frontiers. Those that I have cited are not isolated and exceptional cases. In fact, they are the only two places I ever have visited in the West. I have not traveled a great deal, and I am only thirty-one years old. But I am convinced that this country is being built by a race just about as hardy as any on the face of the earth.

*The day of the frontier in America has not passed.*

Only three hundred years ago this United States was a wilderness. Sit down some day and think that over three or four times. Think what your city or town was when you were a boy. Consider that most of the settlement and building of America has come within the past hundred years, and that the speed has increased every decade, right up to today. A decadent civilization, a bunch of folks who are going to the dogs and crops of younger Americans who are condemned as past all salvation, do not accomplish these things. It just isn't done. The proof of the pudding, as we always have understood, is in the eating.

If I could persuade some editor

to print it, I could write an article—after considerable research—proving that the present age is the most divine known to history. My process would be simplicity itself. First I should draw a picture, and a true one, of the court of Alexander Hamilton at Philadelphia, and of the general flippant civilization of that age. I should work in some of the more stern and fanatical aspects of the earlier religious frenzy. I should touch on this and that, being careful to select only such things as suited my theme, and, by holding them up as pictures of the times, would gradually lead up to the present.

Then I should tell of the modern pioneers. Of the sturdy farmers who are ever pushing farther into the forests. I should picture the building of a nation. I should tell of the sterling qualities of the modern workingman, of the office man, the business executive. I might even touch on the open-mindedness of the modern clergy, and the broadening of religious views. And perhaps I should throw in a few statistics. For example, as balm to those who mourn the passing of log-cabin days, I think I could scare up figures to show that there are more log cabins in America today than ever before. Of this—of the truth of it—I am certain. I have lived in a log cabin with my family, right in town. I have visited the parson in his log cabin, and have taken a brace of wild geese to a log-cabining neighbor to swap them for a loin of elk. I shall take you into certain districts of Wyoming, of Northern Minnesota, and show you log cabins until you dream of them.

All false argument is based on a fundamental untruth, and the palming off of this untruth is the art and science of arguing falsely. For example, let us suppose a person wishes to champion the olden times, to decry the modern tendencies. He says, perhaps: 'This is a day of degeneracy, paganism, unbelief in God, false standards, moral decay, and general idiocy. The old order was divine, God-fearing, upright, honest, sturdy, home-loving, and generally excellent.' And then, with this as a basis, he goes on to prove that the old order was more desirable than is the new. And he is right, as anybody is willing to grant, *provided* he is correct in his estimate of the present and in his assertions as to the past. That is the real meat and soul of the argument. But it is not proved, not even discussed. It is simply stated. That is false argument.

Having stated these 'facts,' it is a simple matter to go ahead and prove that the one era transcends the other. For it needs no proof. What really matters in the argument is this: Was that predominantly true of the old order, and is this mostly true of the new? Those are the things the intelligent reader wants to know, and they are the questions that are passed over with such a pleasant facility by the writers.

There is something startlingly amiss in the idea that advanced civilization—considered in terms of its luxuries and material aspects—breeds a race of weaklings. It should, perhaps; but does it? I can recall any number of surprises I have experienced in my estimate of men—and of women.

One night during the war I was watching a game of poker in a French café. One of the players—an American aviator—was slender, pale-faced, manicured, yellow-fingered from cigarets. I spotted him as a sheik, and, not being as old then as I am now, I looked on him with a certain contempt. But a moment later I saw his chest. Among the long row of colors there, was the Congressional Medal of Honor: the most prized and rare bit of ribbon that any soldier can pin over his heart.

Out in the West I took passage on a mail stage with a young man bearing every earmark of the drug store cowboy. He had the sideburns, he had the oiled hair, he had everything. I shook my head and wondered what the West was coming to, but I learned a good deal a few months later when I saw him take first prize at the rodeo, competing for three days against the best broncho riders for many leagues around, including some traveling professionals.

One day four years ago I was riding on another mail stage—a motor bus this time—along the north shore of Lake Superior near the Minnesota-Canadian border. The town to which I was going was more than a hundred miles from the railroad and boasted a citizenship almost one-half Indian. Along the shore of the big lake were the scattered houses, huts, cabins, of settlers. Near one such cabin, all alone on that bleak coast, the stage stopped to pick up a passenger: a young mother with a babe in her arms.

I gave her assistance in mounting the stage, and exchanged a few words with her. I noticed that she spoke with a French accent.

'You are from Canada?' I asked.

'No,' she replied, 'I am from Paris.'

As I grow older I begin to realize that in such an awfully big world, one can find almost anything, and can come to almost any convenient conclusion, according to the current style.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of THE DEARBORN INDEPENDENT, the Ford International Weekly, published weekly at Dearborn, Michigan, for October 1, 1926, State of Michigan, County of Wayne, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of THE DEARBORN INDEPENDENT, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:

Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, none; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding one per cent or more of the stock are:

The Ford Motor Company of Delaware; Henry Ford, Dearborn, Michigan; E. G. Liebold, Detroit, Michigan; Clifford B. Longley, Royal Oak, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: none.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders, who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

Sworn to and subscribed before me this 21st day of September, 1926.

[SEAL] ISABEL LAWTHER.

(My Commission expires Sept. 21, 1926.)

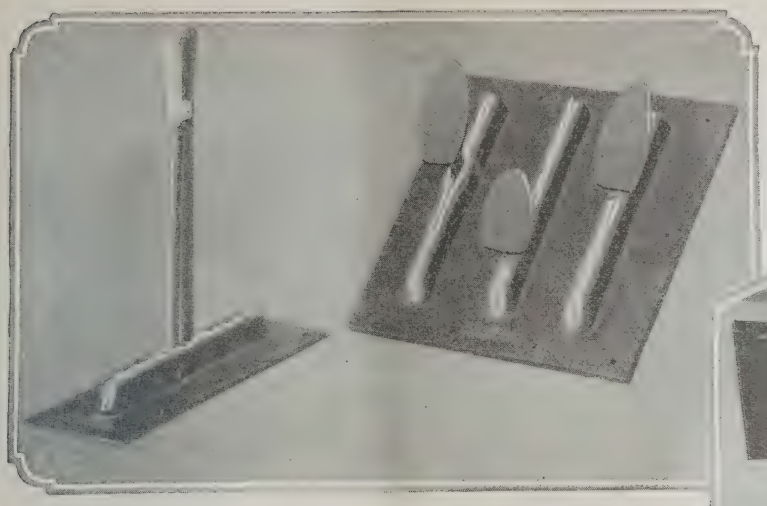
# A Lake-Shore Tragedy

*By* BEN EAST

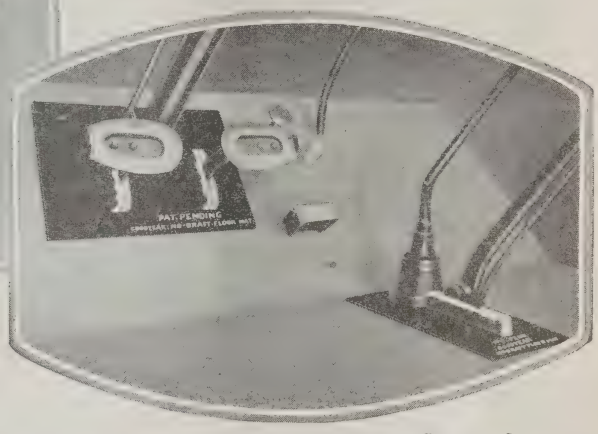
THE story of an outdoor tragedy was recently revealed by the finding, on Lone Tree Island, in Saginaw Bay, Michigan, of a young common tern, its foot fast in the shell of a small mussel or fresh-water clam, both captor and captive dead.

The tern have this lonely island entirely to themselves. More than 5,000 of them

*Trapped by a clamshell.*



nest upon its sandy, desolate beaches, and they hang above it in a whirling mottled cloud all summer long. No natural enemy ever crosses from the mainland, miles away, and men never come nearer than when Bay fishermen pass in their small tugs, far out beyond the bars and reefs. Yet even in this remote haven, tragedy could, and did, come to the young tern.



The clam lies in shallow water, half buried in the sandy bottom, the two halves of the exposed top of its shell slightly parted to permit it to inhale and exhale water, bearing oxygen and microscopic food. Into this opening, the young tern, barely old enough for flight, had thrust three of his toes while wading along the edge of a bar.

To the clam, the entrance of any large animate object within his shell means invasion and danger. He follows the only line of defense he has. His thick hinge muscle instantly clamps the shell tight shut and holds it so. So powerful is this grip that the shellfish may be pulled from his bed by thrusting a green reed into the opening of the shell and allowing him to clamp shut upon it.

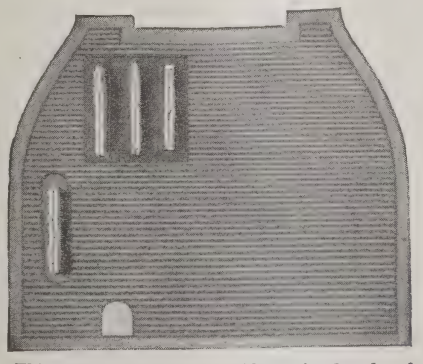
The young tern was caught, with no hope of escape. As long as his toes remained within the shell, the clam would not relax, and until the shell was opened the bird could not withdraw his foot. So the pair fought their grim, silent battle, each thinking the other the aggressor, the one not daring, the other not able to yield.

The clam was pulled from the mud and dragged about the beach. His weight prevented the bird from making more than short bursts of flight, or from catching minnows for food. In the end the clam conquered, as he was bound to do. Relentless and inexorable, he kept his grip upon the bird's foot, suffering little harm himself.

# Keeps Out Cold, Snow and Dirt
## —*for Small Cars*

A Goodyear No-Draft Mat can be installed in five minutes! Then—all winter, and in summer as well, the floor of your car will be clean and tight.

No cold wind, no snow or slush, can come in during the winter months. And when warmer weather comes the Goodyear No-Draft Mat keeps out swirling dust.



Made for all models—either open or closed.

And costs so little that everybody can have one.

See your Dealer!

* *

**NOTE**—*Dealers should prepare to cash in on the demand for this timely and useful item. It sells like hot cakes at the first hint of cold weather. No installation problem, or special tools. Write today for complete details. Address Goodyear, Akron, Ohio, or Los Angeles, California.*

*This complete floor mat provides entire floor board covering plus the No-Draft features*

NO-DRAFT MATS

# Chief Source of the Alcohol Flood

(*Concluded from page 4*)

bearing on the 'protection' phase of the matter:

Philadelphia, Nov. 24, 1925.
Mr. W. G. Murdock,
Prohibition Director,
Philadelphia, Pa.
Dear Sir:

Report is being forwarded complaining of the Cuba Corona Chemical Company, located at 1022 Spring Street, Philadelphia, Pa., for refusing to permit prohibition agents on two different occasions to enter and inspect the books.

It has been reported to me that the proprietors of this plant stated that they have connections with the prohibition office and, therefore, do not care about any revocation proceedings being issued against them.

I make this a personal, special issue, and request that citation proceedings be issued immediately, leaving the case to be judged on its merits only when witnesses are produced, and not be judged in an opinion rendered that no citation can be issued.

This is an important matter, and should all plants act in a similar manner, we would not be able with the entire forces of the United States to properly check and cover the alcohol.

(Signed) Herbert Smith.

The Cuba Corona Chemical Company mentioned in these letters has a permit to withdraw 180,000 gallons a year of specially denatured alcohol to make tobacco sprays, *a quantity sufficient*, as has been pointed out to the authorities at Washington, *to take care twice over of the tobacco production of the United States and half the production of the rest of the world besides.* The proceedings against it were dismissed in the face of Smith's emphatic protest.

SMITH, at the time he served as Assistant Administrator, was on leave of absence from his duties as chief deputy warden of the Eastern State Penitentiary of Pennsylvania. He was a former officer of the Pennsylvania State Constabulary and noted as a vigorous law enforcement officer. At the time Major Murdock took office, he requested that Smith be granted leave to serve temporarily as his assistant. It was generally understood that Smith was the chief figure in the reorganization of the Philadelphia prohibition office that soon followed. Smith was recalled to his prison post soon after the date of the quoted letters.

There have been many similar cases where the field agents of the Internal Revenue Bureau have shown clearly that permits were being grossly violated and the men on the ground have failed to get necessary coöperation. It is not unusual for Washington to fail to suspend the use of alcohol under these permits and to refuse even to institute proceedings for their revocation, as provided for by law. At one stage both the Internal Revenue Commissioner at Washington and his assistant, Mr. Haynes, telegraphed to the prohibition administrator in Philadelphia ordering him to permit more than twenty indicted concerns to continue their alcohol withdrawals. What was the influence that paralyzed the arm of the law in all these Philadelphia cases? There are more than forty-five permittees today withdrawing alcohol in Philadelphia, against whom charges brought by the prohibition agents have been dismissed by the 'higher ups'—some as many as three times—or permits revoked and restored. *Withdrawals authorized of these permittees amount to more than 1,240,000 gallons a year.*

REVOKED permits have frequently been restored long before the year from their date of revocation has expired, as required by law.

The law on this point reads:

Section 9, Title II, National Prohibition Act: 'If at any time there shall be filed with the Commissioner a complaint under oath setting forth facts showing, or if the Commissioner *has reason to believe, that any person who has a permit is not in good faith* conforming to the provisions of this Act, or has violated the laws of any state relating to intoxicating liquor, the Commissioner or his Agent shall immediately issue an order citing such person to appear before him on a day named . . . If it is found that such person has been guilty of willfully violating any such laws, as charged, or *has not in good faith conformed* to the provisions of this Act, such permit shall be revoked, and *no permit shall be granted to* such person within one year thereafter.'

Out of twenty-eight permits revoked in Philadelphia in 1924, in less than three months after their revocation nineteen of them had been restored, and a month later five more were restored. Before the end of 1925 it became necessary to revoke fourteen of these twenty-four, and four surrendered their permits.

Few permits have been permanently revoked. The Internal Revenue commissioner and his assistants will say, in defense, that if they do not grant the permits, the courts will order them to do so, or, if they revoke them, the courts will restore the permits. The answer to this is that if the Commissioner and his legal assistants properly handle and fight proceedings brought in United States courts for the granting or restoration of permits, presenting the department's reasons why the permit is withheld, no judge would order permits to be issued or restored in such proceedings.

Formulas for making specially denatured alcohol, for use in manufacturing toilet waters, hair tonics, tobacco sprays, and other preparations have been allowed by the Internal Revenue Commissioner and his assistants, which have been absurdly easy to redistill so as to obtain pure alcohol; and permits to withdraw such alcohol under these formulas—ostensibly to make these toilet waters, sprays and hair tonics—have been granted for hundreds of thousands of gallons in excess of what legitimate business required, for the use for which such alcohol was alleged to be necessary.

Touching this crooked alcohol traffic, the federal grand jury in Philadelphia said:

In the last three years (especially the last two years) a large number of persons have been granted permits to withdraw specially denatured alcohol, either in their own name or in a trade name; this specially denatured alcohol to be used by them in the manufacture of barbers' supplies, toilet preparations, hair tonics, so-called theater sprays and tobacco sprays.

Enough of these articles could be manufactured out of this alcohol to meet the demands of the whole country, and yet throughout this city, nor anywhere else, can there be found any considerable part of these products, either offered for sale or consumed by the public . . . The fact of the matter is, this alcohol is not used for the manufacture of these articles. It was never intended to be so used by these persons who received the permits and never will be so used by them.

The federal grand jury's scathing denunciation of the permit system as operated by the Prohibition Bureau (under control of Mr. Mellon's Treasury Department) apparently impressed the Secretary of the Treasury and his assistants not at all. Excessive allowances for the use of specially denatured alcohol continued and increased. Commissioner Haynes thereafter granted a temporary permit to a cigar manufacturing concern in Philadelphia—Bobrow Brothers, Inc.—to withdraw 35,000 gallons of specially denatured alcohol each month for making tobacco casing fluid. And the permit was made permanent for 20,000 gallons.

The real nature of the application was clearly disclosed when the treasurer of Bobrow Brothers in a formal hearing on the application for an allowance of 50,000 gallons a month held by a representative of the Internal Revenue Bureau testified that in the previous years the company's business had never required more than $408 to be expended in specially denatured alcohol for manufacturing cigars, and generally used water, but hereafter, properly to cure their tobacco, would require every 350 pounds to be treated with from 50 to 150 gallons.

TO THINK of granting a 20,000 gallon alcohol withdrawal on a monthly permit for a tobacco spray on such evidence would be ludicrous did it not reveal such gross inefficiency and misfeasance in the department at Washington. Experts have testified that the best and largest tobacco manufacturers in the United States would not use more than about a gallon of specially denatured alcohol for each 12,000 pounds of tobacco for cigars; and if any such amount were used as Bobrow Brothers' representative testified was to be used by his concern, these manufacturers would not be able to sell a single one of their cigars.

Without these vast quantities of illegal alcohol manufactured, withdrawn from bonded warehouses and distributed throughout the eastern section of the United States, the illicit rum business would be badly crippled. To spend huge sums to run down small bootleggers when the Government apparently sanctions these transactions involving hundreds of thousands of gallons of bootleg alcohol is one of the absurdities of the situation.

# Reliability of the New Testament

(*Concluded from page 8*)

with difficulty, turned itself in the direction opposite to that in which it was being carried. Such were the portents, but even greater the slaughter of the defeat.'

Even more remarkable were the omens and wonders which preceded and followed the murder of Caesar in 44 B. C., and these are soberly recorded by historians and poets even down to our own Shakespeare.

What wonder then that so great an event as the founding of a world religion and such a personality as that of Jesus were foreshadowed by similar prophecies and that there were ominous accompaniments of His death on the Cross. Some of these legends may even have crept into the accepted writings of the New Testament, but much of the more marvelous was, we know, cast aside by the good sense of the early church.

The birth and childhood of Jesus gave more scope for exaggeration and the addition of the marvelous than the period of His ministry, for it dealt with times and places that could not have been known at first hand by any of the authors of the New Testament. Accordingly it is natural that that portion of the life should be omitted by Mark and even by John. Matthew and Luke have it, but it is not handled by them with any such fullness or exaggeration as in the uncanonical Gospels, of which an extreme example is the *Epistle of James*, twenty-five short chapters on the period up to the Slaughter of the Innocents at Bethlehem. We may quote chapter xxii as an example:

'But when Herod perceived that he was mocked by the wise men, he was wroth, and sent murderers saying unto them: Slay the children from two years old and younger. And when Mary heard that the children were being slain, she was afraid, and took the young child and wrapped him in swaddling clothes and laid him in an oxmanger.

'But Elizabeth when she heard that they sought for John, took him and went up into the hill country and looked about her where she should hide him; and there was no hiding-place. And Elizabeth groaned and said with a loud voice: O mountain of God, receive thou a mother with a child. For Elizabeth was not able to go up. And immediately the mountain clave asunder and took her in. And there was a light shining alway for them; for the angel of the Lord was with them, keeping watch over them.'

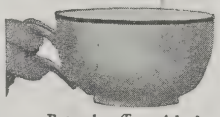
THIS may serve to show the kind of exaggeration which the Second Century was adding to the simple story of Christ. More than a dozen Gospels of this general character are known to us, mostly in fragments, and some by their titles only, but they serve to show us how carefully and thoroughly the church sifted its early records.

After reading such works of ignorant and superstitious writers we turn to the canonical Gospels with a sense of relief. *John* is not, to be sure, on a plane with the other three, and it may well be that *Mark* stands in first place as the earlier document, yet in the main we rely on the general agreement of all. Where all four or even three agree we must consider it good historical evidence. Practically all of this agreement is confined to the three years of the ministry and that is the portion that is of most import to us.

The same may be said of Paul, the greatest teacher of the infant church. He has left us first-hand evidence of his ministry in his many authentic letters, and Luke in the last half of *Acts*, as an eyewitness, has told the story of Paul's later teaching.

These are the parts of the New Testament for which the historical evidence is the strongest and it is ample to establish in its main features the teachings of Christ and the beliefs of the early church.

Doubt has often been cast on the historical character of Jesus and of the early years of the church, because of the scanty evidence from contemporary secular history. The beginnings of Christianity were so simple and the early converts so humble, that rulers and their satellites might well ignore them.



YET by A. D. 64 the Christians were sufficiently numerous to attract attention in Rome. They had aroused envy and hostility by their nonconformance with heathen worship, and by the fact that their real teachings were little understood. When the Emperor Nero was accused of burning Rome and of singing a tragedy (not fiddling, be it known) during the fire, he tried to throw the blame on the Christians as Tacitus, who was ten years old at the time, tells us in his Annals: 'Nero therefore accused the Christians and punished them with exceptional tortures. The author of that name was Christ, who was put to death by the governor Pontius Pilate during the reign of Tiberius, but the destructive superstition, repressed for the moment, kept breaking out anew, not only in Judea, the origin of the evil, but even as far as the city of Rome.' Then there follows a description of the tortures, which Nero inflicted, and the final comment: 'Pity arose, as if they were being burned, not for the public good, but to satisfy the cruelty of one.'

Pliny was a contemporary of Tacitus and he gives a clearer picture in his letter to the Emperor Trajan about the Christians in Bithynia. The letter as a whole is too long to quote, but a bit of this unbiased picture of the early Christians may well close this article: 'They were accustomed to assemble before daylight on a stated day and to sing a song together to Christ as if to a God, and to bind themselves by an oath, not for the sake of some crime, but that they would not commit theft, robbery, or adultery, and that they would not break faith, nor deny their debts. And when these vows had been made they were accustomed to separate, and again to come together for the sake of taking food together.'

These two writers, Tacitus and Pliny, are among the best known of the Romans at the end of the First Century, and their evidence is sufficient without other support to establish the early existence of Christianity, the name of its Founder, the manner of His death, and as much of its early practices as a prosecuting attorney would be apt to find out about a religion that he was investigating because he considered it a crime.

REAL COFFEE
That's Harmless!

Not even children are fooled by coffee substitutes!

What do you gain by serving them? Harmless, yes. *But so is coffee with the caffeine taken out.*

Buy real coffee, and drink all you want! A pure coffee from which the caffeine has been extracted, without disturbing or altering a single one of the good qualities of real coffee,—taste, aroma or quick satisfying effects. All remain at their best. It can't affect the heart or kidneys. Nor keep one awake, though taken at bedtime.

Kaffee Hag is coffee at its best. At your grocer's or clip this coupon now!

KAFFEE HAG
1533 Davenport Ave., Cleveland
Send me postpaid, enough Kaffee Hag to make ten cups of real coffee; I enclose 10 cents (coin or stamps).

# The Laws of the Sky in Future Wars

(Concluded from page 6)

tiveness of the field forces of the enemy. Zeppelin raids on London might seem to do harm to Britain, but they actually stiffen the resistance of the intrepid Englishman.

A raid into rear areas is, according to the military principles of economy of force and of the military objective, to be directed against something that will be of tactical or strategical advantage for you to destroy. There we have the rules the fighting fliers will follow as regards the bombardment of cities and towns. Whatever the alarmists say, the principle of the 'military objective' will govern. Whatever the humanitarians say, the principle of the 'military objective' will govern.

THERE will not be indiscriminate bombing of civilian populations, because it is wasteful and costly in ammunition and planes and skilled fliers, and does not help along the main issue. There will not be any absolute bar against the bombardment of cities and towns, because those towns may contain arsenals, dockyards, troop concentrations, factories, or railway shops valuable to the enemy's war effort.

A country cannot put its military production under the cloak of noncombatant protection, particularly in these days when entire populations engage in war effort of one sort or another.

A general cannot march his troops into billets in a town and 'touch wood' like a small boy playing tag. The troops and the organizations which maintain and direct them will be subject to attack, from the air the same as from the land or the sea. If the bombing is not absolutely 100 per cent accurate, and a proportion of the explosives fall on peaceful homes or kill bystanding civilians, that is their misfortune. The normal percentage of hits a bombing plane may make while directing its fire from the air is a military weapon which a fighting nation is entitled to use.

The proposed regulations for the conduct of aerial warfare, drawn up by a committee of jurists and military and naval men at The Hague in 1923, recognize these facts. They condemn the 'indiscriminate' bombing of civilian populations, and say that aerial bombing must be 'directed' at military objectives. They do not say that every bomb must 'hit' a military objective. It is like the French peasant who got a machine-gun bullet through his ear on that day when an American plane first brought down a German flier on Gallic soil. It was one of those stray shots which noncombatants may expect to come their way if there is fighting in their neighborhoods. In aerial warfare, the problem is no different than it is in land warfare.

The man on the spot may expect possibly to be hit by an accidental shot. On land, he knows he is in the theater of operations. In aerial warfare, he may have thought himself safe because he was many miles from the front; but the cruising range of fighting planes is such that the front is extended. A cannon shot used to go three miles. Now one can go nearly half a hundred. The danger area has increased in depth, and with the airplane it is hundreds of miles deep.

Finally those who are trying to figure out what will happen in a future war, when airplanes form a prominent part of the fighting force, are compelled to look with new light on the entire question of the distinction between combatants and noncombatants. There have been wars before this when entire populations were seemingly involved. But the World War was the first of that character when the new weapons science had devised actually put the civilian population within range of enemy blows.

If we are 'al' in it,' as Ian Hay said, and if, as President Wilson said, the men at home on the farms and in the factories and shipyards form a great 'service army' essential to the war, will it not be right and fair to direct your aerial blows at these productive persons behind the front?

By strict logic and fine reasoning, it would be possible to conclude that the 'morale' and the productiveness of the civilians might be subject to aerial bombardment. But wars are not fought by strict logic and fine reasoning. They are fought by common sense.

The commander will figure the wastage, and the need of using his trained fliers against military objectives. He and his superiors will also figure on the stories of 'atrocities' that would be circulated if he started in to annihilate whole cities. The entire world might be turned against his country.

WE cannot put too much trust on mere rules. We must use common sense, both in our actions and in judging the actions of the fighting fliers.

There is a persistent force of practicality tending to keep belligerent activities within specified bounds, permitting neither inordinate motion toward needless brutality, nor visionary theorizing into the realm of dreams and idealism. No particular swing of the pendulum is proof of definite progress in either direction. In the history of mankind, the World War covered but the space of a fraction of a second. Just as war always brings a swaying back and forth between the rights of neutral nations and the demands of belligerents, just so war in the course of many centuries records a perpetual swing between perfection and error. The consistent action of the pendulum, constantly drawn toward a central halfway point, is the real truth. Now that military men are rather thoroughly aware of the real characteristics, values and limitations of war planes, we can trust to their common sense to hew to the line and fight for the winning of war along military lines.

The chief hope of the new rules drawn up at The Hague in 1923 lies not so much in the fact that they were framed by distinguished jurists, as in the fact that they conform so well to the principles of military strategy and tactics, and rest on the basic doctrine of the military objective. They will be applied, not by barristers before a court, but by soldiers in battle. There will be errors in interpretation and errors in commission, as there are in every war, for even the principles of strategy and tactics, with which generals and admirals are supposed to be familiar, seem almost as regularly violated as regarded. Yet the rules will tend to govern just the same.

The test of the rules of war is a test of ideas, not a test of facts. It is a test of feelings, not a test of successive events.

# A Hero's Tomb in Weeds

IN THIS unkempt tomb lies the body of Major General Zachary Taylor, Twelfth President of the United States.

Now, in the old family burying ground of the Taylors, near Louisville, Kentucky, rests the body of this hero whose fellow countrymen voted him to the highest office in their power to bestow. A stone shaft nearby marks the plot, but the old vault and grounds are neglected.

*Zachary Taylor's tomb today.*

Taylor overcame the Indian Chief Tecumseh, was victorious in the Black Hawk War, and conquered the belligerent Seminoles in Florida. Returning from the Mexican war where he had repeatedly overcome great odds, he was acclaimed the nation's hero. In the presidential race of 1848, he was elected.

The new President succumbed to a severe illness which attacked him when he had been chief executive of the nation just eighteen months.

The tomb of 'Old Rough and Ready,' a humble spot covered by a little grassy mound, shows above the door the five-pointed star of a military man.

A shaft, erected by the State of Kentucky, surmounted by a statue of the warrior, in the family cemetery, bears the simple inscription:

Major General Zachary Taylor
Twelfth President
of the
United States
Born November 24, 1784
Died July 9, 1850

# Doing *and* Daring

## *In the Cause of Science*

## The Story of Dr. Edward Nelson of the Bureau of Biological Survey

*By* GEORGE H. DACY

*For fourteen years Doctor Nelson scoured Mexico and Guatemala for specimens of birds and mammals and lived in camps like this one.*

*Doctor Edward Nelson studies one of the birds he knows and loves.*

IN THE lounging room of one of America's most famous scientific clubs recently, a group of big game hunters, explorers, scientists and adventurers, whose travels carry them from one end of the earth to the other, were discussing remarkable acts of bravery and heroism with which they had come in contact.

One unassuming, mild-mannered gentleman, of modest appearance, did not speak until the topic was talked almost threadbare.

'The bravest man I ever knew is neither a soldier nor a sailor. He knows nothing of the song of shells nor the terrifying attacks of mustard gas. He is made of the stuff from which our most famous generals and admirals have been molded. He is one man who I am sure knows no fear. Apparently he was born to do and dare. He is one of the world's greatest naturalists. He has devoted his life to the study of mammal and bird life. His name is Doctor Edward Nelson, chief of the Bureau of Biological Survey, a branch of the Department of Agriculture. He has worked harder, faced more hardships and dangers and said less about his notable exploits than probably any other official servant in Uncle Sam's great family.'

There are but few towering mountain peaks between Alaska and Mexico that offer a silent challenge that Doctor Nelson has not climbed. There is no hardship in the icebound interior of Alaska that he has not faced and survived. The most determined bandits of Mexico were unable to turn him back from his quests for scientific specimens in the land of toothsome tortillas. Neither the rigors of extreme heat or cold nor the ravages wrought by sickness and disease have been able to conquer the 'do and dare' spirit of this courageous scientist. If danger came his way Doctor Nelson always went out and faced it—in fact, from what can be gathered from his friends, he rather courted such meetings with peril and privation.

In Alaska, where he spent four years, Doctor Nelson traveled thousands of miles by dog sled in the most severe weather. He has paid his Eskimos extra to sleep in his clothes at night to dry them out so that he could use them the following day.

While in Alaska, Doctor Nelson extended his researches to points far beyond the Arctic Circle. He was a member of a relief expedition sent out in search of the lost Arctic steamer *Jeannette*. No hardship of the rugged Northland was too great for this young American to dare.

Once he made his way in a diminutive kaiak far from shore to a tiny island where he went in search of the eggs of a rare northern bird. Trying to reach the coveted eggs, Doctor Nelson lost his balance, the kaiak was overturned and the scientist was plunged into the icy water. After a severe struggle he regained the capsized kaiak and secured footing on a submerged point of rock. The rough sea and approaching night made death certain unless the kaiak could be freed of water and Doctor Nelson could regain his seat in it. By agile balancing and quick work this was finally done and he returned safely to the fur-trading station where he lived.

The many exposures and the incessant toil and strain finally undermined the venturesome naturalist's health. Pleurisy laid him low. Finally, he recovered sufficiently to return to the United States. In his weakened condition, tuberculosis germs waged successful warfare. Specialists ordered the promising young man to New Mexico and later to Arizona where they demanded that he remain. Sick almost to death, most men would have abandoned their ghost of a chance for life and resigned themselves to die; but Doctor Nelson, made of sterner stuff, refused to acknowledge defeat. He continued to work outdoors. He resumed his work of collecting mammals and bird specimens for Uncle Sam. After a half-dozen years of battling against disease germs, the naturalist won the hardest fight of his dramatic life—was able to return to active work as a representative of the National Biological Survey.

Thereafter, for fourteen years, Doctor Nelson and his scientific assistants scoured the remote regions of Mexico and Guatemala. They secured many rare specimens and identified hundreds of previously unknown birds, mammals and plants. In Mexico they collected the most extensive treasures of wild life ever assembled in that land. Doctor Nelson climbed to the top of Mount Orizaba, an 18,000-foot peak, the highest in North America south of Alaska. He made the last 3,000 feet afoot over rough, rugged and almost perpendicular going, which was a remarkable feat for a man whose lungs had been seriously scarred and damaged by the inroads of tuberculosis.

In those days, outlaws and bandits were

*One of Doctor Nelson's camps in Mexico where he searched for specimens despite the country being overridden with bandits.*

numerous in many parts of Mexico. Travelers risked their lives whenever they rode into terrorized districts. Doctor Nelson, ready rifle slung across his saddle, always rode about 100 yards or more in front of his companions. The scheme was that if bandits attacked him from ambush his associates could dash forward to his relief or, vice versa, if the pack outfit should be attacked he could turn to its assistance. Fortunately no attack ever occurred. If the bandits had held up the scientists, it would have been easy for them to shoot Doctor Nelson from concealment. He appreciated the risk he ran but spoke triflingly of his danger. This action is typical of the man. He interpreted danger as though it were harmless. His purpose was always to shield and protect those associated with him.

ONE of the most dangerous climbs Doctor Nelson ever made was up over a glacier on Mount Iztaccihuatl of volcanic origin near the city of Mexico.

The narrowest escape from death which Doctor Nelson experienced was during a western expedition. Unexpectedly he was called upon to make a hurry-up saddle trip to a distant ranch.

The only horse available was a big stallion of unmanageable temper. Doctor Nelson mounted this dangerous steed and started on the trip. All went well until a railroad crossing was reached, when the stallion suddenly seized the bit in his teeth and dashed at full speed down the track. The doctor tried to check the wild flight but only succeeded in breaking the bridle. He was at the mercy of the vicious brute. Suddenly a short distance ahead a large cattle guard on the track was seen. It appeared certain the mad horse would plunge through this obstruction and the fatal consequences to horse and rider were promptly visualized.

At the last moment the stallion leaped to one side down a steep embankment, veered from the railroad and raced toward the border of a low, dense forest with wide-flung branches. By a desperate sudden pull on the remaining bridle rein as the edge of the threatening forest was reached the horse was thrown off its balance enough to drive it headlong into the massed branches of a sturdy tree and brought up against its trunk with a stunning shock. This enabled Doctor Nelson to dismount. After he had roughly repaired the bridle he remounted and the thoroughly subdued stallion made a satisfactory steed the remainder of the journey.

Doctor Nelson is seventy-one years old but he is as active and vigorous as men a score of years younger. He is an indefatigable worker—keeps two or three stenographers busy at top speed during his days in Washington. He has to travel considerably visiting the bird sanctuaries and game refuges throughout the United States as well as the various headquarters of the Biological Survey. A detailed bibliography of all the writings of this remarkable American covers twenty-four large pages of single-spaced typewriting. The Nelson mountain range in California, Nelson Island in Alaska, near the mouth of the Yukon, and Nelson Lagoon near the northern shore of the Alaskan Peninsula have all been named in his honor. Scores of reptiles, birds, mammals and plants also bear his name as their original discoverer.

# The Story of the Big Ten

(*Concluded from page 15*)

session of the 'Little Brown Jug'; or the Ohio State-Michigan attraction.

With active construction begun on the Indiana Memorial stadium at Bloomington and on the Ross-Ade bowl given to Purdue University, every school in the Conference now has a concrete stadium for its football and track contests. That of Ohio State, which was dedicated at the Michigan-Ohio game in 1922, is considered the finest of its kind in the United States. The Illinois Memorial stadium, now completed, is a thing of real beauty and the peer of any bowl.

The 'Fighting Illini' stadium was officially opened on October 18, 1924, when Harold 'Red' Grange made his immortal dashes to fame against Michigan.

Wisconsin's stadium, seating about 40,000 at present and being increased in size every year, is unique among all college stadia in that it is being paid for solely from football gate receipts, without one cent being contributed from outside sources.

Among all the indoor sports, basketball is admittedly king, and the Western Conference was in the very forefront in pursuing this game with all fire and enthusiasm. Long before the East, the Far West and the South were enjoying this game, the Big Ten universities were playing it to the utmost and were furnishing excitement galore for their followers. That the game has attained such universal popularity among all schools, colleges, and athletic clubs, is largely due to the splendid start in popularizing made by the Conference teams.

In the cage sport, one school, Wisconsin, must be recognized as the most successful. The Badgers owe their position as leader to their good fortune in having as a coach Dr. Walter E. Meanwell, universally admitted to be one of the few greatest basketball strategists since the origin of the game.

Other successful teams in the Conference have been Illinois, with three championships in the past fifteen years and the record of having won more games against Meanwell-coached teams than any other school; Purdue, which has won three titles in the same period; and Minnesota and Chicago, which were the powers in the 'Big Ten' cage race before 1912.

SO GREAT has the interest in basketball become in the Conference that the huge gymnasiums erected to seat the crowds have usually proved insufficient to accommodate the throngs seeking admittance. Michigan's Yost Field House, the largest indoor playground in the world, holds 12,500; Ohio State has crowds of 10,500 at its games; Iowa's new gymnasium can accommodate almost 9,000 spectators. Illinois, Indiana, and Northwestern seat about 5,000 each and the other schools somewhat smaller numbers.

Perhaps the best sport for comparing the merits of any two groups is track and field. In this ancient form of competition the Big Ten has been preëminently successful. Many world record holders have been developed, as well as Olympic games stars.

The annual Big Ten track meet brings out just as fast company as any other collegiate group in the world. The Conference record in the discus, 155 feet 8 inches, made by Arlie Mucks, Badger giant, in 1916, is also the world's record in this event; Binga Dismond, Chicago's brilliant middle-distance colored star, became a joint holder of the world's quarter-mile record when he tied the great Ted Meredith's time, 47 2/5 seconds at the Conference meet in 1916.

TO THE American Olympic track team in 1924, the Conference contributed Guthrie and Payne, of Ohio State; Brooker and Hubbard, of Michigan; Kinsey and Osborne, of Illinois; Coulter, Phelps, Eric Wilson and Brookins, of Iowa. Of these Brooker tied for first in the pole vault; Hubbard, giant negro star, took first place in the broad jump; Dan Kinsey, then an Illinois sophomore, won the 110-meter high hurdle event in 15 seconds flat, with Guthrie closely pursuing him and also placing. Brookins, Hawkeye speed marvel, took second place in the 400-meter hurdles, but was disqualified, after strenuous protest, for supposedly stepping out of his lane. In addition to track men, Steele, of Ohio State, won a place on the Olympic wrestling team and then took a first place in the heavyweight event, being the only American to win first place in the wrestling tournament. Then Breyer, Howell, and Bob Skelton, of Northwestern University, and Faricy, of Minnesota, 'made' the Olympic swimming team. Of these Skelton won the world's championship in the breast-stroke event, and the others all finished well up in the point columns.

Northwestern University has easily the greatest college swimming teams in the world. So popular has aquatics become in the Big Ten that it is a major sport in some of the members. Crew, or rowing, finds its sole Conference representative at the University of Wisconsin, which, by its natural facilities, has maintained the sport for more than thirty years. Michigan and Iowa have facilities for crew, and have seriously contemplated taking it up. It has also been agitated at Chicago and Northwestern by the building of breakwaters out into Lake Michigan.

Baseball, the remaining major sport in the Conference, still maintains its old favor among all lovers of the national pastime. Because of the late spring, which allows little time for pre-season practice out-of-doors, several of the Big Ten schools, including Illinois, Michigan, and Wisconsin, take a southern training trip during the spring vacation, playing the strongest college teams in the far South.

Fielding H. Yost, the veteran coach of Michigan's football teams, has outlined the spirit of the Conference as well as anyone. 'One thing is certain,' he has declared, 'the fine spirit of sportsmanship that has carried the Conference through its long career of successes will be in evidence both upon the side of the victor and the vanquished. Intercollegiate athletics should be so conducted that they develop to the highest degree friendliness between student bodies, alumni, and followers of the various contestants.'

# An Arctic Empire Builder

(*Concluded from page 3*)

Stefansson, always an ardent lover of debate, apparently had taken the negative side, for the good woman, at the end of the conversation, called him to one side and informed him in no uncertain terms that she wouldn't have a young man with such questionable religious beliefs looking after her cows.

Stefansson attended successively the preparatory school, the University of North Dakota, the University of Iowa, and Harvard University, graduating from Iowa and winning a scholarship at Harvard, and later the Thaw fellowship. He received his master's degree in anthropology at Harvard, and became assistant instructor. Like most other young men on the threshold of life, Stefansson hesitated before finally choosing his career.

FOR a while, with his Viking ancestry uppermost, he seriously contemplated devoting his life to the writing of poetry. It was his ambition at that time to follow in the footsteps of Livingstone, and he was actually preparing himself for exploratory work in Africa when one of his articles on anthropology attracted the attention of Ernest de K. Leffingwell, who was preparing to lead an expedition into the Arctic. Stefansson was offered the position of ethnologist, and accepted.

Fortunately for him, the expedition vessel was unable to meet him at the Mackenzie Delta (he had traveled overland and down the river while the ship was coming up through Bering Strait and around Point Barrow, Alaska), and he found himself at Herschel Island, the rendezvous of the Arctic whaling fleet, with no money, no experience in the North, and no equipment. If Stefansson had been a different type of youth, he probably would have appealed to the Hudson's Bay Company for assistance. He also might have thrown himself upon the mercy of the Northwest Mounted Police; or he might have borrowed a dog team to reach his expedition, whose vessel, he learned, had been wrecked on the north coast of Alaska some two hundred miles to the westward.

Being a born explorer, Stefansson did none of these obvious things. He saw his opportunity as an ethnologist, and decided to make a first-hand study of the Eskimo. He settled down to live with an Eskimo family, eating their food and wearing their style of clothing. Because he was not rich, like the Hudson's Bay men or the Mounted Police, but poor like themselves, these hospitable people accepted him and made him welcome. In their snow houses or caribou-skin huts, and about their fires, they lived their normal lives. This gave Stefansson an ideal opportunity to learn their language and their customs.

There is nothing about Stefansson of the worn and haggard explorer of the imagination. He is a comparatively young man with a touseled mop of blond hair, like a school-boy's; clear, blue eyes; a lean, wiry figure; a pair of legs that are good for a fifty-mile hike; and a face unmarked by hardship or privation. Dressed in the habiliments of civilization, he might be taken for a business man, a prosperous physician, or a Philadelphia lawyer. His fingers are long and slender, even fragile in appearance, and his palm is as soft as a woman's.

The newspaperman who once described this six-foot explorer as a 'slight little man, with black, beady eyes, set far back in his head,' must have had a lively imagination. Another reporter who observed that Stefansson 'spoke English with only a slight accent' could not have met the real explorer, who is qualified to teach English in any American university.

For fifteen years Stefansson has been endeavoring to correct the impression which we received from our school geography: that the polar regions are one vast field of snow and ice; that it is always cold in the Arctic; that there are long nights—six months at a stretch—when it is pitch dark; that a man is a hero who once has braved the manifold terrors of the North and returned to tell the tale.

He holds the world's record for the longest single Arctic expedition (five and one-half years), and for length of polar service—ten winters within the Arctic Circle. He has received the highest gold medals from the leading geographical societies of the United States and Europe, and many honors and degrees from learned societies and universities, awarded for his discoveries and scientific writings. Among other things, he has added more than a hundred thousand square miles to the maps of the polar regions.

Stefansson's three-month journey over the drifting, jagged ice fields north of Alaska marked an epoch in Arctic exploration no less distinct than the present flying era. It solved the greatest problem in the dog-team method of travel—the transportation of food supplies. He is without doubt the most extraordinary Arctic traveler living in his ability to take care of himself and his party, and in the opinion of competent explorers he shares with Captain Amundsen the distinction of being the world's greatest explorer.

Stefansson not only has proved that an explorer may depend for both food and clothing upon the game which the North country affords, but has extended the possibilities of the plan to the inhospitable and dangerous ice fields of the Arctic Ocean.

CONTRARY to the almost universal experience of explorers from the Elizabethan age to the present, Stefansson encounters no 'hardships' in the Arctic. He has little patience with the traditional explorer, who not only endures privations unnecessarily but inflicts tales of his heroic fortitude, in the form of magazine articles, books, or lectures, upon a long-suffering public. To Stefansson these men are not heroes, but fools; their adventures are but signs of incompetence.

Stefansson does not freeze his feet or his hands. On all his 20,000 miles of sledge travel in the Arctic, he has never lost a dog from hunger. He is one of the few masters of the Eskimo language, which is more difficult to learn than four ordinary languages such as Greek, Hebrew, Russian and German. For example, in English we have four forms of the noun; the Eskimos have *several thousand* forms for a single noun, each with a precise meaning. An Eskimo has a far larger vocabulary than a white man; in his daily speech he must have at least 10,000 words at the tip of his tongue.

LEARNING the Eskimo language cost Stefansson five years of intense application. During this period he also learned to meet the Arctic on its own terms; to dress in fur clothing, live on an almost exclusive meat diet, and to build an Eskimo snow house. As a result, he does not get lost, even in the most severe blizzard; he does not eat his dogs as a last resort, or feed them to their mates; he can kill a seal at 200 yards, although a seal's head is no larger than one's two fists put together, and the animal must be killed with a brain shot; he keeps his diary with a fountain pen while in the Arctic; he has demonstrated that it is possible to live on a straight meat diet for two years and thus defy scurvy, the dread of all Arctic explorers; and he has made the longest sledge journeys in history. The credit for the progress made in exploration during the last hundred years rightfully belongs to less than a dozen men, of whom Stefansson is one.

A little more than a hundred years ago, Stefansson points out, the treeless grasslands of Europe were supposed to be incapable of supporting anything but a nomad population, with their herds. The prairies of the United States in those times were considered to be almost worthless. It was thought that they would not even support domestic cattle. But the prairies of Europe, North and South America, and Australia have since become the great wheat fields of the world. Similar grasslands in Africa and Siberia are rapidly being turned to cereal production.

In Stefansson's opinion, there are only two obstacles that stand in the way of the colonization of the Far North: a Chinese Wall of ignorance, and man's inherent conservatism. He sees the Arctic much as Lewis and Clark saw the West of their time—as the 'Friendly Arctic,' a new and permanent phrase in the literature of geography. By this he means that the Far North is friendly to the resourceful pioneer, in the sense in which the ocean is friendly to the fisherman. The conservatives who argue that commercial fisheries, oil wells, copper mines, and reindeer grazing lands in the Arctic will never be profitable, Stefansson declares, are merely the temperamental successors of the early Virginians who thought the coal mines of West Virginia would never be developed because they were too far from the Atlantic.

In his ten years in the Arctic, Stefansson has developed from a young man in whom the spirit of adventure was uncommonly strong into a type of pioneer who sees beyond the present. He visualizes a future empire in the Arctic. His visions of empire, in fact, are comparable only to those of Cecil Rhodes when he first saw in his mind's eye the Africa which we know today. Like Rhodes, Stefansson dreams great dreams. Whether they will come true in our day, or in the next generation, is not his main concern, for he thinks in centuries.

# A Dairy Coöperative Managed by Farmers

(Concluded from page 13)

unwisely felt that to compete with these cream stations they had to take any cream, in any condition and at any time. As these coöperative creameries realized they were drifting into destructive practices, the urge for associating the business of the local creameries pressed upon them.

It is difficult to conjecture what might have happened at the first county meeting if there had not been present the mild-mannered, cautious, but experienced McGuire who, when the discussion reached the point of action, took a hand in it and in his easy, persuasive Irish way induced these practical farmers to take more time by showing them that they were not yet prepared to take this big step. He suggested to them that the creameries present 'could not make the riffle against competitive opposition.' He called their attention to the fact that a few creameries associated together, even though they were among the largest and best in the state, 'could not get to first base' in changing the system of marketing butter that had been built up through twenty-five years. Their dreams were too far ahead of the realities of the situation. What they needed was an intensive missionary work that would bring at least 300 of the creameries into the fold to work together for higher quality, carload shipping, a study of the markets, and finally the actual merchandizing of the butter.

THEY listened then as they do today to the man who is the manager of their association, and when he had finished they decided to adjourn until they were fully prepared. Finally, in June, 1921, they felt that the hour had struck and thirty years after Professor Haecker had initiated the coöperative movement about 300 creameries, a few of which were over the border line in Wisconsin and Northern Iowa, met at St. Paul and organized the Minnesota Coöperative Creameries Association.

That the creameries might have a direct and final voice in the management of the association and to keep them in close touch with each other, they divided the area of 69,000 square miles into fifteen districts with an average of forty local coöperative creameries to a district. Each district was organized into an association which named a director to be one of the board of managers of the central organization located at St. Paul. Each district association was comprised of one member from each creamery who had one vote. When the state association met, each creamery was represented by a vote that was cast by the director of the district association who represented it on the board of the central association. Then St. Paul, Duluth and Chicago were the three strategical points selected at which to assemble the butter, make the tests, and ship and distribute it.

At first they intended only to sell butter for a few of the creameries that had already requested the Land O'Lakes to handle it. They also planned to help the remaining creameries find a market for their butter and for these purposes placed men in New York, Chicago and Philadelphia. They would not dump butter in two or three cities as they had been doing in the past.

But they soon found that their methods were antiquated and that mountains of butter began to roll in from those who had already expressed a desire to sell through the central organization. Unless they changed their set-up, it was apparent that they would have to go back to the old method of dumping wherever they could.

It was this or a single selling agency for the entire output. They boldly chose the latter course. Instead of simply helping the various creameries to find markets, they determined that the only practical method was to adopt a label of their own covered by a trade-mark to be used on their print butter, open branch offices throughout the East and put traveling men out on the road who could hunt up additional markets. It was at this juncture that they offered a prize for a name and from the thousands offered chose the fascinating Land O'Lakes label. They also set up inside the organization a traffic department.

This department is now saving more than $300,000 a year in freight costs through carload shipping. During 1924 the association sold 32,000,000 pounds of butter and 675,000 pounds of sweet cream, for which it was paid more than $18,000,000. Its total volume of business, including the machinery and supply departments, for its first year amounted to more than $20,000,000.

The supply department is one of the most interesting developments of their move to control their own destiny. It is more than obvious that if the things the farmer purchases can be corralled by monopolies, and prices controlled and advanced as the monopolists see fit, there will be very little net profit to the farmer for the year no matter what he gets from the sales of his butter. In proportion to the measure of his prosperity, the monopolist measures the price on things the farmer purchases. Thus the additional profits redounding to him from his coöperation may and do disappear. These farmers soon decided to save money at the purchasing end by buying the supplies necessary for coöperative creameries through a central organization.

In the year 1923, the first year of the organization of the supply department, the Land O'Lakes had saved $50,000 in the purchases for its creameries. Last year the department did a business of $1,523,000 with a saving of more than $137,000, and this year it will save more than $175,000. They are buying for the creameries all kinds of creamery machinery and supplies, such as salt and coal.

IT IS fair to predict that in five years instead of a business of approximately $40,000,000 annually, which it will do this year, the Land O'Lakes will double this volume. So far it has not forgotten its duty to the public, for the association has sought, among other things, by every means to improve the character of its product.

It has put into practice methods by which the amount of high-scored butter is increasing daily and it has the inspection and tests closely supervised by federal-state representatives. The result is shown during the last year in a report on the average monthly price for the 79,106,082 pounds of butter. For the entire amount of butter the average monthly price paid to the farmer was 45.35 cents a pound, while the average price of 'New York Extras,' which is the standard of quality butter, was 45.22 cents. Thus the association paid to its members .13 cents a pound more on an average for butter of all grades than the average price of New York Extras.

SINCE true coöperation comprehends the highest interests of the city folk who buy the farmers' products, let us see how this Minnesota coöperative association treated them. Take, for example, the city of Washington, D. C. Land O'Lakes butter is sold in Washington in 277 retail grocery stores—a chain-store system. The average price at which this high-scoring sweet cream butter sold to Washington consumers during the past six months, from October 1, 1925, to April 1, 1926, was 58.11 cents a pound. This apparently was less than the price charged for some similar butter scoring 93 or over. In his comments on this coöperative, one of the Department of Agriculture experts informed a Congressional committee that 'the housewife is getting a superior product and getting it for much less money and is getting something where she knows the grade of her butter.'

Knowing that Land O'Lakes butter goes directly from the Minnesota coöperative warehouses to these chain stores in the capital city with no other distribution costs than freight and chain-store costs intervening, I was curious to discover what proportion of the Washington consumer's dollar paid for Land O'Lakes actually came back to the Minnesota farmer. To do so, I secured the figures at both ends of the line. Here is what they show. During the past six months, from October, 1925, to April, 1926, Washington housewives paid an approximate average of 58.11 cents a pound for Land O'Lakes while at the same time the farmers who produced this 93 scoring butter realized a net return of approximately 44.24 cents a pound. This means they got 76 cents of the Washington consumer's dollar as against the usual average of 35 cents that a farmer customarily receives.

Moreover, instead of butter fat being gathered up and shipped to some distant point often outside the state, the industry is decentralized over an area of 67,000 square miles with creameries in every county which manufacture the butter and are under the control of the farmers themselves. In such an organization no absentee control can lay its withering hand upon the industry. On the contrary, these farmers have fashioned an industrial democracy responsive to themselves as far as its economic control is concerned. The association is at the same time entirely under the political control of the local government.

The Land O'Lakes is also building for the future citizenship of the Northwest by keeping the door of opportunity open for the children of the farmers.

# Trust Your Children to Pick Out Best Books

(*Concluded from page 7*)

Carleton Washburne, superintendent of schools in Winnetka, Illinois, and Miss Mabel Vogel, research assistant, compiled a list of books read by 36,750 children in the grades (public schools). They sent out eight questions from which to check whether the book read is 'One of the best' to 'I don't like it.' Out of ten books selected by the majority of these boys and girls as being the best, seven were afterward starred by three-fourths of the leading literary experts on the job as being their own choice, or of the highest literary merit. This means that if thousands of our children are left to themselves, their judgment on books will tally with the trained minds that have been steeped in literature. This is encouraging.

My readers may like to know what these books are which among 40,000 children were considered the best, so here they are:

*Little Women**
*Black Beauty*
*Tom Sawyer**
*Call of the Wild*
*Dutch Twins*
*Hans Brinker**
*Huck Finn*
*Heidi**
*Pinnocchio**
*Dr. Dolittle**
*Toby Tyler*
*Treasure Island*
*Wild Animals I Have Known*
*Viking Tales*
*Little Black Sambo*
*At the Back of the North Wind*
*Kidnapped*
*Little Lame Prince**

Those books starred were ones the critics agreed were the best.

IN CONNECTION with this, recently I met one of my daughters, who is married and has two children, after not having seen her for several weeks. She exclaimed: 'I am so excited I don't know what to do, over a book I haven't read since I was a little girl.' It was *Little Women*.

I once knew a bank president who read *Little Women* over every year. I never thought before that any bank president had as much intelligence as that.

THERE are two defects on the part of grown-ups with regard to children's reading that should be set down here. One is, too much paternalism on the part of the educators, and the other, too little on the part of the parents. With regard to the latter, it is, however, I think true as well as quite interesting (in view of the widespread emancipation of women) that the more recent tendency on the part of mothers is to take more personal interest in their children's reading. The other tendency is, as my title suggests, due to the commercialization of children's literature.

For example, the fact that a consensus of the world, over a long period of time, has pronounced a certain book a classic, is no reason why this should inspire any publisher or hack writer to 'do' it over again in his own words. Here we have Plutarch retold 'in simple and condensed English.' Here is a common title: 'Fifty Famous Stories Retold,' followed by 'Thirty More Retold.' There is practically not a great world-writer whose works have not been garbled and rewritten for children, the assumption being that because a child is a child he is not entitled to the same chance as a grown-up in acquiring culture. A list of the world's great books that have thus been mangled by publishers and writers would fill one issue of this paper.

Naturally, there are exceptions, and I am glad to note one, namely, *The Adventures of Odysseus*, written by Padraic Colum, who, being an Irishman of parts, never wrote a poor line in his life.

As far as fairy stories are concerned, Andrew Lang deserves a monument. His Red and Blue (and other colors) fairy books are excellent.

When we come to history and biography, the case is even worse. Here is a description of a compiled life of Abraham Lincoln (I spare the author's name):

Abraham Lincoln, the savior of his country and, above all others, the American. How he rose to the highest eminence and died a martyr for Liberty, Union and the rights of man.

My own experience has been that there is nothing so important in the life of a child as the books he or she reads between eight and sixteen. This period is the formative one, and considering the tremendous influence books read at this time have over the future life of the child, is this not worth considering?

And the one important thing to be noted is that the fewer books a boy or girl has the better. It is very easy, and indeed almost impossible, to avoid getting the book 'just out,' especially when so much attractive pressure is brought to bear by the publisher and his blurb writer. But it is not too much to say that the very lives of human beings are at stake in many cases, during this formative period. As we grow older, we know this to be a fact, for we can trace so much of our later success to what we learned during this period.

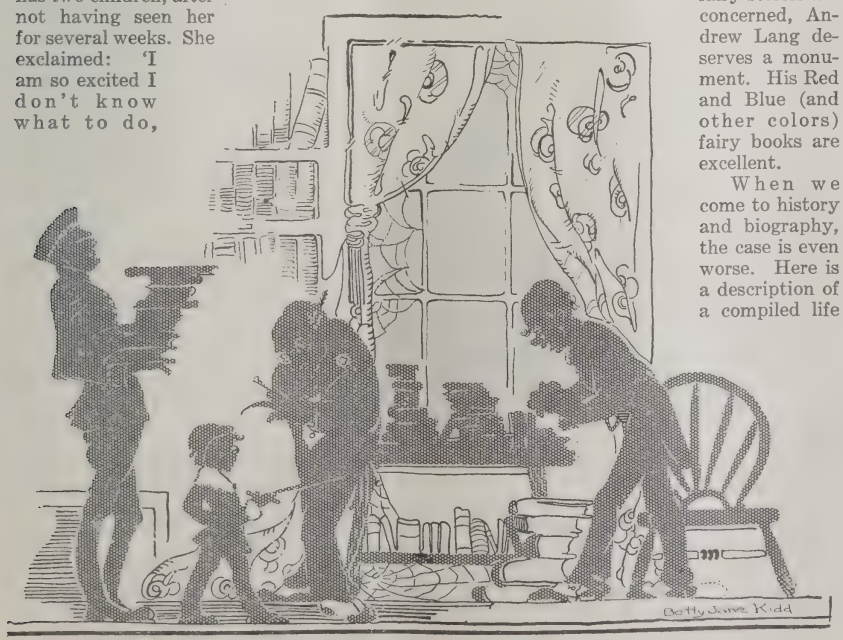
I am very strong for letting the children largely alone, but I am stronger still for not putting in their way, as a steady diet, these rewritten classics. Let them loose (in addition to the list already given) to browse among *Mother Goose, Robinson Crusoe, Swiss Family Robinson, Arabian Nights* (discriminating among the many garbled editions), Scott by all means, Dickens, Cooper (*The Last of the Mohicans* is the best), Marryat, *Jungle* books, *Alice in Wonderland, Uncle Remus, Water Babies* and *King Arthur's Round Table*.

PERSONALLY, I would not give children either history or biography until they naturally came to it. You cannot give to young children the real perspective of a very great man so that the child will understand it in the right way, owing to his limited experience with life. These mangled rewrites fasten themselves on his childish experience, so that later on he cannot take up the real lives at the right time with a correct judgment.

What we should insist upon more than anything else are style and creative power expressed in books. Children demand this and their demands should be met.

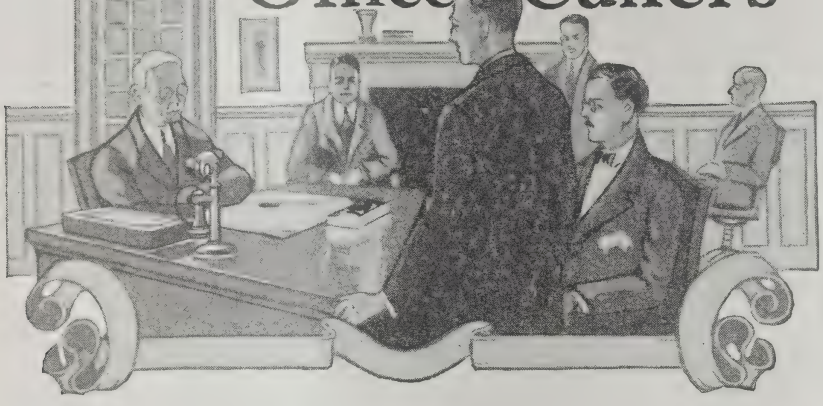
Do children know anything? Well, here is the comment of a twelve-year-old boy on a book called *East o' the Sun and West o' the Moon:*

I like this book because it is easy to understand what it means: in other words, it is easy to read; for instance, if you start to read there are no words that will stop your reading. I like books of that sort.



(Quoted from Winnetka Book List)

What better comment on what the public wants can you get than that?



And here is another by a fourteen-year-old American:

*Courtship of Miles Standish*—I liked it because it was about a brave man who liked to fight but he was afraid to ask a lady to marry him.

We don't change so much, generation after generation, after all.

# Chats *with* Office Callers

'One of the things you don't read in the newspapers about the recent skirmishing on the Yangtse River,' said ***the Man just home from China,*** 'is that some of the British ships fired upon by the Chinese were carrying munitions to the opposing faction. That is the chief trouble with your conception, here in the States, of the situation in China. The newspaper dispatches tell only half of the story—and sometimes not even that.

'Take their designation of the Canton government as Bolshevistic. Why, the Cantonese are no more Bolshevists than I am! [The man from China is a college professor of pronounced conservative tendencies who has passed nearly twoscore years in the Orient.] It is, of course, true that the Cantonese did have Russian army officers; but they were hired as individuals, not as representatives of their government—just as Chang Tso-lin, the Manchurian tuchun in the north, hires some Americans as his advisers. And I for one think it a disgrace that one of Chang's men is a former American consular officer, who is valuable to Chang largely because of the knowledge he gained while in the service of the United States Government.

'But to return to Canton. The movement there is nationalistic, and is therefore antagonistic to the rich "concessions" that the European powers hold, but it is not communistic. Canton has one of the few real governments in all China. There was some Russian influence a year ago, but the people have been casting it off. The students —who are the leaders of the nationalist movement—realize that they were duped by the Russians and they have turned against them.

'There is more—far more—behind the present troop movements than appears from the press reports. Chang Tso-lin is playing Japan's game. And he has united with his old enemy, Wu Pei-fu against both the Kouminohun (or nationalist army from Canton) and Feng Yu-hsiang, the Christian general. But Chang, wily old boy, is letting Wu bear the heaviest brunt. Feng is also accused by the newspapers of being "Red" because he purchases munitions from Moscow. But where else could he get them from? Surely not from Japan, which is secretly backing Chang. He is confined to Mongolia, cut off from the sea. He must either obtain arms from Russia or surrender. And Feng has no intention of surrendering. He is probably the squarest of the Chinese war lords. He does not like to fight, for he is a real Christian, but he is forced to battle to protect his people. There's another significant thing: more than sixty per cent of his army is Christian. And Feng's army is probably the only one in China that does no looting. Any man who attempts to rob even the humblest shopkeeper is promptly shot. Yet Feng's men idolize him.'

ɤ ɤ ɤ

***Three Men Came in*** to the office. The first had gloomy forebodings about civilization and was a sort of reformist with the idea that all taxation should be on a voluntary basis, each giving what he saw fit, or to the amount he felt himself indebted to the government. The second was very keen on military organization and thought that a kind of super-war department should manage every human activity in the country.

The third discussed some aspects of the negro question, and told of a lopsided condition in the past, when freed negroes, who had been slaves, themselves bought and owned slaves. In one or two cases, he said, there were extraordinary tangles, as in the case of a negro shoemaker in Charleston, South Carolina, who bought a negress for $700, then because of incompatibility of temper, sold her for $750.

Another queer case he related was one which occurred in Cumberland County, Virginia, where a negro who had bought his own freedom purchased a negress to be his wife. But she fell in love with a slave, stole her husband's papers and turned them over to her slave-lover, after which the two fled. But they were caught. Then came entanglements, for the officials arrested the husband on a charge of delivering manumission papers to a slave. Legal proceedings cost the innocent man $500, whereupon he sold his wife to pay the attorney fees.

ɤ ɤ ɤ

***The Critic*** of some repute spoke of book-reviewing with some bitterness. He made satirical remarks upon logrollers and the you-scratch-my-back-and-I'll-scratch-yours habit. He was sarcastic about what he called rubber-stamp reviewing, or the jargon of the book page, quoting stock phrases such as 'not a dull page,' 'the interest never flags,' 'criticism is disarmed,' 'a strong story,' 'enthralling,' 'a book on no account to be missed,' 'leaves little to be desired.'

ɤ ɤ ɤ

Speaking of a novelist, a best seller, ***the Critic,*** quoting, said: 'He began with a wealth of thought, but ended with nothing but a thought of wealth.'

He also told of a schoolhouse debating club out West and an excited debater who offered to give a subject, saying: 'What's this here country coming to? You take the affirmative and I'll take the negative.'

ɤ ɤ ɤ

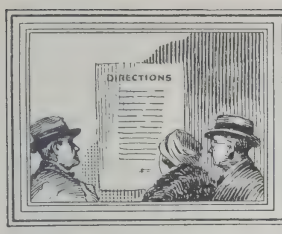
***Many Callers:*** A man with a manuscript which seemed to boost real estate in his locality under guise of a descriptive article which did not describe; a woman with an alleged 'short story' which would fill two issues of THE DEARBORN INDEPENDENT; an artist of ultra-modern persuasion who brought a picture which he said was Wisdom and Destiny, but seemed to be all fog and circles painted red and blue; a gentleman who knew that Shakespeare was written by a woman and had written a book to prove it; a man with a sort of essay entitled 'Life on the Stars,' which was stuff adapted, without recognition, from Proctor's *Other Worlds Than Ours;* another with a long dissertation on Sea Serpents.

ɤ ɤ ɤ

Said ***the Country Judge:*** 'James M. Cox has been telling people in England that jingoes imperil the world's peace. Well, they do. The queer thing is that people forget that they do. Yet it seems to be the easiest matter in the world to stir up the dogs of war. A little active propaganda by those with ulterior motives, who know what they want and how to get it, and you have a nation howling against Mexico, or China, or Guatemala or whatever country you will. A dozen frantic editorials, a few glaring headlines, and common sense is obscured by clouds of dust raised in partisan controversy. Somehow, we must keep close watch on the money lenders and the armament makers. They are the niggers in the woodpile. Turn them loose, and the best peace plans crumble to dust in a few days; the best efforts of decent men are nullified.'

ɤ ɤ ɤ

***A Man*** we never suspected of caring for poetry, who runs a garage, read this aloud, written by Arthur L. Salmon, and entitled



Some Day

Some day we meant to travel far,
Before the glow of noontide failed;
But yonder shines the evening star,
And yet—we have not sailed.

We loitered idly on the quay,
Watching the tides that ebb and flow;
We saw the boats set forth to sea;
And yet—we did not go.

Magic of many tales was brought
By travelers and the traveling wind—
New worlds of deed, new worlds of thought
And yet—we stayed behind.

And still the dream, and still the call;
The boats recede with parting hail;
Shadows of coming night-time fall;
And yet—we do not sail.

# Can You Tell Me?

QUESTION: How does the number of employes of the Federal Government on the civil service payrolls now compare with that when the war ended?

ANSWER: At the end of the war there were 917,760 employes of the Government on the civil service payrolls, whereas today the number has been cut to 560,705. Previous to the entrance of the United States into the war, however, there were only 438,057 such employes.

QUESTION: What was the total number of immigrants admitted into this country during the past year and what was the unfulfilled demand for admittance?

ANSWER: A total of 167,657 immigrants entered the United States during the year ending June 30. The restrictive clause in the immigration law crowded out more than 500,000, according to reports of consuls.

QUESTION: Has the Postal Savings System proved a success?

ANSWER: The total amount on deposit on August 31, 1925, was $132,099,867; this was a slight increase over the previous year but nearly $16,000,000 short of the highest total, which was in 1919. Since the interest rate allowed is only 2 per cent one would not expect increases during periods of expansion, when higher rates are easily obtainable.

QUESTION: Does Turkey require the use of the Turkish language in all business within Turkey?

ANSWER: Under a new law there is such a requirement. Contracts, books and business papers of all kinds must conform to the law.

QUESTION: Is Great Britain still the great creditor nation of the earth, or is she now a great debtor nation and has the United States become the leading creditor nation, and, therefore, financially able to wipe out all the foreign debts due us, as so many European champions and propagandists would have us believe?

ANSWER: Garet Garrett quotes the Chancellor of the Exchequer as having said on May 4, 1925, 'We have still £3,000,000,000 in foreign investments, the interest of which is calculated at £220,000,000 a year.' Garrett says they are increasing that investment every year out of the income, in amounts approximating half a billion dollars a year. THE DEARBORN INDEPENDENT has carried several articles within the past few years that we think demonstrate it to be a fact that the United States is not a great creditor nation but that Great Britain is the great creditor nation of the earth. Any of the war debts that we forgive other nations will be paid for out of American resources and labor and not out of present outstanding American investments abroad.

QUESTION: How much is spent per capita annually in the United States for drugs, medical and surgical attention?

ANSWER: It is estimated that the per capita annual expenditure is approximately $10.

QUESTION: Have American shipments of coal to British ports increased during the British coal strike?

ANSWER: During the first month of the British coal strike, American coal shipments to British ports were ten times the total export in 1925.

QUESTION: What is the percentage of illiteracy among native and foreign-born whites, and colored population in the United States?

ANSWER: According to the census of 1920, population ten years of age and over, the native-born white, with .73 per cent of the population, contribute .25 per cent of the total illiteracy. Foreign-born white, with .16 per cent of the population, contribute .35 per cent of the total illiteracy. Colored, with .10 per cent of the total population, contribute .40 per cent of the total illiteracy.

*In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.*

QUESTION: Where are the graves of General Custer's men located?

ANSWER: Billings, Montana. More than 75,000 people visited the cemetery there last year.

QUESTION: What are the largest rivers in the world? Please give their lengths.

ANSWER: Amazon, 4,000 miles; Nile, 3,766; Yangtse, 3,400; Yenisei, 3,400; Mackenzie, 2,525; St. Lawrence, 2,150; Rio del Norte, 1,800; São Francisco, 1,200; Danube, 1,725; Euphrates, 1,700; Indus, 1,700; Mississippi, 3,160; Missouri, 3,000; Congo, 3,000; Lena, 2,800; Amur, 2,500; Brahmaputra, 1,680; Ganges, 1,500; Amu Daria, 1,500; Zambezi, 1,600; Mekong, 2,500; Ohio, 950; Niger, 2,900; Ob, 2,300; Hoangho, 2,600; Volga, 2,300; Yukon, 2,300; La Plata, 2,300.

QUESTION: Where was the first ice cream ever manufactured?

ANSWER: It was said to have been made 75 years ago at Sandy Spring, Maryland.

QUESTION: Has a new elevator been installed in the Washington Monument; if so, what is the record number of persons to ascend to the top of the monument in one day?

ANSWER: The new elevator has been in operation for the past several weeks. On Sunday, September 5, 1926, 3,220 persons ascended to the top of the monument, mostly tourists; of those 1,601 climbed the stairway and 1,619 went up by elevator. At closing hour about 100 were turned away. This was the record up until that time, and is yet, so far as we are advised. During August, 1926, 77,929 ascended to the top. This was a record.

QUESTION: Is the city of Richmond, Virginia, on navigable water?

ANSWER: Yes. It is situated on the James River which is navigable for large vessels. Richmond is about 125 miles from the Atlantic Ocean and has steamboat service with New York, Philadelphia, Norfolk, Portsmouth and other ports on the Atlantic seaboard.

QUESTION: When and where was Upton Sinclair born? Where was he educated?

ANSWER: Born in Baltimore, Maryland, in 1878. He was graduated from the College of the City of New York in 1897.

QUESTION: When funeral expenses of Indians are paid out of tribal funds do they have to be approved by the Federal Government?

ANSWER: As a case in point, the Interior Department has recently issued notice to the Osage Indians in Oklahoma that where they desire to make large expenditures for burial purposes they must first obtain approval of the Indian Agency at Pawhuska, Oklahoma.

QUESTION: How much milk and butter does the average American consume?

ANSWER: The average American consumes 55 gallons of milk and 17 pounds of butter a year. Also, 3 gallons of ice cream.

# I Read in the Papers

Rabindranath Tagore, the Hindu poet, has been deploring the prevalence of pictures representing sex relationship, sentimentality, crime and all that kind of thing. But Doctor Tagore has done nothing more than voice a widespread opinion. There is reason, and good reason, to believe that the public has no insatiate appetite for scandalous pictures, or for the perniciously sensational, or for the insidiously erotic. Let it be admitted that there are always some hungering for that kind of thing, and there are more who were mildly interested in it when it first came out. But as a fad the day of pictures made by the inept for the half-witted is past. The trouble is that there are producers who still go as far as they dare, only concerned to keep themselves out of the clutches of the law, who fail to see the trend of public opinion. And public opinion, in the long run, stands for decency.

*What Tagore Thinks of the Movies*

Unhappily the average man does not express himself. Perhaps he is too busy making a living. Perhaps the fear of being accused of prudishness prevents him. Perhaps he dismisses the matter as none of his affair, with a sort of grossness-to-the-gross attitude. At any rate he does not let himself become audible. If he did, the off-color stuff would vanish like a mountain mist before the sun.

What the average man does is to practise a policy of abstention. So things are gradually correcting themselves, box-office receipts constituting the recording dial. Soon we may have 'funny' pictures which do not depress, and serious pictures which are not laughter provoking.

ɤ ɤ ɤ

Traffic row, 1976: 'Bah! Why didn't you hold out your hand? How'd I know you was going under the cloud?'—Washington *Post*.

ɤ ɤ ɤ

The transformation of Washington into a modernized 'second-class city' just like any state capital in the country is described by Clinton W. Gilbert in the Philadelphia *Public Ledger*. His protest is prompted by the destruction of some famous old houses in the square in front of the White House. 'With the razing of the John Hay house and the Henry Adams house next door to make room for a hotel, all the north side of Lafayette Park opposite the White House will be a line of modern buildings,' he reminds, 'with one old church in the center—the War-Risk Building, precisely like any office building; the new hotel, like any other new hotel, and the United States Chamber of Commerce Building, a dignified but uninteresting structure.

*Washington Dons New Garb*

'On the east side of the square all of old Washington is gone except the Dolly Madison house and the Cameron house, both now occupied by the Cosmos Club; and it is reported that a Government building is to replace these, and recent Government buildings are mostly second-class office buildings. The chief loss to regret is historic associations and the dullness of the new buildings that replace the old. When the Chamber of Commerce Building went up the house occupied by Daniel Webster disappeared.

'Washington is being rapidly made over, and not in any very distinguished way. Congress is indifferent to anything but post offices in its districts. The Government therefore does not set a standard of beauty and dignity in its buildings. Business is not rich or powerful enough in Washington to house itself magnificently. So what is emerging is a state capital with a few buildings scattered here and there which surpass those of most state capitals and a ground plan that reminds one of the dreams and ambitions of earlier days.'

The Prince of Wales isn't coming to the United States again until next year, so we denizens of the land of the free have still a whole winter in which to wear our hat brims as we choose.—New York *Herald Tribune*.

ɤ ɤ ɤ

Windsor Castle has been revisited by the wraith of a woman believed to be Queen Elizabeth. Usually this 'ghost' has been seen either flitting in or out of the Queen's Library or gliding down the east terrace. But now she is declared to have appeared inside the Saxon Tower and on the battlements.

*A Ghost Visits Windsor Castle*

The story of her latest appearance was told by a well-known Windsor resident living within a stone's-throw of the castle. 'Castle officials have nothing to say about the matter,' he said, 'but it is the talk of Windsor at the moment.

'The story is that a few nights ago, about dusk, a man was walking near the Saxon Tower. As he knew that the tower had been untenanted for over a year he was surprised to see a woman looking out of one of the windows.

'The woman was tall and thin, dressed in black, and with her face partly hidden by a sort of cowl or veil. He saw her quite distinctly one moment, and the next it was as though she had fallen through the floor. He saw the apparition again on the battlements, and as he was watching it faded away.

'Curiously enough, the details of the ghost's dress and appearance are identical with the description given of an apparition seen some years ago by a Windsor Castle sentry.

'The sentry was on the east terrace at night, standing by his box, when he caught sight of a hooded woman walking toward him. Before he had time to challenge her she had flung herself down, kneeling at his feet, and then vanished. The man was laughed at and told that he had been dreaming, but it is a fact that owing to his experience he did not afterward do sentry duty at that spot.'

The best-authenticated version of the hooded woman story of Windsor Castle was related by a Guards officer. He was reading one night in February, 1896, in the Queen's Library. Looking up from his book he was surprised to see a veiled figure walking away from him and then suddenly disappear.—Liverpool *Post*.

The Very Reverend W. R. Inge, of St. Paul's Cathedral, London, upholds his title of the 'Gloomy Dean' in his book, *England*, which has just been published overseas. He pictures Great Britain as on the brink of disaster with the empire about to crumble, and America as the greedy inheritor of England's pristine glory and power.

*Dean Inge Views With Alarm*

'Britain's naval supremacy is at an end,' he declares, 'and with it the instrument by which we built up and maintained our empire. We are no longer rich enough to build ships against all possible rivals, and the Americans by insisting on our repaying of the vast debt incurred for the sake of France, to which we rashly put our names, made sure we shall remain permanently tributary to them and unable to challenge them on the water. Our position as a world power is thusly permanently altered for the worse.'

Dean Inge (which, by the way, is pronounced to rhyme with sing) pays his respects to America in no uncertain terms by asserting that during the Irish trouble this country furnished not only funds 'but agitators, murderers and incendiaries to aid the rebels.' He further declares: 'The American notion that the English are arrogant may chiefly be an inherited prejudice, but it is probably due to the fact that we are not accustomed to being accosted by strangers without introductions. In any case the accusation is no longer true. All that remains of our former pride is wholesome indifference to the opinions of foreign nations, which we find to be generally ill-informed and frequently biased.'

Nor does the 'Gloomy Dean' confine his remarks to Americans. Concerning his fellow-countrymen he says: 'We are governed by Scots, Welsh, Irish and Jews. As for our dominions, their loyalty is not as whole-hearted as could be wished, and the future of Canada is problematical, with the danger of Americanization ever present.'

# Briefly Told

THE UNITED STATES GOVERNMENT is paying pensions to nineteen widows of soldiers who fought in the War of 1812.

SCIENTISTS NOW PROPOSE to utilize poisonous gas in killing mosquitoes.

ONLY THREE CASES of yellow fever—once the scourge of the continent—were reported in all North and South America during 1925, according to the Rockefeller Foundation.

RADIO HAS EXTINGUISHED a flame for the first time. A man in San Francisco broadcast a shrill note which put out a sensitive flame in Berkeley, twelve miles away.

ANDREW JACKSON WAS the only American President ever to figure as a duelist. Abraham Lincoln was once challenged by a young politician and chose as weapons 'cavalry broadswords of the largest size,' but the affair was called off.

ONE MILLION SILVER dollars were minted in the United States during the month of August. The 'cart wheels' are still popular in the West, although most Easterners refuse to carry them.

PLINY RECORDS that the Romans, more than 2,000 years ago, imported Roquefort cheese from France (Gaul) to add flavor to their banquets.

WHAT IS BELIEVED to be the largest human skull in the world was recently discovered in South Africa. It measured eight and one-half inches in length and had a capacity of 122 cubic inches.

BALMORAL CASTLE HAS been equipped with modern heating facilities, and ladies-in-waiting to the Queen no longer shiver while on duty, as they did in the days of Victoria.

THE NERVE CENTERS which react to music are in the feet, according to the Swiss scientist, Hoepli. This explains, he says, why we tap time to music with our feet.

A TRAVELER ON ONE of Germany's seventy-five airplane routes is automatically insured for $6,000 by the concern operating the line.

GOVERNMENT AGENTS IN Mexico are seeking a secret radio station which has been broadcasting attacks on the Calles administration. The plant is believed to be near Mexico City.

A VARIETY OF MUSHROOM with a shiny elastic skin is a natural bomb. It has a white spongy center which changes to black powder as the plant matures and, at a certain stage of development, aided by heat from the sun, explodes.

ELK ONCE ROAMED America from coast to coast.

MUNICIPAL OFFICIALS in a Pennsylvania city are enjoying parking at a fire plug in front of the city hall. The hydrant is an imitation one, but most citizens do not know this and carefully avoid parking near it.

A GOLFER IN PHILADELPHIA struck the little ball such a blow that it soared far away, striking the glass in a fire alarm box and setting off the alarm.

THE EXPRESSION, 'bees in his bonnet,' came true recently in Oklahoma where a man discovered after chopping down a tree that his hat was filled with the insects. He carefully carried them home, being stung only once by a bee crawling down his shirt collar, and placed them in a hive.

NEIGHBORS OF A KANSAS farmer are enjoying radio concerts with him by connecting their loud speakers to a barbed wire fence which is attached to his receiving apparatus.

DINOSAUR EGGS HAVE been found in Montana.

A GREAT GREAT-GRANDDAUGHTER of Sacajawea—the Shoshone Indian squaw who guided the Lewis and Clark Expedition to the Pacific Coast more than a hundred years ago—is teaching the white children, descendants of the frontier pioneers. She is Miss Irtense Large, and her school is 50 miles north of Green River, Wyoming.

A CANDIDATE FOR THE Hawaiian Senate radioed his signature for his nomination papers from San Francisco to Honolulu, 2,090 miles.

DICE WERE USED in Ancient Greece, their invention being traced to the Psalmedes of the 13th Century B.C.

A WISCONSIN COUNTY CLERK discharged his deputy, a young woman, declaring that she 'lacked initiative.' She ran against him for the office and won by 2,500 votes.

TEN COWS ARE KEPT in a shed in the heart of London. They are milked twice daily, giving approximately 160 quarts of milk. When taken to the country they run about ill at ease, unaccustomed to the green grass underfoot.

THE REMOVAL OF HARMFUL toxins from the blood of animals makes it possible to transfuse this blood directly into the bodies of humans.

THE THIRD LARGEST purchaser of American agricultural implements this year is Russia.

THE SUGAR BEET INDUSTRY was introduced into this country in 1880. Today eighty factories representing an investment of $100,000,000 produce annually about 700,000 tons of white sugar.

ALL-STEEL FIREPROOF barns may now be built for $5,000.

SMOKY ATMOSPHERE DUE to forest fires is credited with having helped this year's apple crop in British Columbia, as it prevented the direct rays of the sun from drying the soil when there was a scarcity of rain.

FRANCE IS CONSIDERING the payment of a dowry to marriageable girls at the age of twenty-one to induce them to stay in the country. The influx to the towns has assumed serious proportions.

A SNAKE HAS TAKEN possession of a temple at Jurood, India, and the natives fear to eject it lest they offend their gods.

A NEW WIRELESS DEVICE makes it possible to guide ships in thick fog without danger of hitting submerged rocks off the course.

BUILDINGS IN THE UNITED STATES will reach a value of $7,500,000,000 if the averages for the first six months are maintained during the balance of the year.

MOHAMMEDAN SEAMEN make excellent sailors, according to ship masters, because their religion bars them from drinking.

THE BRITISH MINT HAS manufactured about $8,000,000 in coins for the Soviet government.

STUDENTS WHO STUDY music are twenty-five per cent more efficient in their other studies than those who do not, recent tests indicate.

SANITARY DRINKING glasses made of ice are formed in a freezing apparatus devised by a Dutch engineer.

TWENTY MILLION TONS OF iron go to waste annually because of rust, it is estimated.

A TYPEWRITER HAVING 1,160 keys covering forty alphabets has been devised.

OLIVER CROMWELL'S WATCH has been stolen from the British Museum in London. It was still in running order when taken.

# NOTES COMMENTS CRITICISMS

MR. FORD'S Page this week discusses war and war-makers, and the mental attitude of propagandists for and against it.

Ever since the world began the alleged physical deterioration of the human race has been deplored. Donald Hough vigorously attacks the theory that all our ancestors were hardy and that most moderns are weaklings. He claims that 'the glorious past' has cast a glamour over reason. (p. 16)

*Donald Hough is a Northwesterner with a special love for the outdoor life, and in his wanderings has had special opportunities of procuring material with which to explode this perennial myth. We hear much talk about 'the sturdy Puritan tradition,' the 'days when men were men and blood was red and virtue was its own reward.' This attitude may be due to forgetting evil and recalling only good, Mr. Hough suggests. Mr. Hough condemns such ancestor worship and stoutly maintains that where hardy pioneers were found of old, in log cabins and on the frontiers of deprivation and danger, there they still are. Mr. Hough is a regular contributor to outdoor publications, and this autumn is bringing out a novel in which life in the open will have its part.* (p. 16)

Donald Hough.

IT IS manifestly impossible for any community to pay entirely as it goes, says Samuel Crowther in continuation of his tax articles. But a good many of the public services which are now run at a loss could be put on a paying basis through proper management. During the past few years the issue of bonds for the construction of bridges, roads and schools has far exceeded the wildest estimates of pre-war times. During last year the state and local governments borrowed 1,258 million dollars. (p. 1)

Before this orgy of borrowing began, as many persons as now thought that they wanted fur coats, but they would not borrow to buy them. However, an unreasoned program shoved the whole country into fur coats regardless of cost or the ability to pay for them. There is a growing feeling that the country is living beyond its income. (p. 1)

From O. D. Hollenbech, Trinchera, Colorado: Why does every farm paper print an urgent appeal for production and not one try in any way to improve marketing or distribution. I am a farmer and cattleman and I see and feel myself doing business in a man-organized world with no farm organization and if we have a semblance of any it urges production. Get up earlier, work harder, produce more to sell for less to feed an industrial world cheaper. Outdo your neighbor that others may buy cheaply.

[EDITOR'S NOTE: Mr. Hollenbech is respectfully referred to page 12 of this issue.]

From Christopher J. Carroll, St. Louis, Missouri: I have always been convinced that the ancients, compared with the way science has advanced since the middle of the 17th Century, were not only a very ignorant race of individuals as a whole, but also a very superstitious race which means about the same thing. While we are entirely willing to give full credit for all the gifts that they have left to posterity, of which we ourselves are a part, still anything that has been discovered by the excavators of the earth's surface so far have not indicated any superiority either in architectural design or in the material that was used.

Now, in the 20th Century as compared with anything that was in vogue during the ancients' time, the differences are easily noticeable. We have everything that can possibly be desired. Control of the air above and also below the earth's surface; control of the seven seas by radio.

Stefansson believes in the 'Friendly Arctic.' In all his enterprises he has approached the frozen North with a smile and a heart full of hope and confidence. He believes that thousands of acres of land at present believed to be barren wilderness can be made to produce food both in beef and grain. He has never feared frozen feet or starvation. Burt McConnell, who was associated with Stefansson in some of his most notable adventures, gives us his portrait at close range. (p. 3)

*In Minnesota and contiguous states 90,000 farmers have accomplished the nation-wide distribution of 79,000,000 pounds of butter annually to the tune of $40,000,000. Private capital was purchasing their butter fat at discouragingly low prices, and now they get 76 cents of the consumer's dollar as against the usual average of 35 cents. Huston Thompson tells the story of this self-help organization. Mr. Thompson is about to retire from the Federal Trade Commission after years of service.* (p. 12)

Huston Thompson.

SUBSCRIPTION PRICE in the United States and its dependencies, also Canada, Cuba, Mexico and countries where the United States Domestic Postage Rate applies, $1.50 a year; other foreign countries, $2.00 a year. Single copy, five cents.

CHANGE OF ADDRESS: 1. Notify us at least two weeks in advance. 2. State both old and new address. 3. Write clearly.

In Pennsylvania, the political pull of the various liquor groups has been many times sufficient to overcome adverse reports from local agents. Without the vast quantities of alcohol withdrawn from bonded warehouses and distributed throughout the eastern section of the United States, the illicit rum business would be seriously crippled. John D. Erwin produces the facts. (p. 4)

THE laws of war governing the sky are different from those ruling the earth and the sea. In the air it is war to the death, because aircraft cannot stop and surrender. There are other interesting points in military aviation brought out by Captain Elbridge Colby. (p. 5)

Thomas Masson says that in the matter of juvenile reading there is too much paternalism on the part of educators and too little on the part of parents. (p. 7)

How the 'Big Ten' came into being is the subject of an extended talk on athletics by Walter Monfried. It is an epic on football and track contests. (p. 14)

# Fining Men for Dying

## That's What the Inheritance Tax Does

By SAMUEL CROWTHER

A BED that suggests the Field of the Cloth of Gold. A young woman nestling amid a great heap of unwashable silk pillows. She sleeps, but not as others sleep. She keeps her *hauteur*, her cold disdain, her Marie Antoinette if-the-people-haven't-bread-why-don't-they-eat-cake attitude. Fifi flits about noiselessly, waiting for the sacred eyelids to open—or even to push them open if the paint sticks. She wakes, not vulgarly with a yawn, but gorgeously like the dawn. Fifi pets her. The great doors swing open—a column of lackeys enters, deploys, and advances . . . This is wealth, a spoiled daughter of the rich—in the movies.

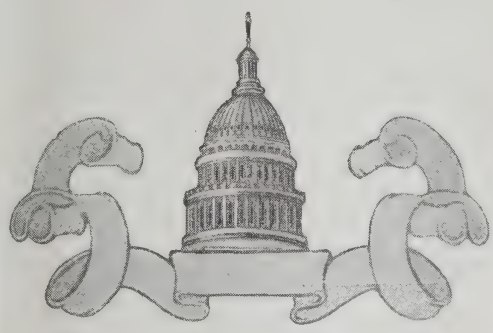
A clean-shaven, steel-eyed, square-jawed man sits at a broad, flat desk in the center of a paneled and vaulted hall. His hair is graying. He is thinking—thinking deep and sinister thoughts. His jaw shuts with a click. He has made up his mind. He presses a button and a secretary pops out. The great man doesn't look at him. He just barks: 'Tell Mr. Simpkins to smash that Brown crowd today' . . . That is wealth, the captain of industry, the king of finance—in the novel.

A fat man with a flabby jowl, wearing a suit embroidered with dollar marks, a top hat, a foolish, cunning leer, and surrounded by boodle bags. That is wealth—in the cartoon.

What is your conception of wealth? Do you think of a rich man as a being of luxury—luxury at any cost and regardless of the inconvenience?

Do you think that the rich have practically nothing to do but spend money, and do you think of the rich as a class with some different sort of blood coursing through their veins? Some of the rich think so—some of the very newly rich—but do you think so, or do you call it a form of paranoia?

Would you object to being rich yourself? And, finally, would you vote for the state to confiscate all fortunes in excess of some certain sum—let it be half a million, or a million?



That is the real crux of the matter. And would you vote 'No'? You have voted 'No' time and again. You have never voted a Socialist or any other ticket which squarely stood for the nationalization of wealth. Not even the most radical of our parties has ever been radical enough squarely to present the real issue.

'Inheritance taxes,' sniffs someone. 'Nobody's going to leave anything to me and I shan't have anything to leave to anybody, excepting maybe the bill for my funeral. Why shouldn't these fellows that have millions give up some of them when they die, instead of leaving it to a lot of worthless loafers? They'll only buy pearls and diamonds and have 'em pinched.'

And because that is the general attitude—indifference—the inheritance taxes are what they are. We have had some kind of inheritance taxes for a long time, but in their present or depraved state they date principally from war time. Their legal foundation is firm and ample. The right to transfer property is a purely legal one created by the state, and therefore the state may impose such conditions as it sees fit. The passing of property from the dead to the living is a transfer and the tax in theory is on the transfer and not on the property itself. All of which is completely unimportant.

The taxes are laid in part for revenue, in part to curb the growth of large fortunes, but mostly to curb the activities of rich men's sons and daughters. By common consent rich men's sons are wastrels and rich men's daughters, after giving themselves many absurd airs, marry foreign titles. That conception of rich men's sons and daughters came into being because of the antics of the offspring of some of the Pittsburgh millionaires and railroad barons and has stuck, along with the notion that no man can honestly earn a million dollars and that two per cent of the people own sixty-five per cent of the wealth.

It is no longer the fashion for rich men's sons to go to the devil. Rich men's daughters marry foreign counts more by accident than by design. The really rich lead quiet lives, and their sons and daughters do likewise. If Ward McAllister were alive today, he could not get four hundred persons of real means to play with him. Social climbing is an obsolete pastime—

*AMERICANS believe that the man who earns a dollar has a first lien on it. At least, we believe it about the dollars we earn ourselves.*

*Nevertheless, without anyone ever having voted that it was wrong for a man either to live or to die with money to his credit, it is possible for a testator to die not owing a penny and with a million dollars in securities and yet have that estate not only entirely confiscated but actually with a deficit over, not counting lawyers' fees. Every sort of ragtail, bobtail notion turns up when we get into inheritance taxes—but every time any of these proposals has been put to the people, they have turned it down.*

there is no place to which to climb. None of the people with twenty millions or more to their credit give big, expensive entertainments. Rich people as shown in the movies do not exist. Very rich men have to keep largely to themselves, not because they like the solitude but because whole armies of inventors, charity workers, and cranks are always trailing them. Their sons as a rule go to work. The average of rich men's sons who go wrong is much below the average of all sons that go wrong, and as for swollen fortunes, my own observation is that in these days, while it is possible to make perhaps a couple of million dollars dishonestly, very little money is made dishonestly.

IT IS all but impossible to get together more than a few million dollars by speculation, and the only way to accumulate more than, say, five million dollars is by rendering supremely intelligent service to the community. I do not know what a swollen fortune is. I have seen men with fifty or a hundred thousand dollars who had far more money than was good for them —yet such an amount of money could not possibly be classed as a 'swollen fortune.' The big fortunes are all hard at work and their owners seldom have much cash. Only bootleggers and gamblers go in heavily for cash.

All of which is beside the point. If it is bad for the community to have a large fortune accumulate in the hands of an individual, then steps ought to be taken to prevent that accumulation. The habits and disposition of the accumulator do not matter, if, as a matter of public policy, we decide that a large fortune is too dangerous to be tolerated. But first it would seem sensible clearly to arrive at that decision—at which, to reiterate, we have never arrived. We doubt, although we do not say so in our laws, the wisdom of leaving too much to heirs. Perhaps the fortune is all right in the hands of the man who earned it—but not in the hands of those who come after.

But if sixty-five per cent of the wealth of the country is in the hands of only two per cent of the people, must not something be done quickly to bring about a redistribution? That statement is in the mouth of every 'friend of the people.' It has been repeated so often that it has become an article of faith. It is an official statement in that it appears in the report of a government commission—the Commission on Industrial Relations—published in 1915. The commission did not make the slightest investigation; it merely took a study made by Dr. Willford I. King from an analysis of the estates probated in Wisconsin and Massachusetts. Dr. King is an economist of high standing and he did not assert that his findings were based upon adequate data or that they could possibly be applied to the nation. The commission on no data at all applied that touch.

Dr. King has since said in effect that the amount of wealth escaping probate is such as to avoid his conclusions even as to the two states he examined. And yet sweeping changes in the whole structure of the country have been vehemently urged on no greater foundation than this 2-65 statement!

We do not know what our wealth is, much less how it is distributed. At the end of December, 1922, the census placed the figure at 320 thousand million, of which only four thousand million was in gold and silver—which is interesting in showing how little of our wealth is in cash. The total wealth figures do not amount to much because land values comprise about one-half of the total and land values are continually fluctuating. Walter R. Ingalls thinks that in 1916 about 1.7 per cent of the people owned 30 per cent of the wealth. But he based his guess on four hundred and thirty thousand income tax returns for 1916. Now we have seven and a half million returns—and you can do your own guessing. What is more important is that 70 per cent of the national income other than agricultural goes to wage earners. Ownership is less important than use.

IT SEEMS to be taken for granted that a great American fortune may develop into a menace, but there are no facts on which to base that opinion. No fortune can be large enough to 'corner' commodities; that has often been tried but always the budding magnate has come out of the fray considerably tattered and with only an empty bag for his trouble. This country is too big to be cornered. Estates do not increase greatly after the death of the founder—unless a more clever man becomes owner and develops them.

The fact is that we have not had enough experience with the big American kind of fortune to know what its effect is. Our big estates are in the securities of industrial enterprises, and even the largest corporation is a fragile thing easily to be wrecked by bad management. The old-world economists knew only estates in land. An heir who was a bad landlord could cause much distress among his tenants. The same sort of an heir coming into the control of a great industrial property might likewise cause some distress—but not for long. In a year or two the business would be in the hands of the creditors.

But in spite of our lack of knowledge of the social effect of wealth, we heavily fine men for dying wealthy. We cash in on the corpse.

THE state where the decedent had his residence taxes his whole estate. If by any chance his estate is in negotiable securities and they happen to be in a safety deposit box in another state, that state may also tax the whole estate. Any real estate owned outside of the state of the testator's domicile is taxed at its location. If he owned stock in a corporation incorporated in another state, that state will tax his stock holdings and the shares cannot be transferred until the tax is paid.

Other states will tax him if the corporation whose stock he owns has property within its jurisdiction—for instance, both Illinois and Iowa tax the stock of the Rock Island Railroad. In a decedent's estate some of the taxes are flat, while others are progressive. Some states have exemptions and some have none.

What is left of a man's fortune depends not so much on the gross amount he had at death as on where he died and what kind of securities he owned. If he laid out his money all through the country, he is most heavily penalized—although it benefits everybody to have capital flowing freely. The laws are so new and so few people even know of their existence that as yet investors generally have not learned that the intrinsic value of a bond or of a share of stock may be secondary to the location of the issuing corporation.

Soon everyone will know the facts and invest accordingly. The consequences may be very serious to the nation, for if money cannot be invested anywhere in the country, then we cannot continue the national business which has made us a nation. The wisest provision of the Constitution was that prohibiting states from obstructing interstate commerce. Tax walls are

## Proves That Thirteen Is Lucky and Talks on *When We Were Very Young*

*By* HENRY ALBERT PHILLIPS

I FEEL more certain than ever now—after this little experience in meeting A. A. Milne—that luck is really nothing more than point-of-view after all, plus or minus a bad digestion, divided usually by the weight of one's purse and then multiplied finally by circumstances. In other words, luck is simply the tide of life—contemplated in the hours of its ebb or flow—when its nature or content has seemingly been greatly altered—but in appearance only.

If I lived at *13* Palace Court, Bayswater, London, for instance—as I did for three months recently—and tumbled downstairs—which I didn't—would it have been due to the unlucky number 13 of the house, or to unmitigated carelessness in placing my left hind foot where no stairs were?

Frankly, not wishing to be branded with my own stupidity, I would look about for someone, or something, on which to blame it and then conveniently call my asininity 'luck,' or more probably 'ill luck.' And so a thousand other clever, stupid persons, who have been looking about for a handy cat's-paw to pull blundering chestnuts from the fire they have heaped on their own heads, ponder for a moment and say, 'By George! That's the little imp in my bottle too!' And so we all club together and form the Brotherhood of Superstition for the Preservation of Self-Conceit and call it luck.

So, as I was about to say when I interrupted myself, I was living at 13 Palace Court when I wrote to A. A. Milne—who lived at *13* Mallord Street—for an interview. Taking in account the double 13, he should have turned me down. Instead, he wrote:

> Dear Sir:
>
> I can refuse nothing to anybody who writes from 13 Palace Court, for it was from that address that my wife used to write me every day just 13 years ago . . .

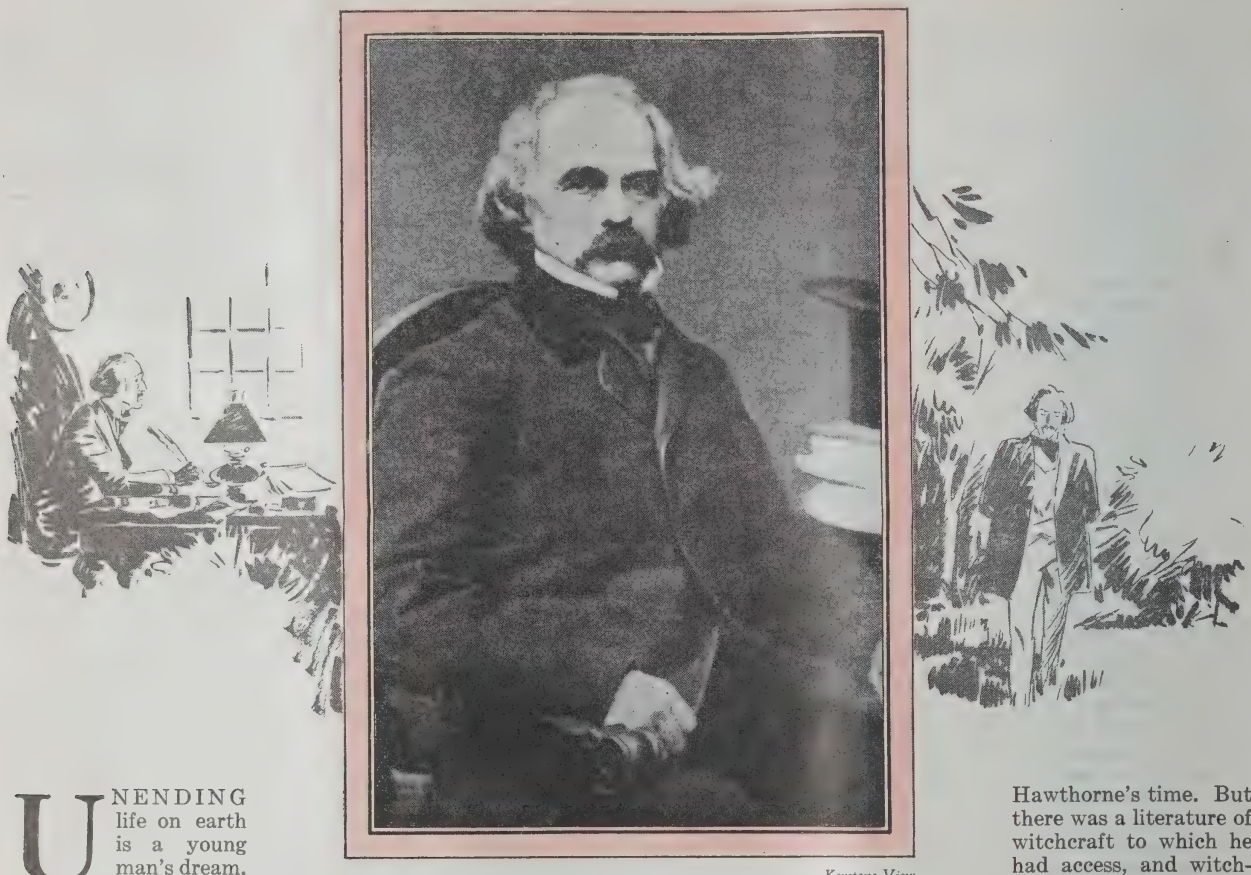
Possibly it was the three times 13 that broke the evil spell.

I happily got lost in trying to find Mallord Street. It is one of those little side streets—of which London has so many—that has run off from the big streets, like an adventurous child, and hid itself in the most unexpected place. If you go along the Strand trying to find Gough Square, where Dr. Samuel Johnson lived, or Wine Office Court, where he used to dine in Ye Olde Cheshire Cheese, you will understand what I mean.

Well, Mallord Street is like that too, only it is over in Chelsea, the Greenwich Village of London, where all the artists are supposed to live. I really didn't care how much I lost myself, because I was constantly bumping into delightful little streets like they once showed us in that charming play, *Pomander Walk*, with quaint little houses built in the time of Queen Anne, each with its little garden and wall and flower boxes at the small windows. I felt like walking down these quaint streets on tiptoe for fear of waking some little old lady of romance who was caretaker of the place.

I bobbed up in Cheyne Walk and found myself peering through the windows of Thomas Carlyle's house, now used as a Carlyle Museum. I fancied I could hear him calling a little sharply to his patient wife from his study upstairs. I went then to where his near-neighbor, Whistler, used to live and recalled his vivid portrait of Carlyle. How had these two crabbed geniuses behaved together while it was being painted, I wondered.

And now I am pausing before the home of the gentle William De Morgan who failed and failed as an artist and then at sixty-six turned on the Muses and wrote that precious book, *Joseph Vance*.



Then I found myself way afield again, wandering along the Thames at the point where Whistler used to sit and paint and etch those gray studies.

At last I found someone who told me where Mallord Street was still hiding after a few centuries. It was just a little crooked and irregular in one spot, like all the others had been, as though it had stubbed its toe there.

I was disappointed in Mr. Milne's Number 13. I had expected something more whimsical and grotesque, something more Milnesque, if you please. It was house, that was all; and frightfully new, not more than fifty years old anyway.

I rang the bell and was shown upstairs amid a perfect forest of antiques. But they were not English antiques at all, but all sorts of fantastic and fascinating pieces of Old France and Old Spain, painted green and rose and buff and further enlivened by flowers until you had the sense of being in an old-fashioned garden, while dozens of pieces of rare amber glass set in the bay window and on shelves and tables gave you an addi-

# *Nathaniel Hawthorne's* Story *of* Immortality

## *As Related by* JULIAN HAWTHORNE

*Decorative Sketches by* RICHARD BROECKER

UNENDING life on earth is a young man's dream, and an old man's nightmare. It is probably ancient. Animals live in Now, and foresee nothing else. Cavemen (not the contemporary sort) thought death depended on the success or failure of their relations with bears and big lizards. But in historical times a man with leisure on his hands would begin to ask himself, 'Why should I die?' People got killed: that could be avoided. Others got sick: that could be cured. Everybody by and by got wrinkled, feeble and useless: was that not a form of sickness? Find a medicine for that, and you might live forever.

Then began the Order of Chemists and Druggists, calling themselves fancy names. They mingled investigations in physics with speculations in metaphysics. Egypt bred its magicians: the Kabbala issued mystic sayings: the Hermetic Philosophers claimed to solve the riddle: the Rosicrucians declared themselves the inheritors of all past wisdom. Legends were propagated of persons who had actually existed ever since the Deluge, and Christianity boosted its Wandering Jew.

Meanwhile India had been going strong, but their explanations were so subtle that we couldn't tell whether their earthly immortals were not, perhaps, spirits which had learned the trick of reincarnation. More practical students decided that the likeliest way would be to find or make a substance or a drink which would renew youth, without the comeback which is the difficulty with hasheesh and opium. The Fountain of Youth must be somewhere—in Florida, Ponce de Leon thought: or, with the right recipe, it might be artificially compounded: or the Philosopher's Stone, if one could but lay hands on it, would not only turn lead into gold, but transform dotards into schoolboys.

Our contemporary thought and science clears its throat to say that, really, our present life-span is shorter than it need be. Temperate diet, judicious exercise, a tranquil mind, ought to bring our average up to a hundred—to more than that, even!

Modern science didn't exist in Hawthorne's time. But there was a literature of witchcraft to which he had access, and witchcraft had its roots in old times. Hawthorne's own ancestors had sat as judges in witch-trials in Salem; and he may have known something of Hermetic and Rosicrucian philosophy. Bulwer Lytton was born a year before him, and was writing novels of magic and mystery in the 1830's; but I doubt if my father read them. The subject was deep in his mind, however, and my aunt, Elizabeth Hawthorne, told me that soon after leaving college he wrote a number of witch stories that in her judgment (and her judgment was good) were interesting and powerful; in spite of which he burned them unpublished, because, he said, they were untrue!

All fiction is untrue in the literal sense, but Hawthorne was not speaking literally. He implied, accordingly, that there was no such thing as real witchcraft—it was a delusion or insanity of the imagination. But it was very picturesque, and being of so remote and universal origin, it must be due to some deep predisposition of the human mind. It was this that most engaged his thoughts; it branched into the conception of long-enduring physical life, its possibility, nature and consequences. Legend ascribed to Satan the power to confer it upon per-

sons willing to barter it for slavery to him after death: which is to assume that long life is wicked—a defiance of the law of God. This seemed hardly justifiable; but leaving the point in abeyance, was it conceivable that our bodies might last indefinitely? and if so, what would be the result on the individual and on society?

AT ALL events, a romance based on that idea might be worth writing. But adequate treatment would involve much thought about the fundamentals of existence. Superficial handling of it would be a mistake. The problem must be fairly faced and worked out to its last element. What is life, its meaning and end? Is what we regard as progress an actual forward and upward movement? Or is it like waves of the ocean, driven now this way, now that, by winds of doctrine, while the depths are unstirred? If progress in mortal life were really intended by the Creator, why did He make the individual transient, so that as soon as he arrived at years of discretion, with his projects promising fulfillment, he must leave it all, and begin (if he were to begin again) on a different plane? Or was man intended ultimately to solve the secrets of nature, and command mortal life at his pleasure?

To compose such a romance with any measure of success, the writer must not only be at the top of his faculty, but he must be able to put his whole heart and brain into the work. But Hawthorne, unusually isolated though his youth was, could not command such concentration as this; and after he married, still less so. He had his livelihood to make: the radius of his social intercourse was lengthened. The tales he wrote—*The Scarlet Letter*, *The Seven Gables*, and the rest—might be regarded as facets of the great theme: studies of details; exercises preparatory to the great enterprise: analyses of the human spirit in its subordinate manifestations, on the way to reaching a comprehension of the central drama. He may have thought that after the minor difficulties of his own life had been subdued, leisure would be given for uninterrupted study. As it happened, however, events did not take this course; he was still too poor to abandon daily labor, and anxieties, private and public, diverted his attention. His health, hitherto excellent, began to fail and his strength with it. Nevertheless, during the last few years of his life, he applied himself resolutely to the effort.

In Italy, before the writing of *The Marble Faun*, he attacked the subject from various angles; and even while still residing in England, he had been meditating a work, provisionally entitled *The Bloody Footstep*, the central figure in which should be a man of mystery, invested with superhuman powers, for which he had paid by the commission of a terrible sin; and wherever he trod, his foot left a bloody imprint. This idea arose from an anecdote of one of the ancestors of a noble English family, told to him by a woman relative as a picturesque family tradition. It is mentioned in his journals; and in Italy he put on paper an outline of it, possibly to be developed later. But it did not satisfy him, though for years it was in the back of his mind.

COMING back in the summer of 1860 to his home in Concord, he conceived the subject on another basis. A young American, Septimius Felton, living at the period of the Revolution, has applied himself to the study of the occult. There is a trace of Indian blood in him, and his only companion is the old Indian woman, a semi-witch, who has dwelt in the house since before his infancy—the house standing on the Boston high-road, at the foot of the low ridge of hills which parallels the road for some distance—evidently the same 'Wayside' which was Hawthorne's own residence in Concord. Breaking in upon his moody seclusion comes a regiment of British infantry, which had already fired upon citizens of Lexington, and was on its way to capture the ammunition said to have been collected by the men of Concord. The regiment halts before the house for water, and a young English officer has a colloquy with Septimius.

The machinery of the tale appears here. The officer's family in England is the same from which sprang the first immigrant to the American colonies, and of which Septimius is also a descendant. This fact transpires later; but we know that the family had a remote ancestor, reputed to possess magical powers, and who had incurred the curse of the Bloody Footstep: Septimius himself was conversant with the legend, and thereby had perhaps been influenced to pursue his experiments, the aim of which was to discover the drink of everlasting life.

THE two young men, meanwhile, part after their brief contact, the regiment goes on, to meet its defeat at Concord Bridge, and to retreat in some disorder past Septimius' house. The officer once more accosts the American, ending in a duel with muskets on the summit of the ridge behind the house. The officer is mortally wounded, but before dying he bids Septimius bury him where he has fallen, and intrusts him with a message, the purport of which, however, Septimius does not as yet fully understand.

He resumes his lonely studies, with the stain of blood upon his hands. This part of the story is mainly concerned with allusions to alchemy and the black art; and the passages are as strange and absorbing as is anything else that Hawthorne has written. Septimius is brewing a liquor, according to a formula found among family documents, which he has grounds for believing is the famous elixir of life itself. The old Indian woman gives him hints from time to time, too obscure to be of much service; and the recipe appears to lack some important feature. But he presses on insatiably, for the reward of success will make him the master of mankind.

But one day, pacing to and fro upon the hilltop as was his wont (and it was Hawthorne's habit also, when meditating his work) he comes upon a young woman seated beside the grave, and tending a singular flower that has sprung up there. She is mysterious; seems to have come from England, to have been acquainted with the officer, and to possess some knowledge of Septimius himself, and of his present pursuit of the great secret. And she intimates that the flower which she is tending, which has grown from the body of death, is an essential ingredient of his elixir; and that she can assist him in the distillation. Septimius suspects that the girl is partly deranged, but she

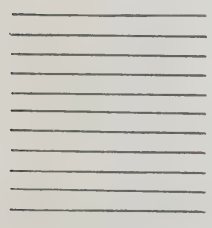
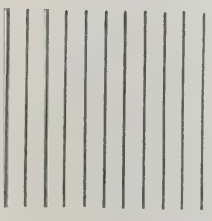
# I Saw It *With My Own Eyes*

## Illustrating That Things Are Not Always What They Seem



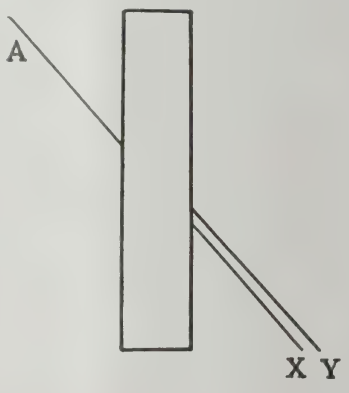
By DONALD A. LAIRD

WHEN one wants to let others know that there is no doubt about certain happenings he says, 'I saw it with my own eyes.' When a man who has spent his entire life in scientific study of vision writes a book he starts it with three cryptic words: 'Seeing is deceiving!'



My first introduction to these deceptions of our eyes was when I attended my first county fair. One side show had the head of the Sphinx on exhibition and I watched this bodiless head intently to try to comprehend how it could exist without a body or how my eyes could be tricked so that the head looked as if it had no body.

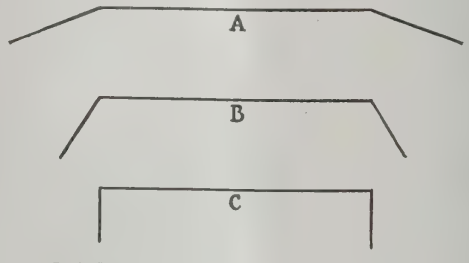
But that is getting a little ahead of the story.



Each of our friends appears to be taller than he really is. This is due to a common illusion which makes vertical lines and distances seem longer than they actually are. This exaggeration may even amount to as much as twenty-five per cent when circumstances are suited to the illusion.

When a tree is being felled, observers always keep a safe distance from the place they think it will strike. After it is on the ground they are astonished to find that the tree is not nearly so tall as it had looked when it was standing.

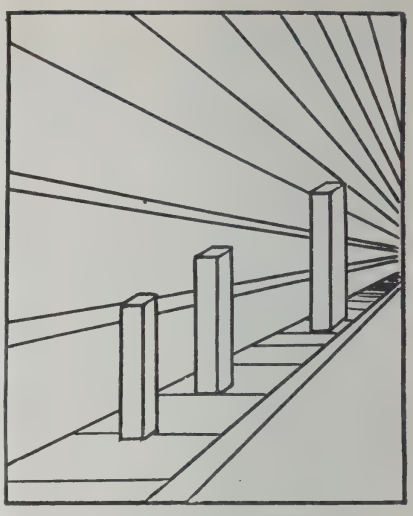
*Left—Which is the taller? Which the wider? Measure the designs to check up your eyes.*



*Is X or Y the continuation of line A? Check your decision with a ruler or the edge of an envelope.*

The average house also appears to be higher than it is in actual feet and inches. Some amateur architects are not familiar with this fact and in copying a house they have seen with pleasing proportions are taken aback to find that their completed house does not have the same balance, since they have taken the height as it looked and not as it was.

These deceptions of seeing justify the great expense to which some people go in building an elaborate model of the proposed house. Often the numerous illusions cannot be discovered until the house is built. These expensive models, however, make it possible to detect some of the distortions that will occur in the house unless corrections are made. A serviceable model can frequently be made from cardboard in kindergarten fashion, using a scale of a quarter-inch for each foot of dimensions of the planned house.

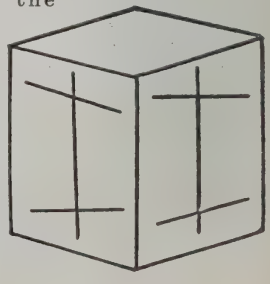


Painting also alters appearances, a red object seeming larger than the same object in blue. Several duplicate cardboard models can be constructed and painted different colors until the best combination is discovered.

*Is A, B or C the longest line? After deciding, make sure about your guess.*

Not only does the length and size of objects deceive the human eye, but the direction of lines is altered, straight lines are made to appear curved, and curved lines made straight. These illusions, which were known to the Greeks when they built their temples, were used during the war to camouflage ships.

Woodwork which has been given a light finish reveals many deceptive appearances on account of the grain of the wood. Door frames of varnished pine, for instance, may appear out of square because of the illusions due to their grain being distinctly visible. This explains why the vogue of lightly varnished, 'grainy' picture frames a few years ago was so short-lived.



*Which pillar is the tallest?*

In the Parthenon at Athens the designers ingeniously overcame many illusions centuries ago. The beam which is on top of the columns, for instance, would appear to sag if it were actually straight. The base upon which the row of columns is mounted would also be deceptive if it were actually straight. So the Greeks built these with a curvature of as much as four inches to overcome these deceptions.

Have you ever looked at a tall building or column and noticed that it seems to be leaning outward? This is because the architect did not correct for this illusion as the Greeks did. The columns of the Parthenon, for instance, are inclined inward almost three inches to overcome this illusion.

Until recent years skyscrapers from two sides of the street appeared to be toppling over onto the pavement. The new type of architecture being used for skyscrapers overcomes this deception of the eye. The upper stories recede to allow light to pass into the canyon of the street.

**Right—**
*Are there any right angles in the figures on the sides of this cube? Even keen eyes may say no, but a calling card with square edges will prove otherwise.*

# *Is the Football Coach* Overpaid?

## *Well,* Look at the Work He Does!

*By* PAUL MACDONALD

*Drawings by* W. O. FITZGERALD

*The good old alumni tell him that if he cannot develop a winning eleven then they will look around for another coach.*

OUTSIDE of motion picture actors, no group of men is publicly credited with drawing more money in comparison to what they actually receive in salaries than the coaches of college football teams.

Speaking in high figures is an American trait. It is more than that. It is a national passion. We have a love for big money.

It was some years ago that a college professor wanted to know why the fellows who taught students how to maul each other on the gridiron received more money than the men who taught the students to be good citizens. What he could not understand was why a football coach received several times as much money for a few months of coaching as a professor received for a year of teaching.

The professor's question has been reiterated many times since, and with the continued repetition of the query the salaries of the football coaches grow in public conception. Since there is so much ado about the matter they must be stupendous and as a consequence the coaches are, in popular imagination at least, the most highly paid individuals in the teaching profession. You often hear people say, 'Salaries of $25,000 a year are common and some football coaches get much more than that.'

*The actual work of coaching the football team does not occupy more than four months, but during the remainder of the year the coach is not idle.*

These reports, however, are sadly at variance with the facts. There is a wide chasm between what the coaches are reported to be getting and what they actually are getting. There are not five coaches in the United States being paid as much as $10,000 a year. There is not a coach in the Middle West drawing within $1,000 of that amount.

Much of the antagonism toward football has resulted from the fabulous sums mentioned as salaries of coaches. Jealousy is one of the passions of the races. The professor is jealous of the football coach because he believes the coach is being paid far more in proportion to the amount of work he does than is being paid the professor. The layman becomes jealous for the same reason. When he hears that a football coach is paid more money, for what he believes is three months of work, than the layman can earn in several years of hard labor, then he naturally resents it. It is not unusual that he should. He decides that football might just as well be eliminated. As a matter of fact the college football coach is being underpaid. It is true that the actual work of coaching the football team does not occupy more than four months of time but during the other eight months the coach is by no means idle.

A football coach is kept busy between seasons. He has to design new plays for the next campaign. You will ask, probably, 'Why won't the old ones do?' They will not do. Plays are built for teams, since it is impossible to build teams for plays. The plays are so designed that they take advantage of the individual talents of the players and since no two teams are exactly alike as to individual talent and since no coach has the same lineup two years in succession, it is necessary constantly to change the repertory of plays. Also, after one style of play has been used through a single season the coach knows that all opposing coaches are working out defenses for that style and it will be impossible to repeat the success the plays enjoyed during the first year they were used. He has to work up a new scheme of offense. That requires time.

Then the coach has to do considerable coaching between seasons. Coaching in none of our major universities and colleges is confined to three or four months. Preparation for the next season (*Concluded on page 22*)

*During the football season the coach works day and night and gets little sleep.*

## Lady Cynthia Asquith Gives Caustic Comment on

# *The Writing of* Indiscreet Memoirs

CAN nothing be done to stem the flow of memoirs which threatens to swamp all privacy and decency? A terrible scourge to society, this selling by the 'new poor' of autobiographies, breaking, as they do, the unwritten laws of personal relationships by the violation of sanctuaries and the ruthless exposure of intimacies!

For the most part these memoirs are written by the intrinsically insignificant. They are incapable of producing literature: and no one will pay to read their reflections or the chronicles of their little lives. Therefore, to produce a 'best-seller' they must mainly rely on a lifelong picking of other people's brains.

They are pirates who fly no Jolly Roger. Disguised as ordinary laity, admitted to the privileges of normal human relationships, they are all the while gathering copy for the discharge of indiscretions and spiritual indelicacies. Conversation and letters from the eminent are so much

ammunition to their shameless artillery.

The Romans had a custom of hanging a rose above the table around which were met the guests. This signified that, under pain of ostracism, nothing which fell from the lips of the assembled was on any account to be repeated. Hence the expression *sub rosa*.

Some such measure will have to be adopted in our midst, and detectives employed to see that it is carried out. Otherwise it will only be safe to dine with the deaf and dumb. Equally we shall have to take to writing in vanishing ink! What man of any eminence will dare to put in a letter anything he would prefer to keep out of the newspapers?

The essence of letter writing is that it should be from one particular person to another particular person. But now any phrase he writes is liable, in the fullness of time, misleadingly to be taken out of its context and to blaze on every poster in America, much to the pecuniary advantage of his sometime correspondent.

It can be urged that protection is afforded by the law. A letter is the property of the writer and cannot be published without his permission. True; but is it fair to place a good-natured 'lion' in the position of having to refuse his consent to a friend who comes with a pathetic tale of overdraft and children to educate?

It seems churlish to withhold material that will so wonderfully assist the sale of her book, and that is, after all, so 'harmless.' He says 'publish with discretion,' and then learns for the first time how easy it apparently is to write 'love letters' without knowing!

Wonderful how easy by a little skilful elimination to alter a palpably playful letter into a ridiculously serious one. Few letters, be they written by the famous, that are not eligible to being advertised as 'love letters.' Such has recently been the lot of several distinguished men of letters.

It is almost a form of blackmail. We are told that Harriet Western (author of the most entertaining memoirs) got more money for the things she did not publish than for the things she did. A franker method: to say, 'Give me £1,000 and I will not publish your letters,' than the one adopted by the ostensibly refined: 'Let me publish your letters or you will lose me £1,000.'

In these books, which flood the market, letters are published like so many testimonials to a patent medicine. All is fish to the net of vanity! Conversations, giving away one friend's opinion of another, are shamelessly reported, and so forth.

Everything which keeps society decent is threatened. Where there is no legal protection, should not social ostracism be called in, as it is in cheating at cards?

Categories are apt to be misleading, but surely one real division may be drawn between such women as will publish love letters, and those who would starve rather than do so.

# MR. FORD'S PAGE

TO ALLOW one's interest in an untried method to obscure one's interest in the end to be achieved is to invite disappointment. But as disappointment is an element in experience, we may think of it as something that must come to pass. Most of the situations which we try to deal with singly are but stages in a larger situation, and when this becomes clear to us our perspective becomes more true.

The reference here is to the matter discussed last week, namely, the possibility of certain kinds of pacifist propaganda being of use to the war-makers. Idolatry of method may be but a stage through which our peace-loving people are passing. And if they are really passing through it, and not regarding it as a permanent position, it may be counted for progress. However, it possesses its points of danger, unless there is time for the natural evolution of our experience to be fulfilled before the danger arrives.

There are signs that our people are already learning that method, except after many experiments and long testing, is not capable of producing all that we seek. In national politics we have changed one method for another upon the promise that the new method would produce a new spirit, or at least render some of the old abuses impossible. We have exchanged the convention method for the primary method of selecting candidates, but doubt is still expressed as to whether it has prevented the abuses which we were aiming at. To some degree we have substituted municipal ownership for private ownership on a perfectly correct theory that works well on paper, but it is a question whether public service has improved, if indeed it has not become less satisfactory. In brief, we have made enough experiments in change of method to indicate that the trouble is not in the methods but in the men who use them. Certainly we have learned enough to know that the cure is not in the method.

Now, as to the matter of peace, it is agreed in a few—a very few—countries, that war is undesirable from every point of view and that peace is the normal condition of anything pretending to be a civilization. Killing men is the most futile of human acts. Anything else that occurs to a man may be charged up to the experience it gives him, but killing him is the end of experience as we know it.

But the world being what it is and a fact not to be disposed of, it becomes necessary for us to examine the foundations upon which we rest our hope for peace. Some of us think now, and events will presently bring us all to think, that the pacifist endeavors which are most advertised to bring us peace will not only fail to do so but will make the likelihood of war much greater. If there are serious, informed and responsible minds which have arrived at that conclusion, it is in itself a sufficient reason for those who are propagating these methods as the sure bringers of peace, to examine the matter again.

*AS FAR as the vote of civilization goes it is for peace. What nullifies that vote? It is not the munition men or the Government, or the pressure of industrial necessity or population. Rulers and statesmen and political parties are not the sources of war but the victims of a power still beyond them. We had no munition works to speak of in this country, nor a belligerent government, nor economic pressure, yet we went to war. War came from a source that the utmost research failed to find. This source must be localized and attacked and flushed into the open. Till then peace is not possible.*

As far as the vote of civilization goes, it is already won for peace. Now what is it that can and repeatedly does nullify that vote? Some say it is the munition men. Wrong. They are the hangers-on of something else. Some say that it is the Government. Wrong. Governments are as helpless as individuals once the avalanche begins to move. Some say it is the pressure of industrial necessity or population. Wrong. Population never has pressed upon the accommodations of the earth, and industry is perhaps our greatest tangible source of peace. Some say there would be no war if people were given the vote in declaring war. But we have seen in our own times people who would have voted for war time and again—often upon false information. All of these minor things which present propaganda deals with do not touch the question at all. We had no munition works to speak of in this country. Yet we went to war. Our Government held out to the verge of cravenness, yet in the end we went to war. We had no industrial necessity, no pressure of population, yet we went to war. War came from a source that the utmost researches of the wise, in countless books and reports, have failed to find. They have hunted down this emperor and that statesman and that party, in search of the source. The main result of their labors has been to implicate all the rulers and all the statesmen and all the parties. And these, not as sources, but as victims of a power still beyond them.

As long as men's minds are diverted from the thing that really counts, there is less danger of them indicting the source of war. For war has a very definite source that can be localized and attacked. And once the cause is flushed into the open, it will be no holiday affair. Our pacifists then will need to become warriors of peace.

## *A Token of Friendship*

AMAZEMENT at the news that American warships were fired on a thousand miles up the Yangtse River in China is exceeded only by wonder at what they were doing there. Hankow on the Yangtse would correspond roughly to Minneapolis on the Mississippi. What brings American men-o'-war so far inland in a nation with which we are at peace? By what right are they there?

From official quarters comes an explanation that somehow fails to explain. 'Chinese treaties with Japan and Great Britain,' the State Department declares, 'open the Yangtse and other river arteries of commerce to the vessels of those nations, and under the most favored nation clause in the original American-Chinese treaty these river routes automatically become equally open to American ships.' Quite so. But what about *warships?* The Treaty of 1903 quite specifically mentions 'vessels . . . for the conveyance of passengers and lawful merchandise.' Can this be construed to mean vessels of war?

America has occupied a unique position as regards China. Most of the treaties concluded between China and the great powers of Europe in recent years have been farcical; they form part of the spoils wrested from Cathay while that great country lies prone and defenseless. But in the midst of the spoliation America has stood out as a beacon to the Chinese. They have regarded this nation as their constant friend. They have felt sure that we would not share in the grab-bag diplomacy of Europe. The Boxer scholarships created a tremendous sentiment in our favor, strengthened through the years by similar acts which have demonstrated our interest in China's welfare. Our friendship has been taken for granted. But now, suddenly, our policy seems changed. We have become the tail to Europe's kite. Our friendship is enforced by our warships—one thousand miles inside of China's territory!

## *The Thinning Line*

THE Grand Army of the Republic is going to carry on. It will not disband until there are no more men to march! And in that news lies the secret of the spirit of America. There had been talk of ending the organization. The thinning ranks could not hold out much longer; that was the rumor. Better to disband before death made its final inroads. But the grand old men of America don't know the meaning of the word surrender. Back in '63 there had been similar rumors: the thinning ranks could not hold out then; they must give way before the onslaughts of the Gray. But they did hold, and the Union was preserved. And for the threescore years since Appomatox they have been holding out—holding out for the preservation of American traditions and American patriotism.

For almost half a century there was no more potent force in the life of the nation than the Grand Army of the Republic. It stood, a bulwark against lawlessness, against subversive alien influence. The bitterness of the war years gone, it joined with the veterans of the Confederacy in promulgating ideals which had become common to both. Now that work has been largely taken over by another great organization, the American Legion. The end of the trail is nearing. But the Grand Army is not to disband. It will carry on—to the last man!

## *Disarmament by the Purse*

THE pocketbook has done what conferences fail to do. Slowly, but surely, armies are diminishing, not so much because of high national ideals as of exhaustion. France has 300,000 less in her armies than she had in 1913. And the French chamber is considering the reduction of military service to one year, which would make for a further drop in the number of her armed men. Belgium has dropped from 118,969, in 1922, to 81,720 last year. Spain's army fell from 215,949 to 123,-851. Sweden has 35,912 men under arms as against 120,000 in 1922. Norway has reduced her quota of 60,000 to 4,405. By treaty Germany is fixed at 100,000; Austria at 30,000; Hungary at 35,000; Bulgaria at 33,000.

Call it an economic phenomenon if you choose. The end is the thing, and that is satisfactory to peace lovers. And with the reduction of armed forces there must come new interests, new efforts, new ideals. There must also be a diminuendo of national jealousies. As nations cease to glare at each other in hate, so light and order will come into international affairs. Trade, the great pacifier, will operate to good effect. The welfare of mankind will cease to be a mere phrase and parrot prattle. For nations, like individuals, like one another better as they become better acquainted.

## *A Senator Speaks*

WHEN it comes to the matter of disturbing the delicate balance of international relationships, it must be confessed in all fairness that the bouncing blunderbuses on this side of the Atlantic contribute fully as much as those on the other. Righteous indignation seethed in these United States a few weeks ago when Senator Caraway, returned from Europe, issued a statement in which he declared:

> There are 30,000 Americans buried in French cemeteries, and so intense has French dislike of the United States become that they do not even hesitate to insult the dead men who gave their lives for France in the Great War. Go into these cemeteries and you will find ribald and insulting remarks chalked or penciled on many of the little white crosses that mark the graves of some American soldiers, as, for instance, 'To hell with America!' To this almost unbelievable extent has France's hate of this country grown.

It was not until several days after this brilliant declaration had been flashed around the world that Senator Caraway issued a second. In the meantime his charges had been denied by French officials, by the Paris American Legion, by American army officers, and by the Americans whose duty it is to guard the graves overseas. In the second statement Mr. Caraway said that his remarks had not been based upon personal observation; *that he had not, in fact, taken the trouble while in Europe to visit the final resting place of America's wartime dead.*

The damage, however, had been done. Thousands of Americans read the first statement who will never read the second. And in France the ridiculous charges are passing from mouth to mouth as further evidence of America's unfairness. In unsettled times such as these, with the troublesome debt problem agitating the world, it is a pity that irresponsible statements should be made by persons in supposedly high positions. France's much discussed dislike for America will be thoroughly justified if there are many more such incidents.

## *High Finance*

CONSIDER Wall Street. Much hostile feeling is directed against the American people and the American Government by Europe because of her financial difficulties. But how many of these difficulties can be laid at the door of the American people, and how many at the door of the international bankers, typified by Wall Street? Europeans—and in fact some Americans—fail to distinguish between the two. They hate America because of the avariciousness of Wall Street.

Switzerland is a case in point. The Swiss franc is quoted far above parity, and so easy is the monetary situation in that country, that its native bankers are loaning their government funds at five per cent. It hurts Swiss pride to witness the fact that their government, which can obtain such favorable terms from its own bankers, must still continue paying eight per cent on $20,000,000 of bonds bought by a Wall Street syndicate six years ago, during a period of Swiss financial stringency. Belgium and France are also paying as high as eight per cent for their Wall Street loans, as is Poland. While these countries at least are still suffering from depreciated currencies, the exaction of seven to eight per cent interest on loans to responsible governments which dare not repudiate their guaranties is regarded as severe while Japan and Mexico are enjoying rates as low as four per cent; and even distressed China is expected to pay Wall Street only five per cent on her railway loans. But the secret of Wall Street success is to make 'advantageous terms' with its borrowers during a period when they are in distress. That's high finance.

## *Fun in the Killing*

THERE are fine points to the sportsmanship of killing which the lay mind finds hard to grasp. Take, for instance, the matter of stag hunting. John Galsworthy and Eden Philpotts, ardent humanitarians as well as eminent men of letters, are roundly denouncing this ancient sport in England, greatly to the disgust of the old-style sportsman. They fail to find pleasure in the terror of the spent stag, or the death agonies of Reynard, the fox. Such unsophistication as this cannot, of course, be allowed to pass unnoticed by followers of the sport. Their retort is fittingly condensed into a single sentence by one newspaper. 'If a man believes that it is perfectly proper that animals shall be killed to provide him with dinner dainties,' it asks, 'how can he complain when some other man contrives to get some fun out of the killing?' This may not be very sound logic, but it is at least illuminating argument. Many of us have wondered in the past just how to distinguish between the sportsman and the butcher. Here at last is the answer. If you get fun out of the killing, you're a sportsman; if not, you're a butcher!

# *The* Luster Ware *of* Long Ago

## A Pottery That Was Loved by Our Ancestors

*By* MARY HARROD NORTHEND

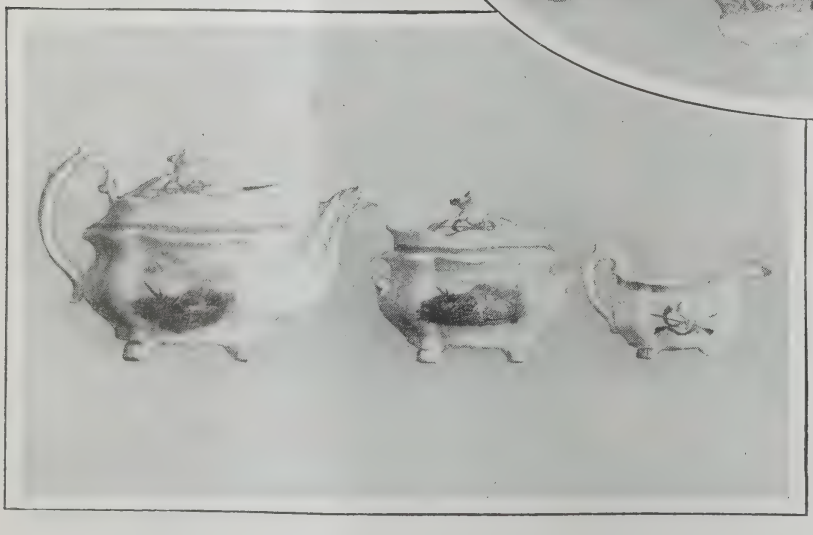
IT STOOD on the dining room mantel—a little cream-jug of copper luster, about four inches tall. It had a confident, not to say pert air, and a green flowered sash encircled its plump middle. My hostess lifted and turned it with her delicate old fingers that I might catch the sparkle and the deep glow in the lovely ware.

'Long ago, when I was about five, my grandmother gave this to me. It was a hot Sunday afternoon, and I was very restless. Presently grandmother said, "If Tillie will sit still just a little longer she shall have something beautiful." Very soon she left the room to return with this pitcher. As she put it into my hand, she sighed, "I suppose you will break it, but it will be nice if Tillie could keep this to remember grandmother by." ' My old friend smiled as she added, 'You see, I did.'

This sweet memory was forever bound to the little copper keepsake; it always brought into the faded blue eyes a tender light.

The luster of long ago, the pottery that catches the first favoring attention of a child yet holds a high place with a connoisseur—where is it to be found? On the shelves of museums, in the locked cabinets of antique dealers, on the top shelves of china closets in private homes. If a pink luster tea set is used today for a social gathering, it is no less a person than the owner herself who washes each precious piece and restores it to safety.

Don't dare to breath as you examine this fluted silver Queen Anne teapot. Its shape and gloss are exquisite. The spout is nicked but even then it has a value of twenty-five dollars. A little pitcher like Tillie's brings eight or ten dollars at auction.



Although much of the precious luster is under lock and key, finds do occur even in these latter days. My friend Rita has been settling the estate of her mother-in-law. 'See,' she said, holding out a small luster flowerpot, 'I found this in a pile of flowerpots under the cellar stairs.

'I was going to throw the whole lot away when something made me look through them. This little pot looked promising. It was nearly full of tar, and so grimy and sticky. I scrubbed and scrubbed and now—you see!'

The salvaged article, radiant with its copper sheen, its lovely pale blue band, and glowing pink roses, stood on the inlaid Hepplewhite card table in her drawing-room, and drew all eyes with its dancing light. 'What if you had lost it!' I breathed. 'The gem! It lights the room as a ruby ring lights a hand.'

Luster ware was first produced in far-away Persia. In the 14th Century, Spaniards, taught by the Moors, made golden-red and pale yellow luster dishes, which were decorated with Saracenic designs. Later still, the Italians made their wonderful majolica 'with copper, purple, and amber surfaces glowing like beaten metal.' The center of this Italian art was at Gubbio, the little place which Josephine Preston Peabody chose as the scene of her beautiful play, *The Wolf of Gubbio.* Among the characters is a potter who, with others, brings his gift to the peasant woman, who typifies the Madonna in the miracle play. The potter says, as he humbly offers his bowl:

> Madonna, 'tis a little bowl;
> Yet masterly made, and whole,
> Look you, and it is lipped both ways;—
> One side for hunger; one for praise.
>
> Good measure it will hold!
> I would not have it scrawled and scrolled.
>
> Burnished and bright and fountain clear,
> My ruddy glaze!

**Oval—*Pink luster.* Left—*Rare variety of luster.***

Luster ware was made in England in the last quarter of the 18th Century and was a common sight in homes and taverns in both England and America. Its use was widespread: communion goblets were made of silver luster; children's toys were made of copper luster.

No less a person than George Washington himself used a copper luster mug for shaving. Seventy-five years was, roughly speaking, the span that marked the popularity of luster. It was made in nearly every pottery in

England and, of course, very largely in Staffordshire. Even the great Wedgwood at one time turned his magic craft in that direction. Today modern luster ware is being made.

Luster may be roughly divided into three classes, according to the metals employed in decoration. They are silver, copper, and gold. The metal is reduced chemically to a form in which it may be deposited in an exceedingly thin coating upon the surface of the pottery. A second glazing adds to the depths and beauty of the tones, thus securing the characteristic luster of the metal without burnishing.

Silver luster was made for those who could not afford silver tea services —for the wives of the farmers and even of the cottagers. The silver or the Sheffield plate of the Georgian period was very carefully copied; it is even claimed that the same moulds were used as were used in making the genuine silver or plate. The metal employed, however, was not silver but platinum, a substance which was discovered in 1741. The early pieces were silvered throughout; later, the insides of the pitchers, teapots, and bowls were not silvered. The lining was dark but not lustrous. Later still a creamy white body was used instead of the brown body.

A few years ago three ardent 'antiquers' were visiting the historical rooms in Hingham, Massachusetts. In a corner cabinet, on a level with the eye, stood a Queen Anne teapot. The sunshine, caressing its perfect contours, gave the effect of moonlight on water. 'How lovely!' sighed one of my friends. 'That must be a Paul Revere piece.' I stood on tiptoe and just caught a white gleam within the teapot. 'It's luster, isn't it?' I appealed to the custodian who nodded at my incredulous friends. The result of the potter's art would deceive the very elect. As a matter of fact, the highly burnished surface of such a teapot has a richer, deeper tone than even silver presents.

*Gold luster jug.*

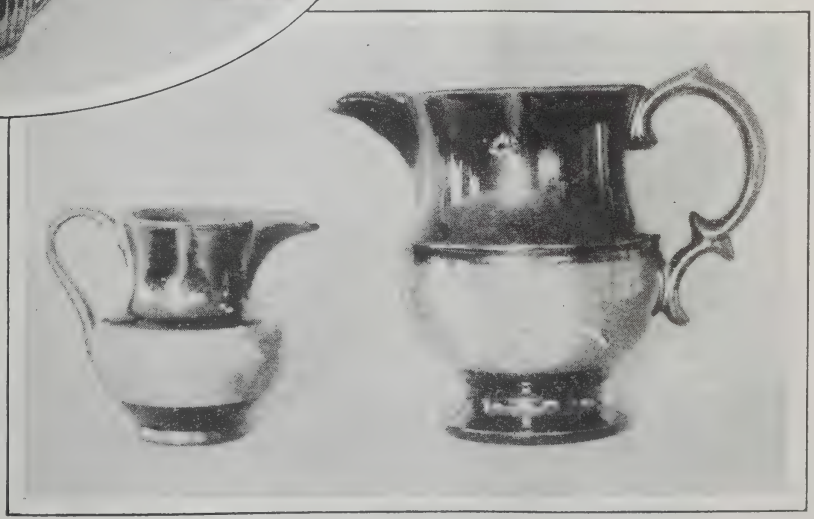
Silver resist is a very attractive form of silver luster. A pattern is sketched upon the pottery with chemicals that resist the action of the platinum that is later applied to coat the object with silver luster. The effect is lovely indeed. The pattern is revealed in white, cream, blue, or canary against the silvery background. Pitchers, cups and saucers, in fact all articles in silver resist are very choice and are eagerly sought.

The date of silver resist has been difficult to determine; it is now thought that this process was contemporaneous with the process of making the plain ware.

In 1838 electroplating was introduced and silver luster declined in popularity. Soon after 1850 it was no longer made.

It has been claimed that Wedgwood made the first silver and copper luster in 1776, first year of our national life.

The first idea was to use the new process solely for the decoration of picture frames, but its possibilities immediately waxed amazingly, and, as a result, beautiful table articles were made. Sometimes a very little gold was added to the copper.

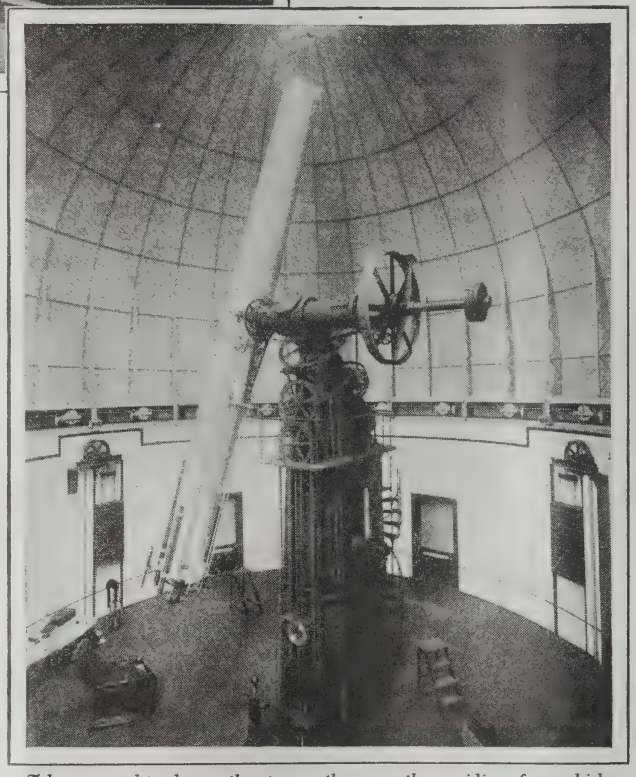


Copper luster may be separated into two groups: the plain copper luster, where the object is entirely covered with copper; and the copper luster in combination with color, either plain or applied to reliefs.

A very choice historic piece of copper luster, marked for its noble simplicity, is the Cornwallis jug. On one side is the picture of Cornwallis' surrender at Yorktown with the caption: 'Cornwallis resigning his sword at Yorktown, October 17, 1781.' On the reverse side is a portrait of Lafayette being crowned with laurel by two nymphs. The jug is a piece of fine workmanship.

Gold or purple luster is exceedingly lovely. One way to determine it is that the article in question shines with a brilliant gold in some lights and with a purple ruby in others. This ruby purple often shows as a rose-pink. Purple, gold, and pink merge into each other so perfectly that the lines are very difficult to draw between them. They all are the result of a skillful mixture of gold with other substances.

The mottled or spotted pink ware, known as Sunderland, is a variation of gold luster. Wedgwood made wonderful candlesticks, dishes of basket-work, and fruit plates (*Concluded on page 21*)



**Oval—*Silver luster*. Right—*Gold luster*.**

# *Keeping the Country in* Correct Time

## The Work of Washington Naval Observatory

By S. R. WINTERS

*Telescope used to observe the stars as they cross the meridian, from which is derived the basis of our correct time. Upper left—Main building of the Naval Observatory, showing meridian transit room at west end and twenty-six foot dome provided with telescope having twelve-inch object glass.*

THAT fleeting, hypothetical thing we call Time, like the weather, is such a commonplace subject of discussion that few contemplate the origin and the method of computing accurately the seconds, minutes, hours and days. 'Have you the correct time?' 'Do you keep standard time?' 'Is your watch set by Western Union time?'—such questions are frequently asked. These inquiries, however, do not suggest the basis for determining the progress of Father Time.

This planet we call earth travels approximately 600,000,000 miles a year in its journey around the sun. We are speeding through space at a rate of sixteen and two-thirds miles a second. Night and day are the results of the revolution of the earth. Time, therefore, is calculated by noting the position of the earth in its relation to the stars. That is to say, astronomers, by means of the telescope, reckon time by the observations of certain stars as they cross the meridian. In effect, the miner toiling underground and the 20th Century Limited, operating on a fast schedule, are both timed by the observations of star-gazers.

However, the millions of citizens of the United States who daily set their watches and clocks by time signals broadcast by radio and transmitted by telegraph wires should not arrive at the conclusion that accurate time-keeping is nothing more than a star-gazing achievement. Intricate mechanism is involved, and the service is world-wide in scope. A ship traveling the high seas, although she may be 4,000 miles from Washington, can receive time signals twice daily. In fact, these dots and dashes, indicating noon-time and ten o'clock at night, may be heard halfway around the world.

Situated on a commanding hill, at 34th Street and Massachusetts Avenue, Northwest, Washington, D. C., is the Naval Observatory, where time is a subject of scientific treatment. A white dome, rearing itself upward, identifies the observatory to the visitor.

Here, on this elevated point, removed from obstructions that would mar the view, time is reckoned by the observations of certain stars as they cross the meridian. Three master clocks, mounted on a concrete pier to avoid vibrations, are kept in an underground vault. These timepieces have pendulums of invar, a metal which does not expand or contract. The clocks, sealed in a glass case from which air has been partially displaced, are maintained in subterranean quarters as a means of insuring their operation at a constant temperature within one-tenth of a degree Fahrenheit. Absence of fluctuations of heat and cold is essential to a constant rate of ticking off the seconds, minutes, and hours.

Sidereal time—meaning observations made by the apparent motion of the stars—is carried by these underground timepieces. Faithful records are preserved of these timepieces—their errors and daily rates of movements being accurately known. No attempt is made to have them carry absolutely correct time, which is impossible. Their errors and rates, however, are known. These are applicable to the clock readings by addition or subtraction of their plus or minus errors. A year consists of 365¼ solar or sun days or 366¼ sidereal or star days. Thus a sidereal day is shorter than a solar day—a difference of three minutes and fifty-seven seconds, to be exact.

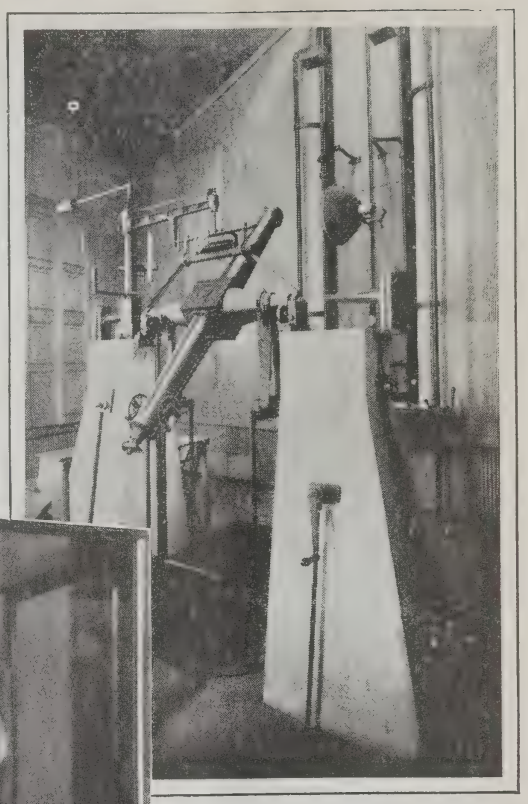
At the Vernal Equinox, occurring about March 21 during each year, the sidereal and solar times coincide. Then, the correct local sidereal time at the Naval Observatory having been determined, the corresponding local mean time is readily obtained. To this is applied the difference in longitude—eight minutes and 15.17 seconds—between the Naval Observatory and the 75th meridian, giving Eastern Standard or 75th meridian mean time.

As is well known, there are four time zones in the United States, their allocations being with respect to geographical divisions. The eastern zone is allotted the time of the 75th meridian, the central zone the 90th meridian, the Rocky Mountain zone the 105th meridian, and the Pacific zone the 120th meridian.

Daily time signals are sent from the Naval Observatory at twelve o'clock noon and at ten o'clock at night, 75th meridian time, by the radio-telegraph stations at Annapolis, Maryland; Arlington, Virginia; and Key West, Florida. These signals are sent out also by the Western Union and Postal Telegraph Companies to all parts of the United States. The Naval Observatory takes care of all territory east of the Rocky Mountains and the Chronometer and Time Office, at Mare Island, California, cares for ships and territory from the Rocky Mountains to the westward.

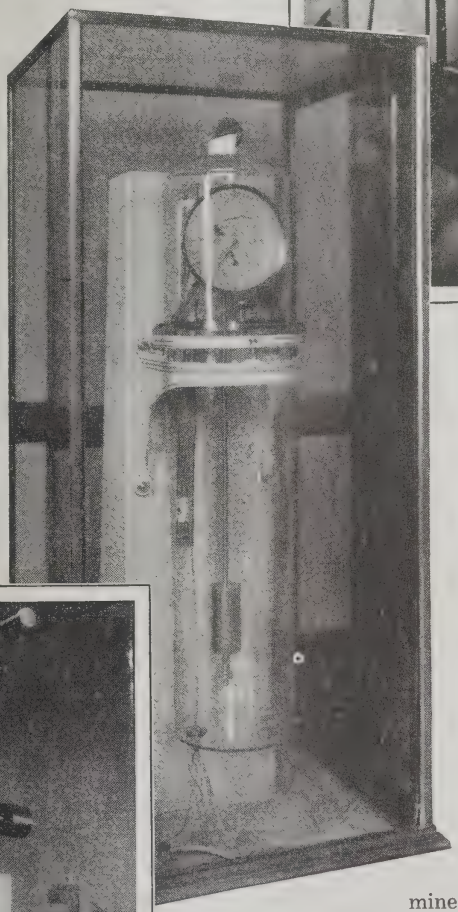
The radio stations at Key West and Arlington, in the transmission of time signals, are controlled by the Naval Observatory at Washington; hence the frequently confusing reference 'Arlington Time Signals.' More recently, with the amazing growth of radio broadcasting, the service of dispersing time signals has been enlarged considerably. Many broadcasting stations transmit these signals each night.

Eastern Standard or 75th meridian mean time is kept by the Naval Observatory on two transmitting clocks located on the first floor of this Navy Department institution. These two timepieces are paired, so in the event of one being put out of commission there need be no disruption of the service. Actually, only one of these clocks at a time is employed in transmitting time signals, the transmission being effected through the operation of a relay. The ticks of this clock are broadcast by both radio-telegraph and Morse-telegraph systems from 11:55 a. m. to noon and from 9:55 p. m. to 10 p. m. daily.



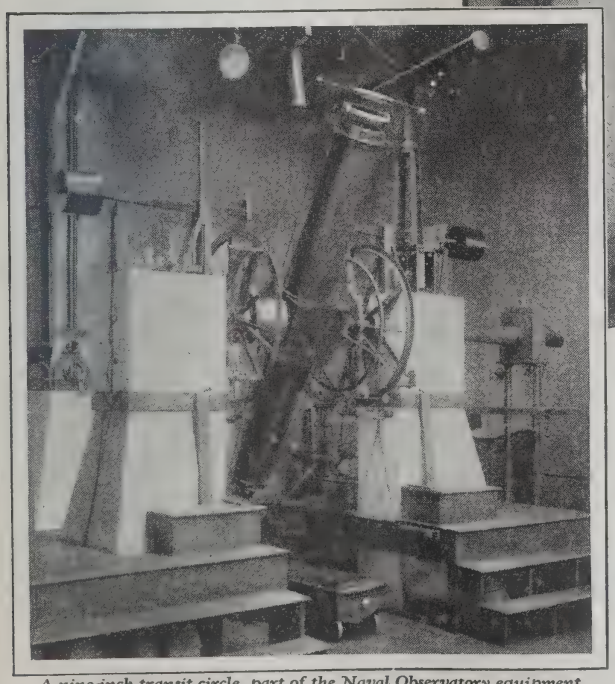
A chronograph—an instrument for measuring and recording time—in the Naval Observatory records the signals dispatched by the transmitting clock and also notes the ticking of one of the standard master clocks in the underground vault.

This serves as a comparison in the interest of accuracy. By automatic electrical connections with Annapolis, Arlington, and Key West, the daily time signals are transmitted from the Naval Observatory to these radio stations. Also, as previously stated, the Western Union and Postal Telegraph Companies receive the signals for distribution to all parts of the United States.



Simultaneously, with the broadcasting of the time signals from Annapolis, Arlington, and Key West, the chronograph in the Naval Observatory is functioning and to this instrument may be assigned the task of receiving the outgoing signals and recording the periods of departure of the latter from the radio-telegraph transmitting instruments. This information may be recorded on the same sheet of paper with the data relating to the behavior of the clocks in the Naval Observatory.

Not only are comparative records of the actions of the clocks maintained, but the lag in the relay between the Naval Observatory and the radio transmitters at Annapolis, Arlington, and Key West is determined. For instance, there is a small lag of 0.01 of a second between Arlington and the observation at the Naval Observatory, and a lag of 0.28 of a second in relaying the signals to Key West.



In advance of the beginning of the transmission of the time signals from the Naval Observatory, the operator measures with a finely-divided metal scale the variation between the ticks of the standard master clock, in the underground vault, and the ticks of the transmitting timepiece on the first floor of the Naval Observatory. Having previously determined the correc- (Concluded on page 22)

## When Heroes Retreated Before Arctic Terrors

# *The* Tragic Story *of the* JEANNETTE EXPEDITION

*By* BURT M. McCONNELL

THE most stupendous as well as discouraging task ever undertaken by an Arctic explorer was Captain George W. De Long's retreat, with his shipwrecked crew, over the jagged ice fields of the Arctic Ocean to the Siberian mainland, a distance of five hundred miles. In all the literature of polar exploration and adventure, there is little to compare with the suffering and endurance set forth in the diary of this heroic young naval captain. There is no parallel for this arduous venture in history.

The shipwreck and retreat of the *Karluk* survivors, a distance of a hundred miles, occurred in midwinter, when ice travel is at its best. The march of the Franklin followers, after their two vessels had been crushed and sunk by the ice, was mostly overland or along sheltered coasts. But De Long suddenly found himself, with seven officers and twenty-five men, marooned on the ice one summer morning in 1881, when his vessel, the *Jeannette,* after withstanding the incalculable pressure of the ice fields for twenty-one months, slowly sank beneath the surrounding ice and snow.

This was the worst possible season of the year for ice travel. The surface of the floes was honeycombed by the melting ice, and the numerous holes and cracks were filled with water. Two of the men were unable to travel and had to be dragged on sledges. Two others were on the sick list, and several others were in poor physical condition. For every mile covered, the entire party traveled six or eight miles, working in relays and making a number of trips over the same course in bringing up the boats and supplies. The dogs were not strong enough to pull the heavy boats and sledges over the rough ice. The runners and crosspieces were continually breaking, which necessitated the unloading of the vehicle and a delay while repairs were made. The progress of the party, therefore, was never more than three miles a day, although they worked like horses twelve hours out of twenty-four.

After traveling southward from the scene of the shipwreck for a week, Captain De Long ascertained from an observation that the party was twenty-eight miles farther *north* than when they had started—*in the opposite direction!* The drift of the ice to the northwestward had been more than they

could overcome. When they had covered but one-seventh of the distance to their goal, the Lena River Delta, on the Arctic coast of Siberia, they found that they had exhausted half of their food supply. And when they finally reached open water, and the thirty-three explorers were divided into three parties, one for each boat, the De Long group of fourteen, after reaching shore, were tricked by fate. Twelve of the fourteen perished miserably in the labyrinthine delta of the Lena River. The third party, containing an officer and eight men, was never heard from. The other group of ten reached shore, and months later discovered the frozen bodies of De Long and his followers partly covered with snow.

Such was the disastrous ending of

*George W. De Long, and outline of the region traversed by his expedition.*

De Long's attempt to reach the North Pole by drifting with the ice to the eastward of Wrangell Island. But the attempt was not a complete failure, for he discovered two islands north of Siberia, and established the drift of a great current across the polar sea and out into the Atlantic by way of Spitzbergen. This fact was used as the basis for Dr. Nansen's remarkable journey twelve years later.

It was in the summer of 1865 that George W. De Long, a strapping big youth, more than six feet tall, came out of the Annapolis Naval Academy. Great Britain, foremost among the nations of the world in fostering exploration, disheartened by the ill-fated expedition of Sir John Franklin, her purse lean from the numerous relief expeditions sent in search of the Franklin survivors, had definitely withdrawn from the search for a northwest passage and for the North Pole. The United States, however, hitherto a laggard in exploration, had been actively stirred by the almost universal search for the Franklin expedition. The participation of American vessels in turn led to a long series of voyages in quest of the Pole; failure seemed merely to lend an added stimulus to further achievement and to intensify the desire to overcome the barrier of ice that had blocked the way for centuries.

It was at this 'psychological moment' that De Long resolved to find that spot at the top of the world which already had drawn hundreds of men to their death. Toward this glittering magnet one generation of explorers after another had fought their way by ships, with dog teams, and afoot, over desolate wastes of snow and ice. Every page of the story is red with the blood of hardy and courageous men who fell and died by the way. De Long knew all this, but the fatal lure of the North had seized him while he was serving as a junior officer on board the *Juniata*, of the North Atlantic Squadron, which was sent by the Government to Greenland waters in the summer of 1873 to search for the *Polaris*. Captain Tyson, of the *Polaris*, and eighteen members of the crew had been rescued off the coast of Labrador by a whaler a few weeks before while drifting southward on an ice floe, and the account the rescued men gave of the danger their vessel was in spurred the Government to immediate action.

UPON the return of the *Juniata* from her unsuccessful cruise, Lieutenant De Long wrote to the Secretary of the Navy, offering his services in the event of another expedition being sent out, either on a relief voyage or in search of the Pole. Receiving little encouragement from that quarter, De Long approached Henry Grinnell, a wealthy New York merchant who had spent a small fortune in Arctic exploration. Mr. Grinnell thought a younger man should continue the search for the Pole, and referred the youthful naval officer to James Gordon Bennett, who had inherited the New York *Herald*.

The old methods of exploration, De Long explained, would be abandoned. Instead of taking a staunch vessel as far northward as possible, then struggling by dog team or afoot over the almost impassable ridges of ice toward his goal, he would boldly enter the ice fields of the Arctic Ocean, and allow his vessel to become frozen in. His theory was that the warm waters of

the Japan Current, flowing through Bering Strait to the north, would open a way past Wrangell Island, and perhaps to the Pole itself. Whaling vessels, frozen in the ice and abandoned by their crews, always drifted northward, and the inference was that the current generally flowed in that direction.

Mr. Bennett was deeply impressed by Lieutenant De Long's theory and the program he had laid out, and agreed to outfit an expedition so that the search for the Pole could begin the following summer. The yacht *Pandora*, which had been used by Sir Allen Young for cruising in the Arctic, was purchased, reinforced inside and out, and rechristened the *Jeannette*. Lieutenant (now Captain) De Long had married by this time, and with his wife and their one child they set sail in the refitted *Jeannette* from Havre, France, in July, 1878.

The voyage to San Francisco, by way of Cape Horn, required almost six months. From the time when the *Jeannette* dropped anchor in the Bay of San Francisco till the day, six months later, when she weighed anchor for her final voyage, the youthful commander devoted himself to the details of preparation.

When De Long set sail from San Francisco on July 8, 1879, he enjoyed the same power that is conferred on admirals commanding fleets, with the addition of being absolutely in command, holding his subordinates accountable to himself, and himself accountable to the Secretary of the Navy. The bow of the *Jeannette* had been filled in solid for a distance of ten feet from the stem, and for forty feet in length and eight feet in depth amidships. The inside had been ceiled with oak planks six inches thick. She had been braced internally, and a portion of a new deck had been laid. New sails throughout had been cut and fitted, as well as an entire outfit of rigging. Coal bunkers had been enlarged and new ones added, and new boilers installed. The machinery had been overhauled, and an entire outfit of instruments, charts, stores, rifles, and ammunition loaded on board. Additional clothing, forty dogs, dog food, sledges, and dog drivers were obtained at St. Michael's, at the mouth of the Yukon River.

The *Jeannette* entered the ice pack near Herald Island on September 5, 1879. She never escaped from the surrounding ice and snow. Soon De Long found himself drifting to the northwestward at the rate of five miles a day. Then, for days at a time, the ship would drift to the eastward, back to the southwestward, and again to the northwest. Occasionally the two Eskimo hunters or some member of the crew would kill a polar bear, seal, or walrus. These furnished food for the men and dogs, fuel for the ship's stoves, and clothing and footgear.

Early in November, the *Jeannette* experienced a foretaste of what was to come, when the floe in which she was held cracked and broke up within a hundred feet of the starboard quarter. The ship groaned and creaked. Five sledges stood packed on the poop, with forty days' provisions for men and dogs. Finally, to the amazement of everyone on board, the ice along the entire length of the *Jeannette* drifted away from the port side, leaving nothing but water. The whole port side simply slid away without noise or excitement, the split occurring in as neat a line with the keel as if it had been cut with a saw, and the ship remaining fastened to the floe along her starboard side.

—Publishers' Photo Service.

*The De Long party was confronted with the necessity of bridging openings such as are visible in the above illustration. Fresh leads in the rear would remove them from their provisions.*

De Long was now in a precarious position. Almost anything might happen to the ship, yet they could take no measures either for her security or for their own. A crisis might occur at any moment, yet there was nothing they could do except be thankful each morning that it had not come during the night. It was like living over a powder mill, waiting for an explosion. 'Daylight' on clear days at that season of the year (the middle of November) began at about seven in the morning and ended at five in the evening, giving them but ten hours of daylight and semi-darkness out of the twenty-four. Sleeping with their clothes on, and starting up nervously at every snap or crack in the ice outside or their ship's frame inside, the officers and crew were denied the proper amount of rest.

After ten days of uncertainty, the ship broke adrift from the floe, but within twenty-four hours she had again been surrounded by ice and squeezed rather badly. At times the pressure became so great the deck seemed ready to burst open. Knapsacks at hand, sledges packed, boats ready, they were continually standing by for a dangerous movement of the ice, always in a state of uncertainty.

On January 17, 1880, the position of the *Jeannette* was a hundred miles to the northward and eastward of Wrangell Island, the vessel having drifted about in a circle since the previous September. On the nineteenth, the vessel received her first—and fatal—wound. With a boom like an explosion, she split somewhere forward. By the time the leak was located, three feet of water had risen in the hold and the sea was running in at the rate of 3,000 gallons an hour. The steam pumps were immediately set going, and while the ship was thus kept clear of water, they used a considerable amount of coal that could ill be spared. De Long was also compelled to distill drinking water for all hands, having been unable to find a single floe from which to obtain fresh water.

In April, De Long records a total drift to the northwestward of forty-six miles. This was slow progress toward their goal. But the men were in good health and they were able to keep the ship comparatively free of water by pumping with steam and an improvised windmill. The Eskimo hunters and certain members of the crew continued to bring in seals and polar bears at frequent intervals. By the first of May, the amount of water which had to be pumped overboard per hour had dropped to 300 gallons. For the first time in their Arctic experience, they enjoyed clear weather. But the life was becoming monotonous, and each day found their coal pile diminishing. By May 25, they were 190 miles northwest of Herald Island. In other words, southwest winds had carried them as far northward in less than a month as they had drifted during the previous eight months. Then, for several days in succession, and apparently without any reason, they drifted from seven to thirteen miles each day to the southward. At this point, Captain De Long made the following entry in his diary:

There can be no greater wear and tear on a man's mind and patience than this life in the ice pack. The absolute monotony; the unchanging round of hours; and the same conditions; the same faces; the same dogs; the same ice; the same conviction that tomorrow will be exactly the same as today, if not more disagreeable; the same impotence to do anything, to go anywhere, or to change one's situation a single iota; the realization that food is being consumed and fuel burned with no valuable results, beyond sustaining life; the knowledge that nothing has been accomplished thus far to save this expedition from being considered an utter failure.

By the end of June they were fifty miles southeast of where they had been at the beginning of the month, but there was now no necessity of pumping out the ship every hour. With the exception of two men, the entire crew continued in good health. Although Captain De Long had hoped to get the ship free in August, they were held fast. Early in the month they again began to drift to the northeastward at the rate of six miles

a day, but at the end of a year in the ice, De Long and his party were only 150 miles to the northward and westward of where they entered the pack. By January 1, 1881, they had drifted 1,300 miles, far enough to have reached the Pole and beyond, but they were actually only 220 miles northwest of where they first were beset. They had been squeezed and jammed, tossed and tumbled about, nipped and pressed, until the ship's sides would have burst if they had not been exceptionally strong; they had pumped a leaking ship for a year and kept her habitable. And they were not daunted. During their first year, the 'Arctic night' was seventy-one days long; during the second year the sun disappeared for eighty-seven days.

ON April 21, 1881, De Long found himself four hundred miles northwest of Herald Island, and drifting at the rate of ten miles a day. On May 16, they discovered their first land, a little mass of volcanic rock rearing itself out of the sea, which they named Jeannette Island, and on May 24 another island was discovered. A party landed on the latter island, hoisted the American flag, took possession of it, and named it Henrietta Island. At midnight, June 10, the ice suddenly opened alongside, and the *Jeannette* righted to an even keel. The members of the crew were called immediately, and brought in the few remaining things on the ice. But on the following day the ice field came down with great force against the port side, jamming the ship hard against the floe. An hour later the pressure was renewed and continued with tremendous force, the ship cracking in every part. Now began a mad race to get the dogs, provisions, sledges, boats, and other equipment to a safe place on the ice, for by this time the ship was beginning to fill with water. This frenzied attempt to save their provisions lasted until midnight. Two hours later the *Jeannette* went down.

There, upon the inhospitable white desert, five hundred miles from the mouth of the Lena River, stood the gallant crew, ready to begin the desperate retreat which for most of them was to end in death. Fortunately, there was no darkness at that time of year, else the *Jeannette* might have carried some of them with her to an icy grave. As it happened, some of them narrowly escaped being precipitated into the water when the floe on which their camp was pitched suddenly split beneath one of the tents. It was only after much scrambling about and the building of temporary bridges and ferries of ice cakes that the men, with their provisions and equipment, were all safely housed on the same floe.

For six days the survivors remained in the camp, preparing the boats and sledges for transportation over the rough ice. They lived well, for food was plentiful and De Long estimated that they would be unable to transport more than the sixty days' rations reckoned necessary for the retreat over the ice to its edge, and thence to the north coast of Siberia.

The castaways were outfitted with clothing, sleeping bags, blankets, rifles, and ammunition, and the commander found it necessary to take south with him five sledges, two cutters and a whaleboat mounted on runners, and six tents. Owing to the heavy loads, it was necessary to travel a short distance, unload the sledges, bring up another load, and continue this until everything had been collected at a safe camping spot. Frequently, when the sledges sank into the soft snow and broken ice, the combined efforts of the whole party were required to extricate them. With five men on the sick list, it required the energy of the remainder to drag the first cutter on its heavy sledge. But twenty-three dogs remained of the original number.

On June 18, the party left their camp on the ice at Latitude 77° 18′ N., Longitude 153° 25′ E. It was arranged that the traveling be done at night. The program was for all hands to drag the first cutter forward, following a trail already chosen by an experienced ice traveler. After dragging that half a mile, or a mile, the party would return for the second cutter. Meanwhile, the dogs would have dragged No. 1 sledge up to the first cutter, and would return with the party. The men were now divided up, one section dragging the No. 4 sledge, and the other section the second cutter. The dogs would drag the No. 2 sledge. All these would be hauled up to the first cutter and the No. 1 sledge, and left there. They would all return to the whaleboat, which would be dragged up to the first cutter by one section, while the other dragged the No. 3 sledge. The dogs pulled the No. 5 sledge. When all these were grouped together at a place of safety, the party would camp.

De Long soon learned, however, that it would be impossible to advance their boats and provisions in three separate hauls, but that it would require six. One of their sledges weighed 1,600 pounds, and this had to be dragged through soft and deep snow, and across numerous ice openings. On the first day three of their sledges were disabled and had to be unloaded while repairs were made.

Their average progress for the first few days was half a mile in ten hours of the hardest kind of work. There is no work in the world harder than this sort of sledging; often the men would break through up to their knees, for, while ice would form over the little pools of water at night, the sun would thaw them the next day.

IT WILL be recalled that De Long started from a point on the ice in Latitude 77° 18′ N. After traveling in a southerly direction for a week, he found, upon taking an observation one day, that he was 28 miles farther north than his original position. The ice was drifting northward faster than they could travel to the southward! De Long thereupon changed his course to the southwestward, to bring them more quickly to the edge of the ice. He informed only his two active officers of his discouraging discovery, fearing that the men, if they knew of it, would give up hope.

By this time their hands and faces were swollen and blistered, and much of the way they were compelled to wade through water nearly up to their knees. On one occasion, while they were bridging an opening twenty feet wide, it opened another twenty feet. The same thing happened, a few hundred yards farther on. Yet they worked like horses for ten or eleven hours each day, while at least three of the party knew that for every mile they traveled to the southwestward they drifted three miles to the northwest.

Their sleeping bags were almost always wet, their feet were never dry, and the thick fog which hung over them seemed to penetrate to their very bones.

On July third, two weeks after their start, De Long found that they had actually progressed thirteen miles to the southward, and that there was no longer a current running against them. The next day they made the unprecedented distance of two and a quarter miles. But it must be remembered that their loads of provisions were getting lighter. On July fourth, De Long wrote in his diary:

> My duty to those who came with me is to see them safely back. My duty to my family also compels me to push forward. But those two duties apart, I fancy it would have made but little difference if I had gone down with my ship.

*(This is the first of two articles by Mr. McConnell. The next will appear in an early issue.)*

*A conception of the difficulty of traveling in the Arctic regions.*

# A. A. Milne at Home

(*Continued from page 3*)

tional illusion of sunlight, which the gathering London fog outside belied.

But I was in the Palace of the Prince of Whimsicality now and would have nothing to do with the dull facts of life.

I HAD not been with A. A. Milne more than a quarter of an hour before I learned something that had puzzled me hitherto, namely: how any grown-up person could get under the most delicate mental and psychological skin of very young children and reveal to us thick-skinned men and women what made them laugh and burble, what was the fine texture of their thoughts and fancies; then go a league further and ensnare their tenderest emotions that the weight of an alien word would crush as though they had been iridescent bubbles. The only explanation that I can offer is, that this A. A. Milne is the youngest man for his years (about forty) that I have ever met. He must be a thousand years young in spirit to be able to write that delectable book, *When We Were Very Young*, that has delighted more than 250,000 readers in America and England.

'Well, really,' Mr. Milne told me when the ice—or rather the icing, for among many other dainties I was offered a large piece of sugar-coated cake, which made me, too, feel very young again for the moment—when the icing was broken then, '*When We Were Very Young* seemed to come into being for no reason at all. It began to be just three years ago when I wrote the little poem, *Vespers*, from just seeing my little boy, Christopher Robin, saying his prayers one night.'

Christopher Robin! The whimsy of the name alone gives you a small biography of A. A. Milne. This Christopher Robin, by the way, whom one meets so often in Mr. Milne's stories and poems—the hero of them all!—is a very real person. I could hear him talking and playing about the house as we talked.

'I wrote *Vespers* for the Queen's Dolls' House, and thought no more of it. Then Rose Fyleman, in getting a new paper going, asked me to write a few verses for it. I wrote *The Dormouse and the Doctor*, among others. Everyone seemed to like them and I came to the conclusion that perhaps I could do this sort of thing. "I will," I told myself.

'We went to Wales about this time. We found it very wet there and there happened to be a little summer house. The two things worked in favor of my project. So I wrote twenty more verses in the same vein right off. That is nearly the whole story of *When We Were Very Young*, except that my wife claims to be the direct inspiration—which there is no denying—of one of the forty-four poems contained in the book and wants—and gets—one-forty-fourth of the royalties therefrom. She is doing quite well from it, I may say.'

Mr. Milne took very little for tea. He got out a gurgly old pipe, which had a habit of interfering with its own suction and going out at frequent intervals. He always lighted it up again in a friendly manner and with a half smile—at the pipe—as though it really were an old and confidential friend.

I was going to say that Mr. Milne sat opposite me in a big armchair; but he didn't. He sprawled in the armchair, squirming around as though he were Christopher Robin himself, or some overgrown schoolboy come home on a holiday and didn't know quite what to do with all his legs and arms and long lean body. Don't construe from what I have just said that Mr. Milne was not enjoying himself. For when he is not enjoying himself, I fancy that he acts like a grown-up man; in other words, is just commonplace like most of the rest of us. But when he likes what he is doing or saying, then every motion of expressing his boyish nature becomes delightful and unique. To complete the boyish touch, he wore plus-fours with tassels at the top of his hose.

THERE were three brothers of us at home, you know,' he explained. 'When we were ready for the university my father gave each of us a thousand pounds. We could draw on him and do what we liked with it and be what we liked, but we would not get another penny from him, we were told. I had a scholarship, I remember. When I came out of Cambridge I had just three hundred pounds left over.

'Like all fathers, I fancy, he didn't think we were much good. My brothers became lawyers and his opinion of me did not improve when I made it plain that I intended to become a writer. "We can't all become Charles Dickenses, you know," was his only comment that I remember.

'So I came to London with my three hundred pounds—and spent it all within a year. I made twenty pounds, however, from writing articles and sending them up to any paper I thought might buy them. I sold twenty articles at a pound apiece! During the years 1903 to 1906 I made about two hundred pounds a year and got into *Punch*.

'Curiously, when I was eighteen and used to read *Punch* at school, I had made a youthful boast: "I'm going to be editor of that journal some day!" Well, as a matter of record, the editor was tired just at this time and offered me the position of assistant editor at two hundred and fifty pounds a year. It looked as though I might become editor after all—then the war came along.

IT WAS during the war time that I began writing plays. I was married then. My wife joined me in a little cottage near where I was stationed and I used to dictate plays to her just to amuse ourselves.

'In 1919 I wrote *Mr. Pim Passes By*. (This is the piece that was played for so long in New York and elsewhere and whose whimsies endeared American playgoers to Mr. Milne as a dramatist of promise, more of whose work they wanted to see.)

'Don't confuse the play with the novel, *Mr. Pim*, although they are the same character study. I wrote the play some time before I wrote the book. The character of Mr. Pim came

into being oddly enough. It seemed that Lillah MacCarthy was just going under new management—her own, I believe. She asked Sir James Barrie for a play, and he told her, "You ask Milne. He can give it to you." '

He looked up for a moment and smiled, as though at the absurdity of it.

'This was in December, 1918. Miss MacCarthy wanted to begin her season in March, 1919. It all happened on a Thursday, I think. Anyhow I left her and went home saying I would write the play. I began the first act on Friday morning and by Sunday had finished the act and created Mr. Pim. Mind you, I never had an idea of either him or the story before that.

'Miss MacCarthy never played in it, by the way. What I wish to make clear is that I have always been a great experimentalist. I think if you *can write*, you can write *anything*, given the idea.

'I had always wanted to write a novel —just as I had wanted to write a detective story—just to see if I couldn't do it. And it so turned out that my first book to sell was a detective story—*The Red House Mystery*. It sold in both England and America, and I became richer by more than a thousand pounds by that experiment.'

I left just at dusk in a London mist that made Mallord Street for me a sort of Milne creation, it was so whimsical with its tiny houses hunched up as though under toadstools from which many lights from their small windows blinked like a thousand eyes, and I thought of some of the poems in Mr. Milne's charming book and felt half-scared myself and very, very young. And all the way through Chelsea on the bus I kept thinking over and over, 'What a very lucky number 13 is!'

## The Luster Ware of Long Ago

(*Concluded from page 13*)

in the form of shells, all of Sunderland luster.

Sunderland pieces are frequently great jugs or washbowls and pitchers, so that I was recently charmed to see, in Boston, a choice collection of small pieces—goblets, exquisite salts, and a wee mustard-pot.

'Why did so many pitchers have pictures of ships?' I inquired of an expert. 'Sea captains often asked to have pieces of china decorated with pictures of their ship,' he replied. 'This was done while the ship was in port, at Liverpool, say. The sea captain later carried the jug home as a scuvenir.'

A word of caution in regard to your choice luster. Do not wash it more than you can help. Warm water tends to make a piece less brilliant. Whenever possible, clean and polish with a soft cloth.

There is much imitation of luster in the market today, but usually the color is too bright and the glaze too glassy, quite unlike the deep, rich tones of the originals. To test a piece ask yourself, Is it light? Are there worn marks on rim, handle, base? If the base is chipped, does red or gray pottery show beneath? If the answer is yes in these cases, you may be pretty sure you are securing the genuine. In any case, I give you 'Good hunting!'—the greeting from the *Jungle Book*, exchanged by fellow-collectors.

# The Most Wonderful Book in the World

MORE than thirty million Bibles or Books of the Bible were sold or distributed in 1925.

Would you not love to have companion volumes to help you discover the treasures in that Wonderful Book?

## SWEDENBORG

[1688-1772]

explained the Bible's practical application to daily life; how it describes the life hereafter; what the Bible parables mean when spiritually interpreted.

His theological works—as issued by himself—have been published by the Houghton Mifflin Co. in most modern translation from the original Latin, in the Rotch Edition of 32 volumes.

The first twenty give the spiritual sense of Genesis and Exodus as understood in Heaven; and volumes 26, 27, 28, give likewise the spiritual sense of the Book of Revelation.

Volume 29, Marriage Love, views from the union of the Divine Love and the Divine Wisdom the Law of Sex throughout all creation. It shows the crown and jewel of the Christian Religion, the union of one with one only. Price $2.00.

Volumes 30, 31, 32, contain a full statement of the True Christian Religion as revealed from Heaven. $3.00 the set.

The whole 32 volumes in half-morocco at $125; in buckram, $40.

◆ ◆ ◆ ◆ ◆

The following are the best introductory books to the Revelations of SWEDENBORG. They are in large print, bound in buckram, and contain from 260 to 485 pages.

| TITLES | PRICE |
|---|---|
| **HEAVEN AND HELL** from things *heard and seen* | **$1.25** |
| Angelic Wisdom Concerning— | |
| **THE DIVINE PROVIDENCE,** which governs the Universe and the Heavens and the Hells, and the least as well as the greatest of all things in creation; and in the everyday life of man. | **$1.25** |
| **THE DIVINE LOVE AND WISDOM,** the profoundest book and revelation concerning God and His Creation ever written, first published in Latin at Amsterdam 1763; along with this is the "Intercourse Between the Soul and the Body" first published in Latin at London 1769. | **$1.25** |
| Price of all three at one time, including postage | **$2.75** |

◆ ◆ ◆ ◆ ◆

## Who Was Swedenborg?

*Emanuel Swedenborg, the son of a bishop, was the great Swedish scientist, philosopher and theologian, whose vast range caused Emerson to term him the mastodon of scholars. Dr. Parkes Cadman recently named him the Universal Genius.*

*Officially connected, by appointment of the King, with the great mining industry of Sweden, he mastered all the sciences of his time, and wrote the most useful books on metallurgy, minerals, geology, astronomy, and the human brain.*

*His life search was for the human soul. How his spiritual senses were opened, after he was 50 years of age, that he might reveal the human soul, the life after death, and the Bible itself, may be read in the above named, uplifting, useful books.*

# Is the Football Coach Overpaid?

(*Concluded from page 7*)

starts in December. The candidates for the next year's varsity and scrub teams are assigned to gymnasium work destined to improve their gridiron play. Basketball, handball, wrestling, boxing, track work, and other sports are enlisted in the development of football talent. The coach oversees this work.

The coach also has a lecture tour during the winter months. He has to address the alumni associations. Football is regarded as the best publicity a university or college can have and the coach is the siege gun of this attack. He strengthens the tie between the alumni and the alma mater. He works in behalf of the school. He tours the country, speaks at luncheons, dinners and rallies.

Glenn S. Warner, coach of Leland Stanford University, was asked one day last autumn why he always managed to produce winning teams when he coached football at the Carlisle Indian School. Warner's reply was brief but memorable:

'The reason was simple. We had no alumni body at Carlisle.'

There is nothing more insecure than the position of a football coach. His life is not all pleasant even when he is winning games but it is unbearable when his team is losing. The good old alumni swoop down on him singly and in groups and tell him bluntly that what the alma mater needs is a winning football eleven and that if he cannot develop one then they had better look around for a coach that can. And, what is more, they do. What the alumni want is a winner.

In this respect the football coach's job is similar to that of the professional baseball manager. When the home team loses the home town fans start telling the manager where he is weak and why. He is generously assailed. But the manager of a major league team knows that his team will play 154 games and he also appreciates the fact that slumps are nearly always only temporary. The slump will be forgotten as soon as the team gets on a winning streak.

The football coach has no such relief ahead. His team engages in eight games, or ten at the most. That gives him little chance to square accounts. His season is brief and it is gone before he can make amends. He rides to glory or to ruin at a dizzy pace that permits no false step.

The professional manager gets several times the amount of salary that is paid a football coach. Tyrus Raymond Cobb, the highest salaried manager in the majors, was paid $60,000 a year by the Detroit club owners for the last three years and in 1925 he received a bonus of $10,000 as an anniversary present on the day he completed his twentieth season in the majors. It is not likely that any football coach will be paid in a lifetime what a major league manager gets in a few years.

A football coach, working on a small salary, never knows when that will be cut off and he will find himself cast adrift.

A famous western coach told the writer one day last season that he had just had a visit from the coach of a minor college team, who had told him the following story:

'I am 43 years old. I have a wife and four children, none of them quite old enough or able to earn his own living. I have never done anything besides coach football and I've never earned more money than I needed to keep myself and family in food, clothes, and shelter. I haven't a dollar in the world and nothing to look forward to except my salary.

'My team hasn't got going this year. We have already lost three games. They have practically told me that they would need another coach next year. I still have a chance. We play our big rival on Thanksgiving Day. If I can win that game I'm pretty sure of staying on another year.

'Now, what I want to ask of you is that you give me six plays that will beat this rival. I'm up against it. Here is their defense, but the offense I've doped out isn't going to be good enough. I'm sure you can give me five or six plays that will beat them. If they do then it means another year for me.

'I wouldn't come to you if it wasn't for the wife and children. It would be tough on them—not alone for being without proper food and clothing but for the disgrace of my being kicked out that they would have to share.'

He got the six plays. The day after Thanksgiving we scanned the football scores. Yes, his team won, 7 to 3. He will coach another year.

*(The first of two articles by Mr. MacDonald. The next will appear in an early issue.)*

*Reports are sadly at variance with the facts.*

# Keeping the Country in Correct Time

(*Concluded from page 15*)

tion to apply to the clock in the vault to make the transmitting timepiece read accurately, the latter may be speeded up or slowed down as preciseness may dictate by the operation of an electromagnet acting through the pendulum of the timepiece. Its second beat is thus increased or retarded. In this way, the transmitting clock will indicate the precise time at the moment of dispatching the time signals.

The three master timepieces, maintained in the constant temperature of subterranean environments, are electrically wound every 28 or 29 seconds. Contrary to the office and household practice, where an error is discovered in keeping tab of the march of Father Time, these master clocks are not subject to change. Any interference with them is likely to vary their rates of movement. Of course, the error thus revealed is applied to the one employed when the time signals are sent to Annapolis, Arlington, and Key West. When observations of the stars are not practicable, in the event of cloudy weather, these rates of movements may be applied to the different clocks and accurate time gauged with almost negligible error.

The time signal consists of telegraphic dashes every second, with these omissions or exceptions: The twenty-ninth of each minute; the fifty-fifth to fifty-ninth, inclusive, of the first four minutes; and the fiftieth to fifty-ninth, inclusive, of the last minute. Following the ticking off of the fifty-ninth second of the last minute, there is a long dash beginning at the outset of the incoming hour or the expiration of the old one.

Radio-telegraph signals issuing from Annapolis, employing a wave length of 16,900 meters, have been received in Australia, nearly halfway around the world. Instances have been noted where these signals, negotiated by the wonders of wireless waves, have been heard coming around the world both ways. The velocity of electromagnetic waves—186,300 miles per second—makes it possible for a radio-equipped ship at sea, 4,000 miles away, to receive the time signal with a variation of less than one two-hundredth of a second. The most accurate timepiece in existence is not sensitive to a fraction of time less than one-fifth of a second.

'The benefit of standard time signals to the shipping and inland transportation interests of this country,' states the superintendent of the Naval Observatory, 'and to watchmakers, jewelers, and persons engaged in scientific and other pursuits requiring accurate time, not to mention the general public, is so tremendous that it is difficult to conceive of the confusion that would arise were this service discontinued even for a few days.'

# Hidden Tricks of the Fur Trade

## Demonstrating That All the Traps Aren't Set for the Animals

*By* A WESTERNER

THIS is the time of the year when the humble rabbit becomes 'French sable,' the trapper becomes angry, and the fur dealer becomes wealthy. The rabbit, be it known, becomes 'sable' only after it has passed through the hands of the ubiquitous fur dealer, and the trapper becomes angry after the same process.

The fur dealer becomes wealthy because of both happenings.

During the early part of the trapping season, before any furs are shipped to him, the fur dealer is a hale, well-met sort of fellow with a self-imposed reputation for honesty, integrity, and self-sacrifice. As the season advances this reputation wanes; but this seldom worries him, for he has nearly a year in which to build up a new one. Nor is this difficult, for he has a large mailing list, a dictionary composed almost solely of adjectives, and an unlimited supply of fake promises.

The trapper and the fur dealer seldom meet, for while the trapper is wearily plodding his way through the snow in the mountains of the Cascade and Rocky ranges of the West or the forests of Michigan or other eastern states, the fur dealer sits quietly in his offices in St. Louis, or Chicago, Denver or St. Paul, and thinks up fancy new names for the fur that once adorned a muskrat.

For the first few pelts sent in early in the season the trapper may receive a fair price. In the middle of the season this drops, and by the end the price has reached rock bottom. Cases are so rare as to be almost non-existent where the trapper has ever been paid a top price for his furs.

A youth living near the town of Winthrop in the upper Methow Valley, Washington, caught a number of muskrats during the winter, hoping by this means to help pay for his education. He selected twenty of the best skins and shipped them to a St. Louis fur house which had quoted a price of two dollars apiece for muskrat. In due time he received payment of just twenty-five cents apiece for his skins.

A few days later the boy's mother sold furs of not such good quality to a junk dealer for a dollar apiece, and the junk dealer later disposed of them at $1.75 apiece.

One trapper in Washington, now a Government hunter, a few seasons back tried an interesting experiment. Early in the season he sent a fur house a very poor wolf pelt. He promptly received a check for eleven dollars. Pleased at this action, he sent them one exceptionally fine pelt and two of a poorer grade. He received just eight dollars for the one and seven dollars apiece for the other two. It was then near the end of the season and the firm apparently thought it could dispense with his goodwill.

A man in Wenatchee shipped five wolf hides to a St. Louis firm and received a check for thirty dollars. Knowing that his pelts were worth much more, he returned the check with instructions for the company either to mail him a new check for fifty dollars or to send back the furs. The original check came back. He returned it once more with the same demand and once more the thirty-dollar check was sent him. Twice more the original check made its journey to St. Louis and back to Wenatchee, and finally the trapper, being hard pressed for funds, cashed it.

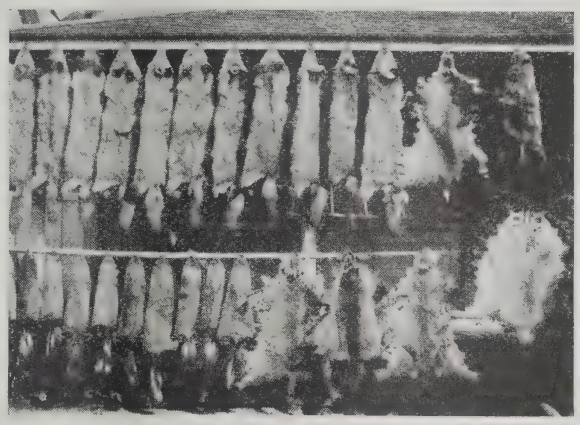
A California trapper, lured by the list of quotations sent him by a Denver fur house, expressed them six coyote pelts for which they paid him approximately the sum they quoted for one. For thirty-five other skins which he sent they paid him less than a dollar apiece.

Some trappers are more fortunate than their comrades in that they have a slight knowledge of the law which they can hold as a weapon over the heads of crooked fur dealers. Some years ago a Wisconsin man sent a consignment of furs to a St. Louis house, inclosing in the shipment instructions that the furs were to be held separate until the deal had been closed.

The shipper waited about ten days without receiving an answer, whereupon he sent them another letter. Receiving no answer to this, he wired them to return the furs at once. He received a return telegram offering him about one-half of what the furs were worth and stating that the market had declined since they made their original quotation.

The Wisconsin trapper sent a second telegram demanding the return of his furs. This time he received a letter stating that the market had again declined and suggesting that he leave the skins at the fur house until it should improve during June or July. This time the trapper wrote the fur dealers:

'Unless the skins are returned at once I will put the matter in the hands of the postal authorities.'



The skins came back by return mail.

A short time ago an old trapper, whose sight is now nearly gone as a result of attacks of snow-blindness contracted in his lonely winter vigils in the high mountains, sent a beautiful fisher skin as black as ebony, a fine fox pelt, and a mink hide to a St. Louis firm. They gave him twenty-one dollars for the lot. On the retail market these furs would bring six or seven times that amount.

An experienced hunter visited a furrier's in Seattle recently. Displayed in the window was a beautiful neckpiece.

'Crossfoxes—two of them,' he exclaimed. 'I sold a couple of pelts better than those to a dealer a few days ago and felt myself lucky to get eight dollars apiece for them.'

The neckpiece was for sale at $190.

*Only $12.47 was paid for these furs by a Jewish fur house in Chicago. Another house paid $36 for 14 furs of the same general description.*

*DISHONEST fur houses are not content alone to cheat the trappers who risk the dangers of exposure in getting the furs, but they insist on cheating the ultimate fur buyer as well.*

*Officials of the Federal Biological Survey have undertaken a campaign against the misnaming of furs by unscrupulous dealers. Hares and rabbits, these officials declare, are being sold under the names of American seal, Arctic seal, Cape seal, cat chinchilla, clipped seal, ermine, fox, French sable, Geller seal, La Meuse seal, new seal, Baltic seal, Polar seal, Semeuse seal, and sable.*

*Muskrat, under their skilful manipulation, emerges onto the market under the alluring titles of Aleutian seal, electric seal, Hudson Bay seal, mole, real seal, Red River seal, river mink, river sable, and Russian otter.*

*Plain wolf hides, with their deft disguise, become 'silver fox.' Skunk hides reach the public as 'sable,' this magic word bearing in front of it the names of many countries which never saw a live sable except in a zoo.*

*Fur houses have a number of coined, derogatory phrases they use in 'grading down' a pelt. The trapper knows that the dealer will have something disparaging to say about nearly every pelt he sends in.*

*Lightly loaded caravan passing through the sun-baked terrain of Palestine between Jerusalem and Jericho.* *Photos, Ewing Galloway.*

# *From* Dan *to* Beersheba *in* Four Days

## Motoring *in* Judea *and* Philistia Where Samson Found His Wife

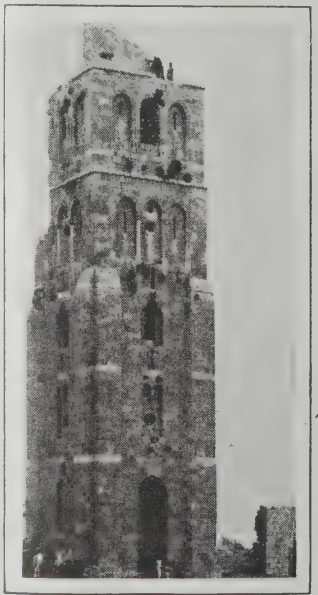
*By* GAIUS GLENN ATKINS

IF THIS article were given a perfectly honest title it might be 'What I Didn't See in Palestine,' for it was only four days from our crossing the Suez Canal at Kantara, under a wonderful sky of stars, till we took ship again at Bayreuth one broiling hot afternoon. One does little enough with Palestine in 96 hours. And yet we saw it and I have brought away memories and impressions which grow more vivid instead of wearing away.

* * *

It means a vast deal to have names become places, if only by the grace of a look through a car window. We went by rail from Cairo to Jerusalem following a road deeply worn through the centuries. We must have followed the old caravan routes from Cairo to Kantara, crossing the Land of Goshen at sunset, as the brief twilight was calling the fellaheen home from their little fields to their earth-colored, manure-covered clay brick huddles of house and barn and barnyard. They come all together—men, women and children, donkeys, goats, red sheep, water buffalo, camels—and from the outside there seemed little to choose between the shelter for the animals and the humans.

But the delta of the Nile is a garden country for all that; flat, fertile, strong green with heading grain, yellow white with ripe grain, blue green with alfalfa and tender green with new planted crops—beans, I suppose, and the like. The oxen still turn the wheel which turns the hollow screw which lifts the water from the irrigation canals to the irrigation ditches, or else they are turned by hand. They still drive the threshing sled around the threshing floor; I suspect they were doing much the same thing when Moses led his people out.



* * *

The day broke across Philistia and the first station I remember was Ashdod. The station was no great affair and the towns, some of which seemed considerable, were to the west of the railway nearer the coast. Remnants of the war were in evidence; bits of camps with their wooden huts, barbed wire, signs of a bomb-proof shelter—at least the half circle of corrugated iron, ten feet high at the top, over which the concrete would have been poured—cactus hedges everywhere. These made the British more trouble than barbed-wire entanglements, and lost them one engagement. Then rolling land, scanty pasture, poor barley, shepherded flocks, camels, groups of people working the soil; the soil red and deeply gullied; something like Georgia in the look and feel of the region, once orange groves—Georgia become California—vigorous trees well loaded; Jaffa oranges are delicious. A long range of hills to the east, Samson's country. Here he got his wife; there he fought the Philistines; anywhere he might have set the barley on fire. Egypt was a living fact, Philistia a time-worn memory.

* * *

Now we change cars, turn to the east and climb toward Jerusalem. Any railway in a mountainous country follows a valley up to the watershed; ours climbed and twisted and turned on itself, 2,000 feet in thirty miles. Stratified limestone mountains worn to the rock and the rock worn to the stronger rock; dry watercourses down every gullied slope; strata worn smooth by falling water of winter rains. I imagine erosion and centuries of washing away explain the barrenness of the land. A handful of soil on the mountain slope and two sickels of barley show against the rock; a hundred yards and a little field with piled stones for fence lines; a pocket with water for the roots to reach, and stunted olive trees. A few women and children at the little stations throwing in flowers through the car window and throwing back the French pennies we threw out—an unprofitable transaction. But little sign of population anywhere—nothing to support them.

Signs any mountain traveler knows that we are getting toward the top; also the

*Crusaders' Tower, at Remleh, memorial to the armies which tried to rescue Palestine from the Turks.*

testimony of the aneroid barometer I carried; 1,500, 1,800, 2,000 feet up; stations closer together; modern buildings on our left; a turn and gray walls on the hilltop; a tower or two—the German church; a white, dusty road, camels, donkeys, motor cars—Jerusalem.

* * *

The city is inside and outside the walls, terraced vineyards about it, olive trees; the homes of the English, Americans and modern Jews to the west and north, comfortable enough looking. There is, of course, a European and American business, diplomatic, governmental, charitable, educational and ecclesiastical life centering in the city. We did not touch even the edge of it. Inside through the Jaffa Gate and the tower of David; a solid fortress held by the English on your right—a fair hotel with shops and bazaars in the arcaded approach; rugs and postal cards and beads for sale everywhere.

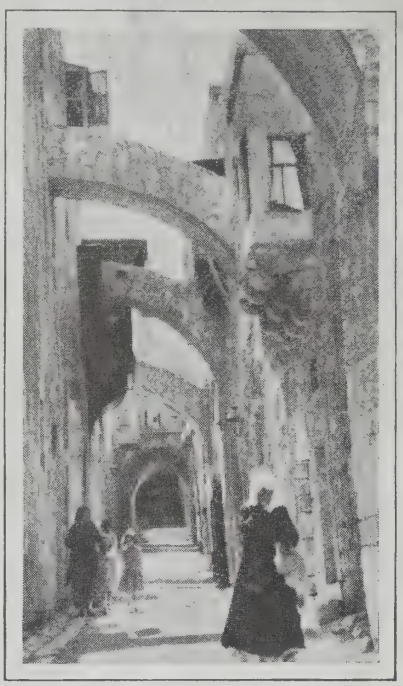
A half-dozen Jerusalems are gone. The Crusaders and the Moslem Jerusalem only remains, 50 to 70 feet above the Jerusalem of David, high above the Jerusalem of Christ. I saw only some old tombs beneath the Church of the Sepulcher inside the walls which seemed to be in the living rock—and they seemed in the half dark to be granite and not limestone. There is no granite in Palestine.

Nothing is what it was. You may be sure of the site of the Temple, the Kidron Valley, Hinnom Valley, the Mount of Olives, the general region of Gethsemane, the general location of the gates—nothing more. The lines of circumvallation are in doubt. The city may have lain more and farther to the south in Jesus' time. The location of the north wall is the disputed key to the authenticity of the holy places. Jerusalem is a document in stone written over and over again. You see a Norman arch which supports nothing in a blank wall, a pointed arch above it, a half arch at the side. What does it all mean? I would give anything to know. The whole region is begging for the spade of the archeologist.

* * *

The dominant color tone of Jerusalem is dusty limestone gray. All the streets slope to the east, some of them steep, always stone-paved, all narrow. No place for wheels in Jerusalem.

The little donkeys come in and out, with their burdens and baskets, and climb the street you use. There may be courts behind the inhospitable walls of the streets, with a little green and comfort; no sign of them from the outside. Some of the streets covered arcades—a perfect rabbit warren.



The old simple crafts of the land in the little shops open at the front, without windows. Food cooking—you smell it everywhere; water, coffee and syrups for sale; old copper, old clothes, old earthenware, a little woodworking, brilliant colored cottons from Manchester, England, and from America, some silks, sandals, beads, postal cards, and a smell peculiar to the place—sourish, fishish, donkeyish, humanish. I can't describe it but I could recognize it anywhere. And everywhere a pitiful, poor, sick, misshapen débris of humanity, too helpless and hopeless even to beg. The Church of the Holy Sepulcher divided among the Catholic and the Eastern communions, under whose roof everything happened—the Hill of the Cross and the tomb of burial, dark, lamp-hung; lamps everywhere, gold—the gift of kings—silver, gilt, hundreds of them; altars and dark mosaics. A lamp-hung door and you are in the tomb; a lamp-hung altar and the place of the Cross beneath it.

I put a coin in the metal cup—that's what it's there for—and my friend, the archdeacon, kissed the altar—that's what he came for.

* * *

The old temple space was sun-drenched and the rich coloring of the Mosque of Omar might have held its own with the fretwork of the old temple. From the wall south of the temple area you can see easily enough why Jerusalem was the key fortress to Palestine. It commands the central road from south to north at its most strategic point.

The Via Dolorosa is what its pictures make it—a narrow, steep street, the stations of the Cross marked by segments of flying buttresses which cross it. By the side are convents where they show you old pavements and cells for Peter and Paul which *do* go down into the living rock and help you to understand Herodian and Roman prisons. The Upper Room might have been on the spot where they show it—nothing more.

*Via Dolorosa, Jerusalem's famous Street of Sorrow. Buttresses brace the walls of the narrow street.*

Outside, to the north, the gaunt, pitted, limestone shoulder of a hill which looks like a skull is what the Hill of the Cross must have been, and the garden tomb beneath is Herodian and if it be not the tomb it is so like it as to help you wonderfully to understand.

* * *

The Garden of Gethsemane is half spoiled by a wall and an iron fence and a gate to get in by, and a fire-new Franciscan Church. Precious little room left for a garden. But there are old olive trees, and the hill above and the valley about help you also to understand. The Mount of Olives, terraced, olive-grown, with winding little paths by which the folk come and go, is entirely right and the view of Jerusalem from the summit a vision you might go far to seek and never forget.

The English cemetery on the Mount, where the soldiers sleep in long, long, long rows, who won the city and the hill and the land for humanity, is a place of peace and beauty and tears and pride. We saw it as the sun set across the city.

* * *

Bethlehem is a prosperous, solid-built little town in a surprisingly hilly region. You reach it by a winding road with a great fall of terraced land at your left as you go down. And they show you the field of Boaz on the mountain slopes beyond. There are empty Norman arches on the face of the

*View of the Mount of Olives, the Garden of Gethsemane, and, at left, a Greek church.*

walls in the entrance courts to the church. Inside, lamps and lamps and a brass star under the altar to show you where Christ was born, and a soldier on guard to keep peace between the rival adoring communions.

* * *

From Jerusalem down to the Dead Sea is a baking ride over a splendid always turning and falling road through desolate hills. Bedouins under their striped tents hiding from the heat, camels, goats, donkeys, children, rags and pride. No water to be seen but there must be a little where the washes of green are. The 'Inn of the Good Samaritan' stone, square and shabby. The approach to the sea over four miles of level, like the alkaline plains of the West. The sea sparkling and blue, tasting like all bitter things in one dose.

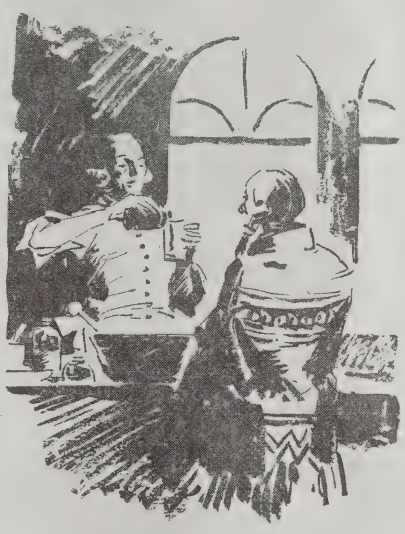
* * *

North and north, over a splendid English road, across a sweeping, rising, falling, mountain-rimmed plateau—goats, camels, olives, barley. Harvest groups on the hillsides reaping with a sickle and the women following the men; children minding sheep; two men, a cow and an ox stirring cloddy soil with a plow as old as Abraham, crossed sticks—I never thought before how the plow and the cross were akin—a pole to the yoke and a stick to the ground, iron shod I suppose. But it served the purpose; nothing else could dodge the stones.

The people were always working in companies, an old habit of the clan, and older habit of security. I do not know yet where they lived. History crowded into half-hours. Mizpah, Gilboa, Bethel, Gilgal, Shiloh—always on the hilltops. Mt. Ephraim, Jacob's Well in the basement of a Greek church, deep and cold; old Shechem with a fair hotel and a lovely garden—and garages; Samaria; some ruins on a hillside; Sychor off the main road—we drove through it; Mt. Gilboa, then a height of land; and Esdraelon. Nazareth a scattered town of winding streets, shops, hospitals, schools, churches, lovely hills behind, Esdraelon in front—and from the heights above such a view as you have always dreamed must be there. A fountain of clear water from which a thirsty carpenter once drank; a church where His house may have been, and—more near to Him, maybe, than the church—a Near-East Relief Station where the fatherless have found fatherhood.

* * *

Tiberius a domed little town with arcaded streets of little shops, lapped by the Sea of Galilee—a little, little sea, but blue, cool, rippled by kind winds and a wall of hills beyond. There to the north a narrow line where the Jordan comes in; Capernaum there—no time to go.



Back to Nazareth for the night, and a long, hard drive east to the sea, north along its blue waters, past the old coasts of Tyre and Sidon, past Acre, an enchanted city of palaces and gray walls and minarets—we did not even enter it, you may never enter an enchanted city—into French Syria. Poor roads now and rumors of brigands and nothing but haste to make the boat. Bayreuth, Turkish officials who took their time to visa your passports, heat, weariness, the Lamartine, and a cool salt bath. It was over.

# Hawthorne's Story of Immortality

(*Continued from page 5*)

captivates him irresistibly; she seems at times to reciprocate his feeling, but again, in a wayward mood, she appears to intend him some mischief. At any rate, she gives him help in his work and the two are in constant association.

The elixir prospers, and Septimius is assured of success; and his visions of the future fill some of the finest pages in the book. He will live forever; and the girl will be his deathless companion. The mysterious flower of death which she has added to the distillation seems to have been the one ingredient that had been missing; by its aid, the mixture clarifies and becomes radiant; in its vase, it gives out rays of pure light, and an exhilarating fragrance. The girl has by this time seemed to yield to Septimius' passion; and she listens with a smile while he tells the marvels which he and she will do for mankind. 'Yes,' she says, at the close of each of his rhapsodies, 'but what

shall we do after that?'—and there is a shade of malignity in her smile. But he will admit no misgivings. The hour comes when the elixir has attained its perfection; they have but to quaff it, and death will be no more. She will take the first draught. But having done so, she lets the great vase fall; it is shattered into bits, and the precious fluid is lost forever.

To Septimius' outburst of despair and reproach, she responds with her enigmatic smile. Then she reveals the truth: the elixir is not life, but death: she had at first designed to compass his death by means of it, but the love which had arisen between them had prevailed, and she chose death for herself instead. The flower of death had contained the fatal poison. She had learned in England that he had killed the young officer who had been her lover, had come to avenge his death, and this was the outcome. For Septimius had won her real love, and she had died for him.

The energy which enabled Hawthorne to set to work at once upon a wholly new conception of his romance is remarkable in one who must already have felt the approach of his own earthly end. *Dr. Grimshawe's Secret* is less finished than was *Septimius*, but its charm and power are quite as great.

AFTER Dr. Grimshawe had been given up, Hawthorne once more returned to America for his scenery and background, and he reconceived the whole subject from the beginning. It was entitled *The Dolliver Romance*, and it begins in Salem. Not more than three or four chapters were completed at his death. Instead of summarizing them, I shall give some of the notes which he made in forecasting the structure of the tale; so far as I am aware, they have not before been in print. I had copied these notes into a notebook of my own about forty years ago; and it is possible they may have been found and reproduced: but I doubt it.

'*Begin here.*

'First, the old chemist to be introduced in his shop, and in the very act, in the very first sentence, of taking a single drop of the liquid in a tumbler of water; and in this first sentence, too, must be introduced the little girl, rushing up, attracted by the old bottle, to get hold of it. He seems doubtful, and fearful what it may do to him: regretful, hopeful, but seems a little renewed by it. Possibly he dropped it into a glass of wine (which is made to foam by it?—No. Yes. Doubtful).

'Then comes a description of the chemist, his present aspect, his origin, his fortunes, all in a grotesque way, yet with a certain earnestness. All this time, the child is playing about, interesting the reader, and arousing suggestions as to the old man's character and purposes. Refer to some mysterious way in which he had got possession of the bottle or recipe.

'Then a few years pass, and the old man continues to take his drop a day, and it produces the effect of a powerful cordial, but it must be described in its various . . . (illegible) . . . ways. People begin to wonder about him, but think it is only false teeth, and perhaps false hair. He, by his dress and general appearance, makes himself look as young as he can. Besides, being an emigrant, nobody knows exactly how old he is. Nevertheless, a certain rumor and wonderment spread abroad concerning him.

'Then comes in another old man—perhaps an old gentleman of eminence in the place, who had never condescended to notice the chemist before, being entirely above him. Powdered, finely dressed, but old, old, aristocratic, puffed up; but wanting something in particular of the chemist. He talks about his age and about the chemist's, and he and the old men discuss age together, the chemist being the freest in talking about infirmities, though in his case they are lighter every day. But he wants to conceal that fact. At last it appears that the visitor has in some mysterious way a knowledge of the recipe, and even of the way in which it came into the chemist's possession.—A great mystery should be made on this point.—And he demands that the bottle be given up to him. To this the

chemist strenuously objects, being now in love with life, and determined not to give up a drop of it. Finally, the chemist being called hastily into the outer shop, the old gentleman rummages for the bottle, and drinks a wineglass full of it, which operates in some strange way, to be hereafter explained in his death.

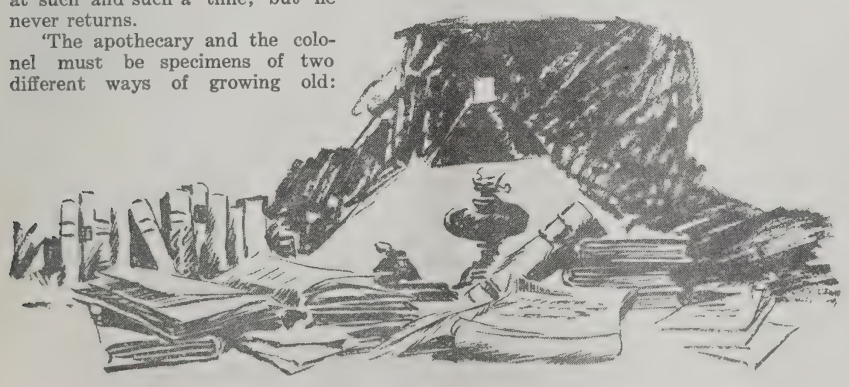
'The old gentleman may be of the same family as that of Smithell's Hall; or a cousin, or a nephew of the man who brought it there, in order to get possession of the secret.

'His whole life is an effort for the means of living longer—utterly neglectful of all the high opportunities which long life and imperishable vigor would seem to offer him. He has no scruple in violating any law for the purpose of attaining his object; and at last fate seems to point out that the thing which he has sought all over the world is really in the keeping of his own granddaughter and her family—so he comes back thither.

'The utter, utter loneliness of the poor monster must be brought out. I think that should be exemplified by a love affair after he has grown to be a young man again.

'Long ago, a stranger came to get him to make up the recipe, leaving it behind him for the purpose. The ingredients were chiefly poisonous . . . (illegible) . . . there was one thing left blank, or written in undecipherable characters, and this the stranger supplied, by giving it to the chemist in a small lump, to be put in with the rest. While the preparation is concocting he goes away, promising to be back at such and such a time; but he never returns.

'The apothecary and the colonel must be specimens of two different ways of growing old: the former fossilized, harshly defined, narrow, hard, selfish, with the humanity petrified out of him, his communication with mankind getting dammed and shored up; the good humor which belongs to him in health and well-being yielding to the fierceness that characterizes an old brute—so selfish that he would eat child-broth, and have a daily child slaughtered to make it with, if he thought it would do him any good, and so forth.—The doctor, mild, meek, gentle, getting worn away and defined by age, readily melting into tears, fading out, cackling with mild laughter, and so forth. The colonel is famous in town for desiring to continue young, and there are strange and absurd stories about his contrivances to keep so, such as his petting children, counterfeiting care for them in order to inhale their breath, and so forth. When he gets back to young manhood, he shows a remnant of fidelity by falling in love with a young woman who reminds him of his long-dead wife. She seems to have excellent traits; but, perceiving something wrong in him, she avoids him. Perhaps she has a glimpse of his age.



'HE questions with himself whether he would share his beloved liquid with the girl with whom he falls in love; but finds himself incapable of that sacrifice.—She had tried to convert him, speaking just as his wife would.

'After the colonel dies, there is a look of youthfulness in his face—perhaps it is quite the face of a wild, passionate, excited young man; but as the old doctor stands gazing at him, it suddenly withers, crumbles, and changes into the face of an old man again.

'Love, which he feels for the girl, brings him back his real youth, and makes him feel what a dry, dusty, miserable mockery he has lived in. All the hopes, the generosity, the magnanimity, the hope in the world's behalf, are reawakened for a time.

'The drug which is wanting—what is it?—A mysterious and rare flower, one that grows out of a grave?—a mystery—a powder—a distillation of various rare ingredients—a charm—some herb known by the old woman, and transmitted to her from her witch ancestors.—Gracious Mercy Me!'

There are more of these notes-by-the-way, but I will not continue. From all we get a glimpse of what might be called the prenatal state of a story in a great imaginative mind. In the published chapters he seems to have found the clue, but before he could follow it up, death overtook him.

# Fining Men for Dying

(*Concluded from page 2*)

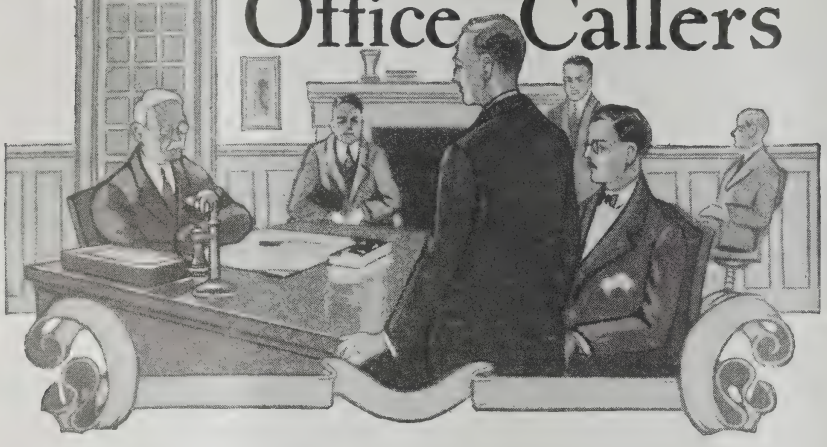
just as effective commerce barriers as tariff walls.

Take the case of Henry C. Jackson, of Boston. He died leaving an estate of three millions, of which one-half was in real estate and personal property in Massachusetts and the other half in stocks and bonds of corporations organized under the laws of seventeen other states. The Federal Government first taxed the estate $295,240, then Massachusetts taxed it $340,435, and then the seventeen states together took $55,325 or a total tax of $691,000—all of which had to be paid within a year, although the cash in the estate was only $47,313. Rich men do not often have much ready cash on hand. The executors of Frank Woolworth had to sell, among other things, his residence on Fifth Avenue to put toward paying the federal estate tax of nearly seven million, and the state tax of over a million.

Theodore Roosevelt left an estate just short of a million but the available cash was only $3,463 to meet taxes and administration charges of $130,647. The estate of George W. Perkins amounted to approximately six million, but the inheritance taxes ran to almost a million and a half and the cash was $183,697.

The British Labor Party talked about a capital levy until the accountants got to work. They discovered that the levy would bring into the hands of the government a miscellaneous assortment of securities and real estate—of course not cash, for only a small part of wealth is ever in cash. So far so good, and the government could retire a lot of bonds; but when they came to calculate the revenues for the future support of the government, they got some figures that put the capital levy on the shelf. For what remained to the taxpayers could not produce enough income to pay the ordinary expenses of government! From a dollars and cents standpoint, the capital levy could not pay and neither does the capital levy imposed at death and called an inheritance tax. It is a mortgaging of the old homestead to pay living expenses.

In any event a system of finance which depends on the death rate among rich men can hardly be called sound. We would have the governor of a state announcing his budget thus:



'Six men of large means are in bad health and we can confidently base our revenue on collecting a minimum of one hundred million from their estates . . . '

The less capital we have at work the lower must be our wages and consequently our scale of living. The property taken by taxation may not decrease the total wealth of the country—it may transfer a portion to the state. But capital in the wrong hands is useless.

To be logical we ought to do one thing or the other about inheritance taxes—either confiscate estates or tax them merely for revenue purposes. Let us flatly decide whether or not it is wrong to die rich—and act according to our decision.

*This is the third of a series of articles by Mr. Crowther. The next will appear in an early issue.*

# Chats *with* Office Callers

Said one of two callers—***Banker and Stockman***—'About this League of Nations now. I hold that the admittance of Germany is the best thing yet. ('I don't,' put in the other.) You see, nations come to a better understanding when they meet face to face, as all living things do. ('Bulls in a pasture don't,' said the stockman.) The League is the world's first serious attempt to settle troubles by moral force, and only a complete attendance and representation will avail. ('Not necessarily,' put in the stockman. 'A part League might be just as effective. It would make some progress.') A half or a part League is about as useless as a half wheel,' answered the other. 'Your progress would only be a silly sawing back and forth, getting nowhere. My notion is that one of the best things in the League's program is article 19, by which it is agreed that the League, from time to time, may invite its members to proceed to a new examination of treaties that have become inapplicable. That is likely to offset any sense of rankling injustice. ('The National individuality will be lost in the mass,' objected the stockman.) Is individuality lost in a debating society?' asked the banker. And so the argument went on but neither convinced the other.

Said ***'Brick' Murphy,*** the other day, when someone spoke about the trend of public sentiment, and the stupendous expression of opinion on the part of the workingman against the Eighteenth Amendment: 'An' so it's public sentiment you'd talk about, is it? Now just as you was astonished at th' number iv people who talked dry whin th' counthry was wet; an' was astonished at th' number of wets whin th' counthry was dry; so you'd be astonished at th' number who'd talk dry if 'twas wet agin tomorrow. 'Tis th' natural cussedness of man to be agin what's th' rule. But don't call fickle mindedness by th' name of public sentimint.'

'How many persons realize,' asked ***the Financial Expert,*** 'that the electoral college of 1924 did not, and the college of 1928 will not, elect the President and Vice-President as provided for by the Constitution of the United States? It is an acknowledged fact that these bodies are not arranged according to the Constitutional basis of population. The Constitution makes it mandatory on Congress to reapportion the House membership after each decennial census, but no action has been taken since that of 1920. House representation must be based on population, and the number of members in the electoral college given each state is based on Congressional representation. Any possible reapportionment must change the relative representation of states, adding to some and reducing others. Neither Congress nor the electoral college today is made up in accordance with the mandates of the Constitution.'

'I just ran across some interesting statistics,' remarked ***the Professor,*** 'intended to show that superiority in weight tends to favor one in the contest for executive positions.

| | |
|---|---|
| Chiefs of police | average 202 pounds |
| Presidents of fraternal orders | average 190 pounds |
| Bank presidents | average 186 pounds |
| Railroad presidents | average 186 pounds |
| Senators | average 186 pounds |
| but | |
| Artists | average 165 pounds |
| Authors | average 158 pounds |
| Philosophers | average 158 pounds |
| Musicians | average 161 pounds |
| Preachers (small town) | average 159 pounds |
| Station agents | average 154 pounds |

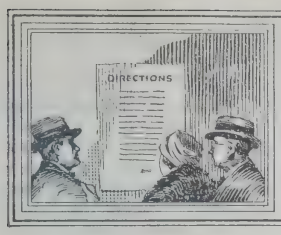
'So are cynics silenced who have thought that ease makes for large waistbands. It's the other way round, apparently. So down with the success advertisers! Clear decks for the new thing, the correspondence course in Advancement by the New Method! Thus:

WIN FAME BY FEASTING
Increase Your Weight and Rule Men
Eat Pottle's Fattening Food and Be An Executive.'

'Show me a parent worthy the name,' said ***the Man With a Large Family,*** 'and I will show you someone engaged in a struggle—fighting against the idea that education is the mere acquisition of facts, and aware that the all-important thing is character, and trying to find the happy medium between a narrow Puritanism and too much laxity.

'And the parent must wage what may sometimes seem to be a losing fight, striving to convert natural curiosity into intelligent interest; on the watch everlastingly to discourage prejudice; fighting for obedience, yet an obedience tempered by self-reliance and independence; advocating discipline of self rather than discipline by definite rules; knowing that driving, browbeating, arguing, wheedling will accomplish nothing; aware that simple diet and fresh air and plain clothing make for health, yet seeing everywhere and being pressed everywhere by those aiming at superficialities.

'All this and more, much more; yet in many cases those who propound ethics editorially are bachelors with never a chick nor child.'



Said ***the Pullman Porter,*** 'One trouble 'bout turning over a new leaf is that there's so many always a-lookin' up the back numbers.'

'We run across queer things,' said ***the Editorial Writer.*** 'J. B. S. Haldane, in his "Daedalus," recalls that Gilbert K. Chesterton prophesied only a few years ago that hansom cabs would continue to do their daily work in London for another century. He thought he detected with the dawn of the 20th Century a cessation of invention.

'On the other hand H. G. Wells seems to have been a fantastic romancer. In 1902 he declared that although he knew full well his statement would excite ridicule, he actually believed that by the year 1950 there would be heavier-than-air flying machines capable of practical use in warfare.

'Verily the rôle of the prophet is a precarious one, but, in the light of developments, an honorable one at its worst compared to that of the satirist. In the field of aviation, for example, who can say how long practical developments were retarded by John T. Trowbridge's clever verses on "Darius Green and His Flying Machine"? There can be no doubt that the state of mind it helped create made pioneering in that line much more difficult than it would otherwise have been or that it deterred many adventurous souls from trying to realize their creative impulses.'

'I hope you are not going to ask me anything about the aboriginals,' said ***the Man from Sydney, Australia.*** 'I've already explained twice today that I've never even seen one. Our city, you know, is almost as modern as some in the United States. It has more than a million population right now, and is second city in size in the Empire. Remote towns in the bush have electric lights and telephone. As for automobiles, there are almost as many per capita in Australia as there are in Canada. It might be said that the ideas concerning ourselves are almost as far-fetched in England as they are in the United States. The fault is not all on your side. We have had, I find, some erroneous ideas concerning the United States. All Americans are not millionaires and the percentage of "crooks" is really quite small. I have been able to walk quite a distance without even meeting a gunman or a cowboy; and the rounding up of desperadoes and the rescuing of heroines is not even a side line with most of your people.'

# Can You Tell Me?

QUESTION: How much has Germany paid in reparations under the Dawes Plan?

ANSWER: Denys P. Myers, librarian of the World Peace Foundation, states in a recent article appearing in the Washington Sunday *Star:*

The Reparation Commission's books show that Germany in six years has paid over 11 billion gold marks of reparations through the second Dawes year as follows:

| | *Gold Marks* |
|---|---|
| Ceded properties | 2,553,905,000 |
| 1920 and 1921 | 3,970,835,000 |
| 1922 | 1,402,685,000 |
| Ruhr period January 11, 1923, to August 31, 1924 | 894,230,569 |
| September 1, 1924, to August 31, 1925 | 1,000,000,000 |
| September 1, 1925, to August 31, 1926 | 1,220,000,000 |
| | 11,041,656,505 |

Garet Garrett, in a recent article, speaking of S. Parker Gilbert, says.

'An Agent General for Reparations Payments . . . is charged to see that only such amounts as Germany can well afford to pay, only such amounts as can be transferred without hurting German credit, shall be passed to the creditors . . . What average sums short of this fatal provocation can be transferred nobody knows, for until now the Germans have been paying with borrowed money—American money.* Seven years have elapsed, and out of her own resources actually she has as yet paid nothing on account of reparations delusion.'

*(This is not altogether American money. America has loaned nearly five hundred millions of dollars in Germany since the inception of the Dawes Plan, and European nations have loaned something over four hundred millions.)

QUESTION: Is illiteracy increasing or decreasing in the United States?

ANSWER: 10.7 per cent of the population of the United States in 1900 was illiterate, 6 per cent of the population of the United States in 1920 was illiterate.

QUESTION: What is the Bertillion System of identification?

ANSWER: It was introduced into France by Alphonse Bertillion—hence the name. Bertillion was a French anthropologist born in Paris in 1853. The Bertillion System is now in wide use throughout the world as a means of identifying criminals. It is based upon the accurate measurement of various parts of the human body, especially the bones—which never change in adults. The trunk, foot, head, ear, height, breadth, middle finger, and extended forearm are among the parts measured.

QUESTION: What does 'E' on the smokestack of a navy ship mean?

ANSWER: Excellency in engineering, an honor coveted by all navy ships.

QUESTION: Is the employment situation in Great Britain improving?

ANSWER: The Department of Commerce advises that a gradual, though slight improvement in the employment situation is apparent.

QUESTION: What is the size of the pool of Bethesda mentioned in John v: 2-9?

ANSWER: Four hundred feet long and 130 wide. It is located in Jerusalem near St. Stephen's Gate and the Temple of Omar. It is now called Birket Israel.

*In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.*

QUESTION: In nautical language what does 'A-1' signify?

ANSWER: It usually designates a first-class vessel, excellently built. Figuratively speaking it means the best of its class.

QUESTION: Are there more men than women in the United States?

ANSWER: According to the 1920 census, the male population of the United States numbered 53,900,431 as compared with 51,810,189 female population.

QUESTION: Has the Federal Government done anything with reference to regulating the use of sink boxes or batteries, mat blinds, and other devices employed in hunting migratory wild fowl in the waters of Southern Atlantic states?

ANSWER: Dr. E. W. Nelson, chief of the Bureau of Biological Survey of the United States Department of Agriculture, recently called a meeting, held in Washington, of sportsmen, game officials, and conservationists from some of the South Atlantic states for the purpose of obtaining valuable information, and the question will be taken up with the Advisory Board, Migratory Bird Treaty Act, at its annual meeting to be held in Washington early in December.

QUESTION: What is the value of property, other than real estate, in the United States?

ANSWER: The value of tangible personality or moveables is estimated at approximately $123,000,000,000.

QUESTION: Are men in the United States as a rule better educated than women?

ANSWER: According to the census of 1920, women and girls in the United States ten years of age and over are 5.9 per cent illiterate; men and boys ten years of age and over are six per cent illiterate.

QUESTION: When and where was the 'Sons of the American Revolution' organized?

ANSWER: New York City in 1876 and reorganized in 1883.

QUESTION: How much money has been accumulated in the Civil Service Retirement Fund since the passage of the Federal Civil Service Retirement Law about five years ago?

ANSWER: The total amount in the fund at the end of the last fiscal year amounted to $54,662,546.54.

QUESTION: What nations engaged in the Crimean War, and when was it fought?

ANSWER: England, France and Turkey were allied against Russia. Date 1854-1856.

QUESTION: What per cent of our gas casualties during the World War were from chlorine gas? Has any official investigation been made of the effects resulting from the various gases?

ANSWER: Out of about 70,000 of our men gassed, 1,843 of them were from chlorine gas. The War Department has made an investigation of the immediate effects of chlorine gassing in more than 800 cases. The Veterans Bureau has appointed a Board of Medical Officers to study the residual effects of war gas. They are now working on chlorine gas, and expect later to take up the question of phosgene, mustard and other gases.

QUESTION: How did the Federal Government acquire title to public lands?

ANSWER: Originally, the titles were held by the original states. Seven states ceded large areas of territory—New York, Virginia, Massachusetts, Connecticut, South Carolina, North Carolina and Georgia—amounting to about 260,000,000 acres. This was donated to the Federal Government. The federal public domain was later enlarged by purchase, discovery and treaty.

# I Read in the Papers

The Republican organization of the South is held together and sustained by the worst kind of corruption. I was in the South a few days ago and learned first hand of an incident which illustrates what I mean. A young man was postmaster. He desired reappointment. He had made a good official. The patrons were thoroughly satisfied with him. The political boss, the national committeeman, stated to him, however, that his reappointment would cost him $1,000. He could not pay it. Another gentleman was recommended. That is general practice in the South.

*Republicans in South Need Reform*

Whenever there is a real contest in the national convention for the nomination of the presidency, the delegates from the South are sought to be controlled and managed by shameless use of patronage and money. We have political brokers in patronage who are experts in the game. When a presidential campaign is on these political brokers carry their wares to the market. That is corruption at the very source of power.

It is poisoning the stream at the very well-springs of national influence. The Republican Party owes it to itself to clean out that Augean stable. It is a difficult task but the Republican Party is big enough and strong enough to do the work.

It is all right to expose the use of money in the primary. One virtue which the primary has is that it does enable us to expose the use of money more successfully than in conventions. But that is only one phase of the evil. We should also deal with this shameless traffic in public positions which goes on under the very eyes of those in power. United States district-attorneyships, marshalships, postmasterships, should be taken off the market. Let us hope that we will throttle the practice which not only has its say in elections but also its influence and effect throughout the field of legislation and the whole fabric of government.—Senator Borah, in a speech in Idaho.

ɤ ɤ ɤ

The only trouble with having a League of Nations is that there is the ever-present danger of a war being started at one of the meetings.—New York *Herald Tribune*.

ɤ ɤ ɤ

General Bruce is reported to be experiencing a difficulty in obtaining permission from the Tibetan Government to resume his attempts upon Mount Everest. This is not surprising to those who have followed events in Tibet since the last Everest party went out. It is stated that the exploit of a certain Englishman, who went to Lhasa in disguise and without authority, is the reason. Such may have been the pretext,

*Western Ideas Not Wanted*

but the truth is that the Everest Expedition has always been opposed by the Lamaist hierarchy on the same grounds that it opposes any European entering the country at all.

It is not that the lamas are troubled about offense which might be given to the guardian diety of the mountain. They are not quite so ignorant or superstitious. What they do fear, and not without reason, is that the introduction of Western ideas and the appliances of Western civilization may well mean the beginning of the decline of their power.

It was precisely this fear that led to the deposition and the alleged assassination, last year, of the late Tsarong Shape, the progressive commander-in-chief of the Tibetan army. Lately came the news that the Tibetan engineer, Rinchengang, who was taking electrical machinery to Lhasa, has been intercepted, murdered, and the machinery broken up and thrown down a precipice. All this is part of the definite policy of resistance against modern tendencies, in which the Everest Expedition becomes a minor episode.

—Edward De O'Orme, in *The Spectator*.

Criminals could not get on so well if they did not get off so easily.—*Wall Street Journal*.

ɤ ɤ ɤ

Rome is indeed still a medieval city both morally and materially. She lies 500 miles down the boot of Italy on a road that leads nowhere. She is on no trade route, and a city of 600,000 souls is not sufficient in these days to be a market by itself. She has no port worthy the name, and even Ostia is twenty miles away down a rapid and turbulent river up which it is difficult to drag even barges. Until last year there was not even a respectable railway service between Rome and Ostia, and it is still needed more for tourists than for merchandise. Her hinterland is only the morbid and miserable Campagna, and therefore she is the outlet for nothing. Even the road approaches, judged by modern standards, are very poor. Nobody, in short, would ever go to Rome on business, and it is hard to imagine why anybody should continue to live there, except archeologists. For the attraction of sentiment has its limits. When the Italians conquered the city they fully expected that as the capital of the new state she would draw all men unto her. The record of their disillusion is written in the acres of moldering masonry and stucco which are the Roman suburbs. These are houses built for a population which never came, and is never likely to come. There is no indigenous industry at all except the keeping of hotels and the weaving of silk for their clients.—C. R. Coote, in *The Nineteenth Century and After*.

*Immortal Rome Is Still Medieval*

About the only seriously discouraging feature in Texas just at this writing is that Jim Ferguson announces that he intends to be of real service to his state in one way or another.—*Ohio State Journal*.

ɤ ɤ ɤ

The British official in India today is genuinely anxious to see Indianization carried as far and as fast as the system will stand, but knows that somewhere there is a point where the whole machine will slip back into the slough from which 150 years have rescued it. He does not, as Lord Olivier has so hastily asserted, prefer or favor the Moslem to the Hindu. In some parts the Moslems are far the more reliable and energetic characters, in other districts the reverse. In many, admirable people of both religions reside and assist equally in good government. To assert that the British official prefers one to the other is to show a complete misunderstanding of the situation. You see in a regiment some illustration of the British inclinations. Some swear by the superiority of the Hindu soldiery, Rajput, Sikh or Dogra, others infinitely prefer the Moslem tribes and races. In their private predilections the British officials vary immensely; in their official ones they vary according to the nature of the inhabitants of their districts. In one the Hindus are infinitely more public spirited than the Moslems; in another it would be exactly the reverse, so varied are the tribes and races that profess the two religions.—George MacMunn in *The National Review*.

# Briefly Told

A FEDERAL HOSPITAL SHIP completely equipped and having aboard a competent physician will soon provide medical service for Alaskans in isolated communities.

LONDONERS ARE COMPLAINING of a new nuisance: the littering of theater floors with peanut shells. The English learned the joys of eating peanuts from the Canadians during the World War.

'I BELIEVE MARRIAGES would in general be as happy, and often more so, if they were all made by the Lord Chancellor, upon a due consideration of the characters and circumstances, without the parties having any choice in the matter.'

—*Dr. Samuel Johnson.*

MORE THAN 19,000 PERSONS have been killed and 52,000 injured in grade-crossing accidents in this country during the past year.

A JAPANESE PEARL FIRM, believing that oysters have souls, has built a miniature pagoda as a shrine to placate the spirits of bivalves from which pearls have been taken.

THE FLOORBOARDS OF A jewelry shop in Birmingham, England, when reduced to ashes, yielded enough precious metal dust to pay for the cost of new flooring.

THE BRIDAL VEIL originated in the Orient where many women still go veiled and where a husband is not supposed to see his bride's face until after the ceremony.

ONE OF THE OLDEST English folk dances is the Abbots Bromley Horn Dance, held annually in England for hundreds of years. The dancers, twelve men, wear deer skulls with antlers attached. The custom is believed to have come down from the time of the Danish invasion and the worship of Thor and Odin.

LESS THAN THREE PER CENT of the farms in America are receiving electric service from central power stations.

A BOSTON RESTAURANT owner bases his daily menus on the forecasts supplied him by the weather bureau. His patrons call for different kinds of foods on hot and on cold days.

THERE ARE 132 WOMEN in the state legislatures in this country. Connecticut, with 17, has the largest number.

THE DAILY RAINFALL of the earth amounts to about 16,000,000 tons a second.

A DEEP-SEA DIVER WALKED on the bottom of the Elizabeth River from Portsmouth to Norfolk, Virginia, a distance of more than a mile, in fifty minutes. His progress was marked for those on the surface by a little cork buoy which was attached by a cord from his shoulders.

ANGERED BECAUSE RATTLESNAKES were killing her turkeys, an Oregon woman procured a rifle and shot forty-four of the reptiles.

ONE-SIXTH OF THE 5,500,000 persons in the United States who are over sixty-five years of age are dependent upon public charity, according to insurance statistics.

KISSING COSTS THE Japanese Government $125,000 a year, even though it is officially barred as immoral and unsanitary. The sum is expended in cutting kissing scenes from motion pictures.

THE CROWN OF GREAT BRITAIN is worn by the King of Great Britain only once—at his coronation. On all other state occasions he wears the State Crown.

BALD-HEADED MEN are brainier than those with luxuriant locks, according to Professor H. J. Fleure, noted scientist. He believes that the growth of the hair absorbs a large quantity of energy.

BURGLARS HAVE CARRIED off many of the crown jewels of Siam from the royal palace at Bangkok. The robbery is regarded by the natives as peculiarly audacious, as the jewels were supposed to be guarded by the ghosts of the dead kings and queens.

THE RAINBOW BRIDGE in the Navajo Mountains on the border of Utah and Arizona is the greatest of all known natural arches in the world.

COOKING SCHOOLS IN Berlin, intended primarily for women, are being overrun with applications from men, married and single, who are anxious to learn the culinary art.

A SOUND-PROOF 'CRYING ROOM' paneled with glass is a feature of a new film theater. Mothers with restless babies can view the picture from the room, without disturbing the other patrons.

A NEW LOCOMOTIVE whistle is described by its designer as having a tone 'as soft as the wood-winds of a symphony orchestra.'

HORSESHOES JUNKED in the United States are being shipped to China where mechanics utilize the chilled iron for making knives.

THE POPULARITY OF bobbed hair is apt to cause widespread baldness among women, according to a prominent hairdresser.

AN ANNUAL VACATION of fifteen days for all workers is compulsory under a law recently put into effect in Brazil.

IN TIBET IT IS the custom of the natives when meeting friends to stick out their tongues as a mark of respect.

APPROXIMATELY ONE HUNDRED new words are added each year to the English language.

IN FORMER YEARS it was believed that mistletoe had some mysterious medicinal virtues when picked from an oak tree.

LIVE FISH AND shellfish similar to those inhabiting the lakes of Palestine have been found by artesian well borers at depths of 200 and 300 feet beneath the sands of the Sahara Desert.

DOGS MAY NOW join the army. New regulations authorize them as army units for such work as acting as messengers to carry relief appeals and for pulling sleds across northern snows.

SLAVERY HAS BEEN abolished in Nepal, the independent state of the Ghurkas in Northern India, through the efforts of the reigning Maharajah. The slaves were purchased at a total cost of $1,376,250.

THE UNITED STATES Infantry in the Canal Zone is trying to find longer mules to carry guns. The weapons tickle the ears of the present-size animals, often causing serious complications.

BEAUTY NOTE FROM Puritan days in New England: 'For ye complexion ye young girl may wash the face in snow, the tingling cold bringing forth the blood and imparting a rich glow of health which is the true beauty.'

THE UNITED STATES GOVERNMENT has more scientific experts at work on the eradication of obnoxious insects than all the other nations of the world combined.

IT IS REPORTED THAT there is a stretch of water in the Pacific Ocean off the coast of Chile which the fish refuse to inhabit.

# NOTES COMMENTS CRITICISMS

MR. FORD'S Page this week discusses the sources of war.

Their ship had been crushed in the grip of the Arctic ice like an eggshell! Marooned on the vast ice fields in the worst possible season for travel, a heartbreaking task confronted them. Four of the men were on the sick list. The mainland was five hundred miles away. And as they struggled southward the drift of the ice carried them farther from their goal than ever. (p. 16)

*The tale of the tragic journey of Captain De Long and his men is a true epic of the Arctic. As the story is written by Burt M. McConnell the figures stand out vividly against the northern background. Perhaps this is because McConnell is so familiar with the region of which he writes. He was assistant to Vilhjalmur Stefansson in the Canadian Arctic Expedition, 1913-14, took part in the rescue of the 'Karluk' survivors from Wrangell Island, has been superintendent of an Alaskan gold mine, and was in American aviation during the war. Besides all this Mr. McConnell is well known as a magazine writer and is at present on the editorial staff of the 'Literary Digest.'* (p. 16)

Burt M. McConnell.

In all the realm of taxation no impost is so ill-devised or irrational as the inheritance tax. It is a capital levy imposed at death—*a fine for dying!* Its effect is to tear down industry, to disrupt the steady flow of commerce. (p. 1)

Samuel Crowther's analysis of the inheritance tax will bear careful reading. It has become a custom in this country to berate wealth merely because it is wealth. The inheritance tax is a phase of this hysteria. It fails to take into account the part wealth plays in the promotion of *universal* prosperity; its result is to concentrate wealth in a few 'safe' securities, while industry as a whole goes beggaring. Any system of governmental financing which depends upon the death rate of the nation for its continuance is fundamentally unsound. (p. 1)

All the traps of the fur trade aren't set for animals. Some are set for the trappers themselves, some for the persons who buy the furs. This article is illuminating. It is written by a Westerner who prefers to remain anonymous. (p. 23)

Captain Winfield W. Robinson, Troop A, New York State Troopers: THE DEARBORN INDEPENDENT is one of the most valued periodicals which comes to our troop library and reading room. Its articles and current information are enjoyed by all, and we have been particularly interested in the historical items pertaining to the American Revolution, Signers of the Declaration, and so forth.

Edwin E. Witte, Wisconsin Free Library Commission: There have been few if any issues in which we have not found one or more articles of value to our library, and a great deal of the material we have taken from THE DEARBORN INDEPENDENT has been used by us in giving information to members of the legislature and others upon questions concerning which they sought our assistance.

Mrs. W. T. Lafferty, University of Kentucky: My work at the university includes the clipping of articles from current magazines and newspapers that are useful to women's clubs in the preparation of their programs. I find valuable articles in every issue of THE DEARBORN INDEPENDENT which I clip, mount in university folders and lend to the women's clubs of Kentucky. I find the articles extremely valuable.

Ex-private, American Expeditionary Forces: Your magazine used to be good, but the articles on A. E. F. court-martials are the worst bunk I've ever seen anywhere. Tell the writer to go on back to his dolls. The war's over.

*Here's an article that tells why things aren't always what they seem. It's by Donald A. Laird, one of the best known of the younger psychologists, whose literary output includes three books, more than a hundred scientific papers and numerous magazine articles. Dr. Laird has taught at Yale, Colgate, Iowa, and Wyoming, and is the originator of the Colgate Mental Hygiene Tests, now widely used throughout the country. Herein he takes up the matter of illusions, of optical deceptions.* (p. 6)

Donald A. Laird.

One dominant theme recurred again and again to Nathaniel Hawthorne—continuous life, immortality. From a dozen paths he approaches the same goal, but he died before he had realized his ambition. Now, half a century later, his son, Julian Hawthorne, tells of this secret ambition—of Hawthorne's great untold story. (p. 4)

The article is without doubt one of the most important literary contributions of the year. It would be valuable for the new light it sheds on America's greatest novelist if for nothing else; but in addition it gives some of Hawthorne's notes, heretofore unpublished. (p. 4)

A few years ago Margot Asquith, wife of England's one-time Premier, startled her contemporaries by the frankness with which she discussed them in her brilliant autobiography. Her daughter-in-law, Lady Cynthia Asquith, in this issue discusses with equal frankness the writing of intimate memoirs. Not content with an inherited reputation, Lady Cynthia is rapidly building one for herself as an author. (p. 8)

The beautiful luster ware of our forefathers forms the basis for a delightful article by Mary Harrod Northend, whose latest book, *American Glass*, is meeting with marked success. (p. 12) . . . Those who have read A. A. Milne's *When We Were Very Young*, and their number is legion, will be anxious to meet him face to face. They can do so in this interview by Henry Albert Phillips, himself a well-known novelist and magazine writer. (p. 3)

A defense of the salaries paid football coaches is advanced by one of the best-known sports writers in the country, who uses the *nom de plume*, Paul MacDonald. (p. 7)
